ACKNOWLEDGEMENTS

The author would like to express his gratitude and appreciation to the people who made this thesis a possibility:

- My Creator for providing the ability, the faculty and me with knowledge required for the completion of this thesis.
- My parents for their continued encouragement and support.
- My supervisor, Professor C.J. Kruger, for this guidance, patience and encouragement during my study, towards the final understanding of the subject matter presented in this thesis.
- My co-supervisor, Professor R.D. Johnson, for his words of encouragement and optimism, and for assisting me in focusing on the most important factors in the subject matter presented in this thesis.
- Dr. M.C. Matthee for her guidance during the initial phases of my thesis.
- Professor C. de Villiers for her continued motivation and inspiration.
- Professor P.M. Alexander for her wisdom when I needed it.
- My friends who listened to endless discussions related to the content of this thesis.

Finally, I offer my best regards and blessing to all those who supported me during the completion of this project and the conclusion and submission thereof.

THESIS SUMMARY

Title: **VOLUME 2: APPENDICES AND ATTACHMENTS**

The Fundamental Building Blocks Of Organisational Knowledge Management – A Statistical Evaluation.

Author: Jacobus Philippus van Deventer (02605805).

Supervisor: Prof. C.J. Kruger.

Co-Supervisor: Prof. R.D. Johnson.

Department: Department of Informatics.
Economics and Management Sciences, University of Pretoria.

Degree: Ph.D. (Informatics).

Keywords: Knowledge, Management, Organisation, Knowledge Management, Organisational Knowledge Management, Text Analysis, Lexical Analysis, Cluster Analysis.

Abstract

As organisations and managers start to realise the strategic value of knowledge within their organisation, several attempts have been made to implement Knowledge Management (KM) within these organisations. The standard approach, which leads to the failure of KM initiatives, is to view KM as a type of technological implementation while failing to realise that the organisation needs to facilitate a KM-friendly environment. Organisations that have successfully implemented KM within their boundaries, structure and scope have developed unique and organisation-specific KM implementations, making it difficult for the success factors associated with these implementations to be transferred to other organisations. As a result, researchers and authors have attempted to develop an ontological or taxonomical mechanism that would assist in the sharing of knowledge within and across organisational boundaries. Due to the organisational specialisation of these mechanisms, these attempts have for the most part been unsuccessful.

This study presents foundational work that can be used within an organisation to develop KM initiatives. By focusing on the language used by KM researchers and KM practitioners working with and practising KM within organisations, the author identified multiple terms and concepts that represent the fundamental building blocks of KM. If these building blocks are applied appropriately between different organisations, they can assist in the development of a KM initiative. The identified fundamental building blocks offer a starting point for the development of a KM initiative. As the study focuses on organisational KM needs, these building blocks may be used to implement a KM initiative that would satisfy an organisation's KM needs.

© University of Pretoria

The goal of this study is therefore to identify the fundamental building blocks of KM that, when applied constructively, would assist the KM practitioner in satisfying an organisation's KM needs. In order to achieve this goal, the research focused on the following objectives (as reflected in the research question, subquestions and chapter division):

- To identify why there is a need for KM within organisations, and how it has been addressed in research, KM initiatives and organisations.
- To clearly delineate the concepts of Knowledge, Management and KM that can be applied in relationship with the process of organisational management.
- To identify organisational KM needs as linked to a generic organisation that is associated with a system interacting with its environment (gaining or losing knowledge due to the system's nature).
- To identify KM's fundamental building blocks associated with the language used by KM researchers and practitioners.
- To represent the identified fundamental KM building blocks that can be applied to a generic organisation to satisfy organisational KM needs.

As a result of the discussion, review and study conducted for this thesis, the author found specific dimensions pertaining to the fundamental building blocks of KM that satisfy organisational needs.

- It was established that there is a clear need for organisational KM in an effort to retain and manage knowledge resources to the benefit of the organisation. This highlighted the need for organisational KM, outlining possible solutions plus concerns found in previous research. It was found that although there is a need for organisational KM, this need has been poorly addressed thus far.
- Based on the discussion and findings in this thesis, it was found that there is a clear distinction between the concepts of Knowledge, Management and KM and it was found that KM provides support for the day-to-day management processes to which it is aligned. This highlighted the nature of Knowledge, Management and KM by redefining the construct of KM based on core considerations related to the concepts of Knowledge and Management and the critical interaction between the two.
- It was found that due to the systemic nature of an organisation, knowledge dissipates into the organisational environment. KM is essential to minimise this effect. Furthermore, organisational KM needs can be satisfied by applying the fundamental building blocks of KM during the implementation of an organisational KM initiative.
- After analysing the lexicon used by KM practitioners, the building blocks of KM were clearly highlighted by comparing patterns presented within the results analysed for this study.
- The final objective highlights and represents the fundamental building blocks of KM that satisfy organisational KM needs as clearly identified from the language used by KM practitioners.

© University of Pretoria

By extending this study to the language used by KM practitioners as formulated within communities of practice in describing KM, the results of this study link directly to not only what KM theoretically appears to be, but also to how KM is viewed by people who work within the KM and knowledge environment on a day-to-day basis.

Title	Integrating Knowledge Management Technologies in Organizational Business Processes: Getting Real Time Enterprises to Deliver Real Business Performance
Description	The first comprehensive analysis relating knowledge management and its integration into enterprise business processes for achieving agility and adaptability often associated with the real time enterprise business models. It constitutes critical knowledge for organizations that must depend on information and communication technologies for increasing strategic agility and adaptability.
Keyword	Knowledge Management, Real Time, Real Time Enterprise, Business Processes, RTE, Real Time Enterprise Business Models, Real Time Scheduling, Business Models, Business Performance, Business Process, Return on Investment, ROI, Information Technology, Case Studies, Cisco, Wal-Mart, Enron, General Electric, Dell, GE
BodyText	Integrating knowledge management technologies in organizational business processes: getting real time enterprises to deliver real business performance Yogesh Malhotra TheAuthors Yogesh Malhotra, Dr Yogesh Malhotra serves on the Faculty of Management Information Systems at the Syracuse University and has taught in the executive education programs at Kellogg School of Management and Carnegie Mellon University. He is the founding chairman of Global Risk Management Network, LLC, the New York based internationally recognized research and advisory company. His corporate and national knowledge management advisory engagements include organizations such as Philips (The Netherlands), United Nations (New York City Headquarters), Intel Corporation (USA), National Science Foundation (USA), British Telecom (UK), Conference Board (USA), Maeil Business Newspaper and TV Network (South Korea), Ziff Davis, Government of Mexico (Mexico), Government of The Netherlands (The Netherlands), and Federal Government of the USA. He can be contacted at: www.yogeshmalhotra.com Acknowledgements Constructive comments offered by the special issue editor Eric Tsui and the two anonymous reviewers are gratefully acknowledged. Abstract Purpose - To provide executives and scholars with pragmatic understanding about integrating knowledge management strategy and technologies in business processes for successful performance. Design/methodology/approach - A comprehensive review of theory, research, and practices on knowledge management develops a framework that contrasts existing technology-push models with proposed strategy-pull models. The framework explains how the critical gaps between technology inputs, related knowledge processes, and business performance outcomes can be bridged for the two types of models. Illustrative case studies of real-time enterprise (RTE) business model designs for both successful and unsuccessful companies are used to provide real world understanding of the proposed framework. Findings - Suggests superiority of strategy-pull models made feasible by new plug-and-play information and communication technologies over the traditional technology-push models. Critical importance of strategic execution in guiding the design of enterprise knowledge processes as well as selection and implementation of related technologies is explained. Research limitations/implications - Given the limited number of cases, the framework is based on real world evidence about companies most popularized for real time technologies by some technology analysts. This limited sample helps understand the caveats in analysts'

© University of Pretoria

advice by highlighting the critical importance of strategic execution over selection of specific technologies. However, the framework needs to be tested with multiple enterprises to determine the contingencies that may be relevant to its application. Originality/value - The first comprehensive analysis relating knowledge management and its integration into enterprise business processes for achieving agility and adaptability often associated with the real time enterprise business models. It constitutes critical knowledge for organizations that must depend on information and communication technologies for increasing strategic agility and adaptability. Article type: Research paper. Keywords: Knowledge management, Real time scheduling, Business performance, Return on investment. Journal of Knowledge Management Volume 9 Number 1 2005 pp. 7-28 Copyright © MCB University Press ISSN 1367-3270 Introduction Technologists never evangelize without a disclaimer: Technology is just an enabler. True enough - and the disclaimer discloses part of the problem: enabling what? One flaw in knowledge management is that it often neglects to ask what knowledge to manage and toward what end. Knowledge management activities are all over the map: building databases, measuring intellectual capital, establishing corporate libraries, building intranets, sharing best practices, installing groupware, leading training programs, leading cultural change, fostering collaboration, creating virtual organizations - all of these are knowledge management, and every functional and staff leader can lay claim to it. But no one claims the big question: why? (Tom Stewart in The Case Against Knowledge Management, Business 2.0 , February 2002). The recent summit on knowledge management (KM) at the pre-eminent ASIST conference opened on a rather upbeat note. The preface noted that KM has evolved into a mature reality from what was merely a blip on the good idea radar only a few years ago. Growing pervasiveness of KM in worldwide industries, organizations, and institutions marks a watershed event for what was called a fad just a few years ago. KM has become embedded in the policy, strategy, and implementation processes of worldwide corporations, governments, and institutions. Doubling in size from 2001, the global KM market has been projected to reach US$8.8 billion during this year. Likewise, the market for KM business application capabilities such as CRM (Malhotra, 2004a) is expected to grow to $148 billion by the next year. KM is also expected to help save $31 billion in annual re-invention costs at Fortune 500 companies. The broader application context of KM, which includes learning, education, and training industries, offers similarly sanguine forecasts. Annual public K-12 education is estimated at $373 billion dollars in US alone, with higher education accounting for $247 billion dollars. In addition, the annual corporate and government training expenditures in the US alone are projected at over $70 billion dollars. One can see the impact of knowledge management everywhere but in the KM technology-performance statistics (Malhotra, 2003). This seems like a contradiction of sorts given the pervasive role of information and communication technologies in most KM applications. Some industry estimates have pegged the failure rate of technology implementations for business process reengineering efforts at 70 percent. Recent industry data suggest a similar failure rate of KM related technology implementations and related applications (Darrell et al. , 2002). Significant failure rates persist despite tremendous improvements in sophistication of technologies and major gains in related price-performance ratios. At the time of writing, technology executives are facing a renewed credibility crisis resulting from cost overruns and performance problems for major implementations (Anthes and Hoffman, 2003). In a recent survey by Hackett Group, 45 percent CIOs attribute these problems to technology implementations being too slow and too expensive. Interestingly, just a few months ago, some research studies had found negative correlation between tech investments and business performance (Alinean, 2002 ; Hoffman, 2002). Financial performance analysis of 7,500 companies relative to their IT spending and individual surveys of more than 200 companies had revealed that: companies with best-performing IT investments are often most frugal IT spenders; top 25 performers invested 0.8 percent of their revenues on IT in contrast to overall average of 3.7 percent; and highest IT spenders typically under-performed by up to 50 percent compared with best-in-class peers. Based upon multi-year macroeconomic analysis of hundreds of corporations, Strassmann (1997)

© University of Pretoria

had emphasized that it is not computers but what people do with them that matters. He had further emphasized the role of users' motivation and commitment in IT performance [1] . Relatively recent research on implementation of enterprise level KMS (Malhotra, 1998a ; Malhotra and Galletta, 1999 ; Malhotra and Galletta, 2003 ; Malhotra and Galletta, n.d. a ; Malhotra and Galletta, n.d. b) has found empirical support for such socio-psychological factors in determining IT and KMS performance. An earlier study by Forrester Research had similarly determined that the top-performing companies in terms of revenue, return on assets, and cash-flow growth spend less on IT on average than other companies. Surprisingly, some of these high performance benchmark companies have the lowest tech investments and are recognized laggards in adoption of leading-edge technologies. Research on best performing US companies over the last 30 years (Collins, 2001) has discovered similar findings. The above findings may seem contrarian given persistent and long-term depiction of technology as enabler of business productivity (cf. Brynjolfsson, 1993 ; Brynjolfsson and Hitt, 1996 ; Brynjolfsson and Hitt, 1998 ; Kraemer, 2001). Despite increasing sophistication of KM technologies, we are observing increasing failures of KM technology implementations (Malhotra, 2004b). The following sections discuss how such failures result from the knowledge gaps between technology inputs, knowledge processes, and business performance. Drawing upon theory, prior research, and industry case studies, we also explain why some companies that spend less on technology and are not leaders in adoption of most hyped RTE technologies succeed where others fail. The specific focus of our analyses is on the application of KM technologies in organizational business processes for enabling real time enterprise business models. The RTE enterprise is considered the epitome of the agile adaptive and responsive enterprise capable of anticipating surprise; hence our attempt to reconcile its sense making and information processing capabilities is all the more interesting. However, our theoretical generalizations and their practical implications are relevant to IT and KM systems in most enterprises traversing through changing business environments. Disconnects between disruptive information technologies and relevant knowledge Organizations have managed knowledge for centuries. However, the popular interest in digitizing business enterprises and knowledge embedded in business processes dates back to 1993 [2] . Around this time, the Business Week cover story on virtual corporations (Byrne, 1993) heralded the emergence of the new model of the business enterprise. The new enterprise business model was expected to make it possible to deliver anything, anytime, and, anywhere to potential customers. It would be realized by digitally connecting distributed capabilities across organizational and geographical boundaries. Subsequently, the vision of the virtual, distributed, and digitized business enterprise became a pragmatic reality with the mainstream adoption of the internet and web. Incidentally, the distribution and digitization of enterprise business processes was expedited by the evolution of technology architectures beyond mainframe to client-server to the internet and the web and more recently to web services. Simultaneously, the software and hardware paradigms have evolved to integrated hosted services and more recently to utility computing and on demand computing (Greenemeier, 2003a, b ; Hapgood, 2003 ; Sawhney, 2003 ; Thickins, 2003) models. Organizations with legacy enterprise business applications trying to catch up with the business technology shifts have ended up with disparate islands of diverse technologies. Decreasing utility of the technology-push model Management and coordination of diverse technology architectures, data architectures, and system architectures poses obvious knowledge management challenges (Malhotra, 1996 ; Malhotra, 2001a ; Malhotra, 2004b). Such challenges result from the need for integrating diverse technologies, computer programs, and data sources across internal business processes. These challenges are compounded manifold by the concurrent need for simultaneously adapting enterprise architectures to keep up with changes in the external business environment. Often such adaptation requires upgrades and changes in existing technologies or their replacement with newer technologies. Going business enterprises often have too much (unprocessed) data and (processed) information and too many technologies. However, for most high-risk and high-return strategic decisions, timely

© University of Pretoria

information is often unavailable as more and more of such information is external in nature (Drucker, 1994 ; Malhotra, 1993 ; Terreberry, 1968 ; Emery and Trist, 1965). Also, internal information may often be hopelessly out of date with respect to evolving strategic needs. Cycles of re-structuring and downsizing often leave little time or attention to ensure that the dominant business logic is kept in tune with changing competitive and strategic needs. As a result, most organizations of any size and scope are caught in a double whammy of sorts. They do not know what they know. In simple terms, they have incomplete knowledge of explicit and tacit data, information, and decision models available within the enterprise. Also, their very survival may sometimes hinge on obsolescing what they know (see for instance, Yuva, 2002 ; Malhotra, 2004b ; Malhotra, 2002c). In other words, often they may not know if the available data, information, and decision models are indeed up to speed with the radical discontinuous changes in the business environment (Arthur, 1996 ; Malhotra, 2000a ; Nadler and Shaw, 1995). In this model, incomplete and often outdated data, information, and decision models drive the realization of the strategic execution, but with diminishing effectiveness. The model may include reactive and corrective feedback loops. The logic for processing specific information and respective responses are all pre-programmed, pre-configured, and pre-determined. The mechanistic information-processing orientation of the model generally does not encourage diverse interpretations of information or possibility of multiple responses to same information. As depicted in Figure 1 , this model of KM is often driven by technological systems that are out-of-alignment with strategic execution and may be characterized as the technology-push model. This model has served the needs of business performance given more manageable volumes of information and lesser variety of systems within relatively certain business environment. However, with recent unprecedented growth in volumes of data and information, the continuously evolving variety of technology architectures, and the radically changing business environment, this model has outlasted its utility. The limitations of the technology-push model are evident in the following depiction of IT architectures as described in Information Week by LeClaire and Cooper (2000) : The infrastructure issue is affecting all businesses ... E-business is forcing companies to rearchitect all or part of their IT infrastructures - and to do it quickly. For better or worse, the classic timeline of total business-process reengineering - where consultants are brought in, models are drawn up, and plans are implemented gradually over months or years - just isn't fast enough to give companies the e-commerce-ready IT infrastructures they need ... Many companies can't afford to go back to the drawing board and completely rearchitect critical systems such as order fulfillment and product databases from the bottom up because they greatly depend on existing infrastructure. More often, business-process reengineering is done reactively. Beyond its disruptive effect on business operations, most IT managers and executives don't feel there's enough time to take a holistic approach to the problem, so they attack tactical issues one-by-one. Many companies tackle a specific problem with a definitive solution rather than completely overhaul the workflow that spans from a customer query to online catalogs to order processing. Strategic execution: the real driver of business performance The gap between IT and business performance has grown with the shifting focus of business technology strategists and executives. Over the past two decades, their emphasis has shifted from IT (Porter and Millar, 1985 ; Hammer 1990) to information (Evans and Wurster, 2002 ; Rayport and Sviokla, 1995 ; Hopper, 1990 ; Huber, 1993 ; Malhotra, 1995) to knowledge (Holsapple and Singh, 2001 ; Holsapple, 2002 ; Koenig and Srikantaiah, 2000a ; Malhotra, 2004b ; Malhotra, 2000b ; Malhotra, 1998c) as the lever of competitive advantage. At the time of the writing, technology sales forecasts are gloomy because of the distrust of business executives who were previously oversold on the capabilities of technologies to address real business threats and opportunities. This follows on the heels of the on-and-off love-hate relationship of the old economy enterprises and media analysts with the new economy business models over the past decade. We first saw unwarranted wholesale adulation and subsequently wholesale decimation of technology stocks. All the while, many industry executives and most analysts have incorrectly presumed or pitched technology as the primary enabler of

© University of Pretoria

business performance (Collins, 2001 ; Schrage, 2002) [3] . The findings from the research (Collins, 2001) on best performing companies over the last three decades are summarized in Table I . These findings are presented in terms of the inputs-processing-outcomes framework used for contrasting the technology-push model with the strategy-pull model of KM implementation [4] . Subsequent discussion will further explain the relative advantages of the latter in terms of strategic execution and business performance. Given latest advances in web services, the strategic framework of KM discussed here presents a viable alternative for delivering business performance as well as enterprise agility and adaptability (Strassmann, 2003). Will the real knowledge management please stand up? The technology evangelists, criticized by Stewart (2000) , have endowed the KM technologies with intrinsic and infallible capability of getting the right information to the right person at the right time. Similar critiques (cf. Malhotra, 2000a ; Hildebrand, 1999) have further unraveled and explained the myths associated such proclamations made by the technology evangelists. Specifically, it has been underscored that in wicked business environments (Churchman, 1971 ; Malhotra, 1997) characterized by radical discontinuous change (Malhotra, 2000a ; Malhotra, 2002b), the deterministic and reductionist logic (Odom and Starns, 2003) of the evangelists does not hold. Incidentally, most high potential business opportunities and threats are often embedded within such environments (Arthur, 1996 ; Malhotra, 2000c ; Malhotra, 2000d). Such environments are characterized by fundamental and ongoing changes in technologies as well as the strategic composition of market forces. Increasing failures rates of KM technologies often result from their rapid obsolescence given changing business needs and technology architectures. Popular re-labeling by vendors of many information technologies as KM technologies has not helped the situation. Skeptics of technology have observed that real knowledge is created and applied in the processes of socialization, externalization, combination, and internalization (Nonaka and Takeuchi, 1995) and outside the realm of KM technologies. Practitioners' inability to harness relevant knowledge despite KM technologies and offices of the CKOs caused the backlash and KM was temporarily branded as a fad. Scholarly research on latest information systems and technologies, or lack thereof, has further contributed to the confusion between data management, information management, and knowledge management. Recent reviews of theory and research on information systems and KM (Alavi and Leidner, 2001 ; Schultze and Leidner, 2002) seem to confirm Stewart's (2000) observation about the key flaw of knowledge management: Knowledge management activities are all over the map ... But no one claims the big question: why? Hence, it is critical that a robust distinction between technology management and knowledge management should be based on theoretical arguments that have been tested empirically in the real world messes (Ackoff, 1979) and the world of re-everything (Arthur, 1996). We are observing diminishing credibility of information technologists (Anthes and Hoffman, 2003 ; Hoffman, 2003 ; Carr, 2003). A key reason for this is an urgent need for understanding how technologies, people, and processes together influence business performance (Murphy, 2003). Explicit focus on strategic execution as the driver of technology configurations in the strategy-pull KM framework reconciles many of the above problems. The evolving paradigm of technology architectures to on demand plug-and-play inter-enterprise business process networks (Levitt, 2001) is expected to facilitate future realization of KM value networks. Growing popularity of the web services architecture (based upon XML, UDDI, SOAP, WSDL) is expected to support the realization of real-time deployment of business performance driven systems based upon the proposed model (Kirkpatrick, 2003 ; Zetie, 2003 ; Murphy, 2003). The technology-push model is attributable for the inputs - and processing - driven KM implementations with emphasis on pushing data, information, and decisions. In contrast, the strategy-pull model recognizes that getting pre-programmed information to pre-determined persons at the pre-specified time may not by itself ensure business performance. Even if pre-programmed information does not become out-dated, the recipient's attention and engagement with that information is at least equally important. Equally important is the reflective capability of the recipient to determine if novel interpretation of the information is

© University of Pretoria

necessary or if consideration of novel responses is in order given external changes in the business environment. The technology-push model relies upon single-loop automated and unquestioned automatic and pre-programmed response to received stimulus. In contrast, the strategy-pull model has built in double-loop process that can enable a true sense-and-respond paradigm of KM [5] . The focus of the technology-push model is on mechanistic information processing while the strategy-pull model facilitates organic sense making (Malhotra, 2001b). The distinctive models of knowledge management have been embedded in KM implementations of most organizations since KM became fashionable. For instance, the contrast between the models can be illustrated be comparing the fundamental paradigm of KM guiding the two organizations, a US global communications company and a US global pharmaceutical firm. The telecommunications company adopted the mechanistic information- and processing-driven paradigm of KM (Stewart and Kaufman, 1995): What's important is to find useful knowledge, bottle it, and pass it around. In contrast, given their emphasis on insights, innovation, and creativity, the pharmaceutical company adopted the organic sense-making model of KM (Dragoon, 1995, p. 52): There's a great big river of data out there. Rather than building dams to try and bottle it all up into discrete little entities, we just give people canoes and compasses. The former model enforces top-down compliance and control through delivery of institutionalized information and decision models. In contrast, the latter model encourages discovery and exploration for questioning given assumptions and surfacing new insights (Nonaka and Takeuchi, 1995). Real time strategic execution: the real enabler of the RTE The issues of technology deployment, technology utilization, and business performance need to be addressed together to ensure that technology can deliver upon the promise of business performance. Interestingly, most implementations of KM systems motivated by the technology-push model have inadvertently treated business performance as a residual: what remains after issues of technology deployment and utilization are addressed [6] . This perhaps explains the current malaise of IT executives and IT management in not being able to connect with business performance needs (Hoffman, 2003). A sense-and-respond KM system that can respond in real time would need to consider the holistic and collective effect of: real-time deployment in terms of tech and human infrastructure (inputs); real-time utilization in terms of what is done about or with information (processing); and real-time performance in terms of how it delivers business performance (outcomes). Deployment of intranets, extranets, or, groupware cannot of itself deliver business performance. These technologies would need to be adopted and appropriated by the human users, integrated within their respective work-contexts, and effectively utilized while being driven by the performance outcomes of the enterprise. To deliver real-time response, business performance would need to drive the information needs and technology deployment needs. This is in congruence with the knowledge management logic of the top performing companies discussed earlier. These enterprises may not have created the buzz about the latest technologies. However, it is unquestionable that these best performing organizations harnessed organizational and inter-organizational knowledge embedded in business processes most effectively to deliver top-of-the-line results. The old model of technology deployment spanning months or often years often resulted in increasing misalignment with changing business needs. Interestingly, the proposed model turns the technology-push model on its head. The strategy-pull model illustrated in Figure 2 treats business performance not as the residual but as the prime driver of information utilization as well as IT-deployment. The contrast between the inputs-processing-output paradigms of KM implementations is further explained in the following section to bridge the existing gaps in KM research and practice. Gaps in KM implementation research and practice The knowledge application gap that is characteristic of the inputs- and processing-driven technology-push model have also been the subject of criticism in scholarly research on KM (Alavi and Leidner, 2001 ; Zack, 2001). However, these gaps seem to persist across most of theoretical research and industry practices related to information systems and knowledge management as shown in Table II . As discussed in Malhotra (2000a) , such gaps have persisted over the past decade despite advances in understanding of KM and

© University of Pretoria

sophistication of technology architectures. The sample of definitions of KM listed in Table II is not exhaustive but illustrative. However, it gets the point across about the missing link between KM and business performance in research and practice literatures. Despite lack of agreement on what is KM, most such interpretations share common emphasis on the inputs- and processing-driven technology-push model. Review of most such definitions also leaves one begging for a response to Stewart's pointed question to technologists' evangelism about KM: why? In contrast, the strategy-pull model with its outcomes-driven paradigm seems to offer a more meaningful and pragmatic foundation for KM. At least as far as real world outcomes are concerned, this paradigm measures up to the expectations about KM policy and its implementation in worldwide organizations [7] . Better understanding of the gaps that we are trying to reconcile is possible by appreciating the contrast between the three paradigms of KM implementation that have characterized the technology-push and strategy-pull models of KM depicted in Figures 1 and 2 . This contrast is explained in terms of their primary and differential focus on the inputs, processing, and outcomes. The inputs-driven paradigm considers information technology and KM as synonymous. The inputs-driven paradigm with its primary focuses on technologies such as digital repositories, databases, intranets, and, groupware systems has been the mainstay of many KM implementation projects. Specific choices of technologies drive the KM equation with primary emphasis on getting the right information technologies in place. However, the availability of such technologies does not ensure that they positively influence business performance. For instance, installing a collaborative community platform may neither result in collaboration nor community (Barth, 2000 ; Charles, 2002 ; Verton, 2002). The practitioners influenced by this paradigm need to review the lessons about technology inputs listed earlier in Table I . The processing-driven paradigm of KM has its focus on best practices, training and learning programs, cultural change, collaboration, and virtual organizations. This paradigm considers KM primarily as means of processing information for various business activities. Most proponents of RTE belong to this paradigm given their credo of getting the right information to the right person at the right time. Specific focus is on the activities associated with information processing such as process redesign, workflow optimization, or automation of manual processes. Emphasis on processes ensures that relevant technologies are adopted and possibly utilized in service of the processes. However, technology is often depicted as an easy solution to achieve some type of information processing with tenuous if any link to strategic execution needed for business performance. Implementation failures and cost-and-time overruns that characterize many large-scale technology projects are directly attributable to this paradigm (Anthes and Hoffman, 2003 ; Strassmann, 2003). Often the missing link between technologies and business performance is attributable to choice of technologies intended to fix broken processes, business models, or organizational cultures. The practitioners influenced by this paradigm need to review the lessons about processing listed earlier in Table I . The outcomes-driven paradigm of KM has its primary focus on business performance. Key emphasis is on strategic execution for driving selection and adaptation of processes and activities, and carefully selected technologies. For instance, if collaborative community activities do not contribute to the key customer value propositions or business value propositions of the enterprise, such activities are replaced with others that are more directly relevant to business performance (Malhotra, 2002a). If these activities are indeed relevant to business performance, then appropriate business models, processes, and culture are grown (Brooks, 1987) as a precursor to acceleration of their performance with the aid of KM technologies. Accordingly, emphasis on business performance outcomes as the key driver ensures that relevant processes and activities, as well as, related technologies are adopted, modified, rejected, replaced, or enhanced in service of business performance. The practitioners interested in this paradigm need to review the lessons about outcomes listed earlier in Table I . The contrast between the outcomes-driven strategy-pull model and the input- and processing- driven technology-push model is even evident in the latest incarnation of KM under the moniker of RTE. Given the confusion between KM and KM technologies that resulted in the backlash against technology

© University of Pretoria

	vendors, it is germane to point out a similar future for the proponents of RTE. There is an imperative need for making a clear distinction between the business performance capabilities afforded by the RTE business model and the technologies that are labeled as RTE technologies. As discussed earlier, success in strategic execution of a business process or business model may be accelerated with carefully chosen technologies. However, in absence of good business processes and business model, even the most sophisticated technologies cannot ensure corporate survival. Coming of the real time enterprise: the new knowledge management The RTE enterprise is based upon the premise of getting the right information to the right people at the right time (Gartner, Inc., 2002) in real time, i.e. without latency or delay (cf., Lindorff, 2002 ; Lindquist, 2003 ; Margulius, 2002 ; Meyer, 2002 ; Siegele, 2002 ; Stewart, 2000). Enabling the RTE should lead to faster and better decisions, and enhanced agility and adaptability. RTE represents the future of knowledge enabled business processes: wherein digitized organizations interact with increasing and relentless speed and any specific event results in a real-time response. For instance, businesses such as Gillette and Wal-Mart are trying to minimize the delay between a custome

Appendix 2.4: Cleaned Data Graphed

Please note, for the sake of visibility and visualisation, outriders and data value labels were excluded from this graph. Any records lower that 50 and any record higher than 1000 was excluded from this graph. If these records were included, then one would not have been able to visually inspect data in terms of the following bar-chart.

BodyText	Knowledge Jolt with Jack This blog is about knowledge management, personal effectiveness, theory of constraints and other topics. Opinions expressed here are strictly those of the owner, Jack Vinson, and those of the commenters. Brains! People want pieces of experts' brains I came across Barry Moltz' article 6 Ways To Let People Pick Your Brain Without Wasting Your Time and thought it had some good advice for experts - particularly those worried about being overwhelmed when they become known as experts. Even if expertise location isn't top of mind these days, it's still a valid concern for people who are expected to interact via internal social media efforts. The question I dread the most from business people is â€œCan I pick your brain?â€ While I believe in helping others and paying it forward, I am not even sure how this expression got started since it is so visually unappealing. Why would I want someone to literally look inside my brain and take whatever they want? Sounds like the first ever â€œbusiness horrorâ€ flick! His six ideas are all about both protecting your own time (as the expert), as well as being helpful as possible. He starts with the most obvious question: are you going to be paid for this advice? Then there are much more practical aspects: get a clear explanation of how you can be helpful; stick with the phone instead of in-person; and then set limits around the time and energy you wish to put into the interaction. An element I would add would be to find ways to push the request out to the public - whether that is on the public web or on the intranet. Post the question to your status feed. Post the answer to a blog or wiki other permanent location, so the next person who asks can be redirected there. Point the person to other likely sources of assistance, if you aren't available (or interested). [Photo: title by elliottzone] By Jack Vinson on July 20, 2011 11:58 PM | Permalink | Comments (0) Categories : knowledge+management Tags : Barry Moltz , experience , experts , social media Sampling and other low-contribution participation forms In a Google+ discussion of my last post on Lurking and the negative connotations of the term, someone suggested a great alternative term: sampling . I have joined a number of communities with no specific intention to be an active contributor. I want to learn from what they are doing and talking about, but I am not expert enough and/or I don't have the energy to provide more. I wonder if there are other names for forms of low-contribution community participation? Sampling: learning about topics in the community without necessarily feeding back questions or responses. Learning: stopping in to learn about a topic. Probably a deeper dive than a sampler. Observing: rather than learning about the topic, observers are there to learn about the people participating in the topic and their behaviors. Understanding and mimicking group behavior is a key aspect of becoming a member of the group. Connecting: joining one community to bring back ideas / people / connections to another (either real life or virtual). What are some other POSITIVE (or at least non-negative) things that people do in communities when they are not active participants? By Jack Vinson on July 19, 2011 11:11 PM | Permalink |

	Comments (1) Categories : community , knowledge+management Tags : Keeley Sorokti , lurkers , lurking , sampling Look, I'm lurking Thanks to Google+ and Stephen Downes , there is a nice article on lurking by Christy Tucker, Lurking or Legitimate Peripheral Participation . I've written on the topic of lurkers several times . Christy closes her post with some interesting questions - along with the thoughts she poses throughout. What do you think? Are there communities where you are in the center of the action, but others where youâ€™re on the periphery? Is there a place for lurking in learning communities, or should everyone be an active participant? If weâ€™re designing learning with social media, can we focus just on social learning, or can we also support use of social media for peripheral participation? The problem with calling it lurking makes everyone think negative thoughts. Like our community is full of Peeping Tom's or other people with nefarious intent. People who don't talk are still participating and learning - just in some non-obvious ways. Number one: without people in the room, the community whithers and dies. Once the community grows, there is just no good way for everyone to raise their voice. In fact, the cacophony can run people off just as easily as not enough: communities develop their own balance in this regard. So, what are some things that non-active (or peripheral) participants bring to a community? They advocate for new members. They build upon the ideas from one community in another. They may speak when they have something they feel like contributing. They are the audience to hear the conversation. (I know a very small fraction of the readers on my blog - and a similar number of the participants of my other regular hangouts. The fact that they are there keeps me writing.) [Photo: Peeping Tom by Jessica Park] By Jack Vinson on July 18, 2011 11:05 PM | Permalink | Comments (1) Categories : community , knowledge+management Tags : Christy Tucker , CoP , lurking , participation , Stephen Downes Be Fast or Be Gone Andreas Scherer's business novel, Be Fast or Be Gone: Racing the Clock with Critical Chain Project Management , was a very fast read for me. I thought it did a great job of describing how Critical Chain Project Management might be introduced to an organization without going into the gory detail of what-is-CCPM. It isn't a manual on how to do CCPM, but rather a story of how it might work from initial introduction to pilot to larger implementation. I have to say, though, that the backstory of the main character's child having cancer was almost too much for me. My kids are about the same age, and those parental worries are a little too close. Tears were shed. Having read many TOC business novels, this one follows a familiar pattern, which probably made the reading quick for me. The situation is set up through the familiar aspects of the current project management environment in the book. Every company is different, of course, but there should be many very familiar aspects in this story. This one had things like management-by-milestones (which are usually missed); projects created from (unchallenged) templates; too many things pulling on attention; no clear prioritization; little to no transparency on the true status of projects; and several others. I particularly liked Scherer's description of Schedule Chicken, where people try to out-last each other on admitting there might be a problem. If your problem is bigger than mine, then I am going to be okay. (And the fact that admitting there is a problem is its own problem.) Scherer took this book down the path of showing the value of CCPM through an pilot implementation on a high-profile project, which ended up finishing much earlier than anyone suspected. Given that success, the protagonist is given the opportunity to do the same thing with the entire portfolio of projects. While Scherer does a good job of describing CCPM, I like how he talked about the implementation process. What does it take to build a decent project network that will work in a CCPM environment? (Hint, don't just take the standard template.) How can you go about prioritizing an entire portfolio of projects? Who is responsible for these things? One thing that surprised me is that he didn't talk about a big aspect of multi-project CCPM: not only do you need to prioritize work, but you often need to decide to STOP WORKING on some projects because there are simply too many things going on for the people available to do the work. There is a section of the story that addresses resource overloads, and Scherer takes the discussion in the direction of figuring out how to resolve the overloads, rather than automatically assuming that the resource is overloaded. I almost like this approach,

© University of Pretoria

	since organizations often don't know what their true capacity is. Overall a great description of the world of CCPM and the world that I've found myself in for the last several years. It's the implementation where reality strikes the concepts underlying CCPM. By Jack Vinson on July 16, 2011 12:04 AM | Permalink | Comments (0) Categories : book+review , project+management , theory+of+constraints Tags : Andreas Scherer , CCPM Experience: continuous self-improvement I've been incredibly busy with client work (a good thing), and I haven't made the time to write much or do a lot of other explorations (ahem Google+ ahem). I came across something in my personal life that connects back to my business life. Use experience to get better. One of the ideas of the continuous improvement cycle contains some version of a regular how are we doing review. The whole point of the cycle aspect is that you do it again and again with the goal of always getting better at what you are doing. This applies just as well in my personal life: how did I do today? Did I unnecessarily trample on someone else? Did I successfully navigate a difficult situation? Taken from a more familiar business perspective: What went well? What surprises were there today? What could go better? How will I respond the next time? All of these questions have to do with learning from experience. This is valuable whether I am doing it at home in my journal or with my family, or if it in business with my colleagues and clients. [Photo: fruit loops by davidjmarland] By Jack Vinson on July 14, 2011 7:18 AM | Permalink | Comments (0) Categories : continuous+improvement , personal+effectiveness Tags : experience , learning , OODA What does it mean to manage knowledge Nick Milton makes an interesting observation about Capturing tacit knowledge , referencing a discussion with Alan Knott of Parsons Brinckerhof: ... tacit knowledge is to some extent captured when the knowledge holder joins a network or a community of practice. Up to this point, the tacit knowledge is siloed; inaccessible. Once the person is connected into a network, their tacit knowledge is linked into a system. I love this redefinition of what it means to capture knowledge. It goes along the lines of redefining knowledge management altogether. KM in its early days was about managing the evidence of knowledge work: document management, records management, etc. Or it was about managing access to knowledge through yellow pages and expert locators. This has shifted significantly where today knowledge management is about connecting people: connecting people to one another with the assumption that they will help each other and know how to ask. I think this is the one area where KM still falls short. We provide the tools and forums, but people often don't know what to do once they have them. Does one simply ask questions? How does one take the next steps, once they have found a good nexus of knowledge? How do we solve problems together? In other words: what is the system that we should put in place to ensure that people can make best use of the interconnections that Nick mentions above. That best use is likely defined by the people themselves and the goals of the network. Knowledge management has to include thinking along these lines. By Jack Vinson on June 26, 2011 9:23 AM | Permalink | Comments (1) Categories : knowledge+management Tags : Alan Knott , Nick Milton , tacit knowledge Defining the problem The recent David Allen newsletter has an essay on Time Management Is Not the Issue . I've read and listen to him talk on this topic a number of times, but what he says this time strikes a deeper chord for some reason. Most everyone these days admits they could use better time management. But the reason it has not really been addressed to any universal satisfaction is because time management isn't about managing time. If it was, just buying and using a calendar (and a good watch) would handle it. The savvy among you will usually acknowledge that it's really self managementâ€"what we do with ourselves during the time we have. The issue I'm interested in has to do with how we define the problem. In this case, the problem isn't time management or information overload - it is self management. But in other cases, you might be dealing with other questions / problems. Cash flow problem? Is that not enough income, or too much spending? Frequent inventory stock-outs on one product and constantly too much on hand with another? Is this a problem of forecasting or a poor incoming supply chain or something else? Are you angry at your spouse? Is it their fault, or is it your reaction today? There are many other directions to go with this. I like getting under the skin of a question to

© University of Pretoria

	see what is happening and try to discover deeper understanding of what is going on. It's always interesting to realize that the first blush solution to problems is often a treatment of the symptoms, rather than a solution that will remove the symptoms altogether. Please be careful how you define the problem ... and the resulting solution. [Photo: Problem solving fortune cookie by Tomasz Stasiuk] By Jack Vinson on June 24, 2011 12:14 AM | Permalink | Comments (2) Categories : business , personal+effectiveness Tags : David Allen , GTD , information overload , time management Dr. Eliyahu M. Goldratt 1947 - 2011 Eli Goldratt died on Saturday, 11 June 2011, after a short battle with cancer. In my mind, I will always remember his gruff and challenging approach to any question, combined with what seemed a genuine curiosity to learn and take in new ideas. I had a few personal contacts with him, but most of my experience was either as an audience member or through his writings and videos. His wish that Theory of Constraints become the way business operates will now be out in the world to be taken up by This is the text of the note that appeared in my mailbox and on a number of mailing lists connected to TOC to announce his passing. The video is worthwhile for people familiar with his style (still images with quotes). Sixty-four years ago a giant was born. Dr. Eliyahu M. Goldratt spent his entire adult life fighting to show that it is possible to make this world a better place. We must have the honesty to see reality as it is, we must have the courage to challenge assumptions, and above all, we must use the gift of thinking. Having applied these principles to various management fields, he created the Theory of Constraints. His concepts and teachings have expanded beyond management and are being used in healthcare, education, counseling, government, agriculture and personal growth - to name a few fields using TOC. His legacy is invaluable. On June 11th, 2011 at noon, Eli Goldratt passed away at his home in Israel in company of his family and close friends. The strength and passion of Eli allowed him to spend his last days sharing and delivering his latest insights and breakthroughs to a group of people who have committed to transfer this knowledge to the TOC Community during the upcoming Theory of Constraints International Certification Organization Conference in New York. It was Eli's last wish to take TOC to the next level - truly standing on the shoulders of the Giant he is. I smile and start to count on my fingers: One, people are good. Two, every conflict can be removed. Three, every situation, no matter how complex it initially looks, is exceedingly simple. Four, every situation can be substantially improved; even the sky is not the limit. Five, every person can reach a full life. Six, there is always a win-win solution. Shall I continue to count? Appendix 3.4: Cleaned Data Graphed

Please note, for the sake of visibility and visualisation, outriders and data value labels were excluded from this graph. Any records lower that 50 and any record higher than 1000 was excluded from this graph. If these records were included, then one would not have been able to visually inspect data in terms of the following bar-chart.
