ACKNOWLEDGEMENTS

One of the most important things I have learned during this journey is that one’s dreams and ambitions cannot be realised without the help of others. Therefore I pay special tribute and convey my deepest thanks to the following individuals:

- Professor Erna Alant, my supervisor and guide through this process. Thank you for leading me through this journey. This study is a reflection of your innovative ideas and commitment to scientific research in our field.
- Dr Shakila Dada, my second supervisor, thank you for your input into my work. I have appreciated your dedicated contribution.
- To Mike Isaacson, Purdue University, West Lafayette, USA for starting the work on the self-generation effect in the field of AAC and for inspiring this study.
- Mrs Rina Owen, Department of Statistics, University of Pretoria, thank you for your skilful handling of my statistics. All the very best on your retirement.
- To my friends in my PhD class. Thank you for all your contributions to my work. I will miss our contact. I will remember all our times together during our onsites with fondness. All the very best as you too near the completion of your studies.
- To the PhD students at Purdue University, West Lafayette, USA who at various stages of my work assisted me with ideas and references.
- My husband, Mr Mergandaran Velayudan, who I love most dearly, thank you for your unconditionally support in completing my work. You inspire me to be the very best person I can be. I met you when I started this Phd journey, I married you in the middle of this Phd road and now at the end of this Phd trip, I will be most content spending my time being your wife.
- My wonderful mother, Mrs Amitha Rajaram, for always believing in me and making feel that anything is achievable. I acknowledge the personal sacrifices made and hardships endured in bringing me up. I am so grateful.
- My only sibling, my brother Mr Prineal Arnand Rajaram who is so special to me. Thank you for all your support, love and caring. I look forward to the wonderful journey of life ahead of us as you build your own family and I mine. We are first brother and sister for life.
To the individuals with aphasia I meet and work with, thank you for allowing me into your lives. Thank you for allowing me to develop my skills so that I can best serve you. Special mention to my first and most long-term patient, Mr Veramuthu and his family, you have inspired me.

Finally, the culmination of this study will mean that I will soon think about becoming a mother. To the child I will welcome into this world one day, you have suddenly become the unseen motivator in all my endeavours. I have strived to do my very best in this piece of work so that one day you will be proud of your mother and you too will be motivated to continue in this journey of learning.
ABSTRACT

The Application of the Self-Generation Effect to the learning of Blissymbols by persons presenting with Severe Aphasia.

A severe aphasia following a cerebral vascular accident is characterised by generalised deficits in most speech-language domains. The clinical dilemma remains focused on the extensive verbal speech impairment and in most cases little possibility of regaining verbal speech production. Many individuals living with severe aphasia use augmentative and alternative communication strategies to assist them in getting their communication needs met in their everyday lives. The Blissymbol system is one of the graphic symbol systems that can be used to supplement existing communication and speech strategies of the individual with little or no speech.

Although the use of AAC strategies is gaining momentum in its application to severe aphasia, however, there still remain questions on how best to help these individuals learn and retain such strategies. Not only are individuals with severe aphasia faced with a memory task when learning AAC strategies such as Blissymbols, additional complexity to AAC interventions is derived from clinical presentation of severe aphasia. The presence of extensive damage to the neural centers responsible for linguistic processing and semantic retrieval makes learning of new AAC strategies all the more complicated.

Research studies have looked at whether individuals with severe aphasia can learn to recognise and retain Blissymbols. Although these studies have successfully shown that individuals with severe aphasia can learn Blissymbols, there is little information available regarding how these symbols can best be taught and retained over time individuals with severe aphasia. Recently the research that has looked at the application of symbol learning with persons presenting with severe aphasia using computer technology and sophisticated application software has highlighted the importance of therapeutic methods that may enhance the learning of such software.
This study looks at the application of the self-generation effect as a viable method for enhancing the recognition of Blissymbols in persons presenting with severe aphasia. The self-generation effect is the finding of superior retention and recall for stimuli constructed or generated by an individual. Memory for stimuli such as words, numbers and pictures were found to be enhanced by the extent to which the individual was involved in its construction. Using a 2X2X3 factorial design, this study compared the recognition levels for Blissymbols taught using two treatment approaches which was the self-generation condition and the non self-generation condition. During three experimental sessions which included two withdrawal periods participants were taught using both treatments to recognise a set of Blissymbols. Recognition levels were tested during recognition probes and retention probes. The results from these probes were compared in order to identify which treatment produced superior recognition levels.

The data analysis conducted showed that although there was no recognition advantage for the self-generation effect seen during the three recognition probes some advantage for the self-generation effect was seen during the retention probes conducted. The self-generation effect began to emerge by the final retention probe following a withdrawal period of seven days. The self-generation treatment showed better retention of symbol recognition over time. Previous studies have shown that the self-generation effect failed to emerge with stimuli that were new or unfamiliar. This trend was also seen in this study. The results provide support for a semantic-association theory for the self-generation effect.
