ACKNOWLEDGEMENTS

The following people have contributed significantly to the completion of this thesis. I express my sincere thanks to every single one of them.

Prof M Viljoen for her important role as my supervisor. Professor, thank you for your guidance and support over all the years,

Dr Peter Levay for his tireless efforts in evaluating and enrolling each of the Kalafong patients, for obtaining the specimens from these patients and for assisting with the clinical aspects of this work,

Alan Hall for sectioning of all embedded bone marrow tissue with painstaking care,

Chris van der Merwe for the development of all the beautiful electron micrographs,

Dr Piet Becker for all the complex statistical analyses and the hunting stories,

the staff of the Orthopaedics Department, Steve Biko Hospital (formerly Pretoria Academic Hospital) for kindly obtaining the bone marrow during hip replacement procedures,

Prof DH van Papendorp for the opportunity to complete this study in the Department of Physiology,

the Postgraduate Mentor Bursary Programme for their financial support and

lastly, but surely not the least, the Skye Foundation for their generous financial support and continuous interest in my work.
ABSTRACT
Ferritin is the major protein responsible for the sequestration, storage and release of intracellular iron. The ferritin protein shell exists as heteropolymers of various combinations of two types of subunits, the H-subunit and L-subunit, a phenomenon that gives rise to the existence of isoferritins. As the roles of the H-subunit and L-subunit differ in the mineralization process, the subunit composition of ferritin will influence the metabolic properties of the assembled ferritin molecules.

The primary aim of the present study was to quantitatively measure the expression of the H-subunit and L-subunit of ferritin in bone marrow macrophages and cells of the erythron in patients with chronic T-helper cell type-1 immune stimulation. A second aim was to investigate the possible role that the expression of the H-subunit and L-subunit of ferritin may have in the establishment and maintenance of an iron transfer block.

The study subjects included 48 patients with chronic diseases from the Department of Internal Medicine, Kalafong Hospital and 10 patients with osteoarthritis, scheduled for hip replacement at the Department of Orthopaedics, Pretoria Academic Hospital. Bone marrow and blood samples were collected from each patient. The expression of the H-subunit and L-subunit of ferritin in bone marrow macrophages and cells of the erythron was quantitatively evaluated by post-embedding immunolocalisation with immunogold transmission electron microscopy.

The patients were subdivided into groups with a predominantly T-helper cell type-1 immune reaction (pro-inflammatory) and normal immune status on the basis of C-reactive protein, neopterin and cytokines (INF-γ, TNF-α, IL-1β, IL-6, IL-12, IL-2, IL-8, GM-CSF, IL-4, IL-5, TGF-β and IL-10).

The study showed
• up-regulation of the H-subunit of ferritin in the bone marrow macrophage in patients with chronic T-helper cell type-1 immune stimulation
• no effects for chronic T-helper cell type-1 immune stimulation on the expression of the L-subunit of ferritin in the bone marrow macrophage
• no effects for chronic T-helper cell type-1 immune stimulation on the expression of either the H-subunit or L-subunit of ferritin in cells of the bone marrow erythron
• a 70% prevalence of iron transfer block in patients with chronic T-helper cell type-1 immune stimulation
• up-regulation of the H-subunit of ferritin in the bone marrow macrophage in osteoarthritis patients who had normal T-helper cell type-1 immune activity, but significantly increased TGF-β levels
• up-regulation of the H-subunit of ferritin in the patients with iron transfer block
• iron availability loses its primary role in the establishment of the circulating red blood profile in conditions with chronic pro-inflammatory activity
• indications that the H-subunit and L-subunit of ferritin may play a role in the iron availability for red blood cell haemoglobin production
• various correlations in the osteoarthritis patients between the H-subunit and L-subunit of ferritin and different cytokines

Key words
ferritin, isoferritins, H-subunit, L-subunit, iron, chronic immune stimulation
# TABLE OF CONTENTS

## CHAPTER 1

**INTRODUCTION**

1) Body iron content and distribution  
2) Ferritin and ferritin isoforms: Structure-function relationships, synthesis, degradation and secretion

- 2.1) Structure of ferritin
- 2.1.1) Structure of the ferritin protein shell
- 2.1.1.1) Intra-subunit and inter-subunit amino acid side-chain interactions of the ferritin protein shell
- 2.1.1.2) Channels present in the ferritin protein shell
- 2.1.1.3) The ferroxidase catalytic center of the H-subunit of the ferritin protein shell
- 2.1.1.4) The nucleation site of the L-subunit on the inner iron/protein interface of the ferritin protein shell
- 2.1.2) The iron mineral
- 2.2) Mechanism of iron sequestration and release: The role of the ferritin protein shell in iron mineralization and demineralization
- 2.2.1) Oxidation of ferritin
- 2.2.1.1) Oxidation of Fe$^{2+}$ by the ferroxidase center of the H-subunit
- 2.2.1.2) Oxidation of Fe$^{2+}$ on the surface of the growing iron core
- 2.2.2) Hydrolysis and nucleation of the formed Fe$^{3+}$-compound
- 2.2.3) Different iron oxidation kinetics and the formation of different reaction products by the ferroxidase center oxidation of iron and oxidation of iron on the mineral surface
- 2.2.4) Migration of iron between ferritin molecules
2.2.5) Non-specific Fe$^{3+}$-compound hydrolysis on the outer surface of the ferritin protein shell  

2.2.6) The cooperative roles of the H-subunit and L-subunit of the ferritin protein shell in iron mineralization  

2.2.7) The release of iron from ferritin  

2.3) Isoferritins  

2.3.1) Different H-subunit/L-subunit compositions of the ferritin protein shell  

2.4) The synthesis of ferritin  

2.4.1) Assembly of ferritin from the pool of available H- and L-subunits  

2.4.2) Regulation of the expression of the H-subunit and L-subunit genes of ferritin  

2.4.3) The gene sequences of the H-subunit and L-subunit of ferritin  

2.4.4) Translational regulation of the H-subunit and L-subunit mRNA expression via metabolically available iron  

2.4.5) Translational regulation of H-subunit and L-subunit expression irrespective of metabolically available iron  

2.5) The degradation of ferritin  

2.5.1) The formation of haemosiderin from ferritin  

2.5.2) The increased susceptibility of H-subunit rich ferritins to degradation  

2.5.3) The reticuloendothelial cell and haemosiderin formation  

2.6) Ferritin in cellular organelles  

2.6.1) Nuclear ferritin  

2.6.2) Mitochondrial ferritin  

2.7) Extracellular ferritin  

2.7.1) The internalization of ferritin by cells
2.7.2) Other functions of ferritin 

2.8) In conclusion 

2.9) Figure 1: Heuristic presentation of intracellular ferritin metabolism 

3) Ferritin and ferritin isoforms: 

Protection against uncontrolled cellular proliferation, oxidative damage and inflammatory processes 

3.1) Ferritin and the differential expression of the H- and L-subunits of ferritin during uncontrolled cellular proliferation 

3.1.1) Cellular proliferation, ferritin subunits and cancer 

3.1.2) Cellular differentiation 

3.1.3) Programmed cell death (apoptosis) 

3.2) The expression of the H- and L-subunits of ferritin in diseases and toxicities associated with an increase in reactive oxygen species (ROS) generation 

3.2.1) Oxidative stress and neurodegenerative diseases 

3.2.2) Oxidative stress and vascular disorders 

3.2.3) UV-induced oxidative damage 

3.3) The expression of ferritin and the differential expression of the H- and L-subunits of ferritin in inflammatory conditions 

3.3.1) The macrophage, iron metabolism and ferritin in inflammatory conditions 

3.3.2) Increased ferritin expression as a result of cytokine activation 

3.4) Table 1: The effects of cytokines on the expression of H-subunits and L-subunits of ferritin 

3.5) In conclusion

CHAPTER 7

THEORETICAL BACKGROUND AND EXPERIMENTAL EVALUATION OF THE TECHNIQUE FOR ULTRASTRUCTURAL IMMUNOLOCALISATION OF THE H-SUBUNIT AND L-SUBUNIT OF FERRITIN

1) Introduction page 261

2) Theoretical background of the technique for the immunolocalisation of the H-subunit and L-subunit of ferritin page 262

2.1) Preservation of bone marrow tissue and protein for immunolocalisation page 262

2.2) Ultrastructural immunolocalisation of antigens page 263

2.3) Steps in preservation of the tissue and antigen for post-embedding immunolabelling page 264

2.3.1) Fixation page 265

2.3.2) Dehydration page 266

2.3.3) Embedding page 267

2.3.4) Curing of the resin (polymer cross-linking) page 268

2.4) Surface relief upon sectioning and exposure of the antigen page 270

2.5) Antibody penetration of sections page 271

2.6) Post-embedding procedures for increasing antigen availability page 272

2.6.1) Etching of epoxy sections and removal of osmium tetroxide page 272

2.6.2) Etching of LR White sections page 275

2.6.3) Non-specific labelling on etched sections page 276
2.6.4) Antigen retrieval from formaldehyde-fixed tissue  

2.6.5) Antigen retrieval with proteolytic enzymes  

2.6.6) Combination of etching and formaldehyde-fixed antigen retrieval  

2.7) Immunolabelling of the H-subunit and L-subunit of ferritin  

2.7.1) Characteristics of the H-subunit and L-subunit monoclonal antibodies  

2.7.2) Secondary antibody gold-conjugate  

2.7.3) Non-specific binding of antibodies to the section  

3) Experimental evaluation of the ultrastructural immunolocalisation technique for the H-subunit and L-subunit of ferritin  

3.1) The affinity of the H-subunit and L-subunit monoclonal antibodies for their respective recombinant H-ferritin and L-ferritin proteins  

3.2) The cross-reactivity of the H-subunit monoclonal antibody toward the recombinant L-ferritin protein and the cross-reactivity of the L-subunit monoclonal antibody toward the recombinant H-ferritin protein  

3.3) The effect of fixation and dehydration on H-subunit and L-subunit monoclonal antibody binding to their respective recombinant H-ferritin and L-ferritin proteins  

3.4) Fixation of the core bone marrow tissue  

3.5) Outline of the method for the ultrastructural immunolocalisation of the H-subunit and the L-subunit of ferritin  

3.6) Non-specific binding of the gold-conjugate secondary antibody  

3.7) Non-specific binding of the primary monoclonal antibodies to the resin  

3.8) Investigation of the effect of the antigen retrieval procedures on non-specific binding to the resin of the monoclonal antibodies
3.9) Investigation of the effect of different antigen retrieval procedures on immunolabelling  

3.10) Specific immunolabelling of the monoclonal antibodies  

3.11) Antigen retrieval with sodium ethoxide  

3.12) Investigation of the effect of different polymerisation procedures on immunolabelling  

3.13) The achievement of satisfactory immunolabelling  

3.14) Discussion  

3.15) Final method for the ultrastructural immunolabelling of the H-subunit and L-subunit of ferritin  

4) References  

LIST OF FIGURES  

CHAPTER 6  

Figures 1 – 48 a, b and c. Photographs for the Prussian blue iron stains of the bone marrow aspirates for the Kalafong patients  

Figures 1 – 55 d, e and f. Photographs for the Prussian blue iron stains of the bone marrow cores for the Kalafong and osteoarthritis patients  

Figures 1 – 55 g, h, i, j, k and l. Electron micrographs for the immunolabelling of the H-subunit and L-subunit of ferritin for the Kalafong and osteoarthritis patients  

CHAPTER 7  

Figure 1. The absorbances obtained for the H-subunit monoclonal antibody (green) and the L-subunit monoclonal antibody (pink) at different concentrations for their respective recombinant proteins
Figure 2. The absorbances obtained for the affinity of the H-subunit and L-subunit monoclonal antibodies to their respective recombinant proteins and the cross-reactivities of the H-subunit and L-subunit monoclonal antibodies  

Figure 3. The percentage of the optimal signal obtained for the binding of the H-subunit and L-subunit monoclonal antibodies to their respective recombinant proteins after different treatments  

Figure 4 – 7 a, b, c, d, e and f. Electron micrographs of the immunolabelling of the H-subunit and L-subunit of ferritin  

LIST OF TABLES  

CHAPTER 6  

Table 1. The count/µm² for the immunolabelling of the H-subunit and L-subunit of ferritin in the different cell types for the Kalafong patients (patients 1-48) and the osteoarthritis patients (patients 1001-1010)  

CHAPTER 7  

Table 1. The absorbances obtained for the affinity ELISA for the H-subunit and L-subunit monoclonal antibodies at different concentrations for their respective recombinant proteins  

Table 2. The absorbances obtained for the affinity of the H-subunit and L-subunit monoclonal antibodies to their respective recombinant proteins and the cross-reactivities of the H-subunit and L-subunit monoclonal antibodies  

Table 3. The percentage of the optimal signal obtained for the binding of the H-subunit and L-subunit monoclonal antibodies to their respective recombinant proteins after different treatments
