DECLARATION

I, Jeroen Kroon, declare that the thesis, “THE ECONOMIC ASSESSMENT OF WATER FLUORIDATION IN SOUTH AFRICA AND ITS IMPACT ON HUMAN RESOURCES AND ORAL HEALTH SERVICE DELIVERY”, which I hereby submit for the degree Philosophiae Doctor at the University of Pretoria, is my own work and has not previously been submitted by me for a degree at this or any other tertiary institution.

Jeroen Kroon
April 2008

SUMMARY

THE ECONOMIC ASSESSMENT OF WATER FLUORIDATION IN SOUTH AFRICA AND ITS IMPACT ON HUMAN RESOURCES AND ORAL HEALTH SERVICE DELIVERY

by

JEROEN KROON

Supervisor: Professor PJ van Wyk
Department: Community Dentistry
Degree for which the thesis is submitted: Philosophiae Doctor

Water fluoridation has been confirmed by three recent reviews as one of the most cost-effective and safe primary preventive measure against dental caries. Despite this evidence no artificially fluoridated water scheme exists in South Africa. The economic impact of water fluoridation in times of a reduction in dental caries should be weighed against its benefits. A minimum package of oral care has been proposed for implementation in the public oral health services. Irrespective of the implementation of water fluoridation and/or a minimum package of oral care, it will impact on the required oral health human resources.

The aim of this study was to investigate the economic viability of the implementation of water fluoridation and the delivery of the minimum package of oral care and the impact this will have on human resources planning for oral health in South Africa.

Computerised simulation models were developed for this study. Per capita cost, cost-effectiveness and cost-benefit of the implementation of water fluoridation was calculated for seventeen major metropolitan cities, towns and water boards in South Africa. Treatment need data was converted to a per capita cost to express the delivery of the minimum package of oral care as a monetary value. The World Health Organization/Fédération Dentaire Internationale and a "Service Targets

Method” model were used to calculate the oral health human resources required to deliver the minimum package of oral care.

The average per capita cost of water fluoridation for the total population is R2.08. At an anticipated 30% caries reduction achieved with water fluoridation, average cost-effectiveness is R33.16 and cost-benefit was calculated as 0.18. Cost-benefit equals or exceeds 0.8 for only three municipalities or water boards at an anticipated 10% caries reduction as a result of the implementation of water fluoridation.

The average per capita cost to provide the minimum package of oral care is R245.95 without the impact of water fluoridation and R186.03 at an anticipated 30% caries reduction due to water fluoridation.

Oral hygienists represent more than 50%, dental therapists between 30 to 40% and dentists less than 10% of the total oral health human resources required to deliver the minimum package of oral care. At an anticipated caries reduction of 30% due to the introduction of water fluoridation, the number of dentists required decrease by 29%, dental therapists between 27.5 and 29.8% and oral hygienists between 2.1 and 10.5%. This converts to a saving in salaries of R14,8 million per year.

It is recommended that water fluoridation remains a viable option for South Africa, even if only a 10% caries reduction as a result of its introduction is achieved. All provinces should actively pursue the introduction of the minimum package of oral care with appropriate modes of delivery by creating a number of posts as well as incentives to attract especially oral hygienists and dental therapists to the public service. The impact of the introduction of water fluoridation on human resources should always be considered in planning the number of oral health professionals to be trained.

ACKNOWLEDGEMENTS

“Your biggest break can come from never quitting. Being at the right place at the right time can only happen when you keep moving toward the next opportunity.”

Arthur Pine

I wish to express my sincere gratitude and appreciation to the following people for their contribution and assistance in this study:

My supervisor, Prof Flip van Wyk, Head of the Department of Community Dentistry, University of Pretoria, for his support, encouragement, guidance and constructive criticism throughout and also for being a mentor, friend and colleague.

Prof Flip van Wyk, Ms Sannie Booyens and Dr Pratima Kissoon-Singh, whose research on water fluoridation and human resources planning served as the inspiration for this study.

Prof Tshepo Gugushe, Dean of the School of Dentistry, University of Limpopo and Prof Newell Johnson, Foundation Dean and Head of the School of Dentistry and Oral Health, Griffith University, for allowing me the time to complete this study while employed at their institutions.

Staff from municipalities, local authorities and water boards for providing me with the information needed for this study.

Mr Eddy Valkenburgh and Mr Martin de Klerk, Pelchem, and Peter Leopold, Süd-Chemie, for information on the cost and transport of fluoride chemicals.

Ms Marica Erasmus, Department of Water Affairs and Forestry, for allowing me access to their database on natural fluoride concentrations.

Dr Johan Smit, Director Oral Health, Department of Health, for his support and interest.

Mrs Susan Marsh, Department of Library Services, University of Pretoria, for always being there when assistance was required.

Mrs Wilma Steinbach, Oral and Dental Hospital, University of Pretoria, for providing me with information and her patience with explaining the UPFS fee schedule.

Mrs Gollie Venter, Personal Assistant, Department of Community Dentistry, University of Limpopo, for her assistance and encouragement in sometimes difficult times.

Professor Peter Cleaton-Jones and Prof Elly Grossman, Dental Research Institute, University of the Witwatersrand, for providing me with opportunities and introducing me to the wonderful world of research so many years ago which has culminated in this thesis.

Professor Willie Snyman, previous Head of the Department of Community Dentistry, University of Pretoria, for his role in my development, his advice and leadership over a number of years.

My wife, Amanda, for her love, understanding, support and dedication to our family which has carried me through this study.

My son, Marco, whose enthusiasm for and dedication to the things I also love kept me motivated to complete this study.

My daughter, Rianca, for just being the daughter every father wishes for and for keeping the balance in the family.

My parents, I dedicate this thesis to you for providing me with the opportunities in life.

My friends and other family members, for their understanding during the past number of years.

Soli Deo Gloria
