

A KIRKPATRICK EVALUATION OF COMPUTER-
INTEGRATED LEARNING SUPPORT MATERIAL FOR
TECHNOLOGY EDUCATION

A dissertation of limited scope by
Maria M.C. Haupt

submitted as partial fulfilment for the requirements of the degree
MEd (CIE)

in the
Department of Curriculum Studies
of the
Faculty of Education
at the
University of Pretoria

Supervisor
Prof A.S. Blignaut

November 2005

Acknowledgements

I wish to specially thank:

- My family for unwavering support and understanding during the many hours I dedicated to achieving this milestone in my life and career.
- Prof Seugnet Blignaut for her commitment and dedication.
- Prof Johannes Cronjé for initiating this research.

I wish to thank my God for strength, drive and ability.

Abstract**A Kirkpatrick evaluation of computer-integrated learning support material for technology education**

a dissertation of limited scope by

M.M.C. Haupt

Degree: MEd (CIE)

Department: Curriculum Studies

Supervisor: Prof A.S. Blignaut

November 2005

The aim of this research is to establish which aspects influence students' successful learning of design skills through contextually integrated learning support material for the design and technology education programme at the University of Pretoria. The purpose of the research is threefold:

- The first aim is to investigate the extent to which the electronic tutorial, *Design in Action*¹ (hereafter referred to as "the tutorial") contributes to students' (novice designers) design theory in a technological context i.e. to indicate whether the level of sophistication of the exemplary graphics and explanatory text is suited to the context.
- The second aim is to establish the levels of learning achieved by learners as a result of the intervention using *Design in Action* in order to indicate the adequacy of the learning support material in achieving the learning outcomes of the unit.
- The third aim is to establish possible improvements for the tutorial to increase its effectiveness in terms of curriculum, media & technology, learning & instruction and teacher education & didactics (Van den Akker, 1999).

The findings of this preliminary study will be used in broader studies focused on the design and development of contextually integrated learning support material for design and technology education students.

This research is a qualitative case study, including the evaluation of levels of learning of first year pre-service design and technology students, conducted in the interpretative paradigm, within the theoretical frame of socially responsible research (Reeves, 2000).

The evaluation of the levels of learning was based on a model designed by Kirkpatrick (Kirkpatrick, 1994). The model delineates four levels of instruction (training) outcomes: reaction, learning, behaviour, and results.

¹ *Design in Action* is an electronic self-study guide designed as contextually integrated learning support material for first year technology education students at the University of Pretoria.

Keywords

- Aesthetics* One of the design aspects to be considered in the design of products, which is also considered as the universal visual language providing the necessary rules for synthesizing the basic carriers of meaning (Parr, 2004).
- Design* The concept “design” was taken from the definition of the “act of designing” as part of the design process as prescribed for grade 9 in the RNCS (Department of Education, 2002, p.37)
- Design aspects* It is generally accepted in design studies that the concept “design aspects” refers to the functionality, aesthetics, ergonomics and value of man-made products (Department of Education, 2002; Garratt, 1996; Press & Cooper, 2002).
- Design elements* “Elements” refers to aesthetic design elements, e.g. shape, line, texture, colour/tonal value, illusion of movement (Lauer, 1985).
- Design principles* “Principles” refers to aesthetic design principles, e.g. unity, emphasis, balance, proportion, rhythm, illusion of space (Lauer, 1985).
- Design process* “Process” refers to the model prescribed by the RNCS (Department of Education, 2002) of which the steps are: investigating, designing, making, evaluating and communicating.
- Drawing* The act of “drawing” is an important part of the “designing” and “communicating” steps of the design process (Department of Education, 2002) and seen as a tool to develop “designerly thought” in design and technology students (Garner, 1993).
- Levels of learning* “Levels” refers to Kirkpatrick’s (1994) model of four levels of learning that should be evaluated in order to establish the effectiveness of instruction, namely reaction, learning, transfer/behaviour and results.
- Technology education* The learning area “Technology Education” is a relatively new one and was incorporated in the band of general education of schools in 1997, when it also became part of teacher training at the University of Pretoria.
- Utility judgements* Students’ individual and subjective perceptions of the usefulness of instruction and instructional material (Alliger, *et al*, 1997).
