Means of 3 replicate experiments and standard deviations of heat treated and untreated Bambara flours substitutes at 15 and 30%. Hm Maximum dough height; H'm Maximum height of gaseous production; T1 Time at which dough reaches the maximum height; T'1 Time of maximum gas formation; Tx Time at which gas starts to escape from the dough. Mean values in a column with different superscripts letters differ significantly ( $p < 0.05$ ).
