DISSERTATION SUMMARY

MACRO-LEVEL EVALUATION OF ROAD SAFETY IMPROVEMENT INTERVENTIONS: AN EVALUATION OF THE ARRIVE ALIVE I (1997/98) ROAD SAFETY CAMPAIGN

I VAN SCHALKWYK

Supervisor: Mr Louis Roodt
Department: Civil Engineering
University: University of Pretoria
Degree: Master of Engineering (Transportation Engineering)

700 000 people die annually in road traffic accidents around the world and road traffic safety interventions are implemented annually across the world. Macro-level evaluation is necessary to ensure financial accountability and clarification that the intervention improved road safety. The study identified two categories of indicators that can be utilised, namely quantitative (evaluating accident data using, for example, statistical analysis and also other methods) and qualitative indicators like the human factor (this includes aspects such as behaviour, attitudes, perception, etc.). The study found that the statistical analysis and trend analysis of macro-level accident data is problematic as changes and predictability is statistically non-significant. The evaluation of human factors was identified as a possible alternative and complementary indicator of the effectiveness of road traffic safety improvement interventions. The aspects relevant to road safety improvements with regard to behavioural changes were investigated. The study found that there is a number of criteria that can be used to measure the input (e.g. communication, publications, the media etc.) and output-related aspects of the human factor (e.g. changes in behaviour, attitudes, motivation, risk, skills etc.). A list of these indicators were generated based on the study of aspects related to behavioural change and a preliminary evaluation of the Arrive Alive 1 was made. The study recommends that a measure of exposure be developed that will allow for the utilisation of macro-level accident data in the evaluation process and that the human factor also be included in the macro-level evaluation of road safety improvement interventions.

SAMEVATTING VAN VERHANDELING
MAKROVLAK DIE EVALUERING VAN
VERKEERSVEILIGHEIDSVERBETERINGSPROGRAMME: ‘n
EVALUERING VAN DIE ARRIVE ALIVE I (1997/98)
PADVEILIGHEIDSVELDTOG

Promotor: Mnr Louis Roodt

Department: Civil Engineering

Universiteit: Universiteit van Pretoria

Graad: Magister in Ingenieurswese (Vervoeringeniëurswese)

Jaarliks sterf 700 000 mense in padverkeersongelukke in die wêreld. Verkeersveiligheidsverbeteringsprogramme word jaarliks regoor die wêreld geïmplementeer. Makrovlak evaluering van verkeersveiligheidsverbeteringsprogramme is noodsaaklik vir finansiële toerekenbaarheid en om te verseker dat die program wel verkeersveiligheid verbeter het. Die studie het twee kategorieë aanwysers geïdentifiseer wat gebruik kan word in die evalueringsproses, naamlik: kwalitatiewe en kwantitatiewe aanwysers. Kwantitatiewe aanwysers verwys na byvoorbeeld die analise van ongeluksdata met statistiese analise metodes en kwalitatiewe aanwysers verwys na die menslike faktor wat aspekte soos gedrag, houding, persepsies ens. insluit. Die studie het gevind dat statistiese en tendens-analise van makrovlak ongeluksdata problematies is aangesien die veranderinge en voorspelbaarheid daarvan nie statisties betekenisvol is nie. Die evaluering van die menslike faktor is geïdentifiseer as ‘n alternatiewe en komplimentêre maatstaf vir die evaluering van verkeersveiligheidsverbeteringsprogramme. Die aspekte wat met gedragsveranderinge tydens en na verkeersveiligheidsverbeteringsprogramme verband hou, is bestudeer. Die studie het gevind dat ‘n aantal kriteria gebruik kan word om die in-en uitset van die menslike faktor te meet. Die inset kriteria verwys na byvoorbeeld kommunikasie, publikasies, die media ens en uitset kriteria verwys na veranderinge in gedrag, houding, motivering, risiko, vaardighede ens. ‘n Lys van hierdie kriteria is ontwikkel gebaseer op die studie oor faktore wat gedragsveranderinge beïnvloed en daarmee verband hou. ‘n Voorlopige evaluering van die Arrive Alive 1 veldtog is ook gedoen. Die studie beveel aan dat ‘n maatstaf vir blootstelling ontwikkel word wat die gebruik van makro-vlak ongeluksdata in die evaluering van verkeersveiligheidsprogramme sal moontlik maak. Die studie beveel ook aan dat die menslike faktor ingesluit word in die makrovlak evaluering van verkeersveiligheidsverbeteringsprogramme.

ABSTRACT

MACRO-LEVEL EVALUATION OF ROAD SAFETY IMPROVEMENT INTERVENTIONS: AN EVALUATION OF THE ARRIVE ALIVE I (1997/98) ROAD SAFETY CAMPAIGN

I VAN SCHALKWYK

Title: Macro-level evaluation of road safety improvement interventions – An evaluation of the Arrive Alive 1 (1997/98) road safety campaign

Author: I van Schalkwyk (Miss)

Supervisor: Mr Louis Roodt

Department: Civil Engineering

University: University of Pretoria

Degree: Master of Engineering (Transportation Engineering)

700 000 people die annually in road traffic accidents around the world and road traffic safety interventions are implemented annually across the world. Macro-level evaluation is necessary to ensure financial accountability and clarification that the intervention improved road safety. The study found that the statistical analysis and trend analysis of macro-level accident data is problematic as changes and predictability is statistically non-significant. The evaluation of human factors was identified as a possible alternative and complementary indicator of the effectiveness of road traffic safety improvement interventions. The aspects relevant to behavioural changes were investigated. The study found that there is a number of criteria that can be used to measure the input (e.g. the media etc.) and output-related aspects of the human factor in road traffic accidents (e.g. changes in behaviour, motivation, attitudes, risk, skill etc.). A list of these indicators were generated and a preliminary evaluation of the Arrive Alive 1 campaign was made. The study recommends that a measure of exposure be developed that will allow for the utilisation of macro-level accident data in the evaluation process and the inclusion of the human factor in the macro-level evaluation of road safety improvement interventions.

ACKNOWLEDGEMENTS

I wish to express my appreciation to the following organizations and persons who made this dissertation possible:

- My promotor, Mr Louis Roodt, for introducing me to the human behaviour aspect of road safety during my postgraduate studies and for his guidance and support during the study – and for lots massive patients and faith!
- The Durban Central Council for providing excellent accident data for me on an almost continuous basis, in particular Mrs Preeta Piree, Mrs Colleen Crawford and Mr John Dellis
- The Durban City Police
- The City Council of Pretoria, in particular Mr Dirk Lombaard.
- The CSIR, Transportek for making the raw national and provincial data available for the study
- Mr Gerrie Botha of National Department of Transport for making the long-term annual accident data of South Africa available for the study
- Cornel Wenzel from the Department of Energy Affairs for making the fuel sale information available for the study
- Prof Christo van As for assisting me with the conversion of the accident data to a standard data format
- Prof Romano del Mistro for making me think again about the conclusions I was sure of
- Dr Hermi Boraine and Mrs Rina Owen from the University of Pretoria for the specialist statistical analysis
- My parents for their support
- Mrs Marga Jordaan for her motivation and support
- Mrs Lea Wissing for proof-reading the dissertation
- For all my friends and colleagues that supported me continuously in the strive towards safer road traffic systems.
