Abstract

Measuring the impact of climate change on South African agriculture: The case of sugarcane growing regions

Center for Environmental Economics and Policy in Africa

This study utilized the Ricardian approach that captures farmer adaptations to varying environmental factors to analyze the impact of climate change on South African Sugarcane production. Two production systems, irrigated and dryland were taken for the study. A total of 11 districts, two from the irrigated and nine from the dryland-farming zone were selected for the study. Data for the period 1976/77 to 1997/98 were pooled over districts and net revenue per hectare was regressed on climatic and control variables. The results indicated that climate has a non-linear and significant impact on net revenue per hectare.

Based on the Inter Governmental Panel on Climate Change (IPCC) benchmark warming scenario of increasing temperature by 2°C and precipitation by 7%, which is associated with the doubling of CO₂, it was found that climate change reduces net revenue per hectare in the South African sugarcane production. Moreover, the result of increasing temperature by 2.75°C (associated with the doubling of CO₂ under South Africa) across all seasons, by keeping other factors constant, indicated that both the irrigated and dryland farming zones were equally damaged by this scenario. Increasing precipitation levels by 7% across all seasons, keeping other factors constant benefited the irrigated farming whereas it damaged the dryland farming.

Additionally, the partial impacts of increasing a given season's temperature by 2.75°C or rainfall by 7% indicated that the seasonal effects of temperature and rainfall are differently distributed across seasons and production zones. Finally, the likely impacts of climate change on South African sugarcane production were analyzed based on the critical damage point analysis. The results indicated that sugarcane production in South Africa is more sensitive to future increases in temperature than precipitation as a consequence of climate change.

While the consensus is that arid and semi-arid regions are more vulnerable to warming, management options, such as irrigation, are thought to provide an adaptation mechanism. This however was not the case for sugar farming in South Africa, as irrigation did not reduce the harmful impacts of climate change significantly.

Table of Contents

| | |
|--|----|
| Chapter 1: Introduction | 1 |
| 1.1 Background and Motivation | 1 |
| 1.2 Objectives of the Study | 2 |
| 1.3 Approach and Methods | 3 |
| 1.4 Organisation of the Study | 3 |
| Chapter 2: Agriculture, Sugar Farming and the South African Economy | 4 |
| 2.1 Introduction | 4 |
| 2.2 Contribution of Agriculture to the Economic Well-being in South Africa | 4 |
| 2.2.1 Contributions to GDP | 4 |
| 2.2.2 Food supply and Food Security | 5 |
| 2.2.3 Agriculture as a Source of Foreign Exchange | 7 |
| 2.2.4 Agriculture as a Source of Employment | 8 |
| 2.2.5 Economy-wide Benefits and Economic Multipliers of Agriculture | 9 |
| 2.3 Sensitivity of Agriculture to Climate Change | 11 |
| 2.4 Agro-Ecological Features of South Africa | 12 |
| 2.5 Sugarcane and the South African Agriculture | 14 |
| 2.5.1 Share of Sugar Farming in Total Agricultural Output | 14 |
| 2.5.2 Organizational Structure of the Industry | 16 |
| 2.5.3 Sugar Marketing | 16 |
| 2.5.4 Sugarcane Farming and Climate Change | 18 |
| Chapter 3: Review of Relevant Literature | 20 |
| 3.1 Introduction | 20 |
| 3.2 Climate Prediction Models | 20 |
| 3.3 Economic Impact Assessment Models | 22 |
| 3.3.1 Economy-Wide Models of Climate Change | 22 |
| 3.3.2 Partial Equilibrium Models of Climate Change Impacts | 24 |
| 3.3.2.1 Crop Growth Simulation Models | 24 |
| 3.3.2.1.1 Crop Suitability Approach | 24 |
| 3.3.2.1.2 The Production Function Approach | 25 |
| 3.3.2.2 Econometric Approaches: The Ricardian Model | 28 |
| 3.4 Climate Impact Studies in South Africa | 30 |
| 3.4.1 Studies of Impact on Agriculture | 30 |

| | | |
|--|---|----|
| 3.4.2 | Other Climate Change Impact Studies | 31 |
| 3.5 | Summary | 32 |
| Chapter 4: Approach and Methods of the Study | | 34 |
| 4.1 | The Ricardian Approach | 34 |
| 4.2 | The Analytical Model | 35 |
| 4.3 | Specification of the Empirical Model Variables and Data | 37 |
| Chapter 5: Results of the Empirical Analysis | | 40 |
| 5.1 | Estimation Procedures | 40 |
| 5.2 | Results and Discussion | 41 |
| 5.3 | Simulation of Climate Change Impacts | 42 |
| 5.3.1 | Simulation Using Elasticity Measures | 43 |
| 5.3.2 | Simulations Utilizing Estimated Regression Model Coefficients | 45 |
| 5.3.2.1 | Total Effect Scenarios | 46 |
| 5.3.2.2 | Partial Effects' analysis | 47 |
| 5.3.2.2.1 | Partial Temperature Effects | 48 |
| 5.3.2.2.2 | Partial Precipitation Effect | 48 |
| 5.3.2.2.3 | Seasonal Effects | 49 |
| 5.3.2.2.3.1 | Seasonal Temperature Effects | 49 |
| 5.3.2.2.3.2 | Seasonal precipitation Effect | 52 |
| 5.4 | Synthesis of the Likely Impacts of Climate Change on Sugar farming in South Africa | 54 |
| Chapter 6: Summary and Conclusions | | 61 |
| References | | 65 |

Acknowledgments

I would like to thank the institutions and individuals that contributed to the success of this study. The South African Sugar Producers Association for providing the data for this study. The Ethiopian Agricultural Research Organization for granting the financial assistance. Dr. Poonyth Ravin¹ provided useful assistance as a co-supervisor, his inputs are much appreciated. Professor Rashid Hassan² has been tremendously helpful in supervising the work and providing the necessary guidance.

I am very grateful to my family and friends (specially Mampity, Fufa, Yesi and Bultosa) for their encouragements and assistance under all circumstances.

*" I will bless the Lord at all times. his praises
shall continually be in my mouth."*

Psalms 34:1
