DECLARATION

I hereby declare that:

AN ECONOMIC IMPACT ASSESSMENT OF TOLL ROADS, WITH SPECIFIC REFERENCE TO THE IMPACT ON ALTERNATIVE ROADS BETWEEN THE PUMULANI AND HAMMANSKRAAL TOLL GATES Is my own work, and that all the sources used and quoted have been indicated and acknowledged by means of complete references and that this dissertation was not submitted by me for a degree at another university.

Signature	Date

ACKNOWLEDGEMENTS

I wish to express sincere appreciation to Professors M.C. Breitenbach and T.J.C. Slabbert for supervising this work. Their attention, inspiration and positive critique helped shape my thoughts, research efforts and indeed, this study.

I also wish to thank the following individuals and institutions that provided information, access and assistance during the study.

Dr Nico Meyer of the Development Bank of Southern Africa.

Mr Ken Harrison of the National Road Agency

Mr T Lamprecht of CSIR Transpotek

Mr I Schutte of CSIR Transpotek

Mr De Graaf of the Anti Toll Road Association

Mr P Gore of Phillip Gore and Associates

The library staff of the University of Pretoria.

My sincere gratitude to God the creator, who gave me life and strength to persevere in completing this work even when it was tough.

Special thanks also to my parents and for the support and encouragement over the years.

Finally a big thank you to every body who have contributed directly and indirectly in assisting me during my studies whose names are not mentioned above.

ABSTRACT

The erection of tollgates along the N1 freeway has triggered a great deal of interest. As a result of the

toll fees, traffic has been diverted to alternative roads. This study investigates how traffic diverted

from the toll road affect the welfare of users of the alternative road.

The literature review provides a theoretical framework of economic impact assessment and road

pricing. Furthermore, the literature study reviews previous studies of a similar nature and compare

them with the findings of this study.

There is no conclusive evidence that diversion of traffic from the N1 causes congestion on the R101

and has a negative impact on the economy of the region. On the contrary, evidence suggests that

there was an initial diversion of traffic when the toll came into operation but that is slowly filtered

back after six months.

In the application of the RED model, economic benefits are derived from user benefits, which is a

function of savings in VOC's and time of normal and generated traffic on a road or saving due to an

improvement in road safety, resulting from improved roads. A decrease in traffic has a measurable

effect on vehicle travel speeds and travel time only when the roads are significantly congested.

In the case of scenario 1 (including diversion), frequent maintenance needs to be performed under

increased traffic. Increased traffic due to "diverted traffic" causes congestion in accidents and

travelling time, which is a cost to the economy. Under scenario 2 (excluding diversion), it is assumed

that ADT will return to normal. Due to lower levels of congestion and travelling times would be

faster, while maintenance costs and accident rates would decrease. Scenario 2 is selected as being

economically the most feasible option.

It is clear that the R101 cannot cope with the current levels of traffic and congestion. One can

speculate about the causes of the congestion but in order to derive at a solution to the problem more

research needs to be done on the cause of the congestion in order to resolve the problem.
