

DECLARATION

I, Michelle Marizan Roelofse declare that this thesis is my own unaided work. This thesis is being submitted for the degree of Master of Science in Anatomy at the University of Pretoria, Pretoria. It has not been submitted before, for any degree or examination at any other University.

_____ day of _____ 2006

For Johan and Hannetjie Roelofse

SUMMARY

The identification of a person from his/her photograph for forensic purposes is extremely difficult (e.g., in cases of bank robberies or ID book fraud). Facial identification can be achieved through morphological methods, metrical methods or superimposition. However, very little data on facial variation of South Africans is available. The aim of this study was thus to analyse the metrical and morphological characteristics of the faces of South African black males, for the purpose of facial identification. Where possible the morphological characteristics of the South African black males were compared to those of other population groups.

Facial photographs of 200 volunteers from the Pretoria Police College, taken in norma frontalis, were used. The subjects were 20–40 years old. Subjects younger than 20 years and those with facial deformities were excluded. Fourteen standard facial landmarks were identified on the photographs. From these, a total of 13 measurements were taken to the nearest 0.5 mm, using a digital sliding calliper. The measurements were then used to calculate 12 different indices. Indices were used to nullify the effect of absolute size. Standard ranges were calculated for each index. These ranges were then used to classify the different measured facial features into categories, e.g., small/narrow, average and large/wide.

Eight morphological features were also analysed on each face. Each feature was divided into different categories, describing variants of the feature. The metrical, as well as the morphological data was then used to create various combinations of facial characteristics. The frequency of occurrence of these combinations was calculated for the study population.

Results showed that the most common features for the study population were oval or inverted trapezoid facial shapes, intermediate size nose with a down turned septum tilt and intermediate size mouth with a flat V-shaped cupid's bow. The eyes were situated closely together. Some of the rare or absent features included round or square facial shapes and leptorrhin (narrow) noses with an upturned septum tilt. Matching these features on facial photographs would probably be most useful during cases of disputed identification.

OPSOMMING

Die uitkenning van 'n persoon vanaf sy/haar foto, vir forensiese doeleindes, is verskriklik moeilik (bv. in gevalle van bankrowe of ID boek bedrog). Gesigsuitkenning kan gedoen word deur morfologiese metodes, metriese metodes of superimponering. Daar is egter min data oor die variasie in Suid-Afrikaanse gesigte bekikbaar. Die doel van hierdie studie was dus om die gesigseienskappe van Suid-Afrikaanse swart mans metries en morfologiese te bestudeer, vir doeleindes van gesigsuitkenning. Die morfologiese eienskappe sal, waar moontlik, vergelyk word met dié van persone van ander bevolkingsgroepe.

Gesigsfoto's van 200 vrywilligers van die Pretoria Polisie Kollege was gebruik. Alle individue is afgeneem in die norma frontalis posisie. Die proefpersone was 20-40 jaar oud. Proefpersone jonger as 20 jaar en met gesigsdefekte was uitgesluit. Veertien standaard gesigslandmerke is geïdentifiseer op elke foto. Tussen hierdie 14 landmerke is 13 afmetings geneem met 'n digitale skuifpasser tot die naaste 0.5 mm. Die afmetings is gebruik om 12 indekse te bereken. Indekse is gebruik om die effek van absolute grootte te elimineer. Standaardreekse is bereken vir elke indeks. Hierdie reekse is gebruik om die verskillende gesigskenmerke in kategorieë te klassifiseer, byvoorbeeld klein/smalle, gemiddeld en groot/breed.

Agt morfologiese gesigskenmerke is ook geanaliseer. Elke kenmerk is verdeel in verskillende kategorieë, wat die variasies van die kenmerk beskryf. Verskillende kombinasies van gesigskenmerke is geskep deur die metriese sowel as die morfologiese data te gebruik. Die frekwensie van verspreiding van hierdie kombinasies is bereken vir die studiebevolking.

Die resultate het getoon dat die mees algemeenste eienskappe ovaal of omgekeerde trapesoïede gesigsvorms, 'n gemiddelde grootte neus met 'n afwaartse septum en 'n gemiddelde grootte mond met 'n plat V-vormige bolip is. Die oë was na by aan mekaar. Van die seldsame eienskappe sluit in ronde of vierkantige gesigsvorms en smal neuse met 'n opwaartse septum. Die vergelyking van hierdie seldsame eienskappe sal die mees bruikbaarste wees tydens sake waar uitkenning in dispuut is.

FOREWORD

This work was supported by grants from the South African National Research Foundation (NRF) as well as the Research Committee of the University of Pretoria (NAVKOM).

I would like to express my gratitude to my mentor, Prof. M Steyn, who provided invaluable guidance and assistance and great appreciation to Inspector JE Naudè, National Trainer in Facial Identification, with the South African Police Services (SAPS) for her involvement in the study.

I would like to thank Assistant Commissioner JK Phahlane, Directors E Adlam and Nyalungu and Senior Superintendent J Schnetler from the South African Police College in Pretoria for their contribution to the study population. Thanks are also owed to all the volunteers who took part in the study, as well as Me. L van der Merwe and Mr. M Loots for assistance with the photographs.

A special word of thanks to Prof. PJ Becker for the statistical analysis of the results and Mrs. M Pretorius for providing the figures in Chapter 3.

Thanks are also owed to my family and friends for their support and patience during the preparation of this dissertation, as well as my colleague, Mrs. L Hutten for her continuous support and Mr. FC Holdt for his contribution regarding the German translations.

LIST OF FIGURES	xi
LIST OF TABLES	xiv
LIST OF ABBREVIATIONS	xvi

CHAPTER 1

1. Introduction

1.1 General	1
1.2 Applications of facial identification.....	2
1.3 Difficulties	4
1.4 Aim and objectives	5

CHAPTER 2

2. Literature Review

2.1 Introduction.....	7
2.2 Birth of somatotyping	7
2.3 Development of anthropometry	12
2.4 Using morphology of the face for classification.....	15
2.5 Classifying race: The history	18
2.6 Facial studies done on people of African origin	20
2.7 Facial identification	22
2.7.1 Superimposition	23

2.7.2 Morphological characteristics	23
2.7.3 Anthropometric measurements	27
2.7.4 Morphometrical methods	30
2.8 Facial identification and its forensic application	33
2.9 Facial identification case studies	38

CHAPTER 3

3. Material and methods

3.1 Materials	41
3.2 Photography	42
3.3 Metrical analysis	43
3.3.1 Landmarks.....	45
3.3.2 Measurements	48
3.3.3 Basic statistics and indices for each individual.....	51
3.3.4 Intra and inter observer error	53
3.4 Morphology.....	54
3.4.1 Facial shape	54
3.4.2 Jaw line	58
3.4.3 Chin shape	60
3.4.4 Cupid's bow	62
3.4.5 Philtrum	63
3.4.6 Septum tilt	65
3.4.7 Nasolabial fold	66
3.4.8 Nose bridge height	68
3.5 Statistical analysis.....	69

CHAPTER 4

4. Results

4.1 Introduction	72
4.2 Metrical analysis	72
4.2.1 Forehead size index.....	74
4.2.2 Facial index.....	77
4.2.3 Intercanthal index.....	79
4.2.4 Nasal index.....	81
4.2.5 Nasofacial index.....	84
4.2.6 Nose-face width index	86
4.2.7 Lip index	88
4.2.8 Vertical mouth height index.....	90
4.2.9 Upper lip thickness index.....	93
4.2.10 Lower lip thickness index	95
4.2.11 Mouth width index	97
4.2.12 Chin size index.....	99
4.3 Morphological analysis.....	102
4.3.1 Facial shape.....	102
4.3.2 Jaw line	103
4.3.3 Chin shape.....	104
4.3.4 Cupid's bow	105
4.3.5 Philtrum.....	106
4.3.6 Septum tilt.....	107
4.3.7 Nasolabial fold.....	108
4.3.8 Nose bridge height	109

4.4 Analysis of the occurrence of combinations of characteristics.....	110
4.4.1 Complete face	110
4.4.2 Upper region of the face	116
4.4.3 Middle region of the face	120
4.4.4 Lower region of the face	124
4.5 Intra- and inter-observer reliability	128

CHAPTER 5

5. Discussion and conclusion

5.1 Introduction	131
5.2 Drawbacks and problems experienced	131
5.2.1 Organisation	131
5.2.2 Identification of landmarks	132
5.3 Photography	134
5.4 Sample size	136
5.5 Repeatability	136
5.6 Discussion of results	138
5.6.1 Individual features	138
5.6.2 Combinations	141
5.7 Comparison to other studies.....	149
5.8 How to use the results of this study	154
5.9 Conclusion	156
