

Improving the management of dairy production systems in Cameroon

by

Bayemi Pougue Henri Dieudonné

Submitted to the Faculty of Natural and Agricultural Sciences

Department of Animal and Wildlife Sciences

In partial fulfillment of the requirement for the degree

Philosophiae Doctor

Pretoria

February 2009

DEDICATION

To my dear wife Judith who has supported me during this work in a special way. To my children: Longè, Charles-Dimitri, Anwarite, Lipem and Beau.

To my brothers nicknamed Baba, Type, Vieux and sister Aimée. Lastly to my parents without whom I could not be what I am today: Bayemi Charles and Ngo Pougue Marthe.

DECLARATION

I declare that this thesis for the degree of Philosophia Doctor (Faculty of Agriculture, department of Animal and Wildlife Sciences) at the University of Pretoria has not been submitted by me for any degree or exam at any other university.

Signature.....

ACKNOWLEDGEMENTS

This work has been possible thanks to the support of the International Atomic Energy Agency (IAEA). I am particularly grateful to the following people: Dr Hermann Unger, Dr Paul Boettcher, Dr Oswin Perera.

My special thanks Dr Mike Bryant of the University of Reading, England, who put me in contact with the IAEA, arranged for a scientific visit at Reading and strongly supported me during the first months of my work.

Many thanks to Prof Edward Webb from Pretoria University who accepted to supervise this work and used his personal initiative to help it to be completed.

I also thank Dr Mbanya Justin and Dr Devendra, for his editing of the first chapter.

I cannot forget the support of the administration of the Institute of Agricultural Research for Development (IRAD). Dr Zok Simon and Dr Njoya Aboubakar. Many thanks to Mr Apiembo Josue, Mr Njong Vincent, Mr Fonguh Emmanuel, Mr Sali Django, Ms Ngo Lihep Marthe and Mr Naoussi who helped in data collection.

I would like to thank my colleagues, Dr Tanya Vincent, Dr Ndi Christopher, Mrs Imele Helen, Ms Nsongka Victorine, Ms Leinyuy Isabel, Dr Kameni Anselme, Mr Pingpoh David, Mr Ntam Fidelis, Mr Chinda Valentine and Mr Ndambi A.

Many thanks for special friends in the UK: John, Kate, Jonathan, Christina, Anthony, Victoria, Frances and Mary Lillington. Kate even edited part of the work. Their constant support has been a great help for our familk. We also thank Sue Cooper, Bob, Dalila and Saskia Castelijn, Tom and Rosemary Woodman, Phil and Laurinda Brown.

Finaly, I am grateful to all the Word of God group Members.

I am grateful to the Heifer International Cameroon.

Thanks be to God.

SUMMARY

Title: Improving the management of dairy production systems in Cameroon

Candidate: Bayemi Pougue Henri Dieudonné

Supervisor: Prof E.C. Webb

Department: Animal and Wildlife Sciences

Degree: Philosophiae Doctor

This work was carried out with the objective of improving dairy farms in Cameroon using an integrated method. Research done in the area on milk production in the country was reviewed. A participatory rural appraisal was conducted in dairy farms of the North West Region of Cameroon. An economic opportunity survey was carried out on 61 dairy farms in the same region. Interventions aimed at solving main constraints were planned. An on-farm study on the effect of feed supplementation before calving on milk production, ovarian activity and calf growth of Holstein, indigenous Red Fulani cows and their crosses was conducted. Corresponding blood samples were analyzed using ELISA Progesterone kits. Animal health studies involved screening for *Brucella abortus* antibodies in 21 villages by ELISA. Partial budgeting was used to evaluate the financial impact of interventions.

Results show that five small scale dairy production systems are found in the region: transhumance, improved extensive, semi intensive, zero grazing and peri-urban. Main constraints to dairy production include in order of importance: poor marketing opportunities and long distances to market, limited grazing land and poor supplementation of cattle, limited health control, inadequate knowledge in processing, conservation and storage of milk, poor

reproductive management and prolonged calving interval, lack of water in the dry season, poor housing, poor organization of group, limited number of dairy cows and poor record keeping. Milk production per cow on-one-day and average calf production interval account for the greater part of economic opportunity. A human progesterone ELISA kit was validated for use in cattle. *Brucella* screening showed a general seroprevalence of 8.4%. It is recommended that infected cattle should be slaughtered. A specific control programme should be organized and an effort should be made to determine the causes of the spread of brucellosis. A regular *Brucella* testing should be instituted. Farmers adopting interventions had returns of 193 and 232% without and with opportunity costs proving the positive impact of interventions using the integrated method. These interventions need to be spread to more farms in the country.

The integrated method was proven to be effective in ensuring improvement of dairy systems in Cameroon. This method needs to be adopted for further dairy production improvement by the creation of multidisciplinary intervention teams and the training of integrated intervention specialists in the dairy sector.

Key words: Cameroon, Integrated method, Interventions, Small holder dairy
