ACKNOWLEDGEMENTS

There is a Muslim tradition to the effect “ Whoever does not express his gratitude to people will never be grateful to God.” My heartfelt gratitude to the following people and institutions that contributed to the study, especially:

- Professor Erna Alant for her mentoring over the years and who inspired and continues to inspire me with her high level of skills, competency, professionalism and humanity.
- My parents and family, who provided unfailing support and encouragement, particularly my mother who, encouraged me to seize the opportunities of education that were denied to her.
- My dear husband, Naushad for his love, gentleness, support and encouragement during the first stages of our marriage and final stages of this study.
- My friends and colleagues who listened and encouraged me throughout the study in particular Maureen Casey for her interest and support.
- My fellow Ph.D. students who contributed towards the endless discussions in the planning and the finalization of this study.
- Mrs. Rina Owen, Department of Statistics: Research Support, University of Pretoria for her valuable input and advice with the data and statistical analysis.
- Kerstin Tonsing & Erica Poeschel who acted as independent raters.
- The staff members of the school at which the study was conducted as well as the participants and their families for their consent to participate in the study.

- The Gauteng Department of Education for their consent to undertake this study.
- The financial assistance of the Mellon Foundation Mentoring Programme towards this research project is hereby acknowledged. Opinions expressed in this report and conclusions arrived at, are those of the author and not necessarily attributable to the Mellon Foundation.
- Finally, to the Creator, my thankfulness for His strength in the completion of this study.

ABSTRACT

The impact of aided language stimulation on the receptive language abilities of children with little or no functional speech.

Comprehension of spoken language skills are often taken for granted in research concerning early childhood language acquisition in typically developing children. While the onset of early word comprehension arguably precedes word production, traditional research has focused on language production rather than comprehension. A similar trend of focussing on expression is evident in the field of Augmentative and Alternative Communication (AAC). Traditionally, the role of AAC systems for individuals with little or no functional speech (LNFS) has been as an output mode for expressing messages. While this is an essential role and final outcome of AAC intervention strategies, the role of listeners is equally important. The comprehension of spoken language provides an essential foundation upon which language production competence can be built.

AAC users' ability to comprehend spoken language is varied from age equivalent comprehension of spoken language to minimal comprehension. Some AAC users comprehend spoken language and therefore come to the AAC acquisition task with an established knowledge of spoken language. Others who experience difficulty comprehending spoken language require AAC as both input (receptive) and output (expressive) mode. Graphic symbols play a role in facilitating comprehension of messages either through facilitating the comprehension of the spoken language or the AAC symbols. The use of augmented input strategies like aided language stimulation is one type of instructional technique used in teaching graphic symbols to AAC users. Aided language stimulation refers to a technique in which a facilitator or communication partner combines the use of AAC with natural speech through simultaneously pointing to graphic symbols and speaking.

The aim of this study was therefore to determine the impact of a three week long aided language stimulation program on the receptive language skills of children with LNFS. Four

children participated in this multiple probe study. The aided language stimulation programme comprised three activities viz. arts and crafts, food preparation and story time activity. Each activity was repeated over duration of five subsequent sessions. Eight target vocabulary items were taught within each activity. The acquisition of all 24 target items were probed throughout the duration of the three week intervention period. The results indicated that all the participants acquired the target receptive vocabulary items. There were, however, variations in terms of the rate of acquisition. There was no statistically significant improvement in the general receptive language abilities of the participants.

Key terms: Little or no functional speech; Augmented input; Aided language stimulation; Augmentative and Alternative Communication (AAC); Receptive language abilities

OPSOMMING

Die impak van ondersteunende taal stimulasie op die reseptiewe taalvaardighede van kinders met min of geen funksionele spraak

Gesproke taalbegripsvaardighede word dikwels as vanselfsprekend aanvaar in navorsing oor die aanleer van taal in jong tipies ontwikkelende kinders. Daar word geredeneer dat woordbegrip woordproduksie voorafgaan, maar tradisioneel het navorsing gefokus op taalproduksie in plaas van taalbegrip. Dieselfde neiging word waargeneem in die veld van Aanvullende en Alternatiewe Kommunikasie (AAK), waar die fokus op ekspressie val. Tradisioneel, is die rol van AAK sisteme om uitset metodes te voorsien aan persone met min of geen funksionele spraak sodat hulle boodskappe kan oordra. Alhoewel dit ‘n noodsaaklike rol en gevolg van AAK intervensie strategie is, is die rol van die luisterraar net so belangrik. Gesproke taalbegripvaardighede voorsien ‘n noodsaaklike grondslag waarop taalproduksievaardighede gebou kan word.

AAK gebruikers se gesproke taalbegripsvaardighede verskil en toon ‘n verspreiding van oudersomsgelyke taalbegrip tot minimale taalbegrip.

Sommige AAK gebruikers verstaan gesproke taal, en benader die aanleer van AAK met ‘n gesproke taal. Ander persone wat probleme ondervind met gesproke taalbegripsvaardighede, benodig AAK vir beide inset (reseptiewe) en uitset (ekpressiewe) metodes. Grafiese simbole speel ‘n rol in die fasilitering van begrip van boodskappe deur óf die begrip van gesproke taal te faciliteer, óf die begrip van AAK simbole te faciliteer. Die gebruik van aanvullende invoer strategieë soos ondersteunde taalstimulasie, is een tipe soort onderrigstegniek wat gebruik word in die aanleer van grafiese simbole vir AAK gebruikers. Ondersteunde taalstimulasie verwys na ‘n tegniek waar ‘n faciliteerde of kommunikasie vennoot AAK combineer met natuurlike spraak deur gelyktydig gebruik te maak van uitwysing na grafiese simbole tesame met spraak.

Die doel van die studie was om die impak vas te stel van ‘n drie-week lange ondersteunde taalstimulasie program op die reseptiewe taalvaardighede van kinders met min of geen funksionele spraak. Vier kinders het deelgeneem hierdie veelvoudige basislyn studie. Die ondersteunende taal stimulasie program het bestaan uit drie aktiwiteite, naamlik kuns en handwerk, kos voorbereiding en storie aktiwiteite. Elke aktiwiteit is vyf keer aangebied aan die deelnemers. Agt teiken woordeskat items is aangeleer in elke aktiwiteit. Die aanleer van al 24 teiken items is aangemoedig tydens elke sessie oor die drie-week lange-intervensie periode. Die resultate dui aan dat al die deelnemers al die teiken reseptiewe woordeskat items aangeleer het. Daar was egter variasie in die tempo waarteen die deelnemers die teiken items aangeleer het. Daar is geen statisties betekenisvolle verbetering in algemene reseptiewe taalvaardighede waargeneem onder die deelnemers nie.

Kern woorde: Min of geen spraak; Aanvullende toevoer; Ondersteunde taal stimulasie; Aanvullende en Alternatiewe Kommunikasie (AAK); Reseptiewe taalvaardighede
