To God Almighty who hath been my Tower of Refuge and Strenght

Abstract

Backpropagation (BP) has played a vital role in the resurgence of interest in artificial neural networks (ANNs). Eversince, a lot of research effort concentrated on finding ways to improve its performance. Active learning has emerged as an efficient alternative to improve the performance of multilayer feedforward neural networks. The learner is given active control over the information to include in the training set, and in doing so, the generalization accuracy is improved and the computational cost and complexity of the network are reduced compared to training on a fixed set of data.

While many research effort has been invested in designing new learning approaches, an elaborate comparison of active learning approaches is still lacking. The objective of this research study is to compare and criticize active learning approaches and also to propose a new selective learning algorithm.

This thesis presents a comparison of four selected active learning algorithms. The thesis concentrates on one type of application, namely function and time series approximation.

Opsomming

Terugwaartspropagering neurale netwerke het 'n belangrike rol gespeel in die oploewing van die belangstelling in kunsmatige neurale netwerke. Verskeie navorsingsstudies konsentreer op die verbetering van die prestasie van neurale netwerke. Aktiewe leer het getoon om 'n effektiewe alternatief te wees om die prestasie van multi-vlak vorentoe-voer neurale netwerke te verbeter. Die leerder word aktiewe beheer gegee oor die inligting wat in die leerversameling ingesluit word. Sodoende word veralgemening verbeter, en die berekeningskoste en -kompleksiteit van die netwerk verlaag in vergeleke met afrigting op 'n vaste leerversameling.

Terwyl vele navorsing gedoen is in die ontwikkeling van nuwe leerstrategieë, is daar 'n tekort aan 'n uitgebreide vergelykende studie van aktiewe leer. Die doelwit van hierdie studie is om aktiewe leer strategieë te vergelyk en te kritiseer. 'n Nuwe selektiewe leer algoritme word ook aangebied.

Hierdie tesis bied 'n vergelyking van vier aktiewe leer algoritmes aan. Die tesis konsentreer op die benadering van funksies en tydreeks.

Acknowledgements

I came, I saw and I conquered

I thank God Almighty for my stay and experience in South Africa, and most especially for His wisdom and guidance when I plunged my self into the unknown ocean of Neural Networks.

I deeply express my thanks to the following people:

- My supervisor, A.P Engelbrecht, for his time and advice.
- My sister and her hubby - Dr and Dr Ogunleye for making my postgraduate study a reality.
- My Uncle and his family - Uncle Akin, for his support and encouragement.
- My family at home especially my mother- For your prayers and encouragement.
- My Daddy - Late Prof J.A Adejumo, you inspired me, taught me the values of education, and that with power of knowledge, all men are equal.
- My Husband - Boye Aderogba, for waiting for me and being there when I needed you, thanks.
