## ABSTRACT

Nolunkcwe Jennifer Bomela

This study highlights the importance of national factors in explaining the wide variations in child malnutrition that exists among population groups in the three Central Asian Republics under study, and as an avenue through which the investigation of the processes by which other factors influencing child malnutrition can be executed. This study has been guided by the proposition that the effects of socio-economic, health and the environmental factors vary by province of residence. The suggested theory underlying this proposition is the *structural violence theory*, which stems from the evidence of differences in malnutrition levels among provinces of residence within the three countries under study.

Against the background of this theory, the study explores and compares the effects, on child malnutrition of sixteen covariates of malnutrition within these countries. The study assessed, first, the nutritional status of children below 3 years using the three anthropometric indices, weight-for-age, height-for-age and weight-for-height. Secondly, it examined the confounding factors that influence nutritional status in the Central Asian Republics.

The DHS data for Kazakhstan, Kyrgyzstan and Uzbekistan were used. The data of the countries were combined in order to create a more usable dataset for multivariate analyses. This descriptive analysis was done on all relevant variables in order to get a better understanding of the dynamics involved in the data. A binary logistic regression analysis estimating models using the stepwise forward method (based on Wald statistics) on the pooled dataset was carried out controlling socio-economic, health and environmental characteristics. Separate analysis was carried out to study the odds of being underweight, and stunted

among children in the study population. Analyses for the odds of being wasted were not performed because the percentage of wasted children was too low.

The main results indicate that province of residence within a country, country of residence, number of people in a household, household wealth, birth weight, age of child, knowledge of ORT, maternal education, number of children under five years, and source of drinking water, are strong predictors of child nutritional status in the three Central Asian Republics. Furthermore, it has revealed that chronic malnutrition (stunting), which is long-term undernutrition, is most prevalent in all three countries but at varied levels.

An unexpected finding is that fully vaccinated children were highly likely to be malnourished compared to children who were partially vaccinated. Since stunting appears in early ages in Central Asian children many of the children in this study may be stunted before they receive all the recommended vaccinations. This could also be influenced by the poor nutritional status of the mother who cannot provide nutritious breast milk.

Another unexpected finding was that breast-feeding especially in children more than six months old had a strong negative association with stunting and underweight. Women who breastfeed longer may be doing so because they lack the resources and nutritional knowledge to provide their children with adequate nutrition. Another explanation for the observed adverse association of breastfeeding and nutritional status beyond infancy is that of reverse causality, where mothers continue to breastfeed children who appear small for their age.

In summary, the results from both the descriptive and binary logistic regression analysis are similar in terms of the explanatory variables and the statistical significance in the models. The study recommends more area-specific (province) policies for the development of nutritional intervention programmes including closer attention to childcare and mother care programmes.

## ACKNOWLEDGEMENTS

I would like to thank and express my appreciation to several people who helped and guided me to bring this study to completion. I gratefully acknowledge Professor Louis van Tonder who served as my sole supervisor, and patiently and skilfully guided me through the labyrinth of thesis writing.

Very special thanks is due to Professor Janis Grobbelaar, Head of the Department of Sociology, University of Pretoria for her constructive and insightful comments, suggestions, ideas and willingness to assist me at all times. I am also indebted to her for her constant encouragement and generous support throughout my study. She has devoted many long hours to rigorous reviews of my drafts and has provided me with insightful reactions. Above all, her genuine and generous support has been a great source of encouragement and inspiration.

I must acknowledge the generous assistance of the Department of Statistics at the University of Pretoria. I want to specifically thank Ms Jacqui Sommerville for her steadfast commitment, support and help during the difficult data analysis days.

I want to thank my friends Dr Peter Ubomba-Jaswa and Dr Susanna Ubomba-Jaswa for their unwavering support and help, and for the needed push to keep going through the laborious process of thesis writing.

Finally, but not least, I am very grateful to my husband, Bommie, without his support, encouragement and love, I would not have been able to pursue doctoral studies, let alone complete this thesis. I am thankful for his patience. His advice

has helped me to persevere the excruciating task of combining family responsibilities, work commitments and graduate study. My husband and our children Tandile and Viwe have all my love for their patience and support. I am eternally grateful to my mother for being a superior role model throughout my life. Thank you MaDlomo! Special thanks go to Nontando my sister and Cwezile my brother for being there for me all the time, encouraging and offering me support throughout my career life.

## DEDICATION

I dedicate this thesis to the late Professor Kobus Oosthuizen for introducing me to the field of Demography without whom I would not developed the love and interest that I have for the subject today.

## **El'tsin Resignation Statement**

"I want to ask you for forgiveness, because many of our dreams have not been realised, because what we thought would be easy turned out to be painfully difficult. I ask for forgiveness for not fulfilling some hopes of those people who believed that we would be able to jump from the grey, stagnating, totalitarian past into a bright, rich and civilised future in one go. I myself believed in this. It seemed that with one spurt we would overcome everything. It could not be done in one swoop. In some aspects I have been too naïve. Some of the problems were too complex. We struggled on through mistakes and failures. In this complicated time many people experienced shocks" (B.N. El'tsin, Russian President, 1991-1999, resignation statement, 31 December 1999).  
Ellman M. (2000). The Russian Economy Under El'tsin. *Europe-Asia Studies* (52):1417-1432.
