

# Bovine Brucellosis in Portugal: test and slaughter along with RB51

Fernando Boinas  
*fboinas@fmv.ulisboa.pt*

Brucellosis Research Workshop  
13 – 15 May, Veterinary Faculty,  
University of Pretoria

# Atlantic Ocean

Azores

PORTUGAL

EUROPE

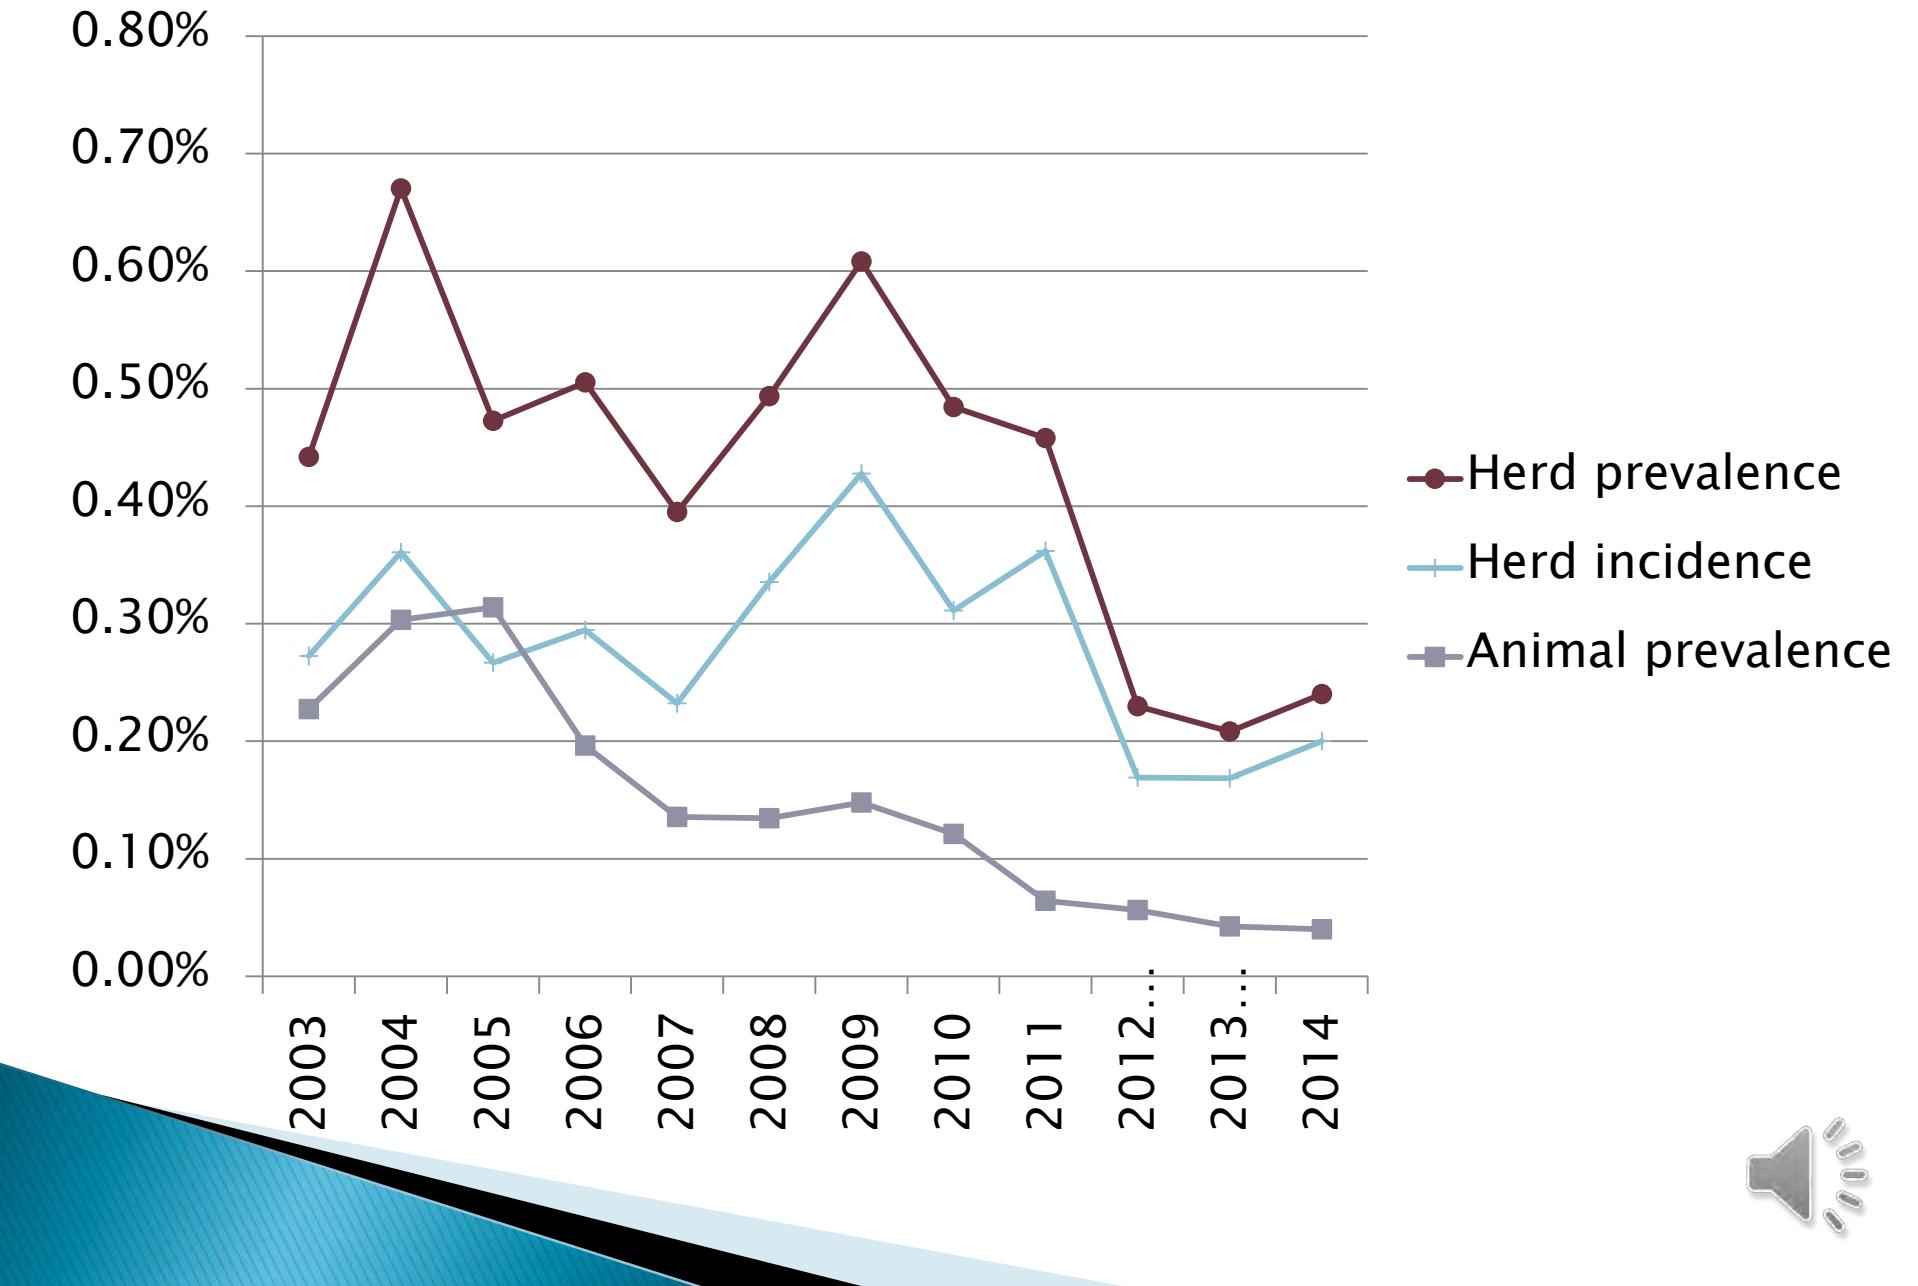

AFRICA

Case studies- 1,2,3

# Portugal – Bovine Brucellosis

# PT Bovine Brucellosis Eradication Programmes Measures

## Sanitary

- Serological surveys
- Sanitary Slaughter of Sero+ animals & bacteriological examination
- Herd quarantine;
- Control of Animal Movement;

## Medical

- Live vaccination with RB51
- Electronic Id

- Abortion
  - compulsory notification of abortion
  - sample collection for bacteriology
    - .abortion products
    - .vaginal swabs

# Control and Eradication Programme

- ▶ Test and Slaughter Policy
- ▶ Annual serosurveillance
  - RBT & CFT – Series / Parallel
  - MRT
- ▶ Abortion notification
- ▶ Bacteriology of abortions & Sero+ animals
  - Isolation
  - Tipification

# Control and Eradication Programme

## ▶ Animal Movement

- Live – restriction
- Slaughter

## ▶ Awareness campaigns

- Producers and Staff
- Human Doctors

# Vaccines for BB

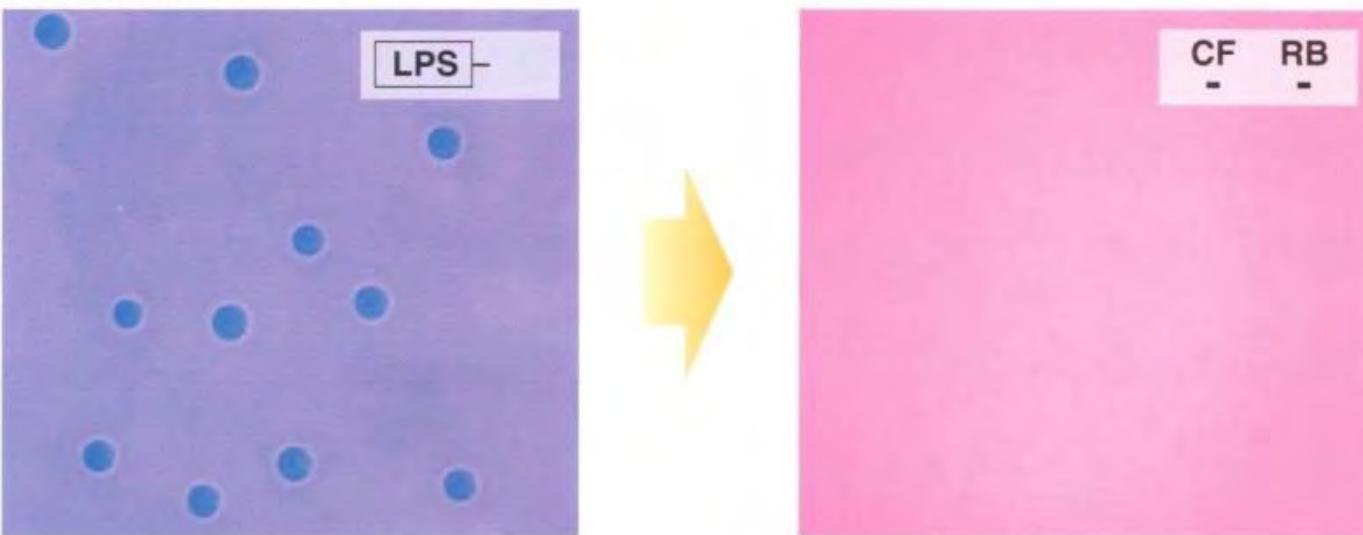

- ▶ long-term protection
- ▶ reduce clinical disease & transmission
- ▶ do not prevent seroconversion after exposure
- ▶ vaccination alone does not eradicate BB
- ▶ risks for humans and pregnant animals

*Brucella abortus* Strain 19

*Brucella abortus* Strain RB-51

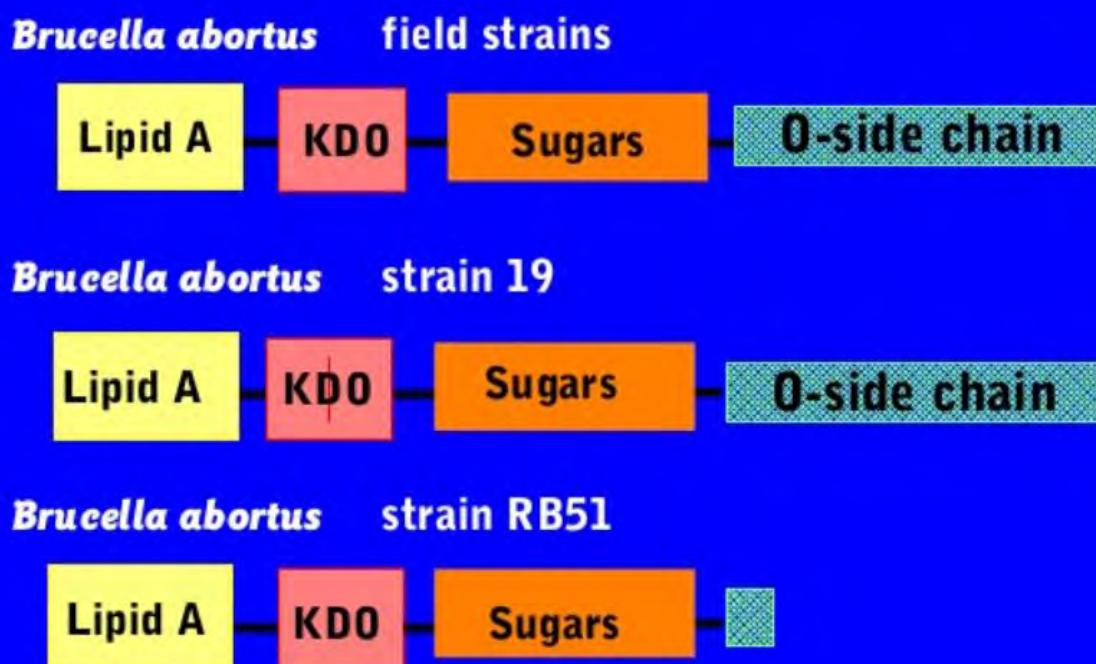

LPS = Lipopolysaccharide  
O = O-side chain  
CF = Complement fixation  
RB = Rose Bengal

# Lipopolysaccharide structure of virulent and vaccine strains

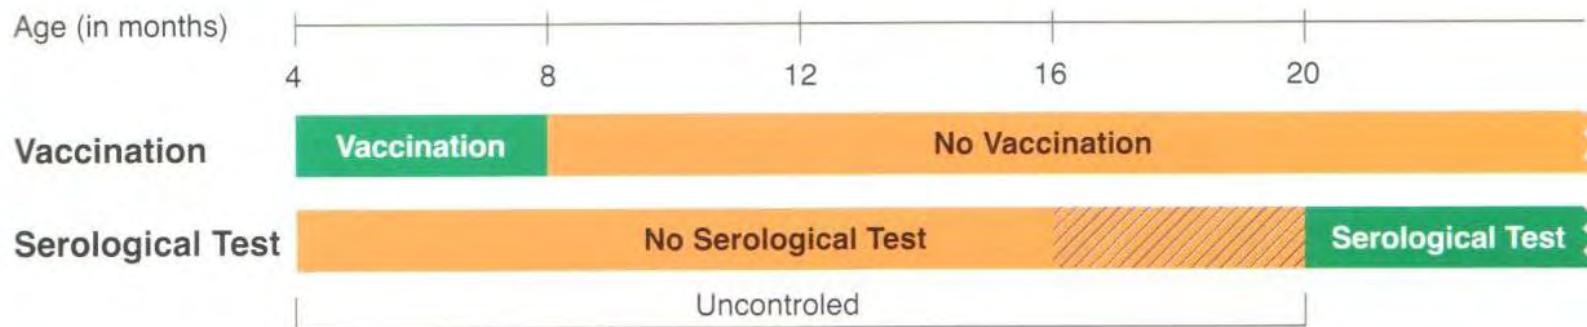

O  
I  
s

n  
,  
2  
0  
1  
3

The O-side chain is the immunodominant antigen  
of *Brucella* for antibody responses

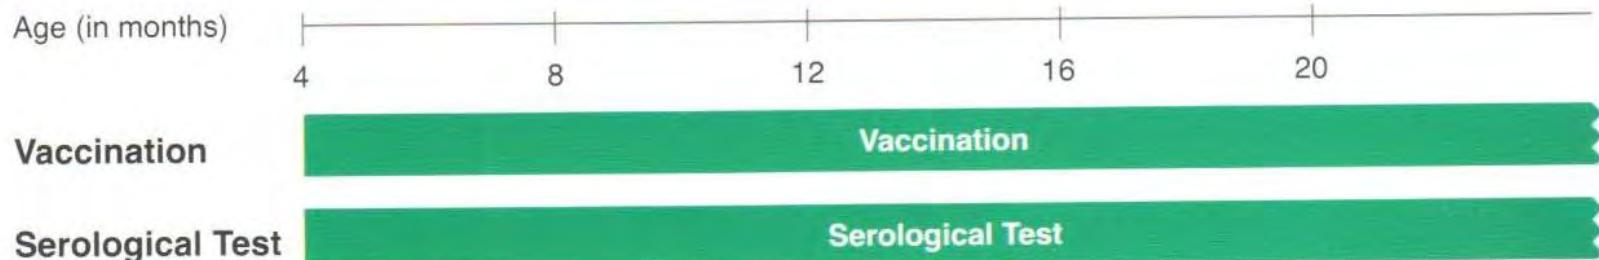

## Eradication programs based on S-19

Adults can not be vaccinated due to interference

## Eradication programs based on RB-51®

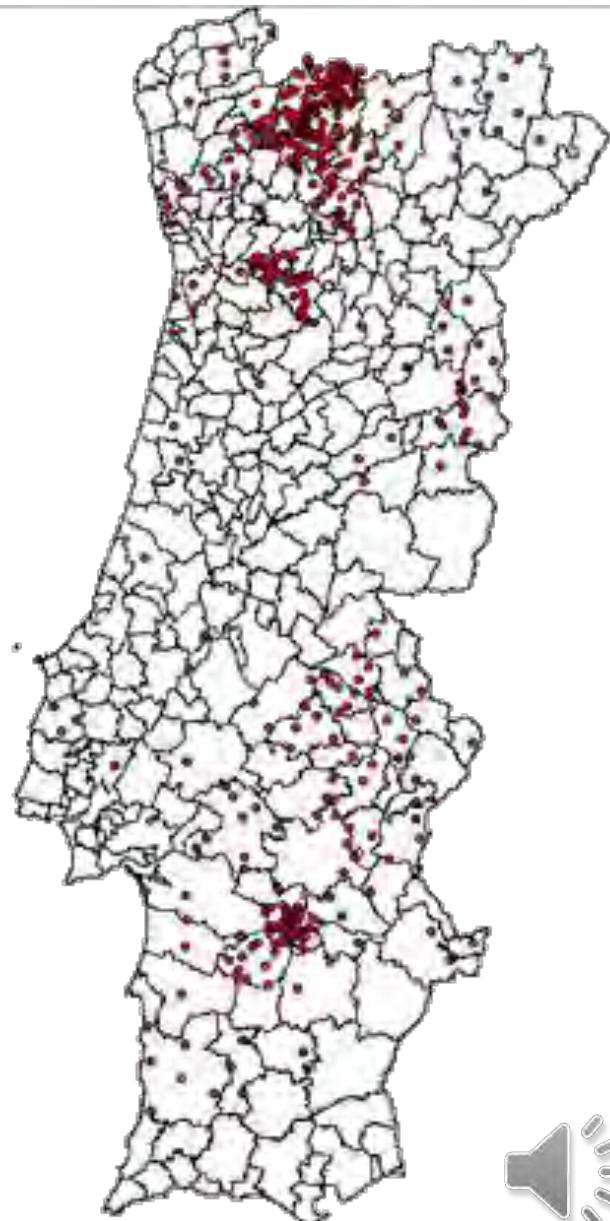

Adults can be vaccinated

# Special Vaccination Programmes (RB51)

## Justification

- ▶ High Prevalence of BB
- ▶ Increase of Incidence of BB
- ▶ Risk Factors
  - Transumance
    - Azores Islands
    - Trás-os-Montes – Montalegre
  - High Animal Density
    - Alentejo-SAPJU
  - Depopulation ineffective
    - Alentejo – SAPJU
- ▶ Limited supply of S19
- ▶ Socio-economic
  - Subsistence
  - Genetic Poll

# Special Vaccination Programmes

## Vaccination Protocol - RB51

- Epidemiological Units
- Breeding Herds
- RB51 - (CZV)
  - S/C -  $10-34 * 10^9$  CFU/dose (2 ml)
  - Female animals
    - Young (+ 4 months)
    - adults
- Epidemiological follow-up  
Revaccination

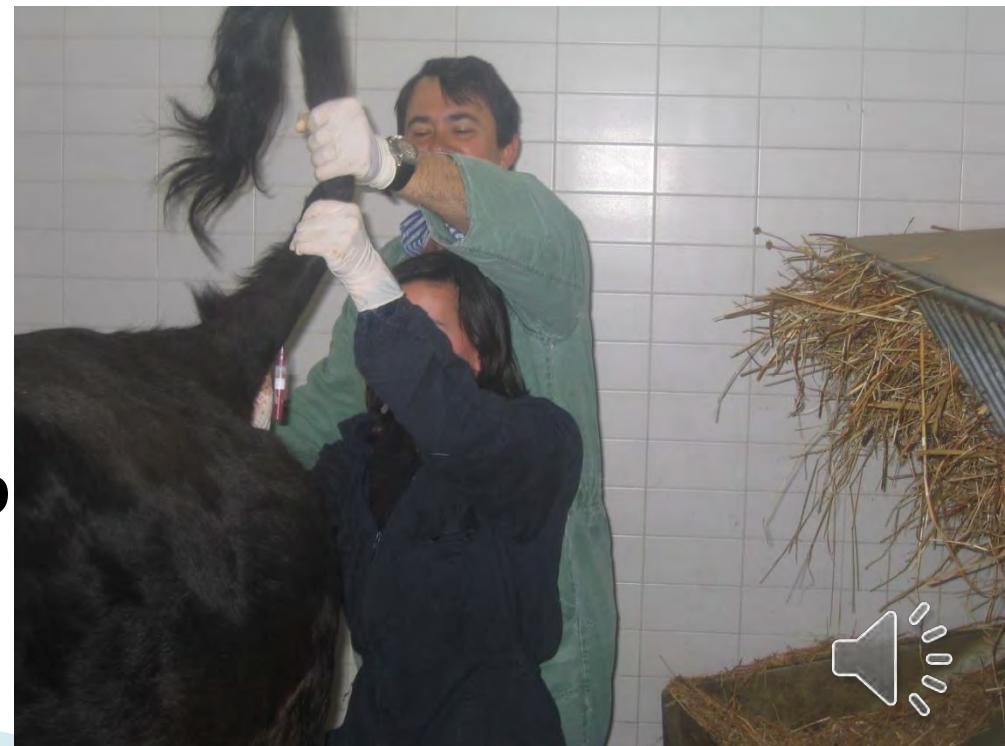

**Animal Identification  
Ear tags  
  
Electronic  
  
Passaport & National  
Database**

**Serological survey**  
**Vaccination date**  
**Epidemiological follow-up**

# Bovine Brucellosis in Azores

- ▶ 1947– 1st Brucella diagnosis in Azores
- ▶ 1950– Eradication Programmes
- ▶ 1968–1984 – Vaccination S19
- ▶ 1986–1999– Vaccination M45/20
- ▶ 2000 –
  - Eradication
    - Corvo, Flores, Graciosa e Pico
  - Low Prevalence
    - Faial & Sta Maria
  - Infection
    - S.Miguel, Terceira, S. Jorge

# Bovine Brucellosis in Azores

## Problems in the Control

- ▶ Climate
- ▶ Large Bovine Population
  - 250,000 Bovine / 12,000 Herds
    - 20.8 animals/ herd
  - S. Miguel, Terceira and S. Jorge- 80% of bovine
- ▶ Extensive Production system
  - 1.3 animal/ ha
- ▶ Large number of parcels
  - Average farm size: 5.3ha
  - Average 6.3 parcels /farm

# Bovine Brucellosis in Azores

## Problems in the Control

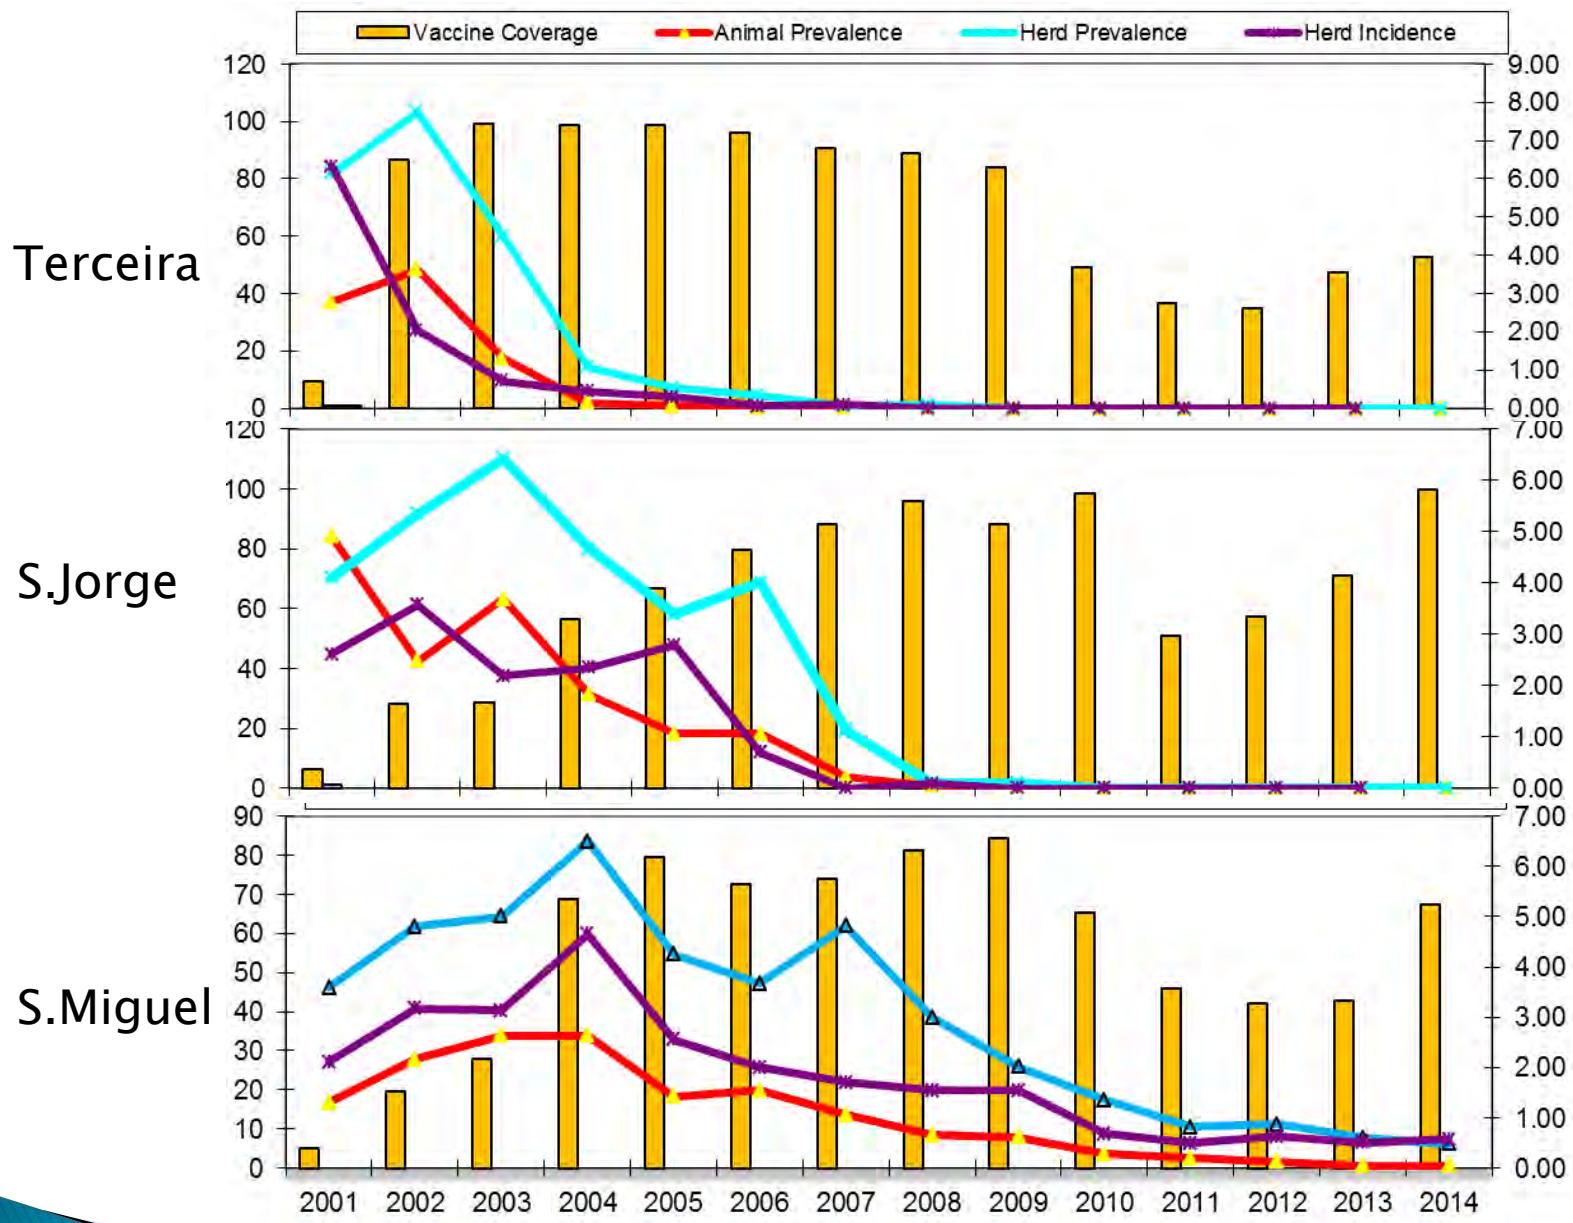

- ▶ Animal movement between pastures
  - Communal paths
  - Common watering points

# RB51 Vaccination Programme

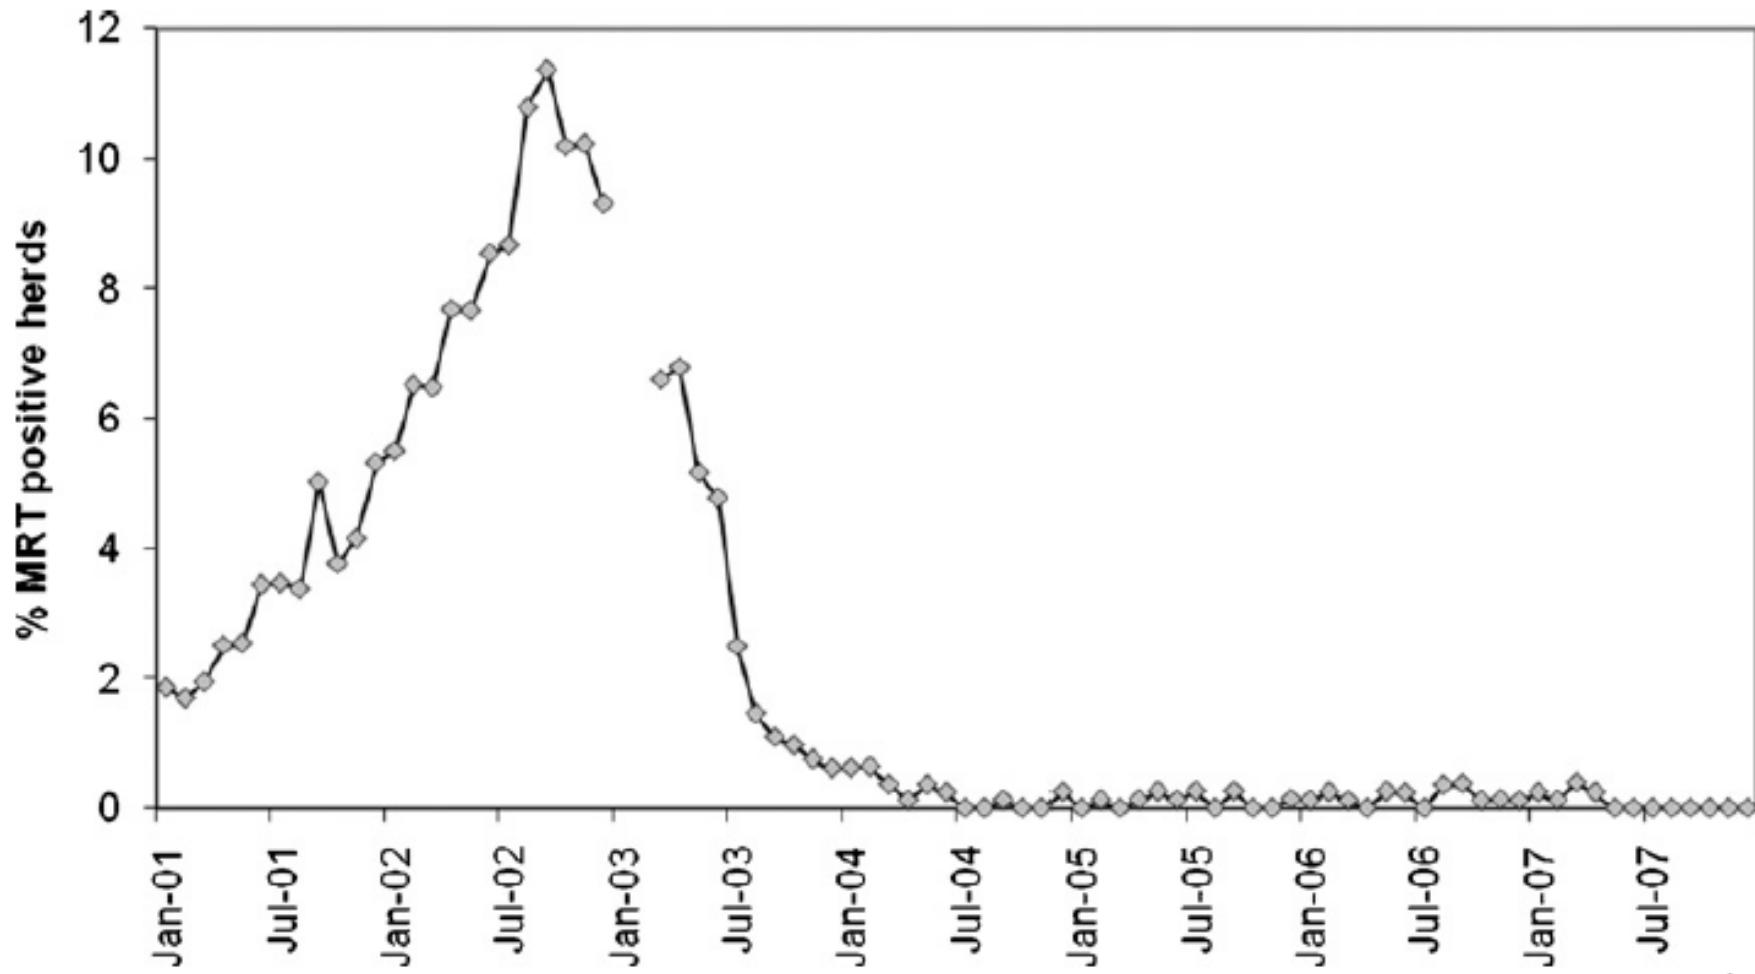

- ▶ Mass Vaccination of 3 islands
  - Terceira
  - S.Jorge
  - S.Miguel
- ▶ Pilot study
  - 2001
- ▶ Programme
  - 2002–2007

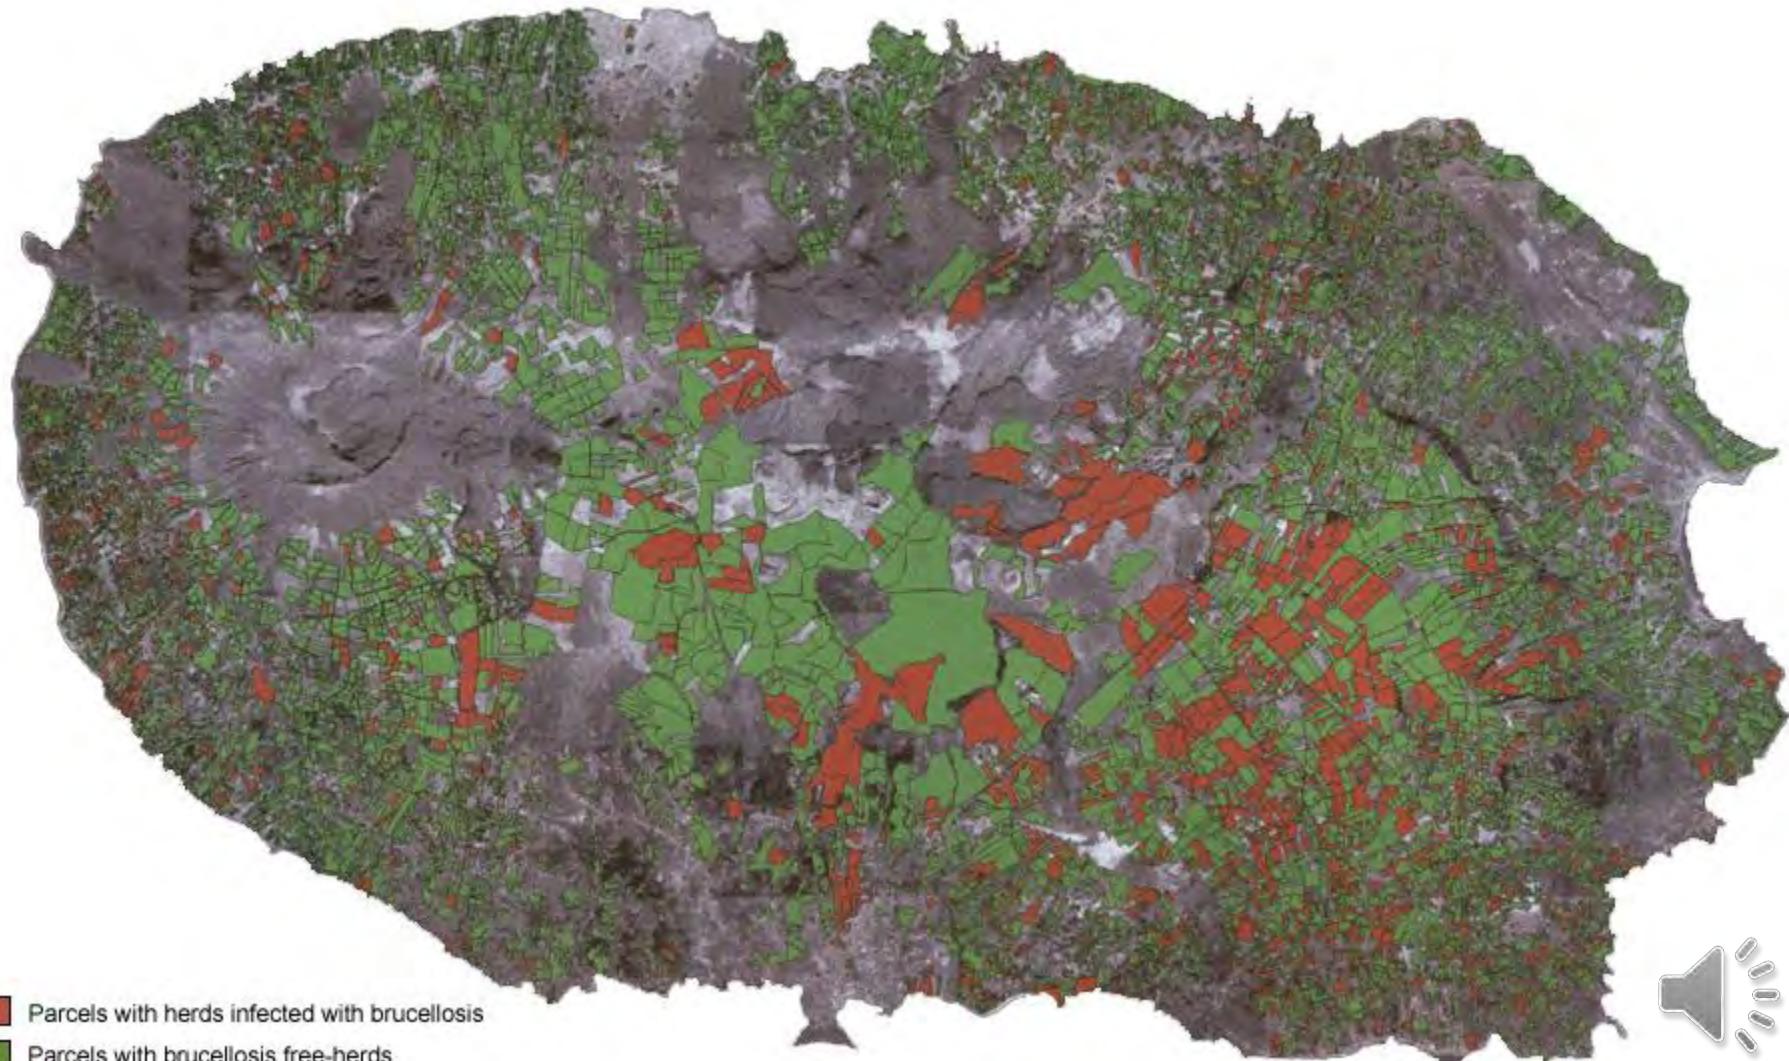

Azores – RB51 Vaccination + Test & Slaughter

## RB51 Special Vaccination Programme

- ▶ Programme
  - Beginning: 7-2004
  - Duration: 5 Years
- ▶ N° of Vaccinated Herds: 10
- ▶ N° of Breeding Animals:
  - Existing: 4277
    - heifers: 1485
    - cows: 2792

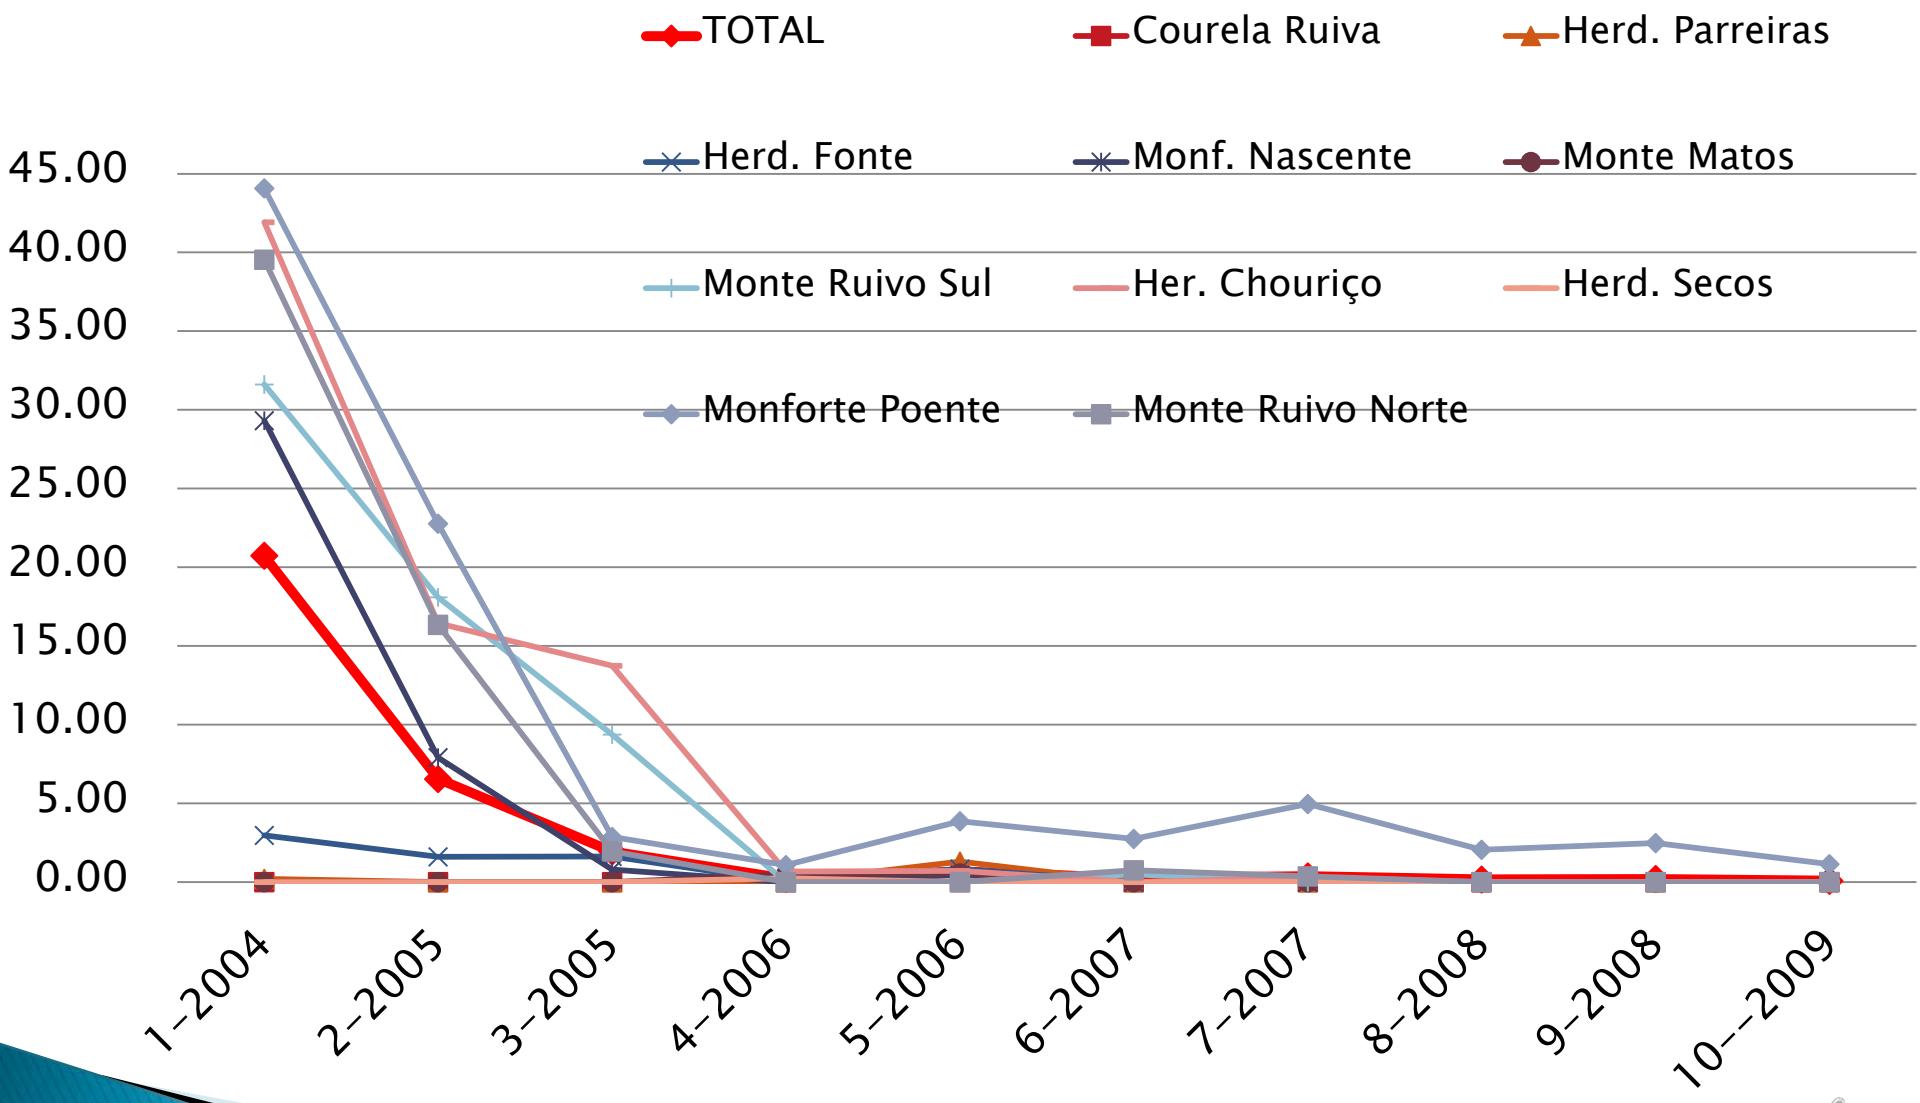

## Regulatory actions, seroprevalence and birth rate in ten Brucella-infected herds in the Alentejo before and after initiation of RB51 vaccination in 2004 .

	Herds					Cattle		Birth rate (%)
Year	Total	Positive	Depopulated	Restocking	Purchase	Vaccinated	Prev. (%)	
1999	8	8	3	0	0	0	26.4	NA
2000	5	5	2	0	0	0	18.1	NA
2001	7	7	0	3	1	0	7.6	NA
2002	9	9	0	2	0	0	4.3	NA
2003	10	8	0	0	1	0	12.6	NA
2004 <sup>1</sup>	10	7	0	0	0	3370	19	60.1
2005	10	6	0	0	0	846	5.7	44.3
2006	10	6	0	0	0	709	0.5	66.0
2007	10	3	0	0	0	755	0.5	68.6
2008	10	1	0	0	0	331	0.2	71.9
2009 <sup>1</sup>	10	1	0	0	0	0	0.1	73.5

# Animal Prevalence Rates SAPJU

# Herds with Sero+ animals (2007)

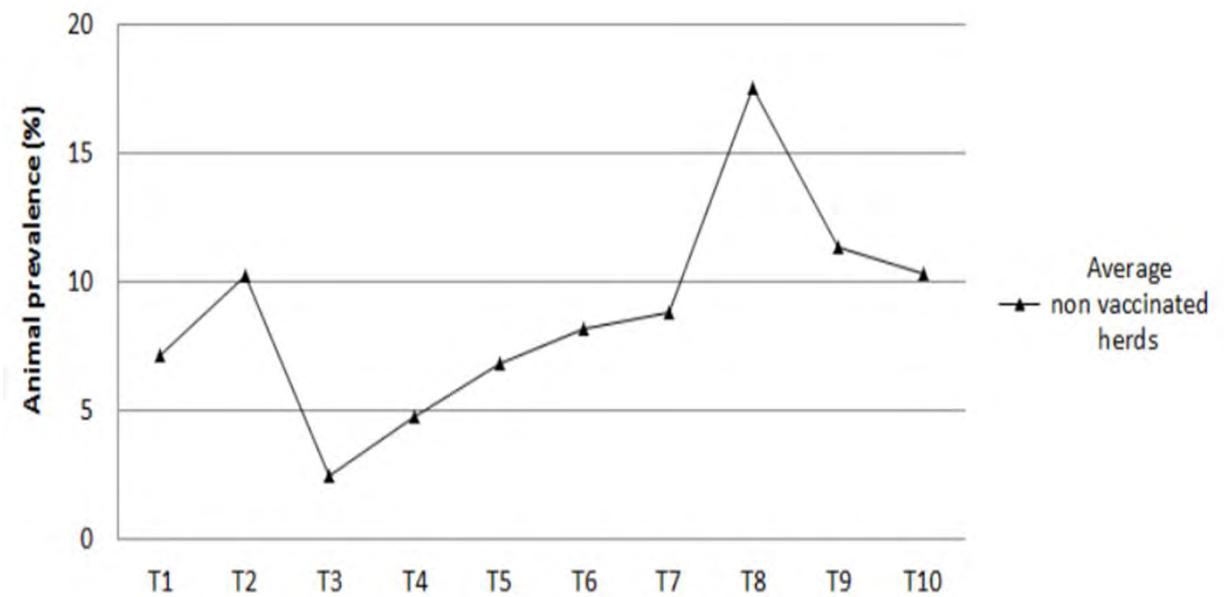

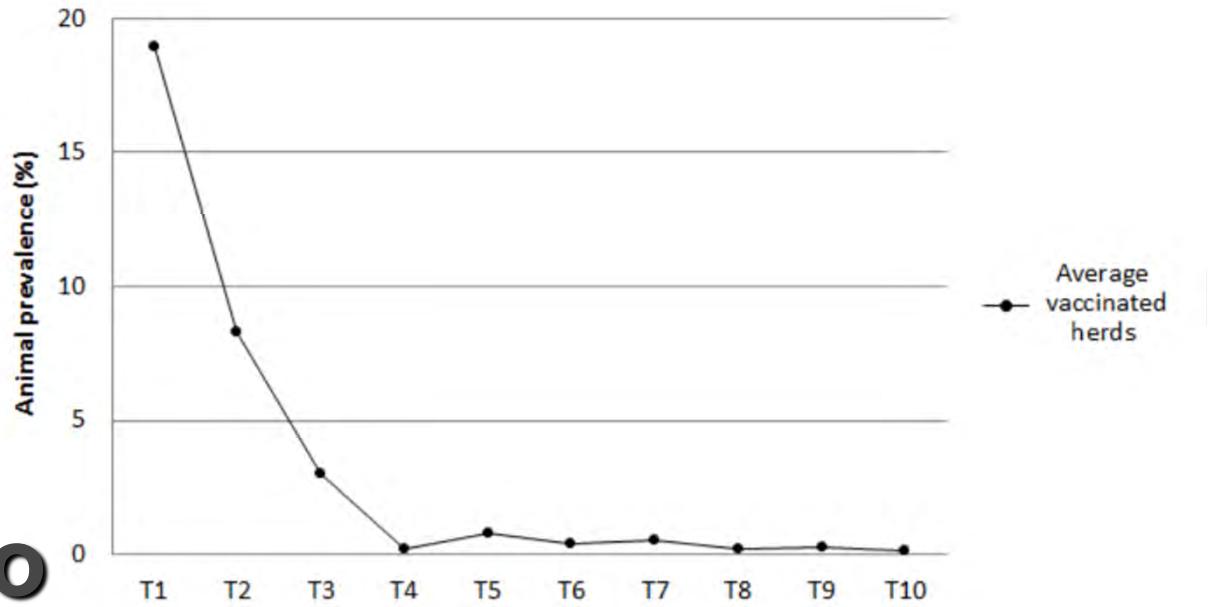

## Follow-up of the ten Brucella-infected herds in the Alentejo region not subjected to RB51 vaccination .

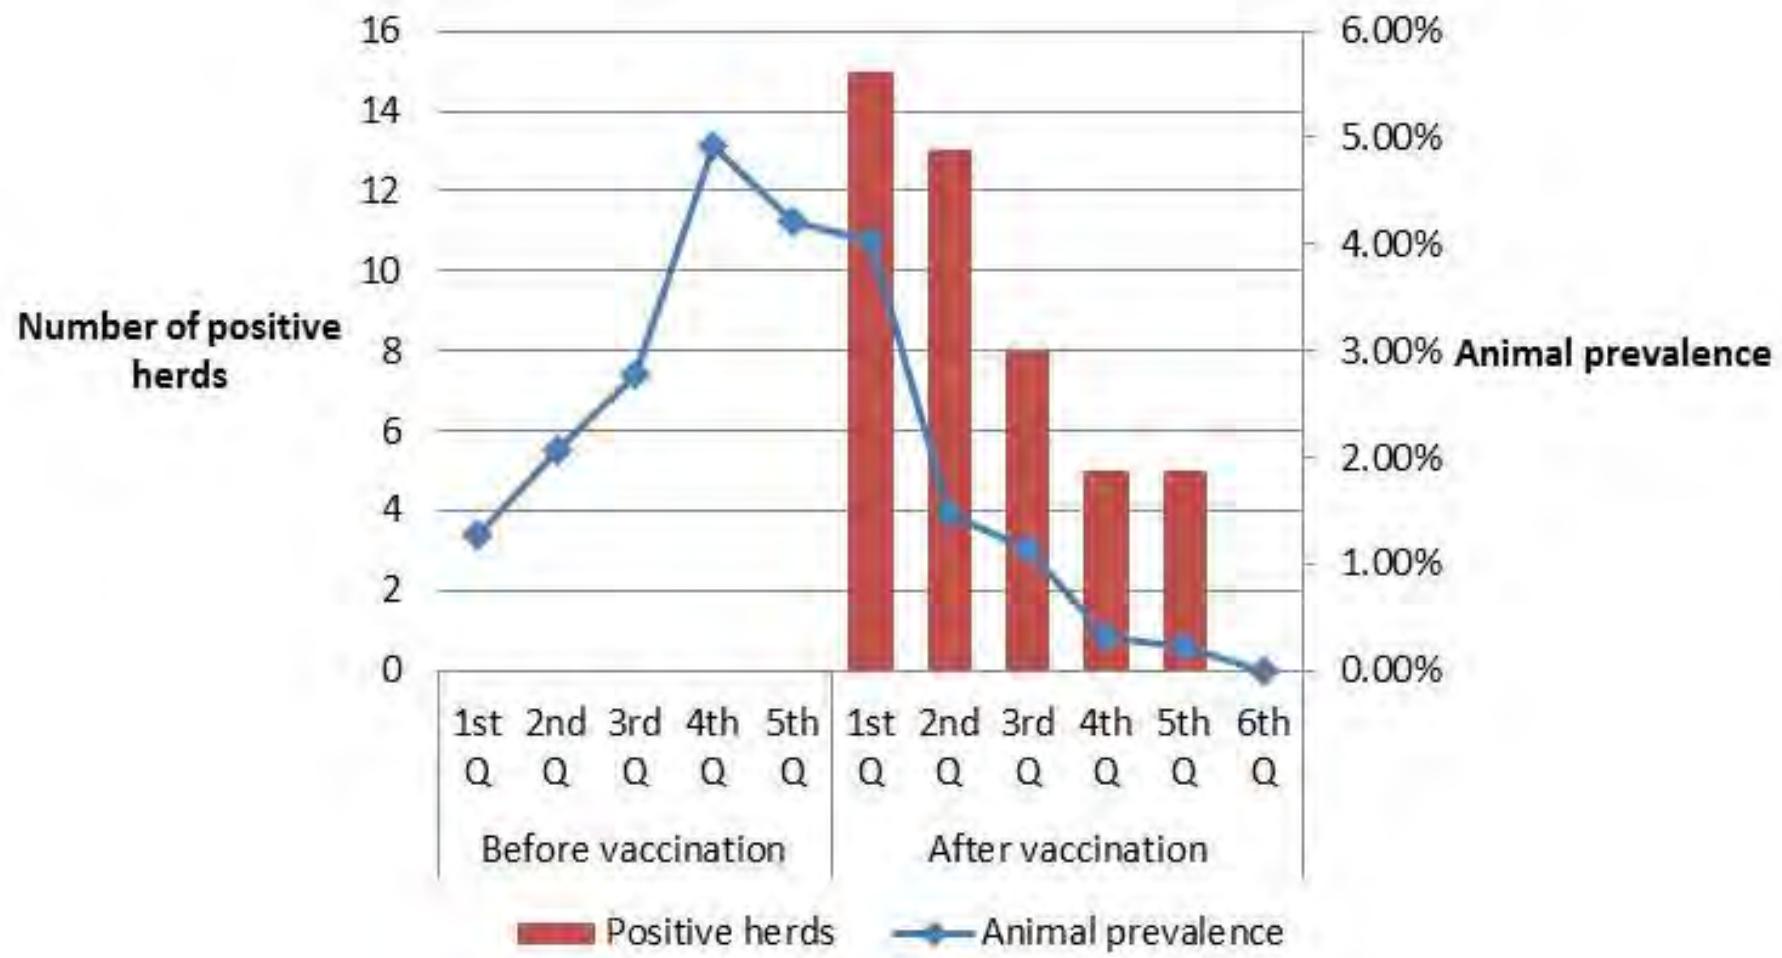

ID herd	1 <sup>st</sup> intervention with positives	Depopulation (year)	Repopulation (year)	Year of first seropositivity after repopulation	Follow-up
1	2001	2003	Yes (2004)		Negative
2	2001	2003	Yes (2004)	2004	Positive until 2006 and negative thereafter
3	1999	2003	Yes (2004)	2004	Positive until 2005 and negative thereafter
4	2003	2004	No		Ceased activity
5	2001	2004	Yes (2009)		Negative
6	2004	2005	No		Ceased activity
7	2003	2006	Yes (2007)	2009	Positive after 2009 thereafter
8	2005	2006	Yes (2007)		Negative
9	2006	2007	No		Ceased activity
10	2007	2008	No		Ceased activity

7	125	4.2
8	132	4.4
7	139	4.6
8	147	4.9
8	152	5.1

Average      7,09      119,64      3,99

# RB51 vaccination & abortions

- ▶ Bacteriology of abortion products and vaginal swabs
  - 61 samples
  - Herds with BB free status : 11 samples with isolation of RB51
  - Rate of isolation: 18%
- ▶ Bovine – Critical Period:
  - Bibliography: 5 – 6 m. gestation
  - ToM: Median 7 m. – range 6-8m.
- ▶ Time from vaccination to abortion
  - Bibliography: 1.5 – 2 m.
  - ToM: Median 4.1 – range 3.0-5.1m

# RB51 vaccination & abortions

## ► Field Studies

- Rate of abortion after vaccination of pregnant cows :
  - Bibliography: 0–2%
  - ToM: 0,18% (75% of 8 073 adults vaccinated = 6055; 11 RB51+)
- No abortions in 348 revaccinated females

# Case studies: discussion & conclusions

- ▶ Implementation of mass vaccination with RB51
  - High vaccination coverage– Excellent results in 1– 1,5 years
  - low vaccination coverage – Delayed results
- ▶ Association with a Test and Slaughter Programme
- ▶ Continuous surveillance
- ▶ Minimal side-effects
  - No human cases
  - Reduced number of abortions

# Case studies: discussion & conclusions

## ► Complementary measures

- Improvement of the awareness
  - Veterinarians
  - Producers
- Investigation of abortions
  - Notification
  - Epidemiological
  - Laboratory
- Implementation of epidemiological units
  - Herds
  - Areas

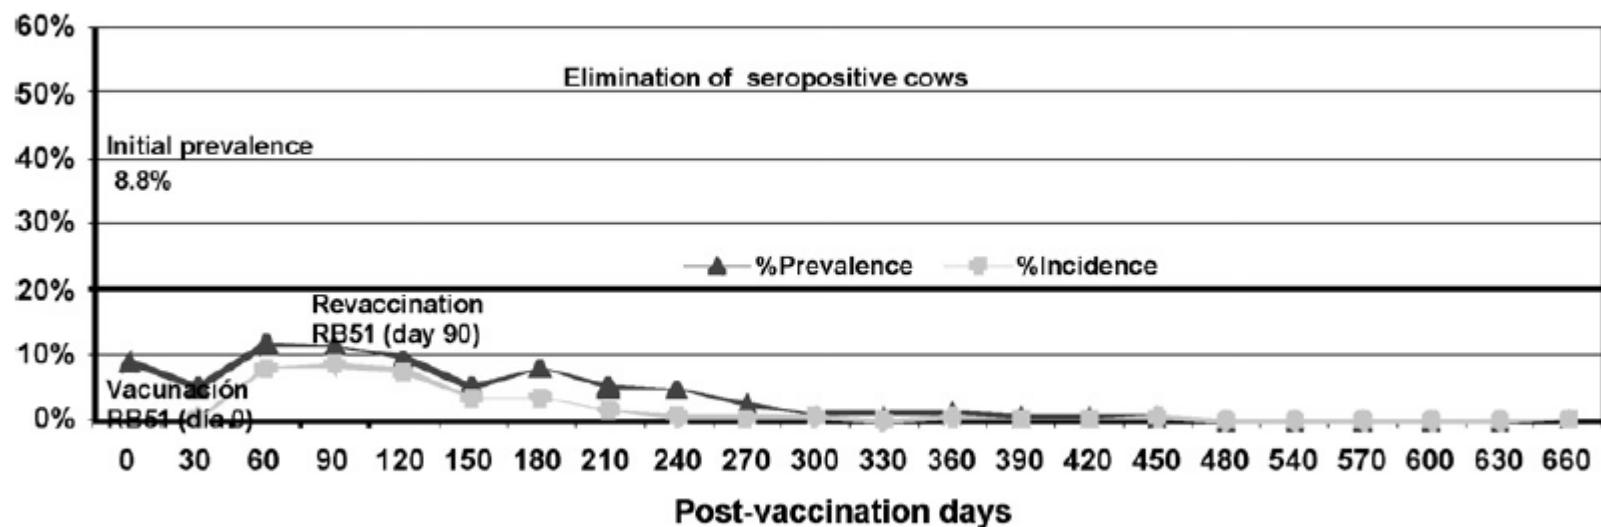

Fig. 1. Prevalence and incidence in dairy herd with low brucellosis prevalence, post-vaccination with *B.*

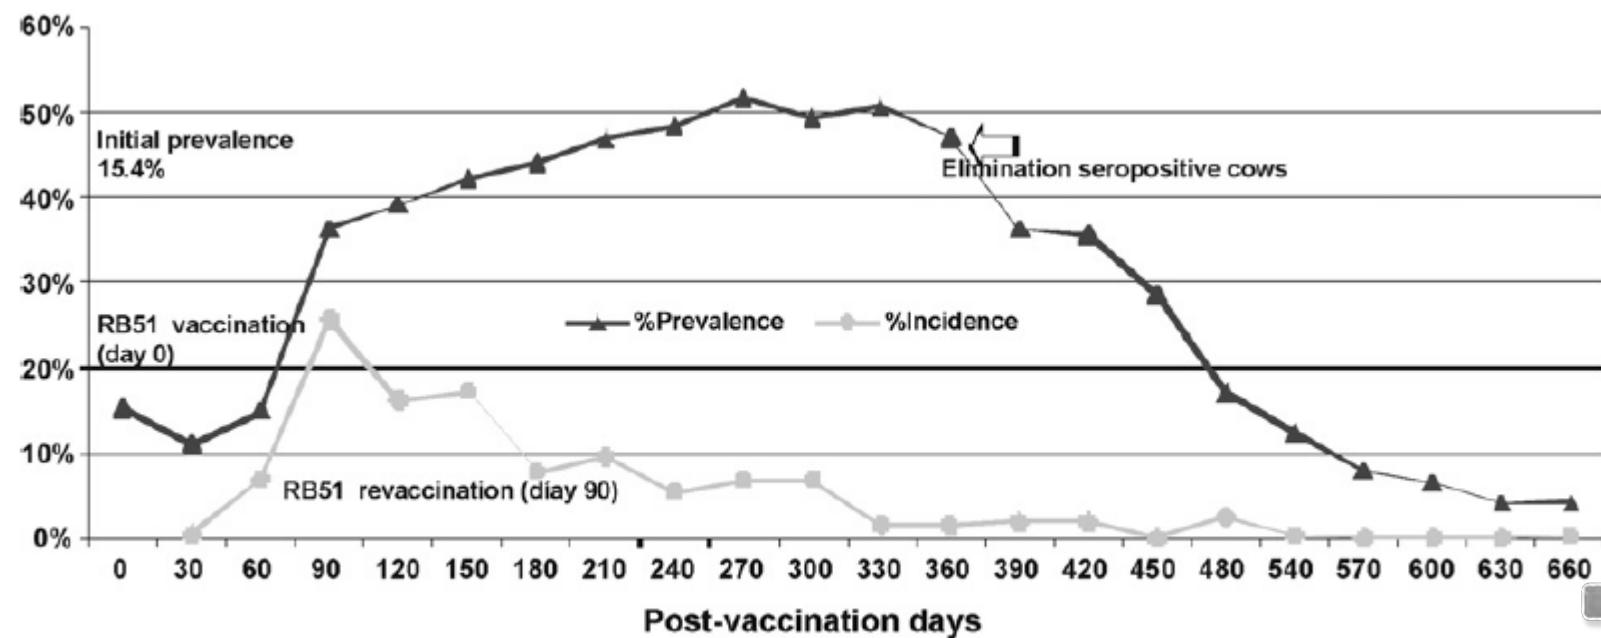

Fig. 3. Monthly prevalence and incidence in dairy herd with high brucellosis prevalence, post-vaccination with *B. abortus* RB51.

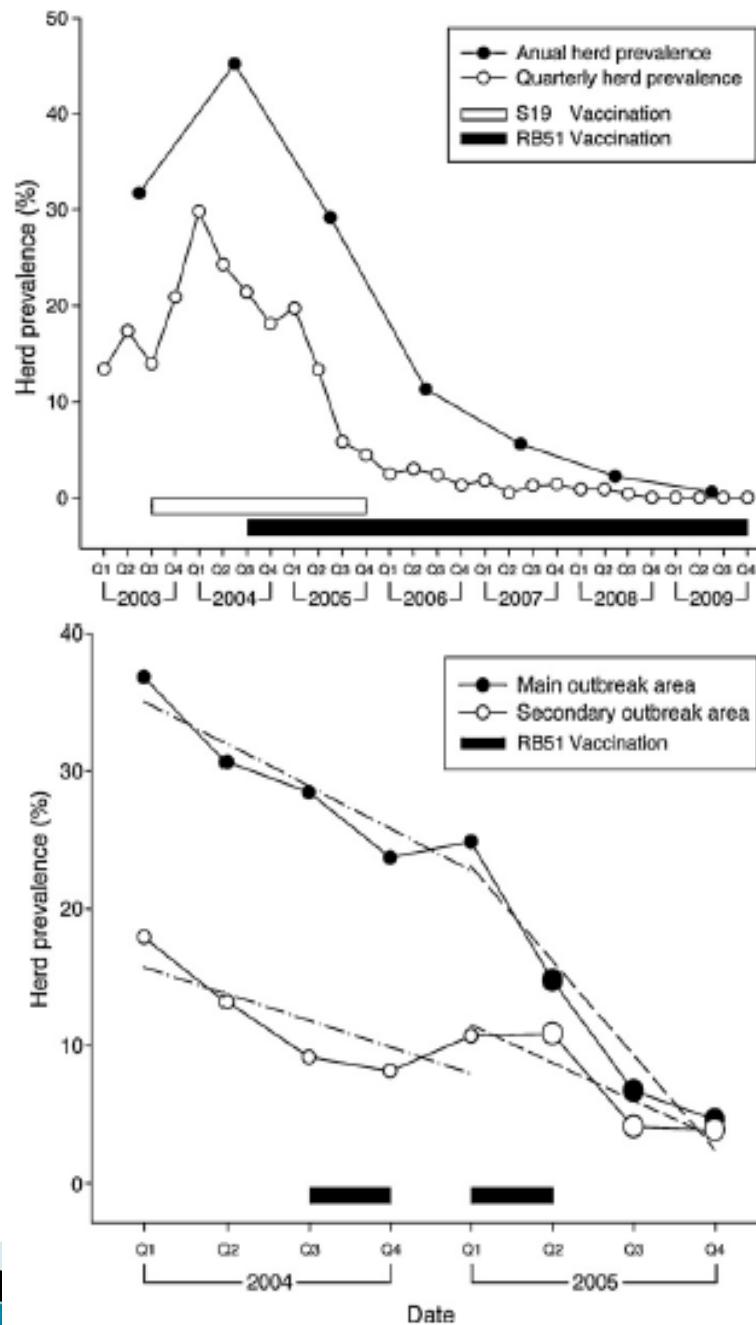

Table 1

Animal incidence (%), number of positive animals previously vaccinated with S19 and proportion of S19 vaccinated reactors from all positive animals in the period of 2004–2009 (bi-annual data) during an outbreak of bovine brucellosis (*Brucella abortus*) in the Extremadura region of West Spain.

Year	Semester	Animal incidence (%)	Reactors vaccinated with S19*	Proportion of S19 Vaccinated reactors (%)†
2004	First	7.77	45	1.39
	Second	6.56	19	0.72
2005	First	2.03	57	7.95
	Second	1.11	64	14.58
2006	First	0.23	28	34.15
	Second	0.27	40	35.40
2007	First	0.08	17	54.84
	Second	0.11	13	27.08
2008	First	0.02	5	33.33
	Second	0.01	2	22.22
2009	First	0.01	3	100
	Second	0.00	0	0

\* Number of reactors that had been previously vaccinated with S19.

† Number of S19 vaccinated reactors divided by all positive animals detected every 6 months.

TABLE 2: Eradication measures implemented in each special incidence area (SIA) depending on the main control strategy applied

General measures included in the national eradication program

Individual identification of all animals and herds

Periodic testing of all animals >12 months of age and removal of reactors

Movement restrictions in case of suspicious or positive<sup>\*</sup> herds

Compulsory reporting and aetiological investigation of abortions

Epidemiological investigation in positive herds (trace-back and trace-forward of breakdowns)

Measures implemented in SIAs	SIA I-III (stamping out)	SIA IV-V (vaccination)
Increased routine testing (serology)	Yes	Yes
Segregation and rapid compulsory culling of positive reactors	Yes	Yes
Total depopulation of herd	Yes	Not†
Disinfection under official supervision and quarantine of facilities and pastures (90 days)	Yes	Yes
S19 vaccination of replacement heifers	No	Yes‡
Mass RB51 vaccination+annual revaccinations	No	Yes

\*Herd in which one or more reactors were found

†Occasionally performed in municipalities not subjected to vaccination (surveillance municipalities)

‡Performed in the first 3-5 years of the study (see text)

HIGHER ANNUAL RATE OF DECREASE IN SIA I-III (46.9%) THAN IN SIA IV&V (14.9%)

Saez et al., 2014 

# Cost of depopulation vs vaccination

- ▶ Annual compensations cost per Sero+ animal / n° of Sero+ animals
  - Depopulation – : 2475€ (95% CI: 1418–3532€)
  - Vaccination – 967€ (CI 572–1368€)
- ▶ Other costs
  - vaccine
  - loosing the OBF status
  - etc.
