

# Supplementary Information

Supplementary Figure 1

a)

b)

c)

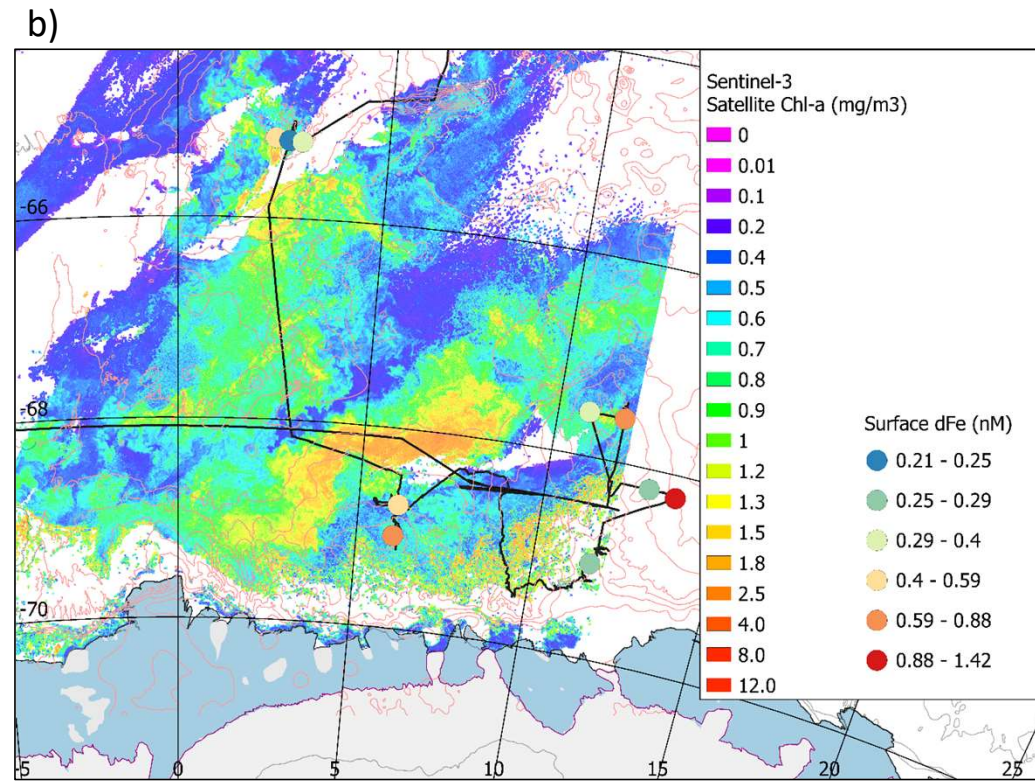

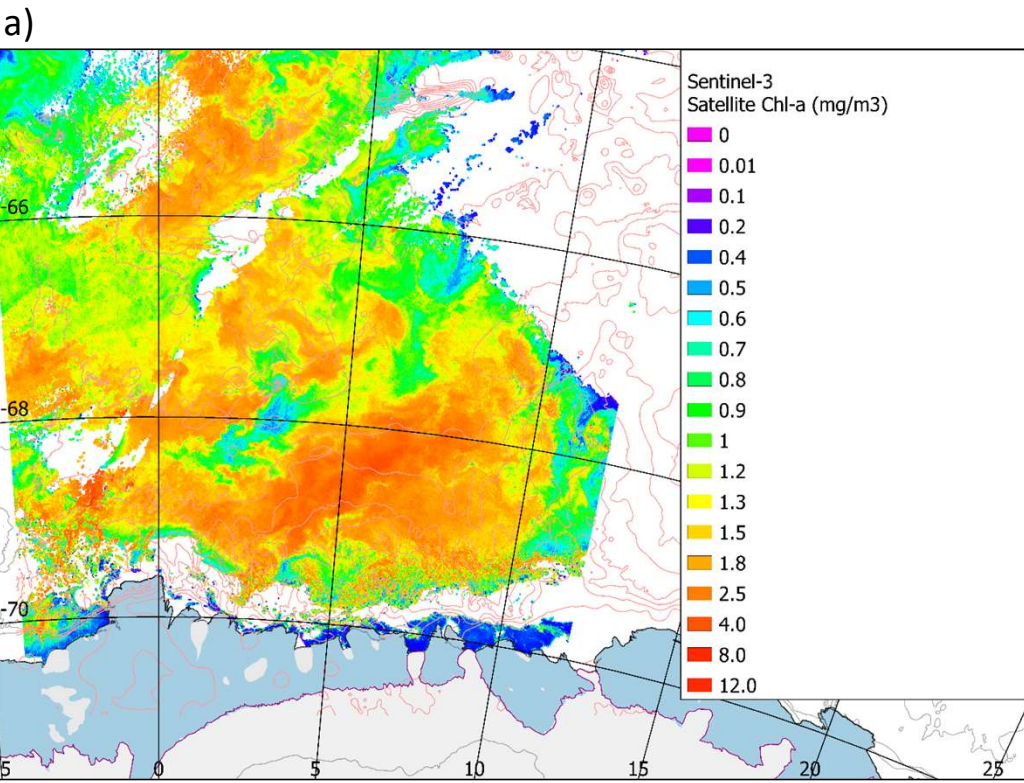

d)

Supplementary Figure 1: Deep export from the phytoplankton bloom. a) Integrated Particulate Organic Carbon (POC,  $\text{g m}^{-2}$ ) and Chl *a* ( $\text{mg m}^{-2}$ ) from each glider profile between 100 and 500 m depth (the location of the glider profiles is given in Fig. 1a); b) contoured POC:Chl *a* ratio ( $\text{mg C m}^{-3}/\text{mg Chl } a \text{ m}^{-3}$ ) between the surface and 500 m depth; c) POC concentration ( $\text{mg m}^{-3}$ ) between 50 and 300 m depth; d) Chl *a* concentration ( $\text{mg m}^{-3}$ ) between 50 and 300 m depth.

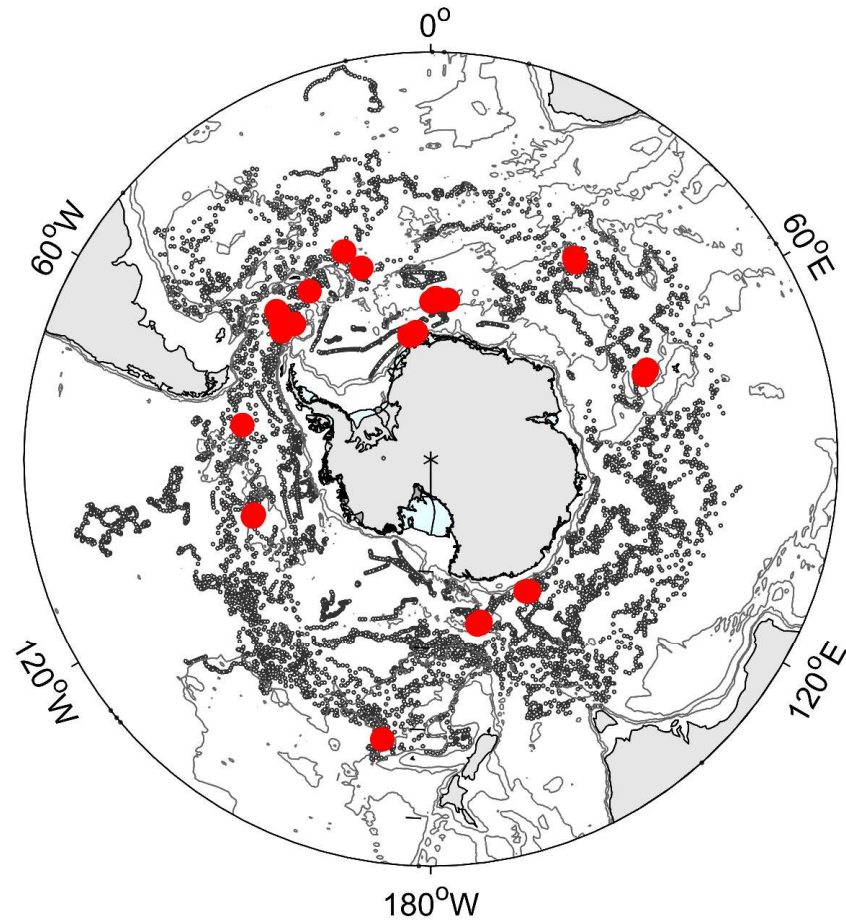

Supplementary Figure 2

Supplementary Figure 2: Peak of the open ocean bloom and surface iron concentration. a) Sentinel satellite image of the open ocean phytoplankton bloom on February 17<sup>th</sup>, 2019. b) Sea surface dissolved iron (dFe) concentration (nM). In b), the Sentinel satellite image of the open ocean phytoplankton bloom on March 8<sup>th</sup>, 2019 is used.

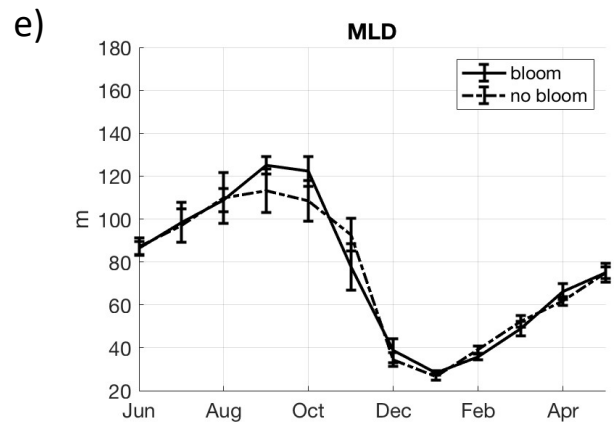

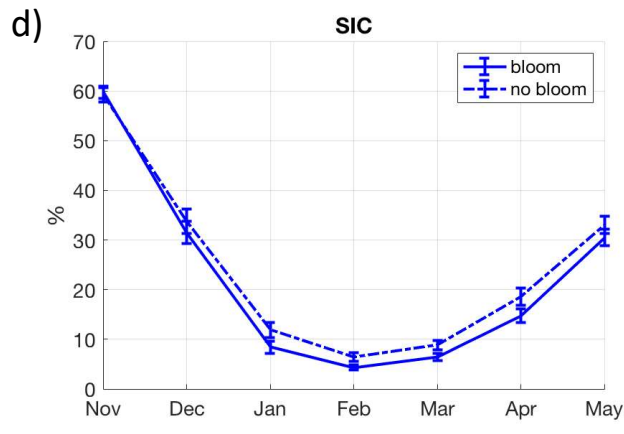

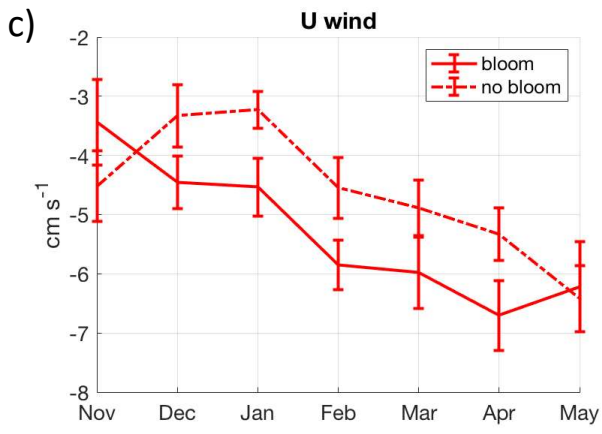

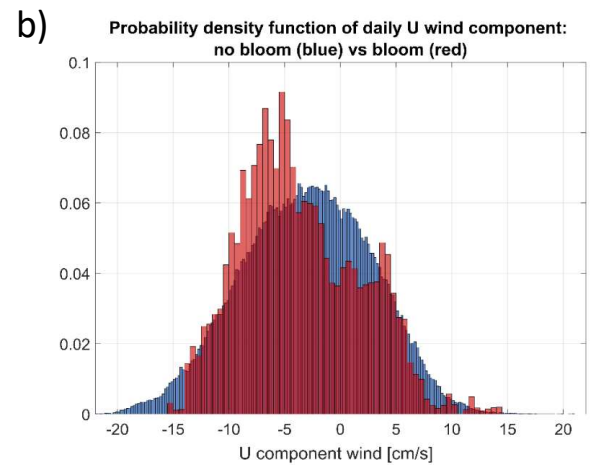

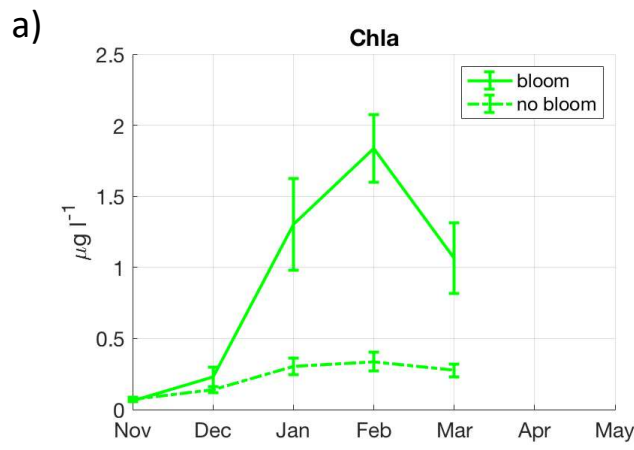

Supplementary Figure 3

All SOCCOM Floats and highest integrated POC profiles

Supplementary Figure 3: POC stocks measured in the upper 100 m of the Southern Ocean by SOCCOM BGC-Argo floats. All SOCCOM BGC-Argo floats profiles that measured upper ocean POC concentration in the Southern Ocean<sup>22</sup> from September 2014 to December 2020, i.e., more than 9500 profiles, (black dots). The highest integrated POC stocks, where the upper 100 m integrated POC was above  $15 \text{ g C m}^{-2}$  are plotted as unique size red circles.

Supplementary Figure 4

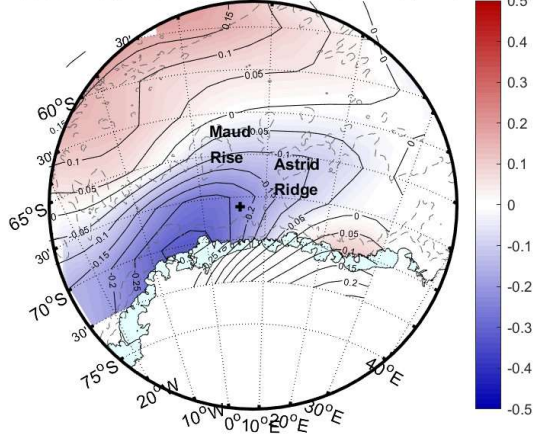

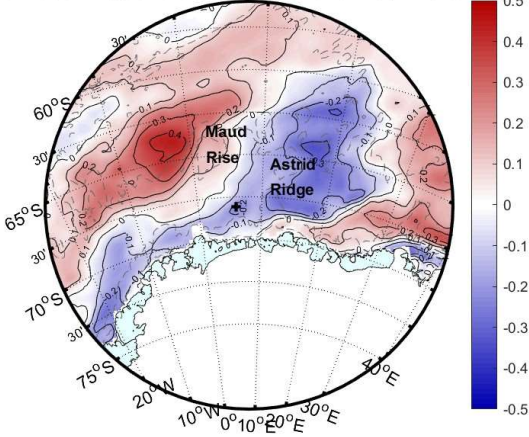

Supplementary Figure 4: Monthly mean seasonal cycles over the bloom area. a) Monthly mean seasonal cycle of the satellite-derived Chl  $a$  ( $\text{mg m}^{-3}$ ,  $N = 240$ ) over the bloom area in the presence and absence of a bloom. b) Probability density function of daily zonal wind component over the bloom area in the presence and absence of a bloom. Monthly mean seasonal cycle of c) the zonal wind ( $\text{cm s}^{-1}$ ,  $N = 240$ ), d) the sea ice concentration (% ,  $N = 240$ ), and e) the mixed layer depth (m ,  $N = 240$ ) over the bloom area in the presence and absence of a bloom. Data are presented as mean values  $\pm$  standard error.

Supplementary Figure 5

a) Correlation map of U-wind and Chl-a anomalies (1 month lag)

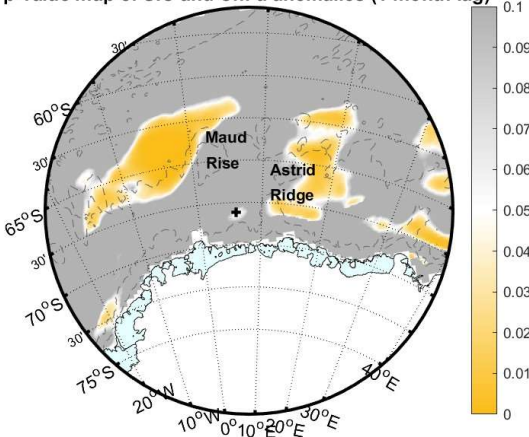

c) Correlation map of SIC and Chl-a anomalies (1 month lag)

b) p-value map of U-wind and Chl-a anomalies (1 month lag)

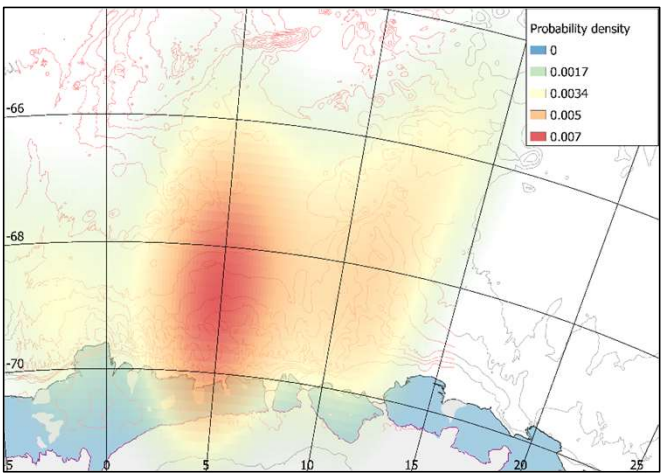

d) p-value map of SIC and Chl-a anomalies (1 month lag)

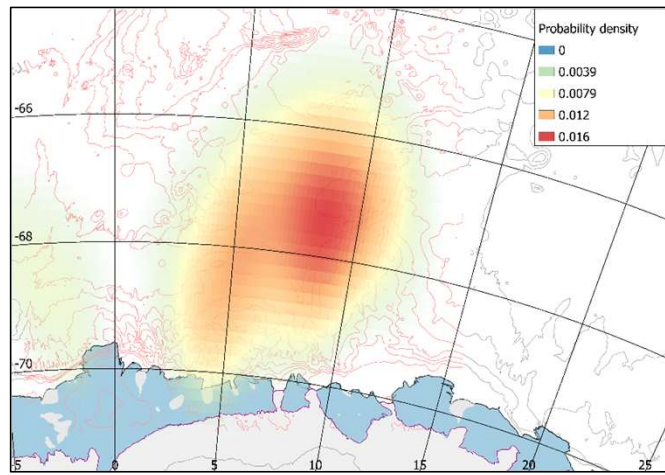

Supplementary Figure 5: Correlations between the Chl  $a$ , zonal wind and sea ice concentrations anomalies in the area of the bloom. a) Correlation map and b) p-value between the satellite-derived Chl  $a$  de-seasoned anomaly (lagged by 1-month) and the zonal wind de-seasoned anomaly in the area of the open ocean bloom. c) Correlation map and d) p-value between the satellite-derived Chl  $a$  de-seasoned anomaly (lagged by 1-month) and the sea ice concentration de-seasoned anomaly in the area of the open ocean bloom. Maps of associated p-values mark the areas where the correlation is significant.

Supplementary Figure 6

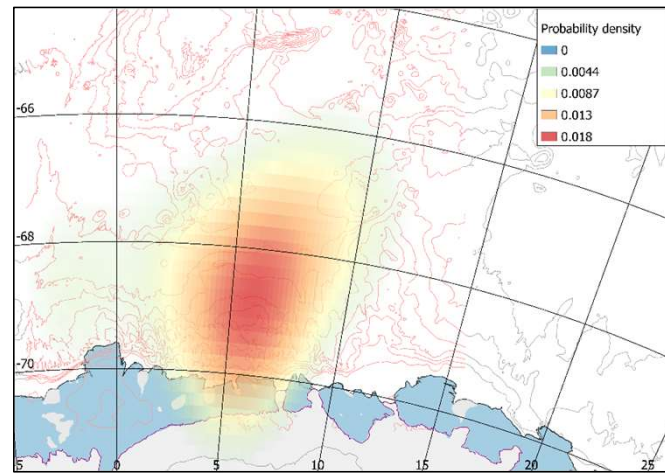

2012

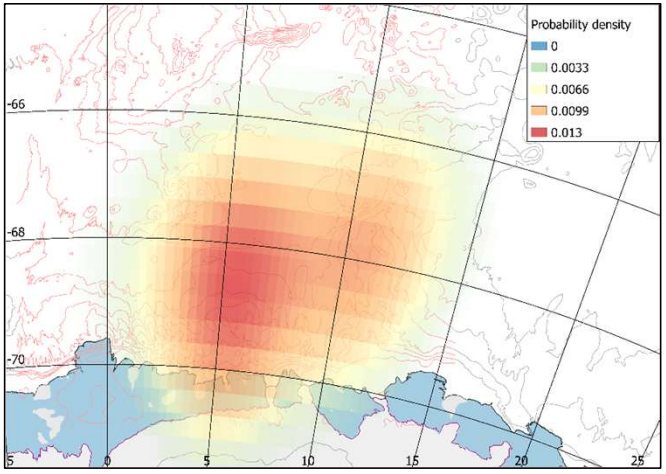

2013

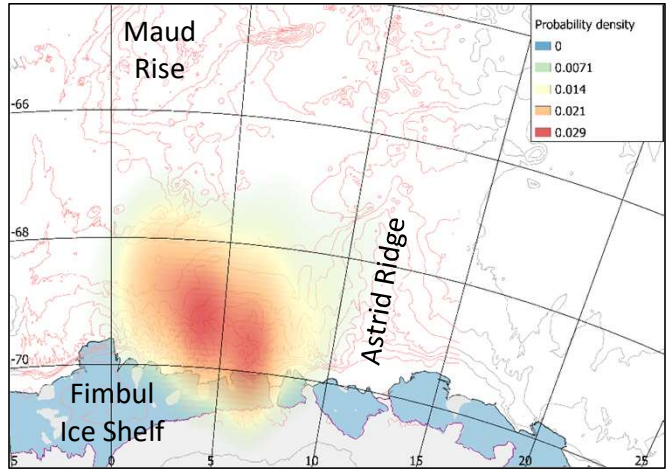

2014

2016

2018

Supplementary Figure 6: Svarthamaren Antarctic petrels' distribution at sea during summer and fall. Heat map of the utilization distribution, (i.e., the probability density that an animal is found at a point according to its geographical coordinates) of Svarthamaren Antarctic petrels during January/February 2012, 2013, 2014, 2016 and 2018.

Supplementary Table 1: Demographic properties of *E. superba* in two trawl catches within the bloom area (Station 4410: 6.72°E, -68.65°S, 35-67 m depth and Station 4412: 3.59°E, -68.21°S, 36-98 m depth). Proportions (%) of sexual maturity stages, sex ratio average lengths.

<b>Station</b>	<b>4410</b>	<b>4412</b>
<b>Juveniles %</b>	3.9	6.5
<b>Male subadult %</b>	39.9	13.6
<b>Male adult %</b>	45.8	19.5
<b>Female subadult %</b>	2.0	21.4
<b>Female adult %</b>	8.5	39.0
<b>Sex ratio (M:F)</b>	8:1	1:2
<b>Average length (mm +/-SD)</b>	52.1 +/-3.3	49.9 +/- 5.1
