

Supplementary material 2

Step-by-step diagram of the data analysis process.

The open coding was initially conducted with two interviews by OBM and CB, followed by a discussion of their initial codes. Then, they independently coded another interview, followed again by a discussion. Two more interviews were independently coded by the two independent coders, and after agreeing and reaching consensus on the coding system, OBM proceeded to code the remaining interviews (n=6; focused and theoretical coding). Next, OBM and CB discussed the emerging findings and potential interactions. Lastly, they presented an overview of the preliminary results to two independent researchers not involved in

the interviews (EV and JS). Codes, categories, and divergences were discussed and compared until the categories of interest were agreed upon for analysis.

Subsequently, the structure of the analysis results was developed with a description of the main core concepts.
