Rhodium(I) Oxygen Adduct as a Selective Catalyst for One-Pot Sequential Alkyne Dimerization-HydrothiolationTandem Reactions

George Kleinhans,[a] Gregorio Guisado-Barrios,[b*] David C. Liles,[a] Guy Bertrand[c] and Daniela I. Bezuidenhout[a*]

An air-stable rhodium(I)-oxygen adduct featuring a CNC-pincer ligand, based on 1,2,3-triazol-5-ylidenes, catalyzes the homo-dimerization and hydrothiolation of alkynes, affording the *gem*-enyne and α-vinyl sulfide isomers, respectively, with excellent selectivity. A one-pot stepwise strategy allows the selective catalytic preparation of non-symmetric bis-vinyl sulfides, as well as the alkyne dimerization-hydrothiolation tandem reaction.

The structural motifs of conjugated enynes[1] and vinyl sulfides[2] render these organic compounds valuable fine chemicals, resulting to their use in a myriad of applications. Enynes and vinyl sulfides are accessible through alkyne functionalization strategies,[3] with catalysts developed to this end for increased atom-economy and milder reaction conditions.[4] However, chemo-, regio-, and stereoselective control remains a major challenge in both alkyne dimerization and alkyne hydrothiolation catalysis. Consequently, examples regarding selective preparation of *E*-,[5] *Z*-,[6] and particularly *gem*-enynes[7] (Figure 1a) during catalytic alkyne dimerization reactions are scarce. The same applies to the alkyne hydrothiolation reactions; β-*E*-[8] and β-*Z*-[9] and especially the more valuable[10] α-vinylsulfides[11] (Figure 1b). Herein we disclose the synthesis and catalytic activity of two air stable Rh(I) oxygen adducts, which are very active and highly selective towards both the dimerization and hydrothiolation of alkynes, yielding *gem*-enynes and α-vinyl sulfides, respectively. Moreover a combination of these two processes in one-pot allows for the preparation of *gem*-ene-β-*E*-vinyl sulfides using a single catalyst at low catalyst loading.

We recently reported an anionic CNC-pincer ligand, featuring

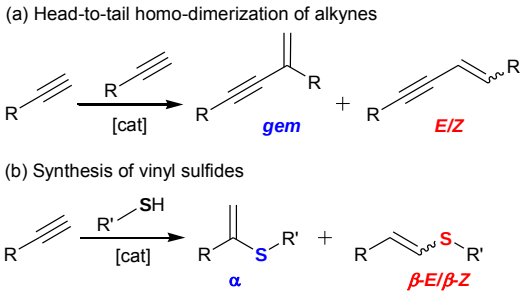

Fig. 1 Previously reported products of (a) alkyne dimerization and (b) alkyne hydrothiolation.

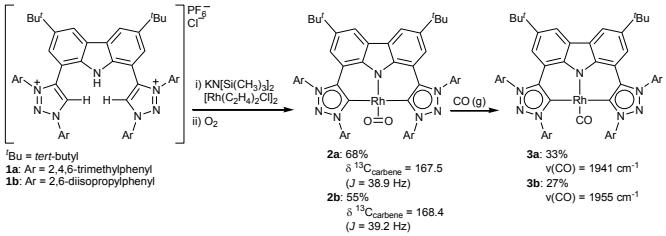
an amido- and two strong sigma-donating 1,2,3-triazol-5-ylidene moieties,[12] for the stabilization of reactive transition metal complexes.[13] It was reasoned that the unique characteristics of the ligand could yield a metal catalyst that exerts both steric and electronic control over the site of attack on an incoming substrate.

Treatment of the cationic ligand precursors, **1a**[14] and **1b**,[13] with excess base (5 eq. KHMDS) in the presence of $[Rh(C_2H_4)_2Cl]_2$ in THF at -78 °C yielded complexes **2a-b** in 68 and 55% yield respectively, after exposure to oxygen (Scheme 1).[14] ^{1}H and ^{13}C NMR spectroscopy as well as mass spectrometry and elemental analysis confirmed the formation of the target complexes. Crystals of **2b** suitable for X-ray diffraction analysis were obtained by slow evaporation of a toluene solution (Figure 2). The molecular structure displays a square planar geometry around the rhodium(I) metal center,



Scheme 1 Preparation of rhodium(I) CNC-pincer complexes **2** and **3**[14]

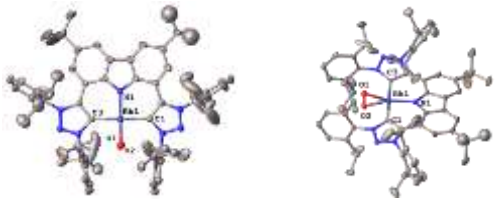

Fig. 2 Frontal (left) and side-on (right) views of crystal structure of **2b**. Selected bond lengths (Å): Rh1–O1, 1.974(3); Rh1–O2, 1.979(3); O1–O2, 1.375(4); Rh1–N1, 1.985(4); Rh1–C1, 2.037(4); Rh1–C3, 2.035(4).

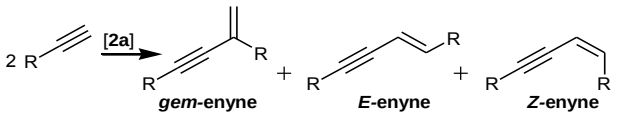
with molecular oxygen coordinating in a side-on fashion, similar to previously reported rhodium(I) carbene complexes.[15] To gain insight into the electronic properties of the complexes, carbon monoxide gas was bubbled through a hexane solution of **2a**, or a dichloromethane solution of **2b**, yielding the corresponding carbonyl complexes, **3a** and **3b**, respectively. The carbonyl stretching frequencies are of low energy (1941 and 1955 cm^{-1}, respectively), suggesting that the ligands have strong donor characteristics, although weaker than the NHC analogue (*bimca)* (1921 cm^{-1}).[16]

The catalytic activity of both **2a** and **2b** towards the alkyne homo-dimerization and hydrothiolation was investigated. 1-hexyne was used as the model substrate for the optimization of the dimerization reaction conditions (see SI, Table S1). The mesityl-substituted complex **2a** catalyzed the dimerization of 1-hexyne yielding the *gem*-enyne isomer exclusively, exhibiting complete conversion in less than an hour at 1 mol % catalyst loading and 80 °C. On the contrary, **2b**, featuring diarylated triazolylidenes with bulkier 2,6-diisopropylphenyl substituents around the metal center, was found to be inactive. Gratifyingly, **2a** displayed a high functional group tolerance whilst retaining the high selectivity (Table 1). More importantly, the catalyst mediates the reaction without the use of base, or additive pyridine acting as a directing co-ligand, in addition to being stable towards atmospheric conditions.[7-9] Based on the mechanistic investigations by the group or Oro *et al.*,[4b] it can be surmised that during the alkyne dimerization reaction, the molecular oxygen is substituted by the alkyne substrate, followed by the oxidative addition of the alkyne C-H to yield the Rh(III)-hydrido-alkynyl intermediate (SI, Scheme S2). Due to the exclusive yield of the geminal enyne isomer, only two of the possible four reaction pathways need to be considered. The first is a 2,1-insertion across the M-H bond, while the second involves a 1,2-insertion across the M-C bond. Both pathways subsequently yield the *gem*-enyne isomer after reductive elimination, and substitution by another alkyne substrate.

For alkyne hydrothiolation, reaction conditions were optimized using the hydrothiolation of 1-hexyne with thiophenol (see SI, Table S2). Both catalysts **2a-b** yielded the α-vinyl sulfide with more than 90% selectivity at 1 mol% catalyst loading and 80 °C (no additive required). Again, **2a** displayed higher catalytic

Table 1 Homo-dimerization of terminal alkynes[a]



Entry	Substrate	t(h)	conv.[b] (Yield[c])	gem/E/Z

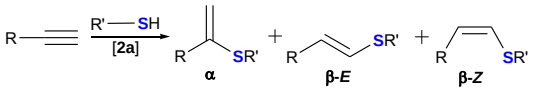
activity compared to **2b**. The catalytic activity of **2a** using in various terminal alkynes with a range of thiols is summarized Table 2. Excellent selectivity towards the α-vinyl sulfide isomer was demonstrated during the hydrothiolation of aliphatic alkynes with aliphatic thiols, and is comparable to the best catalysts reported to date.[11] Lower activities and selectivities were observed when both an alkyne or thiol with aryl substituent as substrate, were used, similar to previous reports.[11a]

Table 2 Terminal alkyne hydrothiolation[a]



Entry	Alkyne	Thiol	t(h)	conv.[b] (Yield[c,d])	α/β-*E*/β-*Z*

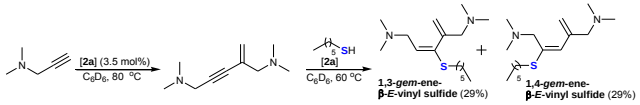
2			9		> 99		38		59 (50)

[a]Reaction performed in 0.5 mL C_6D_6, with 2 mol % of **2a** and 1,4-di-*tert*-butylbenzene as internal standard. [b]NMR calculated overall yield (%).

For alkyne hydrothiolation, a plausible reaction mechanism (see SI, Scheme S2) involves substitution of the coordinated oxygen by a thiol to yield the active starting intermediate. This is followed by S-H oxidative addition, resulting to the formation of the rhodium(III)-hydrido-thiolate complex intermediate. Alkyne coordination occurs *trans* to the hydride ligand, resulting to a *cis* disposition of the alkyne to the thiolate. The α-vinyl sulfide isomer is obtained as the major product of the reaction, which means that, according to the mechanistic studies done by Oro and co-workers,[7c] a 1,2-M-S insertion is the only pathway that can ensue. A 2,1-M-S-insertion will yield β-*E*-vinyl sulfides. After reductive elimination and re-coordination, the α-vinyl sulfide isomer is obtained, as well as the active starting intermediate. Notably, since no dimerization product is observed during the hydrothiolation reaction employing **2a**-**b** it could be concluded that thiol S-H addition across the metal center is more favorable than alkyne C-H addition.

Encouraged by this observation, it was decided to explore the possibility of preparing non-symmetrical bis-α,α'-vinyl sulfides using **2a** as a single catalyst by a sequential bis-hydrothiolation of two different alkynes with dithiols (Table 3). Therefore, 1 equivalent of alkyne was treated with a dithiol in the presence of **2a**, exclusively yielding the mono α-vinyl sulfide. A different alkyne was added to the same reaction mixture, without attempts to exclude air and moisture. Upon completion of the reaction, non-symmetrical bis-α,α'-vinyl sulfides were obtained with high selectivity (Entry 1, Table 3). Dithiols have been previously employed in bis-hydrothiolation of alkynes, albeit only symmetrical bis-α,α-vinyl sulfides were obtained due to addition of 2 equivalents of the same alkyne.[8b,9b,11c,17] As is evident from Table 3, terminal alkynes give rise to bis-α-vinyl sulfides upon hydrothiolation, while the use of an internal alkyne yields the β-*E*-vinyl sulfide (Entry 2, Table 3).

These results prompted us to use **2a** for a one-pot sequential dimerization and hydrothiolation tandem reaction. After alkyne dimerization of dimethylaminopropyne, 1-hexanethiol was added to the reaction mixture under atmospheric conditions. *Syn*-addition of the thiol occurred across the internal alkyne, resulting in the formation of the 1,3- and 1,4-*gem*-ene-β-*E*-vinyl sulfides as the major products (Scheme 2). The two products are evenly distributed, leading to the conclusion that discrimination between the sites of attack across the internal alkyne is not possible. The formation of the by-product 1,4-*gem*-ene-β-*Z*-vinyl sulfide (see SI) presumably occurs as the result of isomerization, as repeating the reaction at higher temperatures, and analysis of the reaction mixture over prolonged periods, result in an increase of the *Z*-isomer yield. The geminal alkene was not affected by the thiol during the reaction. Such a cascade reaction has, to the best of our knowledge, not been reported to date. A few reports describe the hydrothiolation of a pre-prepared enyne, but with diminished selectivity for a specific isomer.[8a,11c,18] In addition, the reported enynes featured terminal alkynes and not the more challenging internal alkyne.



Scheme 2 Sequential alkyne dimerization and hydrothiolation catalyzed by **2a**

Both the non-symmetrical bis-hydrothiolation reaction (Table 3, Entry 1) and the tandem alkyne dimerization-hydrothiolation reaction (Scheme 2) could be scaled up tenfold to illustrate the application of these catalytic processes under preparative conditions (SI, Sections S8 and S10).

In summary, we have developed an air-stable rhodium(I) CNC-pincer complex that selectively catalyzes both atom economical alkyne dimerization and alkyne hydrothiolation reactions. 1,3-enynes and α-vinyl sulfides, respectively, were prepared with excellent selectivity. The selectivity was retained during the first examples of bis-hydrothiolation of a dithiol with different alkyne substrates, to yield non-symmetrical bis-α,α'-vinyl sulfides or bis-α,β-*E*-vinyl sulfides,

respectively, as the main product after the second hydrothiolation reaction using a different terminal alkyne or internal alkyne. Moreover, a one-pot catalyzed dimerization and hydrothiolation yielded the *gem*-ene-β-*E*-vinyl sulfide products.

S1. Standard Operating Procedures

a. Method

All synthetic manipulations, unless otherwise stated, were performed under an N_2 gas or Ar gas atmosphere using oven or flame dried glassware and standard Schlenk or vacuum line techniques. Air sensitive solids where stored and handled in a PureLab HE glove box. Preparation of NMR and crystallization samples that also require an inert atmosphere were done in the glove box.

b. Materials

Reagent ^{t}BuOCl was prepared according to the method of Mintz and Walling.[i] The precursor compound **3,6-di-*tert*-butyl-1,8-diethynyl-9H-carbazole** and pincer ligand precursor **1b** was prepared as previously reported by us.[ii] **1,3-bis-(2,4,6-trimethylphenyl)triaz-1-ene** was prepared by an adapted procedure, as reported for the synthesis of **1,3-bis-(2,6-di-*iso*-propylphenyl)triaz-1-ene**.[ii] All other reagents were obtained from commercial sources and were used without any further purification.

Unless otherwise stated, only anhydrous solvents were used during experimental procedures. Anhydrous THF and Et_2O were obtained after distillation over sodium and benzophenone under a N_2 gas atmosphere. Anhydrous PhMe and hexane were obtained after distillation over sodium under a N_2 gas atmosphere. Anhydrous CH_2Cl_2 was obtained after distillation over calcium hydride under a N_2 gas atmosphere. Deuterated benzene was dried over sodium and distilled under an Ar gas atmosphere.

c. Characterisation Techniques

Nuclear magnetic resonance (NMR) spectra were obtained using either a Bruker AVANCE-III-300 operating at 300.13 MHz for ^{1}H, 75.47 MHz for ^{13}C, 121.49 MHz for ^{31}P and 282.40 MHz for ^{19}F; or AVANCE-III-400 operating at 400.21 MHz for ^{1}H, 100.64 MHz for ^{13}C, 162.01 MHz for ^{31}P and 376.57 MHz for ^{19}F. ^{1}H Chemical shifts are reported as δ (ppm) values downfield from Me_4Si and chemical shifts where referenced to residual non-deuterated solvents peaks (CD_3CN, 1.94ppm; $CDCl_3$, 7.26ppm; C_6D_6, 7.16ppm). ^{13}C chemical shifts are also reported as δ (ppm) values downfield from Me_4Si and chemical shifts where referenced to residual non-deuterated solvents peaks (CD_3CN, 1.32 ppm; $CDCl_3$, 77.16 ppm; C_6D_6, 128.06 ppm). Proton coupling constants (*J*) are given in Hz. The spectral coupling patterns are

designated as follows: s/S - singlet; d/D - doublet; t/T - triplet; q/Q - quartet; sept-septet; m - multiplet; br - broad signal. Quaternary carbons are designated as $\mathbf{C}_q$.

Chemical shift assignment in the ^{1}H NMR spectra is based on first-order analysis and when required were confirmed by two-dimensional (2D) (^{1}H-^{1}H) homonuclear chemical shift correlation (COSY) experiments. The ^{13}C shifts were obtained from proton-decoupled ^{13}C NMR spectra. Where necessary, the multiplicities of the ^{13}C signals were deduced from proton-decoupled DEPT-135 spectra. The resonances of the proton-bearing carbon atoms were correlated with specific proton resonances using 2D (^{13}C-^{1}H) heteronuclear single-quantum coherence (HSQC) and heteronuclear multiple bond correlations (HMBC) experiments. Standard Bruker pulse programs were used in the experiments.

Single crystal X-ray diffraction data were collected on a Bruker Apex II-CCD detector using Mo-K_α radiation (λ = 0.71073 Å). Crystals were selected under oil, mounted on nylon loops then immediately placed in a cold stream of N_2 at 150 K. Structures were solved and refined using Olex2 and SHELXTL. A satisfactory refinement of the crystal structure of **2a** after squeeze methodology was applied in order to eliminate residual electronic density of the solvent that could be refined otherwise [iii-v]

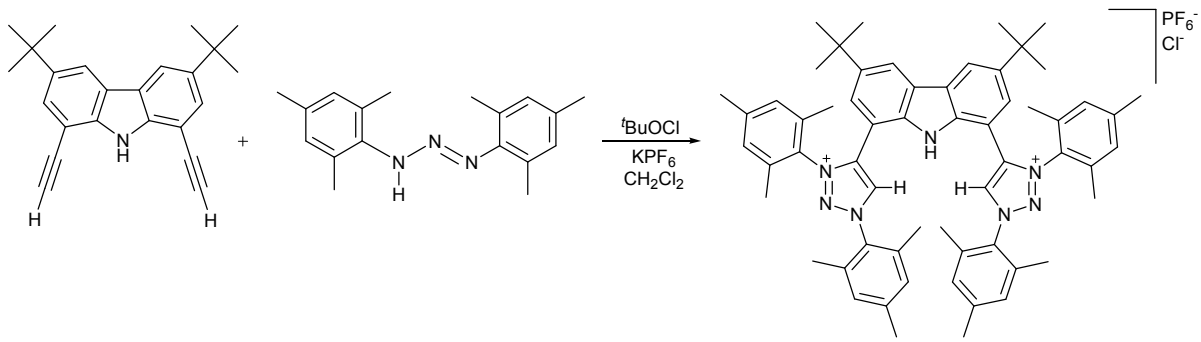
Solution IR spectra (ν(CO)) were recorded on a Perkin-Elmer Spectrum RXI FT-IR spectrophotometer in CH_2Cl_2 as solvent. The range of absorption measured was from 4000-600 cm^{-1}.

Mass spectral analyses were performed on a Waters Synapt G2 HDMS by direct infusion at *5* µL/min with positive electron spray as the ionization technique. The *m/z* values were measured in the range of 400-1500 with acetonitrile as solvent. Prior to analysis, a 5 mM sodium formate solution was used to calibrate the instrument in resolution mode.

Microanalyses (%C, H, N) were performed using a ThermoScientific Flash 2000 elemental analyser. Following extensive drying, analyses of complexes **2** and **3** are outside acceptable limits and are ascribed to the presence of solvent molecules and/or silicon grease. The full ^{1}H and ^{13}C NMR spectra are therefore included in the SI to attest to the purity of the compounds, supported by HRMS, FT-IR and single crystal XRD spectroscopic results.

S2. Synthesis details and characterization

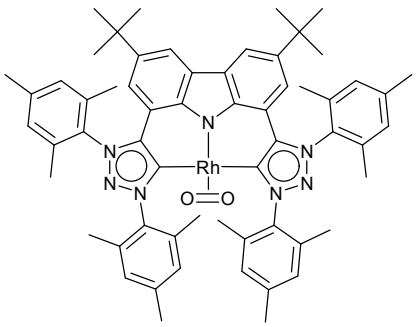
a. Synthesis of 1a



Scheme S1: Synthesis of tridentate CNC pincer ligand precursor **1a**

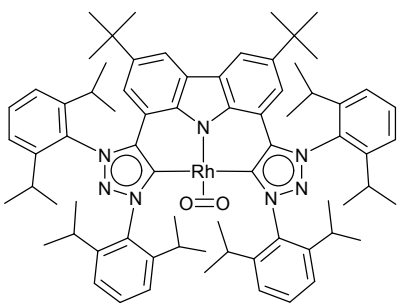
Compound **1a** (Scheme S1) was prepared by a similar method as used for the synthesis of **1b**.[ii] A 500 mL, 3-necked round bottom flask was charged with **3,6-di-*tert*-butyl-1,8-diethynyl-9H-carbazole** (8.00 g, 24.4 mmol), **1,3-bis-(2,4,6-trimethylphenyl)triaz-1-ene** (22.00 g, 78.2 mmol) and potassium hexafluorophosphate (15.24 g, 82.8 mmol). The vessel was purged with N_2(g). The solids were dissolved in dry DCM (250 mL) and the solution was cooled down to -78 °C. To the solution was added *tert*-BuOCl (9.3 mL, 78.2 mmol) in a drop wise manner with subsequent stirring of the solution at -78 °C for two hours. After two hours, the solution was left to slowly warm up to room temperature whilst stirring for 20 hours. The white precipitate was filtered from the brown red solution with subsequent evaporation of the solvent *in vacuo*. Trituration with hexanes followed by Et_2O yielded **1a** as an off-white solid (24.70 g, 23.1 mmol, 95%). Single crystals where obtainable from acetone layered with hexane. For $C_{60}H_{69}N_7ClPF_6$, Anal. Calcd.: C, 67.54; H, 6.51; N, 9.17. Found: C, 67.53; H, 6.56; N, 8.97. ^{1}H NMR (300 MHz, CD_3CN) δ 11.51 (br s, 1H, N**H**$_{carb}$), 10.06 (s, 2H, Ar**H**$_{Triazolium}$), 8.42 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 7.23 (br s, 4H, Ar**H**$_{Mes}$), 7.19 (br s, 4H, Ar**H**$_{Mes}$), 7.08 (d, *J* = 1.5 Hz, 2H, Ar**H**$_{carb}$), 2.46 (s, 6H, ArC**H₃**), 2.36 (s, 6H, ArC**H₃**), 2.26 (s, 12H, ArC**H₃**), 2.08 (s, 12H, ArC**H₃**), 1.16 (s, 18H, C(C**H₃**)$_3$). ^{13}C NMR (75 MHz, CD_3CN) δ 145.3 (Ar**C**$_q$), 144.5 (Ar**C**$_q$), 144.2 (Ar**C**$_q$), 142.3 (Ar**C**$_q$), 138.7 (Ar**C**$_q$), 136.1 (Ar**C**$_q$), 135.9 (Ar**C**$_q$), 133.6 (Ar**C**$_q$), 132.5 (Ar**C**$_q$), 131.3 (Ar**C**H), 130.9 (Ar**C**H), 127.2 (Ar**C**$_q$), 125.9 (Ar**C**H), 122.5 (Ar**C**H), 106.9 (Ar**C**$_q$), 35.4 (**C**(CH₃)₃), 31.5 (C(**C**H₃)₃), 21.4 (Ar**C**H₃), 21.2 (Ar**C**H₃), 18.1 (Ar**C**H₃), 18.1 (Ar**C**H₃). ^{19}F NMR (282 MHz, CD_3CN) δ -72.90 (d, *J* = 706.0 Hz, P**F₆**). ^{31}P NMR (121 MHz, CD_3CN) δ -144.6 (sept, *J* = 706.5 Hz, **P**F₆). HRMS (FIA-ESI): Calculated for $C_{60}H_{69}N_7^{2+}$ $[M]^{2+}$: 443.7802, found: 443.7835.

b. Synthesis of 2a



A flame dried Schlenk tube was charged with **1a** (200.0 mg, 1.9 x 10^{-4} mol), $[Rh(C_2H_4)_2Cl]_2$ (58.2 mg, 1.5 x 10^{-4} mol) and $KN[Si(CH_3)_3]_2$ (186.7 mg, 9.4 x 10^{-4} mol). The reaction vessel was evacuated, purged with N_2 (g), and cooled down to -78 °C. The solids were dissolved by addition of THF (20 mL) which was also cooled down to -78 °C. The solution was stirred for one hour at -78 °C. After one hour, the reaction was slowly heated up to RT whilst stirring overnight. The solvent was evaporated *in vacuo* and the product was extracted with hexanes (4 x 15 mL). Hexane was evaporated, *in vacuo*, yielding a brown residue. The residue was re-dissolved in oxygenated dry toluene, and left to settle at RT for 48 hours. After 48 hours, the solvent was evaporated *in vacuo* to obtain **2a** (130.0 mg, 1.3 x 10^{-4}mol, 68 %) as a brown solid. Crystal suitable for X-ray diffraction could not be obtained. For $RhC_{60}H_{66}N_7O_2$, Anal. Calcd.: C, 70.64; H, 6.52; N, 9.61. Found: C, 68.52; H, 6.42; N, 9.01. ^{1}H NMR (300 MHz, C_6D_6) δ 8.55 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 7.55 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 6.78 (s, 4H, Ar**H**$_{Mes}$), 6.71 (s, 4H, Ar**H**$_{Mes}$), 2.43 (s, 12H, ArC**H**$_3$), 2.34 (s, 6H, ArC**H**$_3$), 2.08 (s, 6H, ArC**H**$_3$), 1.77 (s, 12H, ArC**H**$_3$), 1.25 (s, 18H, C(C**H**$_3$)$_3$). ^{13}C NMR (75 MHz, C_6D_6) δ 167.5 (d, *J* = 39.0 Hz, Rh-**C**$_{Carbene}$), 144.4 (Ar**C**$_q$), 141.1 (Ar**C**$_q$), 140.8 (Ar**C**$_q$), 140.4 (Ar**C**$_q$), 138.3 (Ar**C**$_q$), 137.2 (Ar**C**$_q$), 135.7 (Ar**C**$_q$), 135.7 (Ar**C**$_q$), 134.9 (Ar**C**$_q$), 130.0 (Ar**C**H), 127.2 (Ar**C**H), 118.1 (Ar**C**H), 116.4 (Ar**C**H), 113.9 (Ar**C**$_q$), 113.9 (Ar**C**$_q$), 34.7 (**C**(CH$_3$)$_3$), 31.9 (C(**C**H$_3$)$_3$), 21.4 (Ar**C**H$_3$), 21.3 (Ar**C**H$_3$), 21.0 (Ar**C**H$_3$), 21.0 (Ar**C**H$_3$), 18.4 (Ar**C**H$_3$), 18.4 (Ar**C**H$_3$), 17.2 (Ar**C**H$_3$), 17.2 (Ar**C**H$_3$). HRMS (FIA-ESI): Calculated for $C_{60}H_{66}N_7RhO_2^{2+}$ [M + CH_3CN + 2H]$^{2+}$: 531.2377, found: 531.2393.

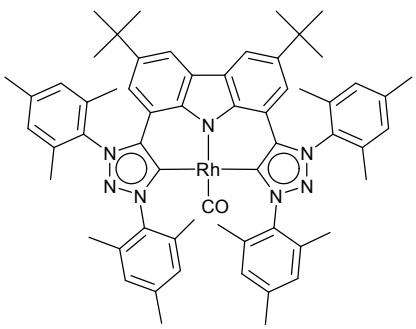
c. Synthesis of 2b



A flame dried Schlenk tube was loaded with **1b**[ii] (200.0 mg, 1.6 x 10^{-4} mol), $[Rh(C_2H_4)_2Cl]_2$ (50.3 mg, 1.3 x 10^{-4} mol) and $KN[Si(CH_3)_3]_2$ (161.3 mg, 8.1 x 10^{-4} mol). The Schlenk tube was evacuated and purged with N_2 (g). The reaction vessel was cooled down to -78 °C, and the solids dissolved by addition of THF (20 mL) which was also cooled down to -78 °C. The solution was stirred for one hour at -78 °C. The reaction, after one hour, was slowly heated up to RT whilst stirring overnight. The solvents were evaporated *in vacuo* and the product was extracted with hexanes (4 x 15 mL). Evaporation of the hexane solvent, *in vacuo*, yielded a brown residue. The residue was re-dissolved in oxygenated dry toluene, and

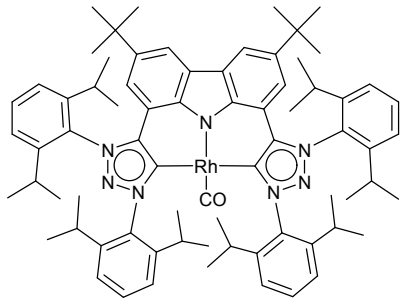
left to settle at RT for 48 hours. After 48 hours, the solvent was evaporated *in vacuo* to obtain **2b** (105.0 mg, 8.8 x 10^{-5} mol, 55%) as a brown solid. Slow evaporation of a toluene solution yielded single crystals suitable for XRD analysis. For $RhC_{72}H_{90}N_7O_2$, Anal. Calcd.: C, 72.77; H, 6.53; N, 8.25. Found: C, 71.65; H, 7.40; N, 7.76. ^{1}H NMR (400 MHz, C_6D_6) δ 8.40 (d, *J* = 2.0 Hz, 2H, Ar**H**$_{carb}$), 7.49 (d, *J* = 2.0 Hz, 2H, Ar**H**$_{carb}$), 7.34 (t, *J* = 7.8 Hz, 2H, Ar**H**$_{Dipp}$), 7.30 (t, *J* = 7.8 Hz, 2H, Ar**H**$_{Dipp}$), 7.16 (d, 4H, Ar**H**$_{Dipp}$ overlaps with C_6D_6), 7.13 (d, *J* = 8.0 Hz, 4H, Ar**H**$_{Dipp}$), 2.98 (sept, *J* = 6.8 Hz, 4H, C**H**(CH$_3$)$_2$), 2.66 (sept, *J* = 6.8 Hz, 4H, C**H**(CH$_3$)$_2$), 1.65 (d, *J* = 6.8 Hz, 12H, CH(C**H**$_3$)$_2$), 1.23 (d, *J* = 7.2 Hz, 12H, CH(C**H**$_3$)$_2$), 1.21 (s, 18H, C(C**H**$_3$)$_3$), 1.05 (d, *J* = 6.8 Hz, 12H, CH(C**H**$_3$)$_2$), 0.78 (d, *J* = 6.8 Hz, 12H, CH(C**H**$_3$)$_2$). ^{13}C NMR (100 MHz, C_6D_6) δ 168.4 (d, *J* = 39.2 Hz, Rh-**C**$_{Carbene}$), 146.3 (Ar**C**$_q$), 145.4 (Ar**C**$_q$), 144.4 (Ar**C**$_q$), 141.6 (Ar**C**$_q$), 140.6 (Ar**C**$_q$), 137.5 (Ar**C**$_q$), 135.3 (Ar**C**$_q$), 131.7 (Ar**C**H), 129.1 (Ar**C**H), 125.5 (Ar**C**H), 121.6 (Ar**C**H), 119.6 (Ar**C**H), 116.7 (Ar**C**H), 113.2 (Ar**C**$_q$), 34.6 (**C**(CH$_3$)$_3$), 32.0 (C(**C**H$_3$)$_3$), 29.6 (**C**H(CH$_3$)$_2$), 29.1 (**C**H(CH$_3$)$_2$), 26.0 (CH(**C**H$_3$)$_2$), 24.8 (CH(**C**H$_3$)$_2$), 24.3 (CH(**C**H$_3$)$_2$), 23.2 (CH(**C**H$_3$)$_2$). HRMS (FIA-ESI): Calculated for $C_{72}H_{90}N_7RhO_2^{2+}$ $[M]^{2+}$: 593.8105, found: 593.8127.

d. Synthesis of 3a



To a flame dried Schlenk tube was added **2a** (25.0 mg, 2.5 x 10^{-5} mol). The reaction vessel was purged with N_2 (g). The brown solid was dissolved by adding hexane (5 mL). Carbon monoxide gas was bubbled through the solution for 5 minutes, resulting in a colour change from dark to orange. After filtration, the solvent was removed *in vacuo*, yielding **3a** (8.3 mg, 8.2 x 10^{-6} mol, 33%) as an orange solid. For $RhC_{61}H_{66}N_7O$, Anal. Calcd.: C, 72.10; H, 6.55; N, 9.65. Found: C, 70.37; H, 6.71; N, 9.15. ^{1}H NMR (300 MHz, C_6D_6) δ 8.67 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 7.42 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 6.84 (s, 4H, Ar**H**$_{Mes}$), 6.73 (s, 4H, Ar**H**$_{Mes}$), 2.40 (s, 12H, ArC**H**$_3$), 2.31 (s, 6H, ArC**H**$_3$), 2.09 (s, 6H, ArC**H**$_3$), 1.78 (s, 12H, ArC**H**$_3$), 1.30 (s, 18H, C(C**H**$_3$)$_3$). ^{13}C NMR (75 MHz, C_6D_6) δ 194.9 (d, *J* = 71.6 Hz, Rh-**C**O), 173.4 (d, *J* = 41.1 Hz, Rh-**C**$_{Carbene}$), 144.9 (Ar**C**$_q$), 141.3 (Ar**C**$_q$), 140.6 (Ar**C**$_q$), 139.1 (Ar**C**$_q$), 138.3 (Ar**C**$_q$), 138.0 (Ar**C**$_q$), 136.1 (Ar**C**$_q$), 135.7 (Ar**C**$_q$), 135.6 (Ar**C**$_q$), 129.9 (Ar**C**H), 129.0 (Ar**C**H), 127.1 (Ar**C**$_q$), 117.9 (Ar**C**H), 116.9 (Ar**C**H), 112.7 (Ar**C**$_q$), 34.6 (**C**(CH$_3$)$_3$), 32.1 (C(**C**H$_3$)$_3$), 21.5 (Ar**C**H$_3$), 21.0 (Ar**C**H$_3$), 18.7 (Ar**C**H$_3$), 17.3 (Ar**C**H$_3$). IR (ν_{CO}, CH_2Cl_2): 1941 cm^{-1}. HRMS (FIA-ESI): Calculated for $C_{60}H_{66}N_7RhCO^+$ $[M]^+$: 1015.4384, found: 1015.4407.

e. Synthesis of 3b



To a Schlenk tube was added **2b** (30.0 mg, 2.5 x 10^{-5} mol), and dissolved by adding CH_2Cl_2 (2 mL) resulting in a brown coloured solution. At room temperature, CO (g) was bubbled through the solution resulting in a colour change from brown to a yellow-brown. The solution was filtered and the solvent removed *in vacuo* yielding **3b** (8.0 mg, 6.8 x 10^{-6} mol, 27%) as a yellow-brown coloured residue. For $RhC_{73}H_{90}N_7O$, Anal. Calcd.: C, 74.02; H, 7.66; N, 8.28. Found: C, 71.87; H, 7.51; N, 7.87. ^{1}H NMR (300 MHz, C_6D_6) δ 8.52 (d, *J* = 1.8 Hz, 2H, Ar**H**$_{carb}$), 7.64 (dd, *J* = 5.7 Hz, 3.3 Hz, 1H, Ar**H**$_{Dipp}$), 7.46 (d, *J* = 1.5 Hz, 2H, Ar**H**$_{carb}$), 7.31 – 7.25 (m, 6H, Ar**H**$_{Dipp}$), 6.93 (dd, *J* = 5.7 Hz, 3.3 Hz, 1H, Ar**H**$_{Dipp}$), 3.04 (sept, *J* = 6.8 Hz, 4H, C**H**$(CH_3)_2$), 2.62 (sept, *J* = 6.8 Hz, 4H, C**H**$(CH_3)_2$), 1.55 (d, *J* = 6.9 Hz, 12H, CH(C**H**$_3)_2$), 1.25 (s, 18H, C(C**H**$_3)_3$), 1.16 (d, *J* = 6.9 Hz, 12H, CH(C**H**$_3)_2$), 1.04 (d, *J* = 6.9 Hz, 12H, CH(C**H**$_3)_2$), 0.78 (d, *J* = 6.9 Hz, 12H, CH(C**H**$_3)_2$). ^{13}C NMR (75 MHz, C_6D_6) δ 195.4 (d, *J* = 70.2 Hz, Rh-**C**O), 173.4 (d, *J* = 41.6 Hz, Rh-**C**$_{Carbene}$), 146.3 (Ar**C**$_q$), 146.1 (Ar**C**$_q$), 144.4 (Ar**C**$_q$), 142.7 (Ar**C**$_q$), 138.2 (Ar**C**$_q$), 137.6 (Ar**C**$_q$), 135.7 (Ar**C**$_q$), 133.4 (Ar**C**$_q$), 131.5 (Ar**C**H), 130.9 (Ar**C**H), 130.8 (Ar**C**H), 129.1 (Ar**C**H), 127.2 (Ar**C**$_q$), 125.4 (Ar**C**H), 124.1 (Ar**C**H), 119.0 (Ar**C**H), 117.1 (Ar**C**H), 111.8 (Ar**C**$_q$), 34.5 (**C**$(CH_3)_3$), 32.3 (C(**C**H$_3)_3$), 29.3 (**C**H$(CH_3)_2$), 29.1 (**C**H$(CH_3)_2$), 25.6 (CH(**C**H$_3)_2$), 24.8 (CH(**C**H$_3)_2$), 24.2 (CH(**C**H$_3)_2$), 23.1 (CH(**C**H$_3)_2$). IR (ν_{CO}, CH_2Cl_2): 1955 cm^{-1}. HRMS (FIA-ESI): Calculated for $C_{72}H_{90}N_7RhCO^{2+}$ $[M + H]^{2+}$: 592.8204, found: 592.8197.

S4. Catalytic Dimerization Details

a. Optimisation of Catalytic Dimerization of 1-hexyne to (*gem*)-7-methylene-undec-5-yne

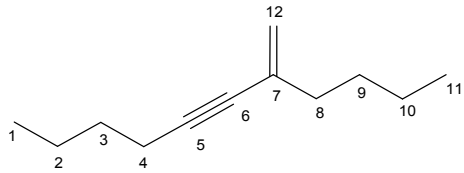
Standard operating procedure for dimerization reactions: a high pressure NMR tube with a J. Young valve was charged with one mol % catalyst **2a** (3.6 mg, 3.5 x 10^{-6} mol) or one mol % catalyst **2b** (4.1 mg, 3.5 x 10^{-6} mol) and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene (16.6 mg, 8.7 x 10^{-5} mol). Catalytic amount of base was added as indicated in Table S1. To the mixture was added deuterated benzene (0.5 mL). One equivalent of 1-hexyne (40 µL, 3.5 x 10^{-4} mol) was added, and the NMR tube capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the alkyne. The reaction mixture was heated up to appropriate temperature and reacted for the duration as indicated (see Table S1). Upon cooling down to room temperature, ^{1}H NMR spectroscopy was performed at the final time. Conversion and calculated yields where determined from NMR analysis based on integration of alkyne and product, referenced to the internal standard. Product identity was confirmed by comparison with previously reported NMR spectra.[vi]

Table S1. 1-hexyne dimerization promoted by **2**.[a]

Entry	Catalyst	Base (mol %)	T (°C)	t (h)	Conversion[b] (%)	Yield[c] (%)	Product distribution		
							Gem-enyne	*E*-enyne	*Z*-enyne
1	**2a**	K_2CO_3 (1)	80	> 1	> 99	99	100	-	-
2	**2a**	K_2CO_3 (1)	40	> 1	6	4	100	-	-
3	**2a**	KO^{t}Bu (1)	80	> 1	> 99	99	100	-	-
4	**2a**	Pyridine (3)	80	> 1	88	88	100	-	-
5	**2b**	K_2CO_3 (1)	80	> 1	0	0	-	-	-
6	**2b**	K_2CO_3 (1)	80	20	9	3	100	-	-
7	**2a**	None	80	> 1	> 99	99	100	-	-

[a]Reaction performed in C_6D_6 (0.5 mL) with internal standard 1,4-di-*tert*-butylbenzene, 1 mol % catalyst (3.5 x 10^{-6} mol) and 3.5 x 10^{-4} mol 1-hexyne.
[b]Conversion as determined through NMR integration based on 1-hexyne referenced to 1,4-di-*tert*-butylbenzene.
[c]Yield as determined from NMR integration based on 1-hexyne.

7-methylene-undec-5-yne



^{1}H NMR (300 MHz, C_6D_6) δ 5.38 (d, *J* = 2.1 Hz, 1H, C=C**H**$_2$), 5.09 (m, 1H, C=C**H**$_2$), 2.16 (m, 8H, **H**$_{4,8}$), 1.59 (tt, *J* = 7.2 Hz, 7.5 Hz, 7.8 Hz, 2H, **H**$_9$), 1.43 - 1.23 (m, 6H, **H**$_{2,3,10}$ overlaps with -C(C**H**$_3$)$_3$ of di-*tert*-butylbenzene), 0.86 and 0.78 (both t, *J* = 7.2 Hz, 6H, **H**$_{1,11}$).

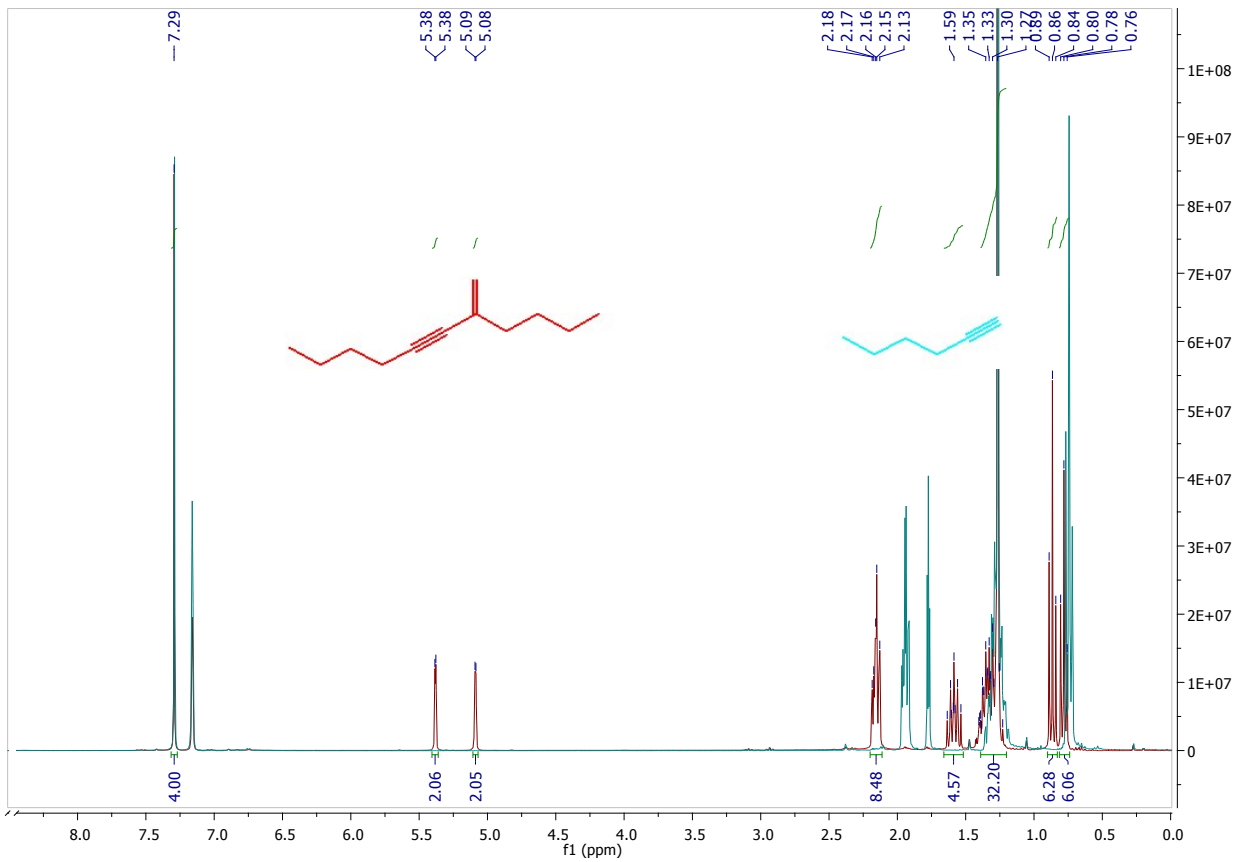


Figure S9. Catalytic dimerization reaction of 1-hexyne (blue) to (gem)-7-methylene-undec-5-yne (red) at time 10 min (blue spectrum) and at time after reaction (red spectrum).

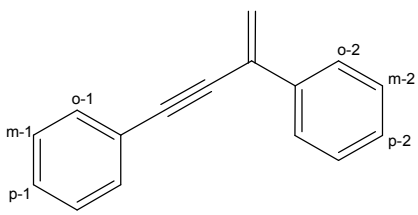
b. Catalytic Dimerization of terminal alkynes to *gem*-enynes catalyzed by 2a

Standard operating procedure for dimerization reactions: a high pressure NMR tube with a J. Young valve was loaded with one mol % catalyst **2a** and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene. To the mixture was added deuterated benzene (0.5 mL). One equivalent of terminal alkyne was added, and the NMR tube capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the alkyne. The reaction mixture was heated up to 80 °C and reacted for the duration as indicated (see Article, Table 1). Upon cooling down to room temperature, ^{1}H NMR spectroscopy was performed at the final time. Conversion and calculated yields where determined from NMR analysis based on integration of alkyne and product, referenced to the internal standard.

Entry 2, Table 1: Dimerization of Phenylacetylene

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (3.7 mg, 3.6 x 10^{-6} mol); internal standard 0.25 equivalent (17.3 mg, 9.1 x 10^{-5} mol) and one equivalent phenylacetylene (40 μL, 3.6 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra.[vi]

1,3-diphenylbut-1-yn-3-ene

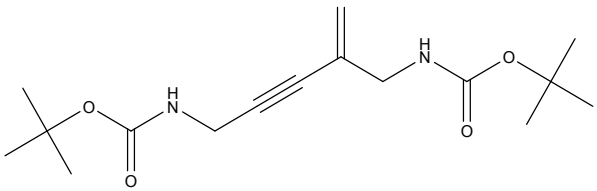


^{1}H NMR (300 MHz, C_6D_6) δ 7.77 - 7.68 (m, 2H, $\mathbf{H}_{o\text{-}1}$), 7.54 - 7.38 (m, 2H, $\mathbf{H}_{o\text{-}2}$, extensive overlap with unreacted phenylacetylene, *E*-enyne, internal standard and residual solvent), 7.09 - 6.87 (m, 6H, $\mathbf{H}_m$ and H_p, extensive overlap with unreacted phenylacetylene, *E*-enyne and internal standard), 5.75 (d, *J* = 0.8 Hz, 1H, C=C$\mathbf{H}_2$), 5.70 (d, *J* = 0.7 Hz, 1H, C=C$\mathbf{H}_2$).

Entry 3, Table 1: Dimerization of *N*-Boc-Propargylamine

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (2.6 mg, 2.6 x 10^{-6} mol); internal standard 0.25 equivalent (12.3 mg, 6.4 x 10^{-5} mol) and one equivalent *N*-Boc-propargylamine (40 mg, 2.6 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra.[vii]

N,N-bis(tert-butyloxycarbonyl)-4-methylenepent-2-yne

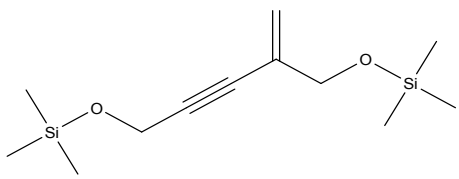


^{1}H NMR (300 MHz, C_6D_6) δ 5.26 (br s, 1H, C=C**H**$_2$), 5.15 (d, *J* = 1 Hz, 1H, C=C**H**$_2$), 4.57 (br s, 2H, CH_2N**H**), 3.82 (d, *J* = 2.8 Hz, 2H, C**H**$_2$NH), 3.66 (d, *J* = 5.3 Hz, 2H, C**H**$_2$NH), 1.42 (s, 9H,-C(C**H**$_3$)$_3$), 1.39 (s, 9H,-C(C**H**$_3$)$_3$).

Entry 4, Table 1: Dimerization of trimethylsilyloxypropyne

Experiments were carried out as described above. Amounts of reagents added are as follows:1 mol % (3.3 mg, 3.3 x 10^{-6} mol); internal standard 0.25 equivalent (15.5 mg, 8.1 x 10^{-5} mol) and one equivalent trimethylsilyloxypropyne (50 µL, 3.3 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra.[viii]

2-trimethylsiloxymethyl-4-trimethylsiloxy-1-penten-3-yne

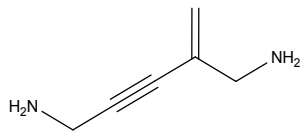


^{1}H NMR (300 MHz, C_6D_6) δ 5.64 (q, *J* = 2.0 Hz, 1H, C=C**H**$_2$), 5.51 (d, *J* = 1.8 Hz, 1H, C=C**H**$_2$), 4.28 (s, 2H, OC**H**$_2$), 4.14 (t, *J* = 1.8 Hz, 2H, OC**H**$_2$), 0.12 (s, 9H, Si(C**H**$_3$)$_3$), 0.06 (s, 9H, Si(C**H**$_3$)$_3$).

Entry 5, Table 1: Dimerization of propargylamine

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (4.8 mg, 4.7 x 10^{-6} mol); internal standard 0.25 equivalent (22.3 mg, 1.2 x 10^{-4} mol) and one equivalent propargylamine (30 µL, 4.7 x 10^{-4} mol).

4-methylenepent-2-yne-1,5-diamine

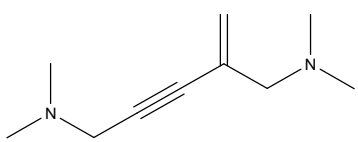


^{1}H NMR (300 MHz, C_6D_6) δ 5.34 (br s, 1H, C=C**H**$_2$), 5.19 (d, *J* = 1.7 Hz, 1H, C=C**H**$_2$), 3.18 (br s, 4H, C**H**$_2$NH$_2$), 0.75 (br s, 4H, CH$_2$N**H**$_2$).

Entry 6, Table 1: Dimerization of *N*,*N*-dimethylaminopropyne

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (3.8 mg, 3.7 x 10^{-6} mol); internal standard 0.25 equivalent (17.7 mg, 9.3 x 10^{-5} mol) and one equivalent *N*,*N*-dimethylaminopropyne (40 µL, 3.7 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra.[vi]

N,N,N,N-tetramethyl-4-methylenepent-2-yne-1,5-diamine



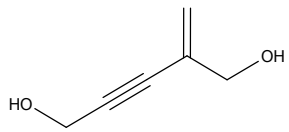
^{1}H NMR (300 MHz, C_6D_6) δ 5.50 (d, *J* = 2.1 Hz, 1H, C=C**H**$_2$), 5.38 (m, 1H, C=C**H**$_2$), 3.24 (s, 2H, C**H**$_2$N(CH$_3$)$_2$), 2.90 (s, 2H, C**H**$_2$N(CH$_3$)$_2$), 2.19 (s, 6H, CH$_2$N(C**H**$_3$)$_2$), 2.12 (s, 6H, CH$_2$N(C**H**$_3$)$_2$).

Entry 7, Table 1: Dimerization of propargyl alcohol

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (4.4 mg, 4.3 x 10^{-6} mol); internal standard 0.25 equivalent (20.4 mg, 1.1 x 10^{-4} mol) and one

equivalent propargyl alcohol (25 µL, 4.3 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra of similar enyne alcohol-type compounds.[ix]

4-methylenepent-2-yne-1,5-diol

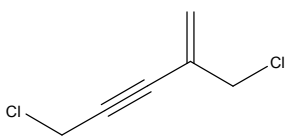


^{1}H NMR (300 MHz, C_6D_6) δ 5.37 (br s, 1H, C=C**H**$_2$), 5.34 (br s, 1H, C=C**H**$_2$), 4.09 (s, 2H, C**H**$_2$OH), 3.96 (s, 2H, C**H**$_2$OH), 2.05 (br s, 2H, CH_2O**H**).

Entry 8, Table 1: Dimerization of propargyl chloride

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 1 mol % (2.8 mg, 2.8 x 10^{-6} mol); internal standard 0.25 equivalent (13.2 mg, 6.9 x 10^{-5} mol) and propargyl chloride, 1 equivalent (20 µL, 2.8 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra of similar enyne chloro-type compounds.[x]

1,5-dichloro-4-methylenepent-2-yne



^{1}H NMR (300 MHz, C_6D_6) δ 5.64 (t, *J* = 6.2 Hz, 2H, C=C**H**$_2$), 4.59 (s, 2H, C**H**$_2$Cl), 4.57 (s, 2H, C**H**$_2$Cl).

S5. Catalytic Hydrothiolation Details

a. Optimisation of Catalytic Hydrothiolation of 1-hexyne with thiophenol

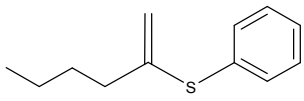
Standard operating procedure for hydrothiolation reactions. A high pressure NMR tube with a J. Young valve was charged with one mol % catalyst **2a** (4.0 mg, 3.9 x 10^{-6} mol) or one mol % catalyst **2b** (4.7 mg, 3.9 x 10^{-6} mol) and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene (18.6 mg, 9.8 x 10^{-5}). Catalytic amount of base was added as indicated in Table S2. To the mixture was added deuterated benzene (0.5 mL). One equivalent of 1-hexyne (45 µL, 3.9 x 10^{-4} mol) and one equivalent of thiophenol (40 µL, 3.9 x 10^{-4} mol) were added, and the NMR tube capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the substrates. The reaction mixture was heated up to the appropriate temperature and reacted for the duration as indicated (see Table S2). Upon cooling down to room temperature, ^{1}H NMR spectroscopy was performed at the final time. Conversion and calculated yields were determined from NMR analysis based on the integration of substrates and product, referenced to the internal standard. Product identity was confirmed by comparison with previously reported NMR spectra.[xi]

Table S2.Hydrothiolation of 1-hexyne (1 equivalent) with thiophenol (1 equivalent) promoted by **2**.[a]

Entry	Catalyst	Base (mol %)	T (°C)	t (h)	Conversion (%)[b]	Yield (%)[c]	Product distribution		
							α-vinyl sulfide	β-*E*-vinyl sulfide	β-*Z*-vinyl sulfide
1	**2a**	K_2CO_3 (1)	80	24	77	71	91[d]	6	3
2	**2a**	K_2CO_3 (1)	40	24	14	11	91[d]	5	4
3	**2a**	Pyridine (5)	80	24	74	64	89[d]	8	3
4	**2a**	None	80	24	81	74	91[d]	6	3
5	**2b**	K_2CO_3 (1)	80	24	58	49	92[d]	2	6

[a]Reaction performed in C_6D_6 (0.5 mL) with internal standard 1,4-di-*tert*-butylbenzene, 1 mol % catalyst (3.5 x 10^{-6} mol) and 3.5 x 10^{-4} mol 1-hexyne.
[b]Conversion as determined through NMR integration based on 1-hexyne referenced to 1,4-di-*tert*-butylbenzene.
[c]Yield of α-vinyl sulfide as determined from NMR integration based on 1-hexyne.
[d]Plus unidentified products.

2-Phenylthio-1-hexene



^{1}H NMR (300 MHz, C_6D_6) δ 7.44 - 7.40 (m, 2H, Ar**H**), 7.05 - 6.96 (m, 3H, Ar**H** overlaps with unreacted thiophenol), 5.06 (s, 1H, C=C**H**$_2$), 4.97 (s, 1H, C=C**H**$_2$), 2.20 (t, *J* = 7.6 Hz, 2H, C**H**$_2$), 1.50 (tt, *J* = 7.6 Hz, 7.5 Hz, 2H, C**H**$_2$), 1.26 - 1.16 (m, 2H, C**H**$_2$ overlaps with C(CH$_3$)$_3$ of internal standard), 0.80 (t, *J* = 7.3 Hz, 3H, C**H**$_3$).

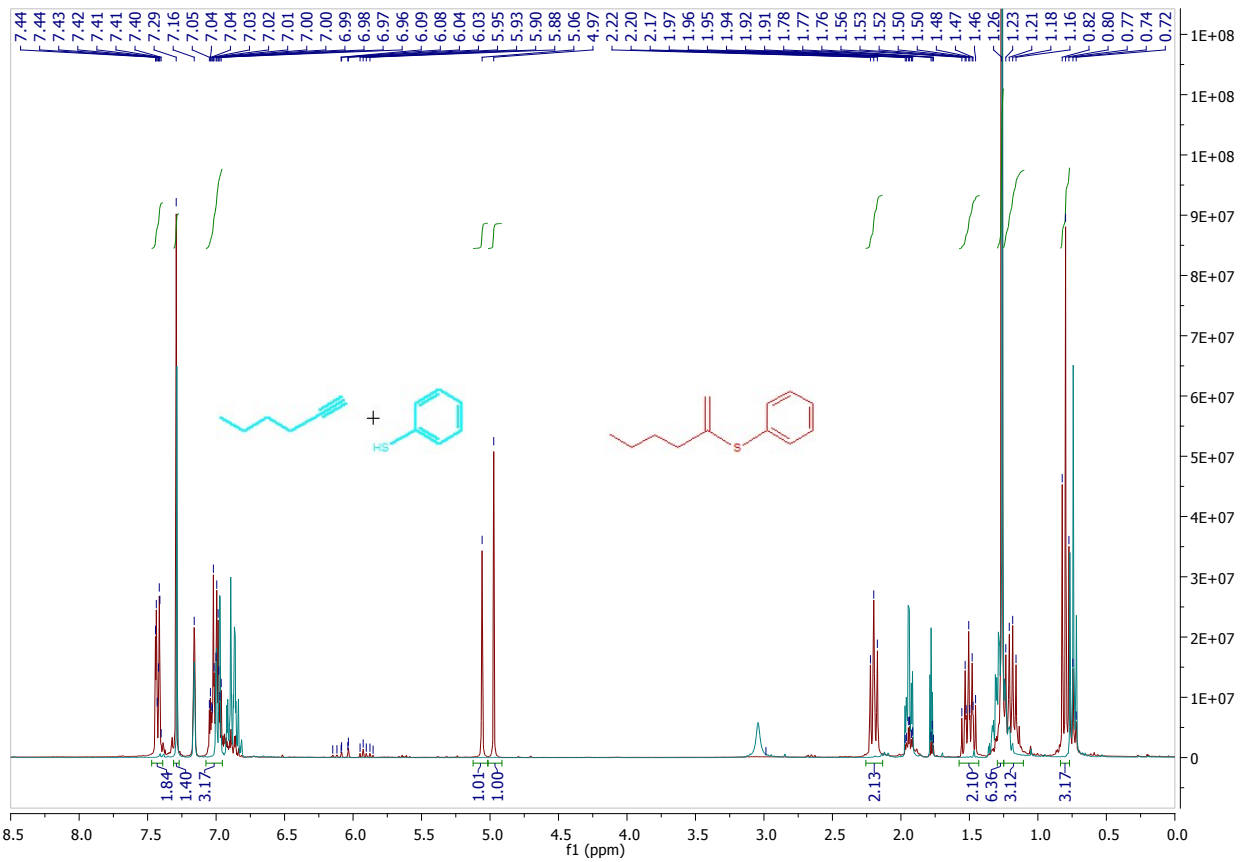


Figure S10. Catalytic hydrothiolation reaction of 1-hexyne (blue) with thiophenol (blue) yielding 2-phenylthio-1-hexene (red) at time 10 min (blue spectrum) and at time after reaction (red spectrum).

b. Catalytic Hydrothiolation of terminal alkynes with thiols catalyzed by 2a

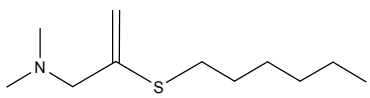
Standard operating procedure for hydrothiolation reactions: a high pressure NMR tube with a J. Young valve was loaded with one mol % catalyst **2a** and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene. To the mixture was added deuterated benzene (0.5 mL). One equivalent of terminal

alkyne and thiol was added, and the NMR tube capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the substrates. The reaction mixture was heated up to 80 °C and reacted for the duration as indicated (see Article, Table 2). Upon cooling down to room temperature, ^{1}H NMR spectroscopy was performed at the final time. Conversion and calculated yields where determined from NMR analysis based on integration of alkyne and product, referenced to the internal standard.

Entry 2, Table 2: Hydrothiolation of *N*,*N*-dimethylaminopropyne with 1-hexanethiol

Experiments were carried out as mentioned. Amounts of reagents added are as follows: 1mol % catalyst **2a** (3.2 mg, 3.2 x 10^{-6} mol); internal standard 0.25 equivalent (15.1 mg, 7.9 x 10^{-5} mol); one equivalent *N*,*N*-dimethylaminopropyne (34.1 µL, 3.2 x 10^{-4} mol) and one equivalent 1-hexanethiol (45 µL, 3.2 x 10^{-4} mol).

N,N-dimethyl-2-hexylthioprop-2-en-1-amine



^{1}H NMR (300 MHz, C_6D_6) δ 5.24 (t, *J* = 1.0 Hz, 1H, C=C**H**$_2$), 4.78 (s, 1H, C=C**H**$_2$), 3.00 (s, 2H, C**H**$_2$N(CH$_3$)$_2$), 2.56 (t, *J* = 7.3 Hz, 2H, C**H**$_2$), 2.12 (s, 6H, CH$_2$N(C**H**$_3$)$_2$), 1.53 (tt, *J* = 7.5 Hz, 7.2 Hz, 2H, C**H**$_2$), 1.27 - 1.11 (m, 6H, (C**H**$_2$)$_3$ overlaps with C(CH$_3$)$_3$ of internal standard), 0.82 (t, *J* = 0.8 Hz, 3H, C**H**$_3$). ^{13}C NMR (75 MHz, C_6D_6) δ 145.7, 106.3, 66.3, 45.1, 31.8, 31.0, 29.2, 28.7, 22.9, 14.2.

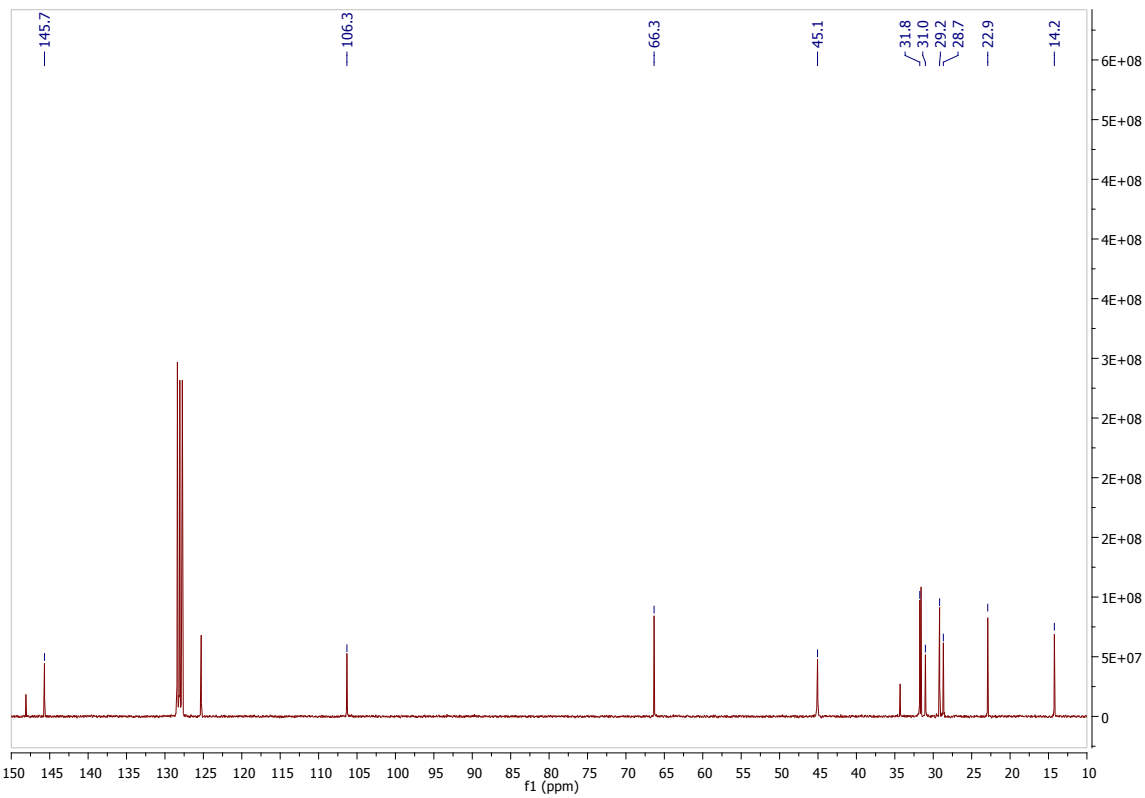

Figure S12. ^{13}C NMR of *N,N*-dimethyl-2-hexylthioprop-2-en-1-amine

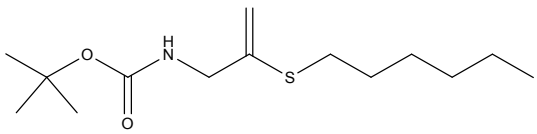
Entry 3, Table 2: Hydrothiolation of *N*-Boc-propargylamine with 1-hexanethiol

Experiments were carried out as mentioned. Amounts of reagents added are as follows: 1mol % catalyst **2a** (3.2 mg, 3.2 x 10^{-6} mol); internal standard 0.25 equivalent (15.1 mg, 7.9 x 10^{-5} mol); one equivalent *N*-Boc-propargylamine (49.1 mg, 3.2 x 10^{-4} mol) and one equivalent 1-hexanethiol (45 µL, 3.2 x 10^{-4} mol).

N-tert-butyloxycarbonyl-2-hexylthioprop-2-en-1-amine



^{1}H NMR (300 MHz, C_6D_6) δ 5.14 (s, 1H, C=C**H**$_2$), 4.77 (s, 1H, C=C**H**$_2$), 4.64 (br s, 1H, CH_2N**H**), 3.82 (d, *J* = 5.9 Hz, 2H, C**H**$_2$NH), 2.45 (t, *J* = 7.3 Hz, 2H, C**H**$_2$), 1.49 - 1.39 (m, 2H, C**H**$_2$ overlaps with OC(CH_3)$_3$), 1.42 (s, 9H, OC(C**H**$_3$)$_3$ overlaps with C**H**$_2$), 1.25 - 1.05 (m, 6H, (C**H**$_2$)$_3$ overlaps with C(CH_3)$_3$ of internal standard), 0.82 (t, *J* = 7.0 Hz, 3H, C**H**$_3$). ^{13}C NMR (75 MHz, C_6D_6) δ 155.6, 144.0, 108.0, 79.0, 46.1, 31.7, 31.3, 29.0, 28.7, 28.5, 22.9, 14.2.

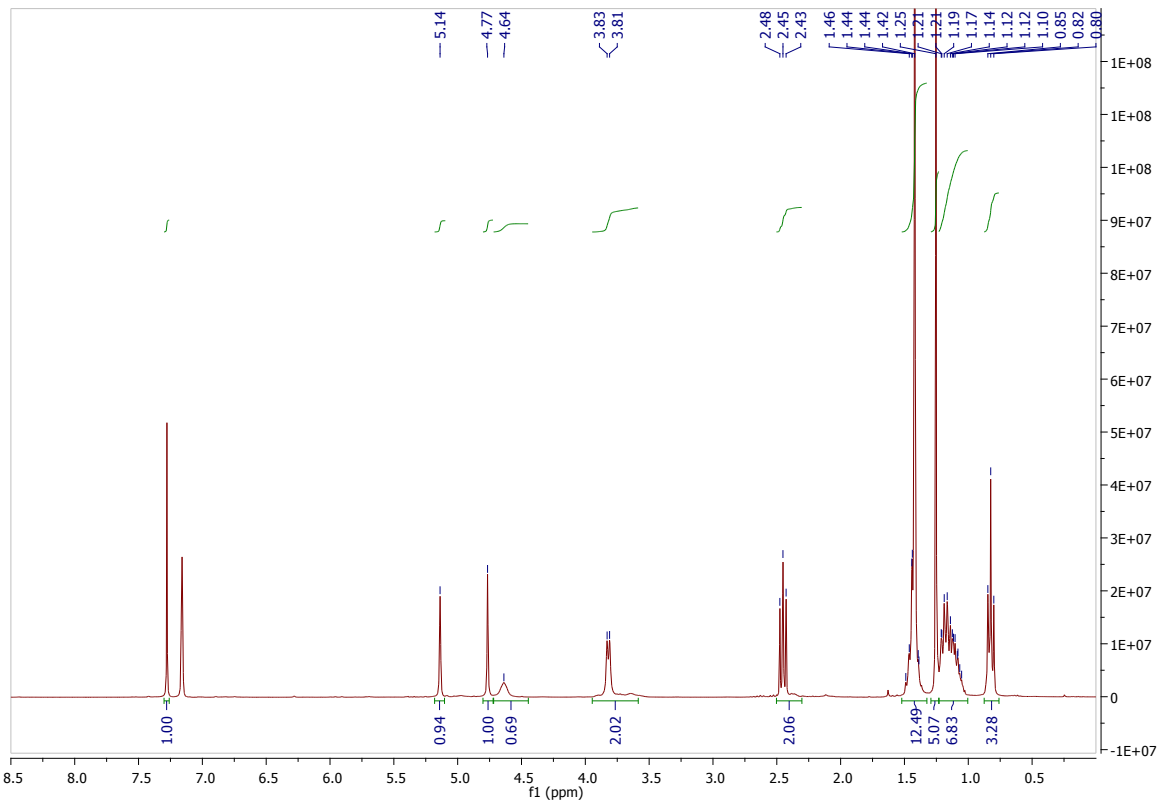


Figure S13. ^{1}H NMR of *N-tert*-butyloxycarbonyl-2-hexylthioprop-2-en-1-amine

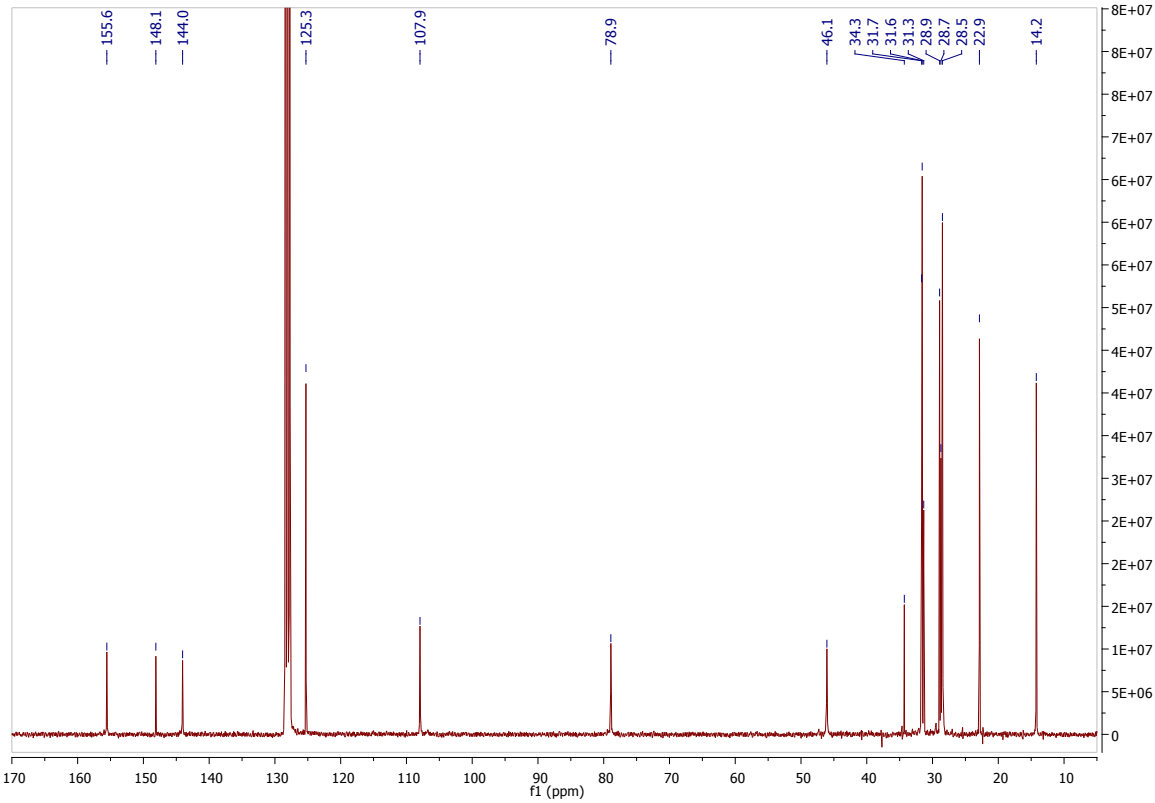

Figure S14. ^{13}C NMR of *N-tert*-butyloxycarbonyl-2-hexylthioprop-2-en-1-amine

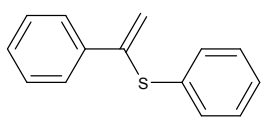
Entry 4, Table 2: Hydrothiolation of phenylacetylene with thiophenol

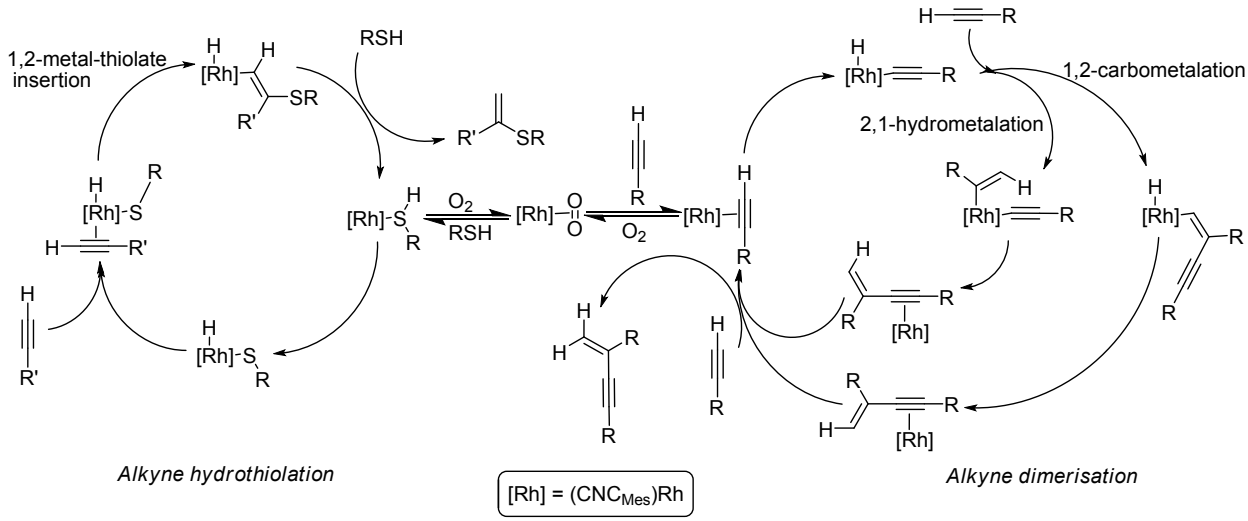
Experiments were carried out as mentioned. Amounts of reagents added are as follows: 1mol % catalyst **2a** (3.5 mg, 3.4 x 10^{-6} mol); internal standard 0.25 equivalent (16.3 mg, 8.5 x 10^{-5} mol); one equivalent phenylacetylene (37.6 µL, 3.4 x 10^{-4} mol) and one equivalent thiophenol (35 µL, 3.4 x 10^{-4} mol). Product identity was confirmed by comparison with previously reported NMR spectra.[xi]

1-Phenyl-1-phenylthioethene



^{1}H NMR (300 MHz, C_6D_6) δ 7.63 - 7.57 (m, 2H, Ar**H** overlaps with *E*- and *Z*-isomers), 7.42 - 7.27 (m, 4H, Ar**H** overlaps with ArH of internal standard and with *E*- and *Z*-isomers), 7.06 - 6.85 (m, 4H, Ar**H** overlaps with *E*- and *Z*-isomers), 5.50 (s, 1H, C=C**H**$_2$), 5.30 (s, 1H, C=C**H**$_2$).

S6. Proposed Reaction Mechanism for Alkyne Dimerisation and Hydrothiolation promoted by 2a



Scheme S2. Proposed mechanistic route of alkyne dimerization and hydrothiolation mediated by **2a**

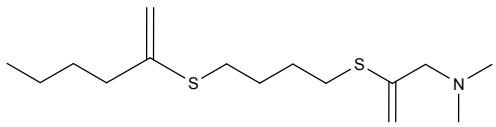
S7. Catalytic Asymmetric bis-Hydrothiolation Details

Standard operating procedure for asymmetric bis-hydrothiolation reactions. A high pressure NMR tube with a J. Young valve was charged with two mol % catalyst **2a** and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene. To the mixture was added deuterated benzene (0.5 mL). One equivalent of terminal alkyne and one equivalent of the dithiol were added, followed by the NMR tube being capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the substrates. The reaction mixture was heated up to 80 °C and reacted for the duration as indicated (see Article, Table 3). ^{1}H NMR spectroscopy confirmed the complete conversion of the substrates to the mono-α-vinyl sulfide product. To the same reaction mixture, in open atmospheric conditions, was added one equivalent of the second terminal alkyne. The NMR tube was capped, a ^{1}H NMR experiment performed, and the tube was subsequently heated up to 80 °C for the duration as indicated in Table 3 (see Article). ^{1}H NMR spectroscopy confirmed the formation of the unsymmetrical bis-α,α'-vinyl sulfide, or unsymmetrical bis-α,β-*E*-vinyl sulfides. Conversion and calculated yields were determined from NMR analysis based on the integration of alkyne and product, referenced to the internal standard.

Entry 1, Table 3: Bis-Hydrothiolation of 1-hexyne and *N*,*N*-dimethylaminopropyne with 1,4-butanedithiol (bis-α,α'-vinyl sulfide)

Experiments were carried out as described above. Amounts of reagents added are as follows: catalyst 2 mol % (6.1 mg, 6.0 x 10^{-6} mol); internal standard 0.25 equivalent (14.2 mg, 7.5 x 10^{-5} mol); 1 equivalent of 1-hexyne (34.3 µL, 3.0 x 10^{-4} mol) and one equivalent of 1,4-butanedithiol (35 µL, 3.0 x 10^{-4} mol). Upon completion of the first hydrothiolation reaction, one equivalent of the second alkyne, *N*,*N*-dimethylaminopropyne (32.1 µL, 3.0 x 10^{-4} mol), was added.

bis-α,α'-vinyl sulfide



^{1}H NMR (300 MHz, C_6D_6) δ 5.20 (d, *J* = 1.3 Hz, 1H, C=C**H**$_2$), 4.99 (d, *J* = 1.4 Hz, 1H, C=C**H**$_2$), 4.72 (s, 1H, C=C**H**$_2$), 4.65 (s, 1H, C=C**H**$_2$), 2.96 (br s, 2H, C**H**$_2$N(CH$_3$)$_2$), 2.48 - 2.41 (m, 4H, (C**H**$_2$)$_2$), 2.20 (tt, *J* = 7.6 Hz, 4.5 Hz, 2H, C**H**$_2$), 2.10 (s, 6H, CH$_2$N(C**H**$_3$)$_2$), 1.58 - 1.46 (m, 6H, (C**H**$_2$)$_3$), 1.31 - 1.18 (m, 2H, C**H**$_2$ overlaps with C(CH$_3$)$_3$ of internal standard), 0.83 (t, *J* = 7.3 Hz, 3H, C**H**$_3$). ^{13}C NMR (75 MHz, C_6D_6) δ 146.4, 145.2, 106.7, 105.2, 66.3, 45.1, 37.8, 31.4, 30.8, 30.4, 28.0, 27.9, 22.4, 14.1.

S8. Sequential bis-hydrothiolation reaction under preparative conditions

The reaction reported in Table 3, Entry 1 was scaled up tenfold. To a Schlenk tube was added 1-hexyne (343 µL, 2.98 x 10^{-3} mol), 1,4-butanedithiol (350 µL, 2.98 x 10^{-3} mol), catalyst **2a** (116 mg, 5.97 x 10^{-5} mol; 2 mol%) and internal standard 1,4-di-tert-butylbenzene (142 mg, 7.46 x 10^{-4} mol, 0.25 equivalent) in 4 mL solvent C_6D_6. The reaction mixture was heated at 80 °C for 14 hours, whereafter the reaction mixture was allowed to cool down to room temperature. The second alkyne substrate, dimethylaminopropyne (321 µL, 2.98 x 10^{-3} mol) was added to the reaction mixture and the reaction vessel heated for an additional 30 hours at 80 °C. After a total reaction time of 44 hours, NMR analysis indicated 64% conversion of the substrates, and a calculated overall yield of the bis-α,α'-vinyl sulfide product of 62%. The reaction mixture was thereafter dry-loaded on an aluminium oxide 90 (neutral, activated) plug, and the product eluted with hexane:EtOAc (3:1). The purified bis-α,α'-vinyl sulfide product was isolated with a yield of 406 mg, 47% overall yield.

S9. Cascade Catalytic Details

A high pressure NMR tube with a J. Young valve was loaded with 3.5 mol % of catalyst **2a** (11.6 mg, 1.1 x 10^{-5} mol) and 0.25 equivalents of internal standard, 1,4-di-*tert*-butylbenzene (15.4 mg, 8.1 x 10^{-5}mol). To the mixture was added deuterated benzene (0.5 mL). One equivalent of *N*,*N*-dimethylaminopropyne (35 µL, 3.3 x 10^{-4} mol) was added to the solution, and the NMR tube was subsequently capped. ^{1}H NMR spectroscopy was performed at time 10 min after addition of the alkyne. The reaction mixture was heated up to 80 °C and left to react for 3 hours. Upon cooling down to room temperature, ^{1}H NMR spectroscopy confirmed complete conversion of *N*,*N*-dimethylaminopropyne to N^1,N^1,N^5,N^5-tetramethyl-4-methylenepent-2-yne-1,5-diamine. To the same reaction mixture, in open atmospheric conditions, was added 1-hexanethiol (23.1 µL, 1.6 x 10^{-4} mol). The NMR tube was capped, and a ^{1}H NMR experiment performed of the resulting mixture. The reaction mixture was heated up to 60 °C for 48 hours. Upon cooling down to room temperature, a ^{1}H NMR experiment was performed on the resulting mixture. Conversion and calculated yields were determined from NMR analysis based on integration of substrates and product, referenced to the internal standard. Product identity was determined by assignments based on 1D (^{1}H, ^{13}C{^{1}H}, ^{13}C-dept 135) and 2D (COSY, HSQC and HMBC) experiments.

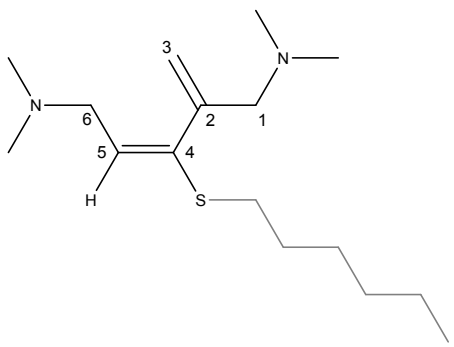
Table S3. Cascade alkyne dimerization/hydrothiolation to form *gem*-ene-vinyl sulfides promoted by **2a**.[a]

Step 1[b]			Step 2[d]					
T (°C)	t (h)	Conversion (%)[c]	T (°C)	t (h)	Conversion (%)[c]	Products	Yield (%)[e]	Product Distribution
80	3	> 99	60	48	82	**a**	29	44
						b	29	43
						c	9	13

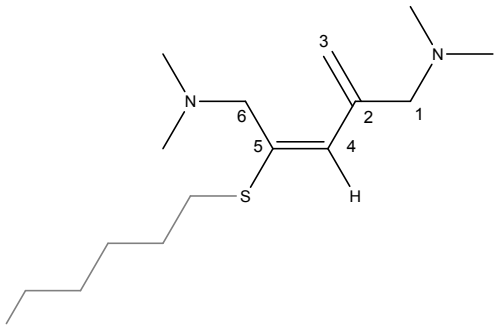
[a]Reaction performed in 0.5 mL C_6D_6 with 1,4-di-*tert*-butylbenzene as internal standard, with catalyst loading 3.5 mol %.
[b]Alkyne homo-dimerization yielding *N,N,N,N*-tetramethyl-4-methylenepent-2-yne-1,5-diamine
[c]Conversion as determined through NMR integration based on substrate and products referenced to 1,4-di-*tert*-butylbenzene.
[d]Hydrothiolation of internal alkyne of enyne formed after step 1, with 1-hexanethiol.
[e]NMR calculated yield.

(a) 1,3-gem-ene-β-E-vinyl-sulfide



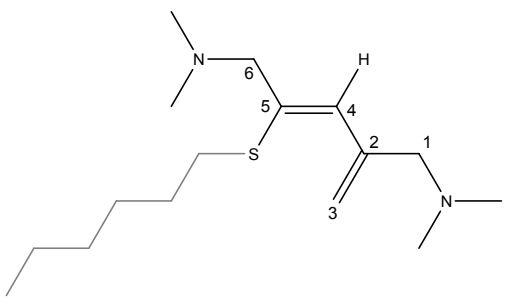
^{1}H NMR (300 MHz, C_6D_6) δ 6.03 (t, *J* = 6.8 Hz, 1H, C5-**H**), 5.44 (dt, *J* = 1.6 Hz, 1.3 Hz, 1H, C3-**H**$_2$), 5.06 (dt, *J* = 1.3 Hz, 1 Hz, 1H, C3-**H**$_2$), 3.10 (t, *J* = 1.3 Hz, 2H, C1-**H**$_2$), 3.03 (d, *J* = 6.8 Hz, 2H, C6-**H**$_2$), 2.18 (s, 6H, C1-N(C**H**$_3$)$_2$), 2.13 (s, 6H, C6-N(C**H**$_3$)$_2$), -S-hexyl moiety (grey scaled) not assigned due to extensive overlap. ^{13}C NMR (100 MHz, C_6D_6) δ 143.8 (C**2**), 138.6 (C**4**), 129.9 (C**5**), 116.9 (C**3**), 63.8 (C**1**), 58.7 (C**6**), N(CH_3)$_2$ not assigned due to extensive carbon overlap.

(b) 1,4-gem-ene-β-E-vinyl-sulfide



^{1}H NMR (300 MHz, C_6D_6) δ 6.03 (s, 1H, C4-**H**), 5.20 (dt, *J* = 1.3 Hz, 1.2 Hz, 1H, C3-$\mathbf{H}_2$), 5.13 (d, *J* = 1.5 Hz, 1H, C3-$\mathbf{H}_2$), 3.35 (d, *J* = 1 Hz, 2H, C6-$\mathbf{H}_2$), 2.86 (br s, 2H, C1-$\mathbf{H}_2$), 2.21 (s, 6H, C6-N(C$\mathbf{H}_3$)$_2$), 2.10 (s, 6H, C1-N(C$\mathbf{H}_3$)$_2$), -S-hexyl moiety (grey scaled) not assigned due to extensive overlap. ^{13}C NMR (100 MHz, C_6D_6) δ 143.6 (C**2**), 140.4 (C**5**), 123.3 (C**4**), 115.9 (C**3**), 67.1 (C**1**), 61.2 (C**6**), N$(CH_3)_2$ not assigned due to extensive carbon overlap.

(c) 1,4-gem-ene-β-Z-vinyl-sulfide



^{1}H NMR (300 MHz, C_6D_6) δ 6.36 (br s, 1H, C4-**H**), 5.12 (d, *J* = 1.3 Hz, 1H, C3-**H**), 5.08 (s, 1H, C3-**H**), 3.23 (s, 2H, C6-**H**), 3.00 (d, *J* = 1.3 Hz, 2H, C1-**H**), 2.16 (s, 6H, C6-N(C$\mathbf{H}_3$)$_2$), 2.14 (s, 6H, C1-N(C$\mathbf{H}_3$)$_2$), -S-hexyl moiety (grey scaled) not assigned due to extensive overlap. ^{13}C NMR (100 MHz, C_6D_6) δ 141.9 (C**2**), 141.7 (C**5**), 128.6 (C**4**), 110.1 (C**3**), 64.1 (C**1**), 57.9 (C**6**), N$(CH_3)_2$ not assigned due to extensive carbon overlap.

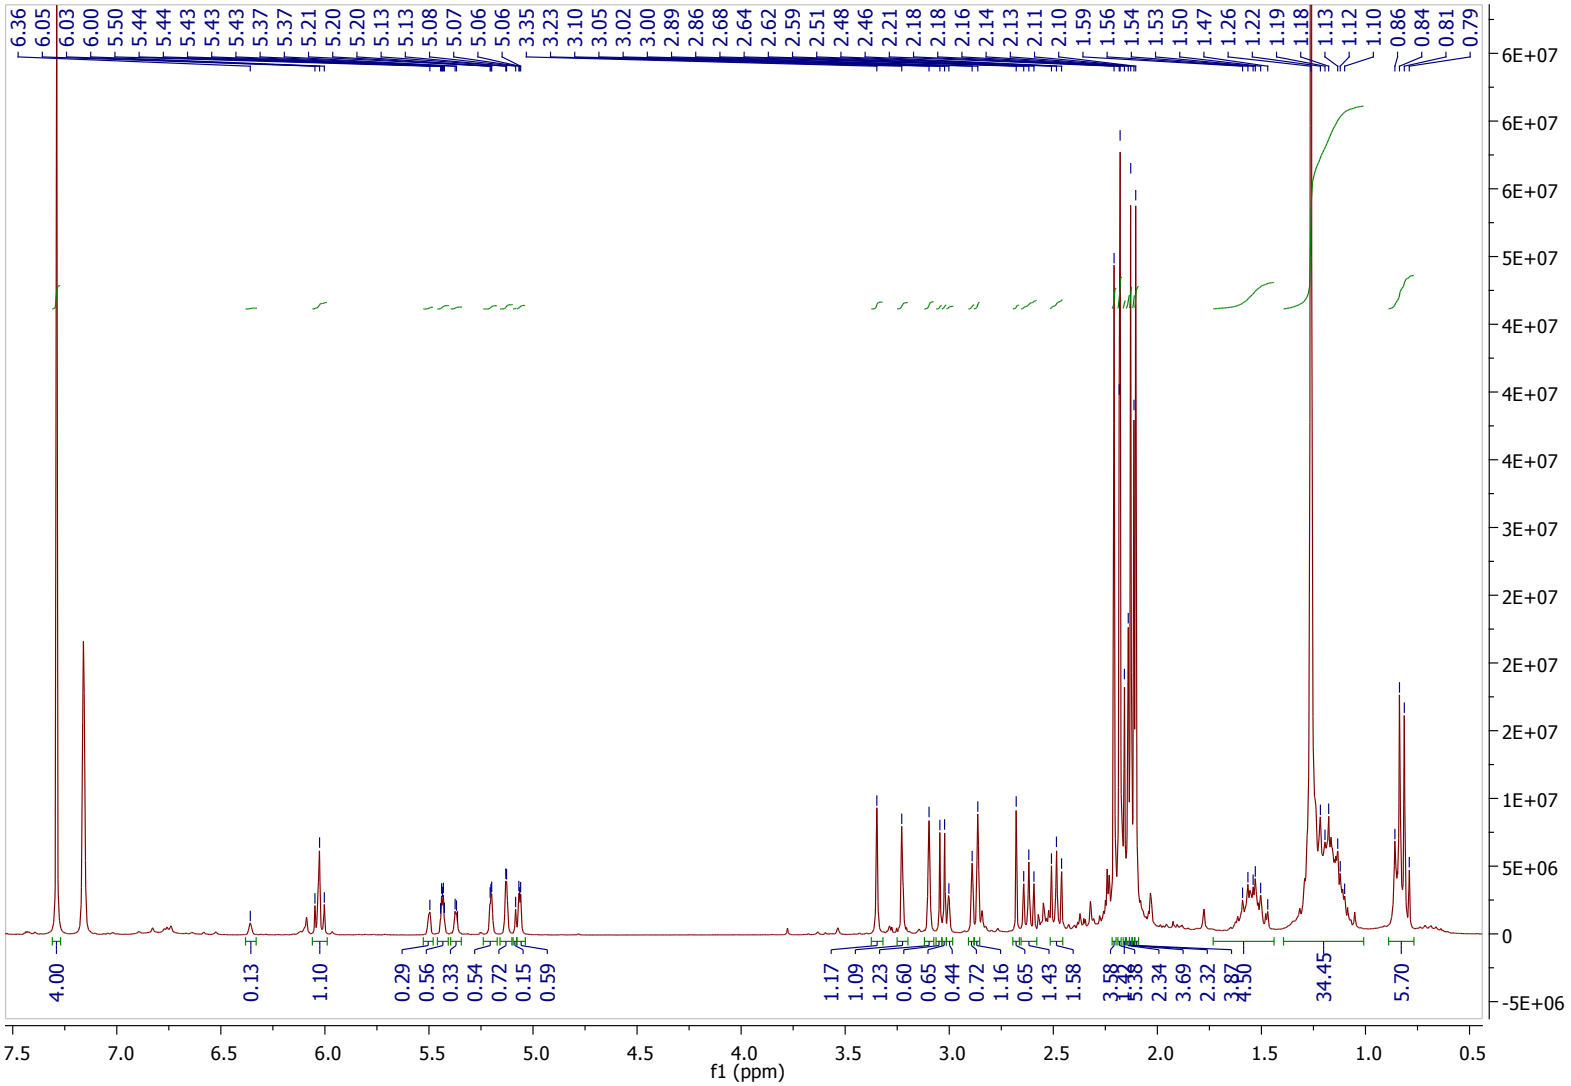


Figure S23. ^{1}H NMR spectrum of products obtained after one-pot catalyzed alkyne dimerization followed by hydrothiolation of the internal alkyne by **2a**

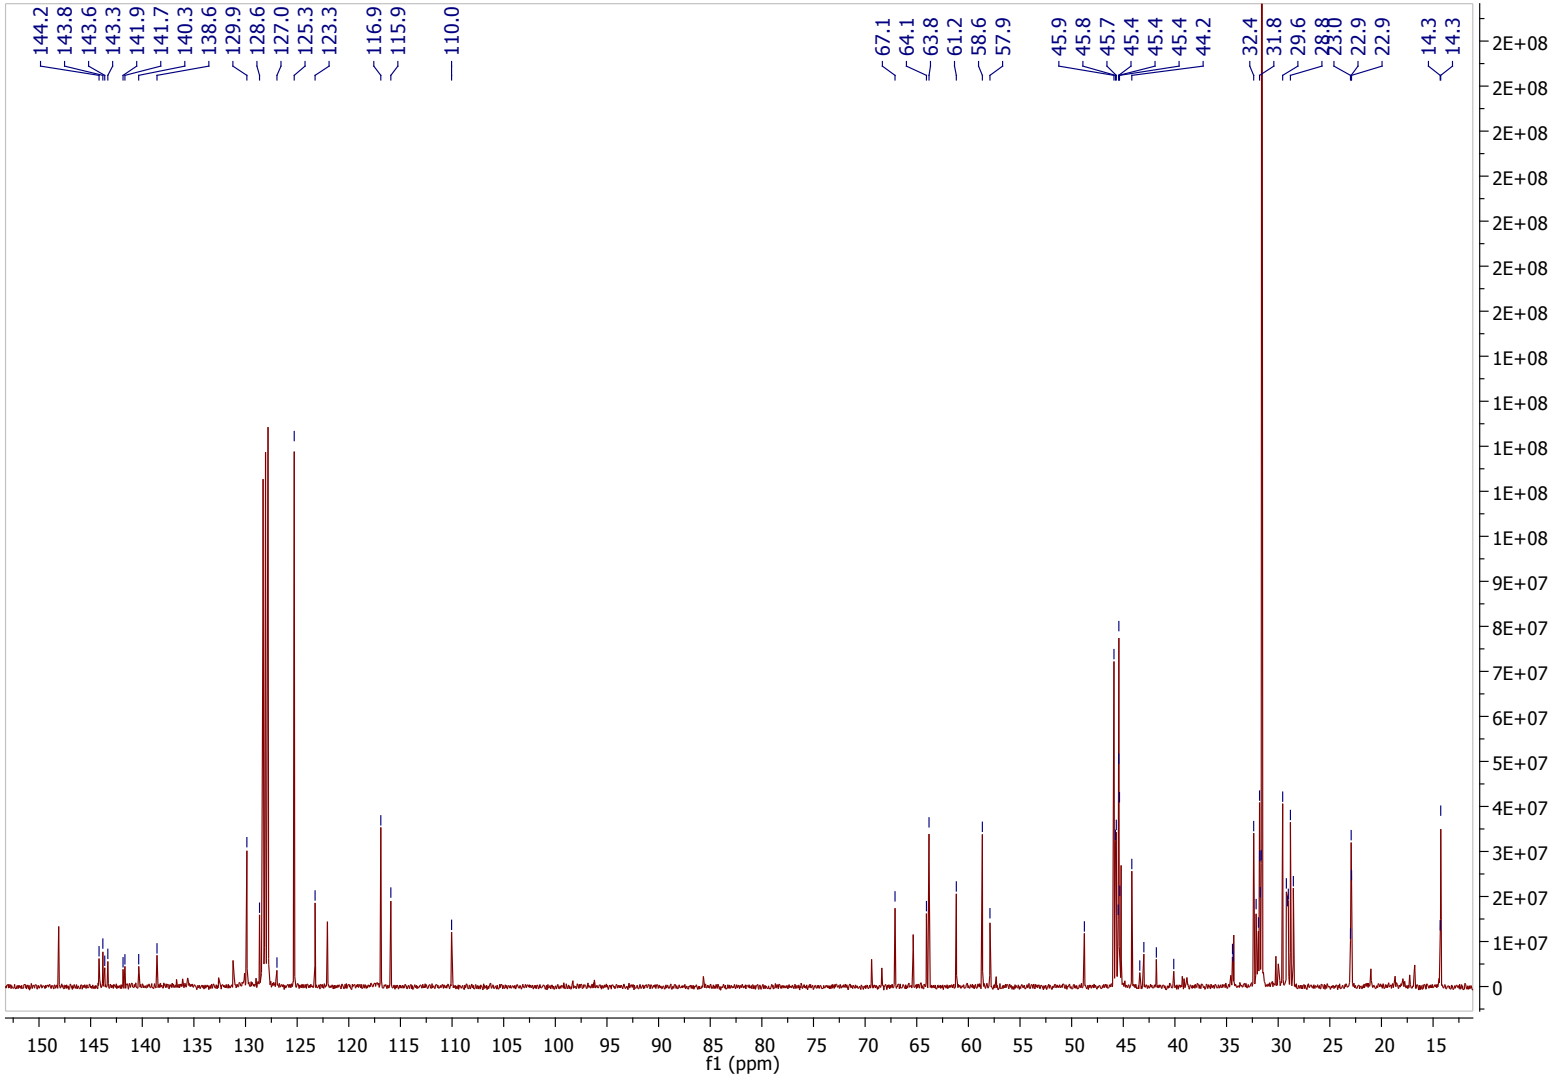

Figure S24. ^{13}C NMR spectrum of products obtained after one-pot catalyzed alkyne dimerization followed by hydrothiolation of the internal alkyne by **2a**

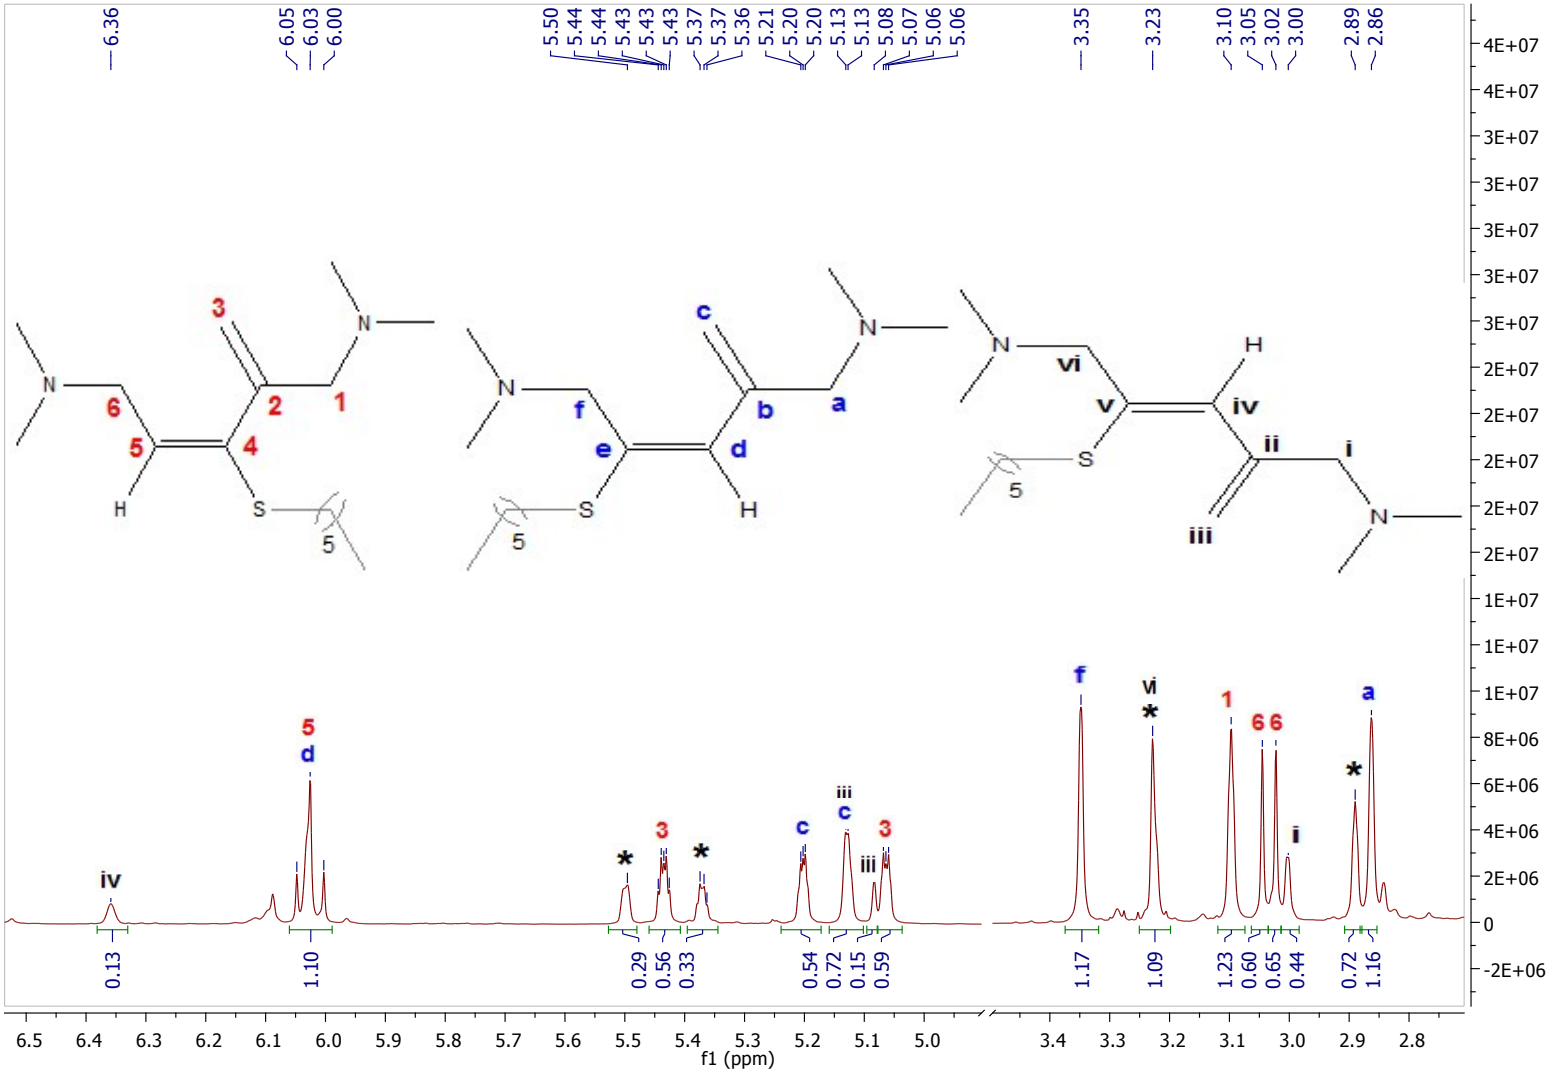

Figure S25. Selected regions of ^{1}H NMR spectrum of products obtained after one-pot catalyzed alkyne dimerization followed by hydrothiolation (* denotes unreacted *gem*-enyne intermediate product)

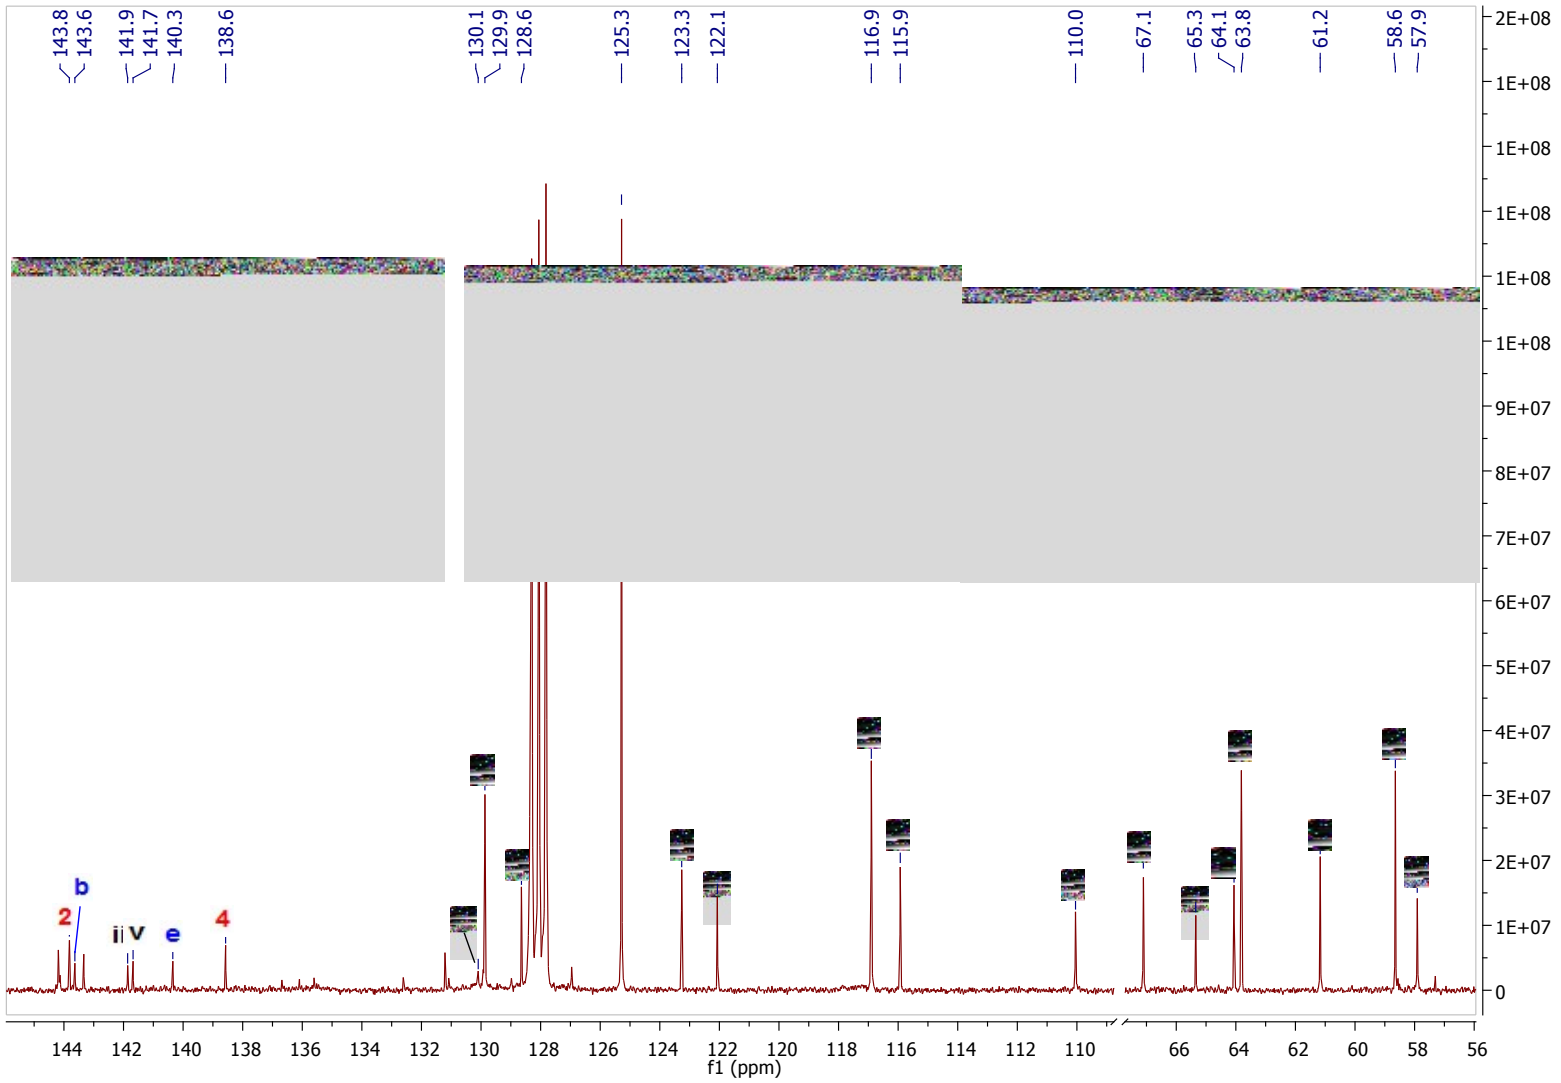

Figure S26. Selected regions of ^{13}C NMR spectrum of products obtained after one-pot catalyzed alkyne dimerization followed by hydrothiolation (* denotes unreacted *gem*-enyne intermediate product)

S10. Tandem Alkyne Dimerization-Hydrothiolation Reaction under Preparative Conditions

The reaction reported in the manuscript Scheme 2 was scaled up tenfold. To a Schlenk tube was added dimethylaminopropyne (350 µL; 3.25 x 10^{-3} mol), catalyst **2a** (116 mg; 1.14 x 10^{-4} mol; 3.5 mol%) and internal standard 1,4-di-tert-butylbenzene (154 mg, 8.13 x 10^{-4} mol, 0.25 equivalent) in 4 mL solvent C_6D_6. The reaction was heated at 80 °C for 5 hours, whereafter it was allowed to cool to room temperature. 1-hexanethiol (231 µL; 1.63 x 10^{-3} mol; 0.5 equivalent) was added to the reaction mixture, and the reaction vessel then heated at 60 °C for an additional 48 hours. NMR analysis revealed 60 % conversion of the substrates, with calculated yields for the different *gem*-ene-vinyl sulfide product isomers as follows: 1,3-*gem*-ene-β-*E*-vinyl sulfide, 28%; 1,4-*gem*-ene-β-*E*-vinyl sulfide, 19%; and 1,4-*gem*-ene-β-*Z*-vinyl sulfide, 9%, with product distribution: 1,3-*gem*-ene-β-*E*-vinyl sulfide: 1,4-*gem*-ene-β-*E*-vinyl sulfide: 1,4-*gem*-ene-β-*Z*-vinyl sulfide = 50 : 34 : 16.

The products were purified by gradient elution with hexane and ethyl actetate after dry loading on an aluminium oxide 90 (neutral, activated) plug to yield all three *gem*-ene-vinyl sulfide products, with an overall crude isolated yield of 180 mg, 6.33 x 10^{-4} mol, 39% yield.

S11. Crystal Structure Details

X-ray structure and crystal data for **1a** and **2b**:

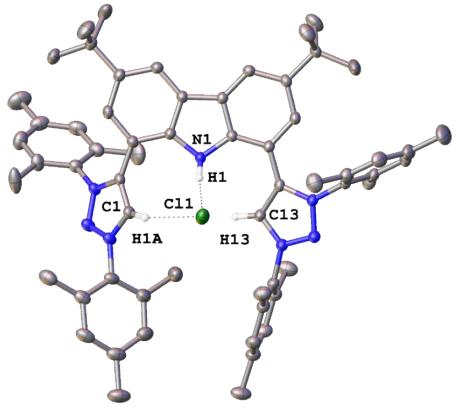

Figure 1: X-ray structure of the salt precursor **1a** with thermal ellipsoids at the 50 %probability level. H atoms except for H1 and H13, and the PF_6 counteranion were omitted for clarity. Selected bond lengths (Å): H1-Cl1 2.203 (5), H1A-Cl1 2.446 (5).

Crystal Data for **1a**: $C_{60}H_{69}N_7ClF_6P$ (*M* =1068.64 g/mol): monoclinic, space group $P2_1/c$ (no. 14), *a* = 16.2214(4) Å, *b* = 24.0518(5) Å, *c* = 15.2494(3) Å, *β* = 108.8560(9)°, *V* = 5630.3(2) Å^3, *Z* = 4, *T* = 150.15 K, μ(CuKα) = 1.404 mm^{-1}, *Dcalc* = 1.261 g/cm^3, 198184 reflections measured (5.756° ≤ 2Θ ≤ 144.494°), 11093 unique (R_{int} = 0.0378, R_{sigma} = 0.0120) which were used in all calculations. The final R_1 was 0.0430 (I > 2σ(I)) and wR_2 was 0.1137 (all data).

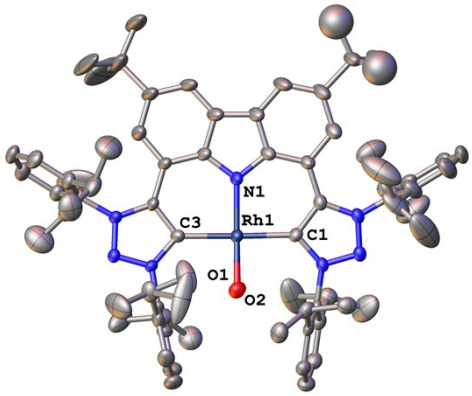

Figure 2: X-ray structure of the salt precursor **2b** with thermal ellipsoids at the 50 %probability level. H atoms were omitted for clarity. Selected bond lengths (Å) and angles (°): Rh1-N1 1.986(3), Rh1-C1 2.035(4), Rh1-C3 2.036(4), Rh1-O1 1.976(3), Rh1-O2 1.980(3), O1-O2 1.389 (7); O1-Rh1-N1 160.91(13), N1-Rh1-C1 89.65 (13), N1-Rh1-C3 89.09 (13), C1-Rh1 C3 178.57(14), O1-Rh1-O2 40.74(11), O1-Rh1-C1 90.21(13).

Crystal Data for **2b**: $C_{72}H_{84}N_7O_2Rh$ (*M* =1182.37 g/mol): triclinic, space group P-1 (no. 2), *a* = 10.8323(5) Å, *b* = 15.4988(8) Å, *c* = 24.8410(13) Å, *α* = 103.4480(14)°, *β* = 97.0590(13)°, *γ* = 107.0370(13)°, *V* = 3795.4(3) Å^3, *Z* = 2, *T* = 150.15 K, μ(MoKα) = 0.267 mm^{-1}, *Dcalc* = 1.035 g/cm^3, 84650 reflections measured (4.428° ≤ 2Θ ≤ 51.56°), 14487 unique (R_{int} = 0.1099, R_{sigma} = 0.0978) which were used in all calculations. The final R_1 was 0.0610 (I > 2σ(I)) and wR_2 was 0.1727 (all data).
