XI. CAMELOPARDALIS GIRAFFA: THE GIRAFFE.
CAMELOPARDALIS GIRAFFA.—THE CAMELOPARD OR GIRAFFE.

**GENERIC CHARACTER.**—In stature the tallest of Mammiferous animals. Adult male, twelve feet high at the shoulder, and eighteen at the crown of the head. Twenty feet in extreme length. Legs slender, and very long. Feet terminating in a divided hoof, shaped like a parallelogram, with rounded heel and pointed toe. No succentorial hoofs. Body short. Withers very elevated, a scanty upright rufous mane extending along the whole neck. Back very oblique. Tail thirty-four inches long, terminating in a tuft of bristly black hair about the same length, which reaches to the hocks. Head light and tapering, thirty-four inches long; provided with osseous peduncles (common to both sexes), eight inches long, covered with a hairy skin, and terminating in a pencilled tuft of black hair. A tuberculum on the chaffron. No muzzle. Upper lip entire; hairy and pointed. Eyes large and melting, with long lashes. No lachrymary sinuses. Ears pure white, and ample. Callosities on the breast and knees. Tongue very long, pointed, and flexible. General colour, deep sienna, with large angular ferruginous spots, variously disposed over the whole; each spot darker in the centre. Belly and cheeks white, with dark blotches.

Female, sixteen or seventeen feet in height at the crown, of a dirty white colour, with pale ferruginous spots as in the male. An udder with four teats. Gregarious in small troops. Inhabits the great wooded plains of the interior.
CHAPTER XI.

THE GIRAFFE.

Magnificent creature! so much like a man
Through forest and glen, over mountain and plain,
Yet mere than art beholds, thy form I admire,
And leave that the reigns of thy greatness is ever.

Thine heart's blood is streaming, thy vigour goes by,
Thy feet feet is joined, and placed in thine eye—
Now the last hard transition of death has come o'er thee
Magnificent creature! who would not deplore thee?

During three centuries and a half, the accounts given of this extraordinary animal were deemed entirely fabulous. Its apparent disproportions and colossal height had classed it with the Unicorns, and Sphynxes, the Satyrs, and the Cynocephali, of the ancients; and had induced a belief that so singular a form belonged rather to the group of chimeras with which the regions of imagination are tenanted, than existed amongst the actual works of the creation.

Leftest of all the Monstrous, and isolated among the remaining creation, whether in family, in genus, or in species, the animal now before us is one so extraordinary in form, and so stupendous in stature, that even the stuffed spoils, the almost shapeless representative of the living creature, produce upon the eye of the beholder a mixed effect of astonishment and awe. Involuntarily is his imagination led back to the early epochs of the world, when colossal beings peopled the earth, and were the undisputed possessors of every region. He fancies himself at once in the presence of one of the survivors of the great diluvian catastrophe, when the Mastodon, the Megatherium, and perhaps its own congeners, were swept away, leaving the Camelopardalis to attest, amongst a few others, what were the forms of a primitive nature.*

The first of this noble species ever seen in Europe is said by Pliny to have been exhibited at Rome, during the dictatorship of Julius Caesar. Several of the emperors subsequently displayed others in the games of the circus, or in their triumphal processions; and Gordian III. is said to have possessed no fewer than ten living examples at the same time. It was displayed by Aurelian amongst other remarkable animals, in his triumph over Queen Zenobia, on the conquest of Palmyra; and it is represented both in its grazing and browsing attitudes on the Preseantine mosaic pavement. In that part of the mosaic which designates the cataracts of the Nile, a larger animal is likewise represented with shorter horns. Since the Southern regions of Africa were a terra incognita to the Romans, these specimens must have been obtained via Egypt, from the Northern, or North-Eastern line of that vast continent. Nevertheless the animal was at no time a native of Egypt, and in the ancient sculptures is introduced only in subjects which relate to Ethiopia, whence it was brought with ape, rare woods, and other native productions, as part of the tribute annually paid to the Pharaohs.+ Amongst the earlier writers, Pliny, Pliny, and Strabo, have all noticed the Camelopardalis, but the first satisfactory description is to be found in the Ethiopicus of Heliodorus, Bishop of Tricca. “The ambassadors,” he says, “of the Axenomite (Abyssinian,) brought presents to Hydaspes, and among other things there was an animal of a strange and wonderful species, about the size of a camel, which had its skin marked with florid spots; the hinder parts from the loins being low, like those of a lion, but the shoulders, fore-feet, and breast, elevated above proportion to the other parts; the neck was small and lengthened out from its large body, like that of a swan; the head in form resembled a camel’s, but was in size about twice that of a Libyan Ostrich, and it rolled its eyes, which had a film over them, very frightfully. It differed in gait from every other land or water animal, and waddled in a remarkable fashion; each leg did not move alternately, but those on the right side moved, and those on the left in the same manner, so that each side was alternately elevated. This animal was so tractable as to be led by a small string fastened to the head, and the keeper could conduct it with-9

† Wilkinson’s Egypt.
‡ Purchas, book vi. chap. 1.
§ Ibid. book viii. chap. 6.
Henry III. of Castile to Tamerlane the Great, in 1403, there is the following minute, and in many respects, accurate account of the animal:—"The ambassadors sent by the king of Castile, Henri III., to the Great Tamerlane, arrived at a town called Hey, now Khoy, on the confines of Armenia, where the Persian empire commences. At that town they fell in with an ambassador whom the Sultan of Babylon had sent to Tamerlane. He had with him as many as twenty horsemen, and fifteen camels laden with presents, which the Sultan sent to Tamerlane. Besides these there were six Ostriches, and an animal called jereyno, which animal was formed in the following manner:—In body it was of the size of a horse, with the neck very long, and the fore-legs much taller than the hind ones: the hoof was cloven like that of the ox. From the hoof of the fore-leg to the top of the shoulder, it was sixteen hands (palmos); and from the shoulder to the head sixteen hands more; and when it raised its neck, it lifted its head so high as to be a wonder to all. The neck was like that of the stag; and so great was the disproportion of the length of the hinder legs to that of the fore-legs, that one who was not acquainted with it would think it was walking, although it was actually standing. It had the haunches slanting like the buffalo, and a white belly. The skin was of a golden hue, and marked with large round white spots. In the lower part of the face it resembled the deer, on the forehead it had a high and pointed prominence; very large and round eyes, and the ears like those of a horse; near the ears, two small round horns, the greater part covered with hair, resembling the horns of a deer on their first appearance. Such was the length of the neck, and the animal raised its head so high when he chose, that he could eat with facility from the top of a lofty wall; and from the top of a high tree it could reach to eat the leaves of which it devoured great quantities. So that altogether it was a marvellous right to one who had never seen such an animal before."**

Prior to the arrival, in 1827, of two living specimens, sent by command of the Pacha of Egypt to the Courts of England and France, none had been seen in Europe since the end of the fifteenth century, when the Solds of Egypt sent one to Lorenzo di Medici. This individual was represented in the frescoes of Poggio Acajano, near Florence, with the inhabitants of which city it was very familiar—being accustomed to walk at perfect liberty about the streets, stretching its long neck to the balconies, to implore fruits and other fruits, wherewith it delighted to feed.† To modern Naturalists the species has been known only since its discovery in Southern Africa—no very precise account being obtained of its figure and habits, until within these last fifty years; and for these the world were principally indebted to the amusing and enthusiastic Le Vaillant, whose assertions, like those of many other travellers, were nevertheless originally received as pure fabrications. So early as the year 1774, a rude design, made from a specimen killed in an expedition two hundred leagues to the North of the Cape of Good Hope, was transmitted by Governor Tulbagh to the Academy of Sciences;—and this drawing, together with the ill-stuffed skin of a young one, presented at the same time, first proved that the species was not confined to Ethiopia as originally supposed; though it served also, by its incorrectness, to confirm the common error, into which even Buffon had been betrayed, of describing the fore-legs to be twice as long as the hind, "so that the ram seems brought down to the ground, and the beast, when it sits on its crupper, appears to be entirely on end,"‡ "I saw," says Belon, "at the castle of Cairo, an animal commonly called Zerapho. It was anciently called by the Latin, Camelopardalis, a name compounded of leopar and camel; for it is sprinkled and variegated with the spots of a leopard, and has a long neck like the camel. It is a most beautiful creature, as gentle in its disposition as a sheep, and more amiable than any other wild beast. The legs are long and slender, and those behind are so low, that the animal seems to stand on end." Such blunders as these have been long exploded; but even the improved delineations of the present day, having been all derived from half-grown and stunted prisoners, § limited to an enclosure which they could traverse from end to end in a few dozens of their ogre-like strides, are very far from being faithful portraits of the prancing Zerapho, as he appeared to me in his native deserts.

Where is the man who could behold the soil he treads upon, impressed with the recent footprints of this colossal quadruped, and not experience emotions of the deepest interest? Who is he amongst the votaries of the chaste Goddess, that shall bear tell of riding familiarly the sacred animal:—The glories of the African wilderness may have closed for ever on my view, so long as memory lasts they can never be obliterated from my mind; my recollections are the thrilling passages of which I am now to treat;—but after pens than mine, dived even in the brightest and most delicate exotics, after being captured in a region of the globe so distant, were transported in health and safety over deserts of arid sand, and across the salt seas, to Northern shores. Accompanied by several Nubian attendants, they were conducted through the streets of the metropolis, before day-light, towards their final destination—across the Nile, through M. Thibaut, through whose exertions the species was not confined to the courts of England and France, none had been seen in Europe since the end of the fifteenth century, when the Solds of Egypt sent one to Lorenzo di Medici. This individual was represented in the frescoes of Poggio Acajano, near Florence, with the inhabitants of which city it was very familiar—being accustomed to walk at perfect liberty about the streets, stretching its long neck to the balconies, to implore fruits and other fruits, wherewith it delighted to feed.† To modern Naturalists the species has been known only since its discovery in Southern Africa—no very precise account being obtained of its figure and habits, until within these last fifty years; and for these the world were principally indebted to the amusing and enthusiastic Le Vaillant, whose assertions, like those of many other travellers, were nevertheless originally received as pure fabrications. So early as the year 1774, a rude design, made from a specimen killed in an expedition two hundred leagues to the North of the Cape of Good Hope, was transmitted by Governor Tulbagh to the Academy of Sciences;—and this drawing, together with the ill-stuffed skin of a young one, presented at the same time, first proved that the species was not confined to Ethiopia as originally supposed; though it served also, by its incorrectness, to confirm the common error, into which even Buffon had been betrayed, of describing the fore-legs to be twice as long as the hind, "so that the ram seems brought down to the ground, and the beast, when it sits on its crupper, appears to be entirely on end,"‡ "I saw," says Belon, "at the castle of Cairo, an animal commonly called Zerapho. ** Levaillant, St. Blaire.  
† Le Vaillant.  
‡ Buffon.  
§ Prior.  
BUFFON.
Well do I recall the avidity with which, in the days of my boyhood, I devoured Le Vaillant’s picturesque and eloquent account of his first success in the chase of the Giraffe, at a period when men had long doubted of its existence; and many a time has my own bosom since leapt to the very emotions he describes. The appearance of a troop of those anteluvian figures, gilding majestically amid the wild magnificence of an African landscape, never failed to transport me beyond myself. Methinks I see them now—in yonder “field, spacious and delightful by the shade of many stately and aged trees”—the white chintz-pattern garments of the lady-like cows contrasting vividly with the chocolate coloured robe of that mighty bull. Aye, there they stand, grouped tranquilly in graceful and dignified attitudes, elevating their stately crests to the clouds, some crooning over the tops of the smaller trees, whilst others—burying their light heads among the reticulated boughs, and darting out their long black tongues like the chameleon, are busily drawing in the tender sprigs.

It was on the morning after our departure from the residence of his Amazoonoo Majesty, that I first actually saw the Giraffe. Although I had been for weeks on the tip-toe of expectation, we had hitherto succeeded in finding the gigantic footsteps only of the tallest of all the quadrupeds upon the earth; but at dawn of that day, a large party of hungry savages, with four of the Hottentots on horseback, having accompanied us across the Mariqua in search of Elans, which were reported to be numerous in the neighbourhood, we formed a long line, and having drawn a great extent of country blank, divided into two parties, Richardson keeping to the right, and myself to the left. Beginning at length to despair of success, I had shot a Hartebeest for the savages, when an object which had repeatedly attracted my eye—but which I had as often persuaded myself was nothing more than the branchless stump of some withered tree, suddenly shifted its position, and the next moment I distinctly perceived that singular form, of which the apparition had at times visited my slumber—but upon whose reality I now gazed for the first time. Gliding rapidly among the trees, above the topmost branches of many of which its graceful head nodded like some lofty pine, all doubt was in another moment at an end—it was the stately, the long-sought Giraffe. Putting spurs to my horse, and directing the Hottentots to follow, I presently found myself halting choked with excitement, rattling at the heels of an animal which to me had been a stranger even in its captive state, and which thus to meet, free on its native plains, has fallen to the lot of but few of the votaries of the chase. Sailing before me with incredible velocity, his long swan-like neck keeping time to the eccentric motion of his stilt-like legs—his ample black tail curled above his back, and whisking in ludicrous concert with the rocking of his disproportioned frame, he glided gallantly along “like some tall ship upon the ocean’s bosom,” and seemed to leave whole leagues behind him at each stride. The ground was of the most treacherous description—a rotten black soil overgrown with long coarse grass, which concealed from view innumerable gaping fissures that momentarily threatened to bring down my horse. For the first five minutes I rather lost than gained ground; and despairing over such a country, of ever diminishing the distance, or improving my acquaintance with this beast of the most treacherous description, I remounted my jaded beast, and one more effort brought me ahead of my pursuers.

Happily there were no bones broken, but the violence of the shock had caused the lashings of my previously broken rifle to give way, and had doubled the stock in half—the barrels only now hanging to the wood by the trigger-guard. Nothing dismayed however by this heavy calamity, I remounted my jaded beast, and one more effort brought me ahead of my wearied victim, which stood still and allowed me to approach. In vain did I now attempt to bind my fractured rifle with my hands, and despairing, over such a country, of ever diminishing the distance, or improving my acquaintance with this ogre in seven-league boots, I dismounted, and the mottled carcase presenting a fair and inviting mark, I had the satisfaction of sitting. Happily there were no bones broken, but the violence of the shock had caused the lashings of my previously broken rifle to give way, and had doubled the stock in half—the barrels only now hanging to the wood by the trigger-guard. Two days after this catastrophe having advanced to the Tolaan river, we again took the field, accompanied by the whole
of the male inhabitants of three large kraals, in addition to those that had accompanied us from the last encampment. The country had now become undulating, extensive mimosa groves occupying all the valleys, as well as the banks of the Tolnaa, winding amongst them on its way to join the Maripas. Before we had proceeded many hundred yards, our progress was opposed by a Rhinoceros, who looked defiance, but quickly took the hint we gave him to get out of the way. Two fat Elands had been pointed out at the edge of the copse the moment before, one of which Richardson disposed of with little difficulty, the other leading me through all the intricacies of the labyrinth to a wide plain on the opposite side—on entering which I found the fugitive was prostrate at my feet in the middle of a troop of Giraffes, who steepled their long necks, astounded at the intrusion—then consulted a moment how they should best escape the impending danger—and in another, were sailing away at their utmost speed. To have followed upon my then jaded horse would have been absurd, and I was afterwards unable to recover any trace of them.

Several hours' diligent search the following day, brought us within telescopic range of twelve, whose carpet robes flickered amid glare and vapour, by which their lower parts were quite obscured. Pursuing them a considerable distance, over an extensive plain, where mokanaa trees grew among thistles and mat-rushes, we repeatedly wounded the largest male, a gigantic dark coloured fellow, probably eighteen feet in height; but he merely acknowledged the receipt of each bullet as it whacked against his stern-posts and bulwarks, by wincing a little as if stung by a gnat—and then, tying an extra knot in his tail, increased his pace. Our famished horses falling repeatedly into the numerous Buffalo holes with which the ground was covered, we at length relinquished the chase, convinced of the impossibility of humbling the lofty head of the Giraffe, until our steeds should have improved in condition upon the fine pasturage which now abounded. A range of blue mountains which we visited some weeks afterwards with better success, bounded the wide prospect to the North Eastward, and the face of the country being covered with large herds of Elands, we ventured our spleen upon them,—the great host of savages by whom we were attended, quickly clearing away the curmuses of those we slew, and even quarrelling for the entrails.

Many days elapsed before we again beheld the tall Giraffes, nor were our eyes gladdened with his sight until after we had crossed the Cashan mountains to the country of the Baquaina, for the express purpose of seeking for him. After the many contraventions, how shall I describe the sensations I experienced, as on a cool November morning, after rapidly following some fresh traces in profound silence for several miles, I at length counted from the back of Bredaer, my most trusty steed, no fewer than thirty-two of various sizes, indistinguishably stretching their peacock necks to crop the tiny leaves that fluttered above their heads, in a flourishing mimosa grove which embellished the scenery. My heart leapt within me, and the blood coursed like quicksilver through my veins, for, with a firm wooded plain before me, I knew that they were mine; but although they stood within a hundred yards of me, having previously determined to try the bowing system, I reserved my fire. Notwithstanding that I had taken the field expressly to look for Giraffes, and in consequence of several of the remarkable spoors of those animals having been seen the evening before, had taken four mounted Hottentots in my suite, all excepting Piet had as usual slipped off unperceived in pursuit of a troop of Koodoos. Our stealthy approach was soon opposed by an ill-tempered Rhinoceros, which with her ugly old-fashioned calf stood directly in the path; and the twirling of her bright little eyes, accompanied by a restless rolling of the body, giving earnest of her mischievous intentions, I directed Piet to saunter her with a broadside, at the same moment putting spurs to my horse. At the report of the gun, and the sudden clattering of hoofs, away bounded the herd in grotesque confusion—clearing the ground by a succession of frog-like hops, and soon leaving me far in their rear. Twice were their towering forms concealed from view by a park of trees, which we entered almost at the same instant; and twice on emerging from the labyrinth, did I perceive them slitting over an eminence far in advance, their sloping backs reddening in the sunshine, as with giant port they topped the ridges in right gallant style. A white turban, that on emerging bore, was instantly charged and trampled under foot by three Rhinoceroses; and long afterwards, looking over my shoulder, I could see the ungainly brutes in the rear fagging themselves to overtake me. In the course of five minutes, the fugitives arrived at a small river, the treacherous sands of which receiving their spider legs, their flight was greatly retarded; and by the time they had floundered to the opposite side, and scrambled to the top of the bank, I could perceive that their race was run. Putting the steaming neck of my good steed, I urged him again to his utmost, and instantly found myself by the side of the herd. The lordly chief, being readily distinguishable from the rest by his dark chromed robe and superior stature, I applied the muzzle of my rifle behind his dappled shoulder with the right hand, and drew both triggers; but he still continued to shuffle along, and being afraid of losing him, I dismounted amongst the extensive mimosa groves, with which the landscape was now obscured, I sat in my saddle, loading and firing behind the elbow, and then placing myself across his path, to obstruct his progress. Mote, dignified, and majestic, stood the unfortunate victim, occasionally stooping his elastic neck towards his persecutor, the tears trickling from the lashes of his dark humid eye, as broadside after broadside was poured into his brawny front.

Presently a convulsive shivering seized his limbs—his coat stood on end—his lofty frame began to totter—and at the seventeenth discharge from the deadly grooved bore, like a falling minaret, bowing his graceful head from the skies, he soon

His drooping head sank gradually lower,  
And through his silk, the last drops sliding down  
From the red gash, fall heavy, one by one,  
Like the first of a thunder shower;—  

Digitised by the University of Pretoria, Library Services, 2013
form was prostrate in the dust. Never shall I forget the intoxicating excitement of that moment! At last, then, the summit of my hunting ambition was actually attained, and the towering Giraffe laid low. Tossing my turbanless cap into the air—alone, in the wild wood, I hurried with bursting exultation, and unshuddling my steel, rank exhausted with delight beside the noble prize that I had won.

When I leisurely contemplated the massive frame before me, seeming as though it had been cast in a mould of brass, and wrapped in a hide an inch and a half in thickness, it was no longer matter of astonishment that a bullet, discharged from a distance of eighty or ninety yards, should have been attended with little effect upon such amazing strength. Did stature alone constitute precedence, observes M. Le Vaillant, the Giraffe would undoubtedly claim the highest rank among quadrupeds.

From the crown of the elegantly-moulded head to the sole of the hoof of this magnificent animal, the extreme height was nineteen feet; the whole being equally divided into neck, body, and leg. Two hours were passed in completing a drawing; and Fret still not making his appearance, I cut off the ample tail, which exceeded five feet in length, and was measurably the most estimable trophy I had ever gained; but on proceeding to saddle my horse, which I had left quietly grazing by the side of a running brook, my chagrin may be conceived, when I discovered that he had taken advantage of my occupation to free himself from his halter, and abscond. Being ten miles from the wagons, and in a perfectly strange country, I felt convinced that the only chance of saving my pet from the clutches of the lion, was to follow his trail, whilst doing which with infinite difficulty, the ground scarcely deigning to receive a foot-press, I had the satisfaction of meeting Fret and Mohonyoom, who had fortunately seen and recaptured the beast. Returning to the Giraffe, we all feasted heartily upon the flesh, which, although at this season highly scented with the rank Mokaala blossoms, was far from despicable; and losing our way, in consequence of the twine-like resemblance of two scarped hills, we did not finally regain the wagons until after the setting sun had ceased to play upon the trembling leaves of the light umbels, and the golden splendour which was sleeping upon the plain, had gradually passed away.

The spell was now broken, and the secret of Camelopard hunting discovered. The next day Richardson and myself killed three; one, a female, slipping upon muddy ground, and falling with great violence, before she had been wounded, was dispatched by a shot in the head as she lay floundering like a tommy-long-legs. From this time we could reckon confidently only, struck in a vital part, fell at once in

is still one of extreme awkwardness, and from the browsing habits of the animal can be rarely necessary—the leaves, tender shoots, and blossoms of that singular species of mimosa, yeelded by the Colonists kameel doorn (Giraffe thorn), and found chiefly on dry plains or sandy deserts, forming its ordinary food. The size of this tree, together with its thick and spreading top, shaped like an umbrella, distinguish it at once from all others of the country—the Namaquas terming it the 'kansoo, whilst by all the Bechuanas it is recognized as the seetahoo. Both in flower and foliage it closely resembles the common Cape acacia, but the pod is an oval hook, filled with a solid mealy substance, and the stem is covered with stout thorns. The wood, excessively hard and heavy, and of a dark red colour, with a black heart, is much used by the Africans in the manufacture of spoons and other domestic utensils, many of which are ingeniously fashioned after the model of the Giraffe.

So far as came under my observation, both sexes are mute, and utter no cry whatever. The male, whose maximum stature appears to be about eighteen feet, increases in depth of colour with his years—the patriarchs becoming well nigh black; but the cows, whilst they seldom attain the height of seventeen feet, are uniformly of a fainter hue, bordering upon straw colour. Both sexes have crisp flaky coats, similarly marked with a rhomboidal or pentagonal carpet pattern, somewhat symmetrically disposed—and they possess in common, obtuse horns, or rather peduncles, about six or eight inches in length, covered with hair like the footstalk of a stag's antlers, but terminating in a black pencilled tuft. On the chaffron also is a remarkable prominence, which increases with age, and in the young females is scarcely perceptible. The senses of sight, hearing, and smell, are acute and defective; the full humid eyes, fringed with dark silken lashes, eclipsing those of the oft-sung Gazelle of the East. Beaming with the mildest and most intelligent expression, they are so arranged that the animal can see both before and behind without turning its graceful head. Nor is the construction of the tongue less remarkable—its mobility being such as to enable it to perform in miniature the office of the elephant's proboscis, by coiling round the twigs of lofty trees, and assisting, like the nose of the Tapir, in drawing the tender sprouts betwixt the flexible lips.

Amongst the Griquas, or Bushmen, as the Malato Hottentots residing beyond the border are termed by the Colonists, large parties are annually formed for the purpose of hunting the Eland and Kameel, the flesh of both being held in equal estimation, and the thick robe of the latter considered the se plus altra for sandal soles. Many of the wretched wиганов of these people are tatoched with an entire hide. During our sojourn at Chool, we had an interview with a party returning from the Molopo, freighted with the spoils of not fewer than thirty-three, in obtaining which they had expended the whole of their ammunition, and worn their wretched horses to skin and bone. A trader whom I met in the Cape Colony, assured me before I visited the interior, that he had himself counted so many as eight hundred Kameels in a single day, and during his extensive travels had ridden down hundreds. But on our return, after a little cross-examination, the number destroyed gradually dwindled down to one; which solitary individual appeared upon further investigation to have been entrapped in a pitfall! They are sometimes taken in this manner by the savages, who can never speak of the lofty Intootla without rising on tip-toe, and stretching their black necks to the utmost. A full-grown female, heavy in foal, was one night slaughtered by a lion whilst in the act of drinking at no great distance from our waggons; and in the morning, an inspection of the scene of the noisy conflict, proved that the giant strength of the victim had been paralyzed in a moment by the grip of its tawny foe. Indeed, notwithstanding the amazing power of the animal, I should be disposed to doubt its ability to maintain a race under the merciless jockeyship of the "great destroyer," who, clinging with teeth and talons, is said, or rather fabled, to be carried fifteen or twenty miles before the quarry sinks under him, and not unusually to be hurled off at last without effecting his purpose.

An inhabitant of Nubia and Abyssinia, as well as of the adjacent regions east of the Great Desert, the princely Zeerupa* occurs southward over central Africa, toward the settlement at the Cape, but is now to be found lower than the 24th parallel of latitude. Of sequestered haunts, it seeks the most secluded deserts, and even at its head quarters is by no means a common animal. Whilst we seldom saw one without having followed the trail, we never found more than five and thirty in the same day; and the range of its habitat, although so extensive, is exclusively confined to solitary regions, in which the kameel doorn is abundant. It was delightful to witness the courage evinced by our horses, in the pursuit of game, and even when brought into actual contact with this almost unsusual quadruped, they evinced no symptom of fear—a circumstance which, I confess,

* The Giraffe is conjectured to be the Zemer of Moses. The modern nomenclature is a corruption of the Arabic Zeerupa, implying elegance or beauty.
we felt sometimes disposed to ascribe rather to their meagre diet, than to the virtue of their training. Not indeed that there existed any real cause for alarm; for naturally gentle, timid, and peaceable, the beautiful Colossus has no means of protecting itself but with its heels; and although jammed into a corner, rarely even resorted to kicking as a mode of defence. Meek and resigned, it trusted to its speed alone, and having learned to its cost that “the race is not always to the swift,” wept such bitter tears, when vanquished, that but for its fleetness and rarity, the expression of its dove-like eyes might almost have disarmed me.
