Faculty of Arts

University of Pretoria

Pretoria

December 1999
Dedicated to my husband for being teacher, best friend, partner, eternally inspiring and dependable
ACKNOWLEDGEMENTS

It is a privilege to thank the following people and establishments for their contributions in the completion of this study:

1. Prof BJM Steyn, Department of Biokinetics, Sport and Leisure Sciences, for his valuable advice, support, patience, encouragement and above all, dignity and respect.

2. Prof JM Loots for his advice, support, patience, encouragement as well as the interminable hours of editing and illustrating, as together with his inexhaustible confidence in the study.

3. The late Mr F de M Cilliers and Ons Eerste Volksbank for financial support.

4. Prof GJ van Wyk and the Department for Biokinetics, Sport and Leisure Sciences placing the facilities needed for this study at my disposal.

5. Mrs Yvette Steyn for doing an excellent job as language editor.

6. Mrs Neeltje Steyn for performing a superb task in the editing of the final manuscript.

7. Prof Maryna Steyn of the Department of Anatomy for her advice and help with some critical aspects of the literature study.

8. Prof GP Loots for his help with the final editing and printing of the manuscript.

9. All the subjects (known and unknown) who were willing to be extensively measured, manipulated and questioned, and who formed the backbone of this study.

10. Vleissentraal Ltd, who helped to supply and finance much of the material for this study during their sport upliftment programmes.

11. The library staff of the University of Pretoria for the assistance with the literary research.

12. Our daughters for their unceasing concessions, tolerance and support.

13. Nadine for her assistance in many spheres.

14. My mother and sister for continuous moral support and encouragement.
15. The memory of my late father that strengthened my resolve to complete the task.

16. Katya for being a promise for the future.
SUMMARY

What is the ideal human upright posture? Where did it come from, how did it develop, what is its significance, how is it measured? What are the cause and effect of malposture?

Much has been published on the role of posture in physical as well as mental and emotional states of the individual. This study was undertaken to investigate these issues, while at the same time aiming to find the position and role of posture in the physical and psychological context of human life.

The first aspect of posture investigated was its definition. What constitutes good posture is still a debated issue. The conclusion drawn was that good posture represents the state of balance in an individual at rest and during motion. Ideally this state should be achieved with all the body parts aligned on top of each other requiring minimal effort and energy expenditure.

The evolutionary origin of the upright posture in man was traced in order to come to a clearer understanding of the anatomical, biomechanical and physiological mechanisms involved in posture. The positions and functions of some muscles and bones have remained, and some have changed during the development of the upright human from its quadrupedal ancestors. Maintenance of balanced posture depends mainly on the coordinated action of the stabilizing mono-articulated muscles, and their place and purpose in upright man were viewed in the light of their origins. By so doing one is able to uncover their intended use and to identify misuse of these muscles.

Development throughout childhood mimics the evolutionary process. A series of postural exercises was described, which follows the childhood/evolutionary
pattern, and have proven to be successful in postural rehabilitation and body-mind integration.

In order to understand the concept of the upright standing posture, control mechanisms responsible for maintaining upright posture were reviewed. These included the sensory and the neuromusculo-skeletal systems. This was duly undertaken in accordance with existing literature, it was concluded that posture is controlled in association with all human functions.

Following the concept that posture affects the mind and emotions, the work and theories of prominent researchers in the body-mind and postural integration field such as Frederick Alexander, Raymond Dart, Moshe Feldenkrais, Alexander Lowen, Wilhelm Reich and Ida Rolf were reviewed and distilled. This led to evidence that treatment of the body has an effect on the mind, that structure influences function and that postural equilibrium has a beneficial influence on both mind and body.

According to numerous workers malposture in man is pandemic. Ensuing literature and empirical research on total body posture, and the position of each area of the body, from the head to the feet, revealed divergent causes of this problem as well as effects of malposture, including negative self-image, psycholological problems, pain, fatigue and the inability to achieve the full human potential.

Although there is no obvious cause of postural imbalance, there are many ways of preventing or rectifying the disorder. During the course of a postural rehabilitation therapy, there is a good chance of uncovering the underlying cause of the postural imbalance. This can be as deep seated as a personality disorder or as clear as the fear of an old sport injury.

The incidence and extent of postural defects were investigated in two small groups of subjects with the aim to determine the range of postural deviations,
and the body areas most commonly affected. All subjects studied, leaned forward with the gravity line anterior to the ankle joint. Postural defects were prevalent in all subjects. Most of the subjects were categorized as having severe postural defects or gross deformity. Postural asymmetry and kyphosis were the most common defects. The conclusions drawn from these studies were that most people, in any age group, suffer from some type of postural defect, supporting the general consensus that malposture is a pandemic condition.

The effects of postural rehabilitation were also investigated. Postures improved in all the subjects over a period of twelve weeks, with a more vertical body alignment the most obvious change.

Postural rehabilitation has physical and psychological consequences. This was demonstrated by improvement in posture and increased body awareness, a decrease in the tendency to become fatigued, an decrease in back and neck stiffness and improvement in mental attitudes. Postural training in general could therefore be profitable for both body and mind, and an appreciation of good posture and its resulting efficiency represents the best kind of preventative medicine. Postural training should have a place in both Education and Health.

KEY WORDS

| Malposture           | Postural control           |
SAMEVATTING

Wat is die ideale menslike regop postuur? Waar kom dit vandaan, hoe het dit ontwikkel, wat is die betekenis daarvan en hoe word dit gemeet? Wat is die oorsake en gevolge van wanpostuur?

Baie is reeds gepubliseer oor die rol van postuur in fisiese, geestelike en emosionele toestande van die individu. Hierdie studie was onderneem om hierdie aspekte te ondersoek, en terselfdertyd die posisie en rol van postuur in die fisiese en sielkundige konteks van die menslike lewe na te gaan.

Die eerste aspek van postuur wat ondersoek was, is die definisie daarvan. Waaruit goeie postuur bestaan, is steeds 'n debateerbare onderwerp. Die gevolgtrekking was dat goeie postuur verteenwoordig 'n toestand van balans in 'n individu gedurende rus of tydens beweging. Hierdie toestand kan bereik word met al die liggaamsdele op mekaar belyn met minimale inspanning en energieverbruik.

Die evolusionêre ontstaan van die regop postuur van die mens was nagevors met die doel om 'n duidelike begrip van die anatomiese, biomekaniese en fisiologiese meganismes betrokke by postuur te bekom. Die posisies en funksies van sommige spiere en dele van die skelet het onveranderd gebly, terwyl sommige verander het gedurende die ontwikkeling van die regop mens uit sy viervoetige voorvaders. Handhawing van 'n gebalanceerde postuur by die mens hang hoofsaaklik af van die gekoördineerde aksie van die stabiliserende, mono-artikulerende spiere, en hulle plek en doel in die regop mens was oorweeg in die lig van hulle oorsprong. Sodoende was dit moontlik om hulle doel te ontbly en misbruik van hierdie spiere te identifiseer.
Ontwikkeling gedurende die kinderjare volg die evolusionêre proses. 'n Reeks posturale oefeninge was beskryf wat die evolusionêre patroon volg, en wat suksesvol toegepas kan word in posturale rehabilitasie en die integrasie van die liggaam en gees.

Om die konsep van die regopstaande postuur te verstaan, was die beheer meganismes wat verantwoordelik was vir die handhawing van die regop postuur nagegaan. Dit het die sensoriese en neuromuskulêre-skeletale sisteme ingesluit. Die studie was onderneem inagneming van bestaande literatuur. Die gevolgtrekking was dat postuur beheer word in assosiasie met alle menslike funksies.

Na aanleiding van die konsep dat postuur die emosies affekteer, was die werk en teorië van vooraanstaande navorsers, soos Frederick Alexander, Raymond Dart, Moshe Feldenkrais, Alexander Lowen, Wilhelm Reich en Ida Rolf in die veld van liggaam-gees en posturale integrasie ondersoek. Die bydraes van hierdie individue het getoon dat behandeling van die liggaam 'n effek het op die gees, dat funksie beïnvloed word deur struktuur, en dat posturale balans voordelig is vir beide liggaam en gees.

Volgens verskeie navorsers is wanpostuur 'n pandemiese toestand. Daaropvolgende literatuur en empiriese navorsing oor totale liggaamspostuur, en die posisie van elke area van die liggaam relatief tot die ander het uiteenlopende oorsake van die probleem ontbloot. Dit sluit in die gevolge van wanpostuur soos swak selfbeeld, sielkundige probleme, pyn, moegheid en die onvermoë om die volle menslike potensiaal te ontwikkel.

Alhoewel daar geen ooglopende rede vir posturale wanbalans is nie, is daar baie maniere om die toestand te voorkom of reg te stel. Gedurende terapie vir posturale rehabilitasie is daar 'n goeie kans op ontblotting van onderliggende rede vir die posturale wanbalans. Dit kan so diepliggend wees soos 'n persoonlikheidsafwyking of so duidelik soos die vrees vir 'n herhaling van 'n ou sport besering.
Die voorkoms en omvang van posturale afwykings was ondersoek in klein groepe subjekte met die doel om die omvang van posturale afwykings na te gaan sowel as die liggaamsarees wat die meeste geaffekteer word. Al die subjekte wat ondersoek was het vorentoe geleun met die gravitasielyn voor die enkelgewrig. Alle subjekte het posturale defekte getoon. Die meeste subjekte was gekategoriseer onder ernstige posturale defekte. Posturale asimmetrie en kifose was die mees algemene afwykings. Die gevolgtrekking was dat meeste mense, van enige ouderdomsgroep ly aan een of ander tipe posturale afwyking. Dit ondersteun die algemene konsensus dat wanpostuur 'n pandemiese toestand is.

Die gevolge van posturale rehabilitasie was ondersoek. Die postuur van alle subjekte het verbeter oor 'n tydperk van twaalf weke, met 'n meer regop liggaam die opvallendste verandering.

Posturale rehabilitasie het fisiese en sielkundige gevolge. Dit was aangedui deur 'n verbetering in postuur en 'n toename in liggaamsbewustheid, 'n afname in die neiging om moeg te word, 'n afname in rug- en nek styfheid en 'n verbetering in gemoedstoestand. Posturale opleiding kan in die algemeen voordelig wees vir beide liggaam en gees. 'n Waardering vir goeie postuur en die gevolglike effektiwiteit daarvan verteenwoordig die beste soort voorkomende medisyne. Posturale opleiding behoort dus 'n plek in te neem in beide Opvoedkunde en Gesondheid.

# TABLE OF CONTENTS

## CHAPTER 1 INTRODUCTION AND STATEMENT OF THE PROBLEM

1. **MAN'S UPRIGHT POSTURE**
   1.1 Posture and human structure
   1.2 The attainment of human uprightness

2. **AIMS AND PURPOSE OF THE STUDY**
   2.1 Posture from a physical perspective
   2.2 Posture from a psychological perspective
   2.3 Quantitative and qualitative studies on posture in South African subjects
   2.4 Conclusion and recommendations

## CHAPTER 2 POSTURE

1. **POSTURE AND POISE**
   1.1 Towards a definition of posture
   1.2 The dynamic nature of posture

2. **THE INFLUENCE OF GRAVITY ON HUMAN STRUCTURES**
   2.1 Definition of postural sway
   2.2 The features of postural sway
   2.3 Effect of age on postural sway
   2.4 Gender differences

3. **MEASUREMENT OF POSTURE**
   3.1 Body sway
   3.2 Unstable - and force platforms
   3.3 Computer analysis of posture
   3.4 Photography
   3.4.1 Photographic methods
CHAPTER 3 THE DEVELOPMENT OF UNIQUE HUMAN CHARACTERISTICS: A PALEO-ANTHROPOLOGICAL PERSPECTIVE

3.1 INTRODUCTION

3.2 FROM A SINGLE CELL TO AN UPRIGHT MULTICELLULAR CREATURE

3.3 THE DEVELOPMENT OF HUMAN CHARACTERISTICS

3.3.1 The transformation from a quadrupedal to an upright bipedal posture

3.3.1.1 The historical precursors of hominid bipedalism and the upright posture

3.3.2 The effect of the advent of the upright posture on human structure and function

3.3.2.1 Forward locomotion of the quadruped

3.3.2.2 Bipedal locomotion

3.3.2.3 Anatomical changes required for the upright position in the human

3.3.2.3.1 Changes in the structure of the sacrum and ilium

3.3.2.3.2 Changes in the pelvic musculature

3.3.2.4 Changes in the structure and function of the spine, thorax and neck

3.3.2.5 Changes in the structure and function of the cranium

3.3.2.6 Changes in the structure and function of the shoulder girdle and upper limbs

3.3.2.7 Changes in the structure and function of the lower limbs

3.3.2.8 The double-spiral arrangement of the body musculature

3.3.2.8.1 The origin of the double-spiral arrangement of the body musculature in vertebrates

3.3.2.8.2 The postural twists, posture and malposture

3.3.2.9 Upright man - the sum total of it all
3.4 THE MECHANISM OF THE UPRIGHT HUMAN POSTURE DURING STANDING AND SITTING: BASED ON PALEO-ANTHROPOLOGICAL EVIDENCE

3.4.1 General
3.4.2 The standing posture
3.4.2.1 The pelvic structures
3.4.2.2 The spine and thorax
3.4.2.3 The lower limbs
3.4.2.4 The neck and head
3.4.3 The spiral arrangement of the body musculature and posture
3.4.4 The sitting posture

CHAPTER 4 ONTOGENESIS: INDIVIDUAL DEVELOPMENT

4.1 INTRODUCTION
4.2 PRENATAL AND POSTNATAL DEVELOPMENT
4.2.1 Prenatal development
4.2.2 Postnatal development
4.3 CHANGES IN BODY PROPORTIONS
4.4 CENTRE OF GRAVITY
4.5 HEIGHT AND GROWTH RATE
4.6 POSTURAL PATTERNS IN CHILDHOOD
4.7 NEUROPHYSIOLOGICAL ASPECTS

CHAPTER 5 MALPOSTURE

5.1 INTRODUCTION
5.2 MALPOSTURE SEEN FROM A TOTAL PERSPECTIVE
5.3 THE UPPER QUARTER
5.3.1 The head and neck
5.3.1.1 Posture of the upper quarter 106
5.3.1.2 Developmental deformities of the upper quarter 108
5.3.1.3 Comments 108
5.3.1.4 Movements of the head and neck 111
5.3.1.5 Muscles of the upper quarter 113
5.3.1.6 Innervation of the upper quarter 114
5.3.1.7 External appearance of the neck 115

5.4 THE CERVICO-THORACIC REGION 116
5.4.1 General 116
5.4.2 Functional anatomy of the cervico-thoracic region 116
5.4.2.1 Kyphosis in the upper back 117
5.4.2.2 Interrelationships between the cervico-thoracic structures 117
5.4.2.3 Response of head and shoulder girdle to voluntary arm movements 118
5.4.2.4 Responses of head and arms to shoulder movements 118
5.4.2.5 Response of shoulder girdle and arms to movement of the head 118

5.5 THE THORACIC REGION (CHEST) 119
5.5.1 Round shoulders 119
5.5.2 The shape of the thorax 120
5.5.3 Thoracic kyphosis 122
5.5.4 The diaphragm 122
5.5.5 Receptors in the chest 123

5.6 THE LUMBAR REGION 124
5.6.1 General 124
5.6.2 Lumbar lordosis 124
5.6.2.1 Low back pain and posture 125
5.6.2.2 Balance between lumbar structures 127
5.6.2.3 Relationship of the lumbar area to others 128
5.6.2.4 Use of the pelvic region 128
5.7 THE PELVIC REGION AND LOWER EXTREMITY

5.7.1 Flexion at the hip
5.7.2 Functional variations
5.7.3 Pelvic tilt
5.7.4 Sacrum and femur
5.7.5 Lower extremities
5.7.5.1 Foot deformities
5.7.5.2 The ankle joint.
5.7.5.3 The knees

5.8 EFFECTS OF FAULTY POSTURE

5.8.1 Faulty posture
5.8.2 Clinical manifestations of faulty posture.
5.8.2.1 Back pain
5.8.2.2 Acroparaesthesia
5.8.2.3 Back strain
5.8.2.4 Cervical spondylosis
5.8.2.5 Fibrositic headache
5.8.2.6 Osteoarthritis
5.8.2.7 Vertigo

5.9 POSTURAL IMBALANCES AND THEIR CAUSES

5.9.1 Postural imbalances due to the fear of falling and other fears
5.9.2 Psychological aspects
5.9.2.1 Malposture and the experience of physical and psychological pain
5.9.2.2 Psychological problems
5.9.3 Habituation
5.9.4 Posture and fatigue
5.9.5 Affectation
5.9.6 Habit
5.9.7 Muscle imbalance
5.9.7.1 The concept of muscle imbalance 153
5.9.7.2 Syndromes involving the muscles 156
5.9.8 Clothing 159
5.9.9 Sedentary lifestyle 159
5.9.10 Standing for prolonged periods 159
5.9.11 Congenital deformity 159
5.9.12 Injury 160
5.9.13 Illness 160
5.9.14 Accumulation 160
5.10 CONCLUSION 160

CHAPTER 6 THE NEURAL CONTROL OF POSTURE AND EQUILIBRIUM 162

6.1 POSTURAL CONTROL 162
6.2 NEUROMUSCULAR-SKELETAL CONTROL OF THE UPRIGHT POSTURE FROM A PALEO-ANTHROPOLOGICAL PERSPECTIVE 165
6.2.1 Muscle synergies and Central Pattern Generators 165
6.2.2 Evolvement of movement control 166
6.3 THE REACTIONS (REFLEXES) RESPONSIBLE FOR MAINTENANCE OF POSTURE 168
6.3.1 Introduction 168
6.3.2 Somaesthetic (proprioceptive) reactions 169
6.3.2.1 Local postural reactions 170
6.3.2.1.1 The positive supporting reaction 170
6.3.2.1.2 The negative supporting reaction 171
6.3.2.2 Segmental postural reactions 171
6.3.2.3 General postural reactions 172
6.3.2.3.1 The neck as a receptor 172
6.3.2.3.2 The neck reactions (reflexes) 174
6.4 THE VESTIBULAR SYSTEM 175
6.4.1 The semicircular canals and the orientation of the body 176
6.4.2 The neural pathways for equilibrium 177
6.4.3 Reflexes of balance 177
6.4.3.1 The labyrinthine reactions 178
6.4.4 Interactions between the neck and labyrinthine reactions 179
6.4.5 The righting reactions 181
6.4.5.1 The five reactions 181
6.4.5.2 Centres for the righting reactions in the central nervous system 183
6.4.6 The general reactions in man 183
6.4.7 The inner ear and the upright posture 185
6.5 VISION 186
6.5.1 The role of vision in postural stabilization 186
6.5.2 Vision and vestibular function in the maintenance of posture 189
6.6 ORGANIZATIONAL HYPOTHESIS FOR THE SENSES 190
6.7 A CONCEPTUAL MODEL FOR THE CONTROL OF POSTURE 191
6.8 THE ANTICIPATORY TRAITS OF POSTURAL CONTROL 191
6.8.1 Cortical representation of the body surface (neural maps) 191
6.8.2 Modification of neural maps 192
6.8.3 Oculomotor control 193
6.8.4 Centre of gravity control 194
6.8.5 Anticipatory postural adjustments 195

CHAPTER 7 PSYCHOSOMATIC TREATMENTS, MIND-BODY THERAPIES AND BODY WORK 198

7.1 INTRODUCTION: THE MIND-BODY PROBLEM 198
7.2 CURRENT TECHNIQUES IN BODYWORK 202
7.2.1 Reichian therapy 202

CHAPTER 8 AN INVESTIGATION INTO SOME ASPECTS OF POSTURE

8.1 INTRODUCTION

8.2 POSTURE OF MIDDLE AGED MALES

8.2.1 Introduction

8.2.2 Subjects and methods

8.2.3 Results

8.2.3.1 Postural defects and their incidence

8.2.3.2 Occurrence and mean score of postural defects in the various body segments

8.2.4 Discussion

8.3 BODY ALIGNMENT AND POSTURE OF PRIMARY SCHOOL BOYS

8.3.1 Introduction

8.3.2 Subjects

8.3.3 Methods

8.3.4 Results

8.3.4.1 Body alignment

8.3.4.2 Posture and postural defects

8.3.5 Discussion

8.3.5.1 Body alignment

8.3.5.2 Postural defects

8.4 GENERAL DISCUSSION ON THE UPRIGHT POSTURE

8.4.1 Vertical alignment of the body

8.4.2 Misalignment and intellectual potential

8.4.3 Awareness of body regions

8.4.4 Implications of the rounded shoulder posture

8.4.4.1 The startle pattern posture

8.4.4.2 Reversion

8.4.4.3 Protection
8.4.5 The forward head position 295

8.5 POSTURAL REHABILITATION 295
8.5.1 Introduction 295
8.5.2 Body re-alignment and it’s effects on simple body movements 296
8.5.2.1 Methods 296
8.5.2.1.1 Subjects 296
8.5.2.1.2 Procedures 296
8.5.2.2 Results 298
8.5.2.3 Discussion 300
8.5.3 Subjective responses to postural education/rehabilitation in adults 302
8.5.3.1 Methods 302
8.5.3.1.1 Subjects 302
8.5.3.1.2 The questionnaires 303
8.5.3.2 Results and discussion 305

CHAPTER 9 CONCLUSION AND RECOMMENDATIONS 310

9.1 CONCLUSION 310
9.2 RECOMMENDATIONS 315
9.2.1 Postural training 315
9.3 AREAS FOR FUTURE RESEARCH 317
9.3.1 The physical aspects of posture 317
9.3.2 The psychological and social aspects of posture 317

Fig. 8.4  Mean position of body landmarks in front of ankle and standard deviation in subjects of the present study and that of Woodhull et al. (1985)  284

Fig. 8.5  Change in vertical alignment with increasing age  286

Fig. 8.6  Body alignment of 10 primary school boys in the present study (a), and adults in the Woodhull et al. (1985) study (b), showing individual variation in posture  287

Fig. 8.7  A comparison between the postural defects in physical education students in the Barlow (1956; 1990) study, and primary school boys of the present study  290

Fig. 8.8  The Mitzvah exercise  297

Fig. 8.9  The effect of the Mitzvah exercise on posture of subjects  298

Fig. 8.9  Fig. 8.9 (continued)  299

Fig. 8.10  Some postures of those who underwent postural education/rehabilitation  301
LIST OF TABLES

Table 3.1  Anatomical features necessary for brachiation, vertical climbing and upright bipedalism. The table shows both hominid uniquenesses and characters that reflect the human climbing and arboreal ancestry

Table 5.1  Alternating layers of hypertrophied and hypotrophied muscles in subjects with layer syndrome

Table 7.1  A classification of techniques for restoring postural homeostasis

Table 8.1  Classification and scoring of body use and defects

Table 8.2  Incidence and severity of postural defects in male senior executives

Table 8.3  Occurrence and mean score of postural defects in different body segments

Table 8.4  Mean positions of body landmarks and their standard deviation

Table 8.5  Occurrence and intensity of postural defects

Table 8.6  Occurrence and mean score of postural defects in different body segments

Table 8.7  Correlations between the different body-landmarks

Table 8.8  Questionnaire to determine the physical and emotional outcomes of postural rehabilitation
Table 8.9  Questionnaire to evaluate feelings of subjects about their bodies based on the possible outcomes of postural integration as proposed by Brennan (1992).

Table 8.10  Response to questions about physical awareness about problems in the body before and after postural rehabilitation.

Table 8.11  Subjective responses to postural reeducation.
