ABSTRACT

This thesis comprises of six independent chapters, besides the introduction and conclusions, with the common theme of optimal public policies in dynamic general equilibrium models with different kinds of distortions. Broadly speaking, the issues considered are: tax evasion, bureaucratic corruption, costs of tax collection and endogenous probability of survival.

With financial repression being modeled via obligatory reserve requirements that banks in the economy need to hold, the second chapter analyzes whether financial repression can be explained by endogenous tax evasion. In this regard the chapter develops two dynamic monetary general equilibrium endogenous growth models. When calibrated to four southern European countries, we indicate that higher degrees of tax evasion emanating from higher corruption and lower penalty rates would result in financial repression as a welfare-maximizing outcome. The third chapter develops an overlapping generations monetary endogenous growth model characterized by tax evasion, and analyzes the effect of the nature of tax evasion on the growth maximizing policies. It is concluded that a growth-maximizing government has to take the behavioral nature of tax evasion into account, since failure to do so will lead to misalignment

in not only fiscal but also monetary policies. In fact, the government is found to repress the financial sector more than the optimal level if it treats tax evasion as exogenous. The fourth chapter develops a dynamic general equilibrium overlapping generations monetary endogenous growth model of a financially repressed small open economy characterized by bureaucratic corruption, and uses it to analyze optimal policy decisions of the government following an increase in the degree of corruption. We find that increases in the degree of corruption should ideally result in a fall in seigniorage, as an optimal response of the benevolent government. In addition, higher degrees of corruption should also be accompanied with lower levels of financial repression. Chapter five develops a production-economy overlapping generations model characterized by financial repression, purposeful government expenditures and costly tax collection, to analyze whether financial repression can be explained by the cost of raising taxes. It is shown that costs of tax collection cannot produce a monotonic increase in the reserve requirements, what are critical, in this regard, are the weights the consumer assigns to the public good in the utility function and the size of the government. Chapter six analyzes the same issues as in the previous chapter, but in a monetary endogenous growth model. We show that higher costs of tax collection produce a monotonic increase in reserve requirements. Moreover, the government tends to rely more on indirect taxation, compared to direct taxation as costs of tax collection increase. The seventh chapter develops a simple monetary pure-exchange two-period overlapping generations model characterized by financial repression and endogenous mortality. The probability of survival of the young agents is assumed to depend upon the share of government expenditure on health, education and infrastructure. In this setting, we analyze the

welfare-maximizing policy mix between explicit and implicit taxation for a benevolent government. We show that increases in the survival probability lead to an increase in the reliance on seigniorage as a welfare maximizing outcome. However, for our results to hold, the seigniorage tax base must be large enough for the benevolent planner to use the inflation tax.

Each of the chapters aims to provide the theoretical underpinnings behind the design of optimal fiscal and monetary policies under tax evasion, bureaucratic corruption, costs of tax collection and endogenous probability of survival. With each of the models based on proper microfoundations and calibrated to match features of developing economies, the six independent papers attempt to broaden our understanding on public policies in the presence of commonly observed distortions that characterize the developing world.

*To my dearest daughter, Panashe Faith, this one is yours as I promised
when you were born.*

ACKNOWLEDGEMENTS

I would like to thank my thesis advisor, Prof. Rangan Gupta, for his guidance and support. Without his encouragement and support this research would not have been possible. I am indebted to him for the time and energy he spent on my work. His guidance throughout my research and career so far is highly appreciated. Working with Prof. Gupta was very inspiring. I am looking forward to our continued collaboration. I would also like to thank my thesis co-advisor, Dr Ruthira Naraidoo for going through my work.

I would also want to thank my colleagues at the Department of Economics at the University of South Africa for their encouragement. Special thanks go to Mrs Elna van Rensburg, Mrs Cecilia van Zyl and Ms Lydia Braimoh for their consistent support during the past three years. I am also indebted to my Ph.D. classmates at the Department of Economics for their encouragement and discussions over the years.

Chapter two of this thesis has been published as a working paper of the Economic Research Southern Africa (ERSA). In this regard, I would like to thank an anonymous referee for valuable comments. The same chapter has been accepted for publication in the Journal of Economic Studies. In this regard, I would like to thank an anonymous referee of this journal for helpful comments on an earlier version. Chapter five of this thesis was presented at the 13th Annual African Econometric Society (AES) conference held in July 2008 in Pretoria. I thank the the participants of this conference for their helpful comments and suggestions. The same chapter has been published as a working

paper in the ERSA working paper series (no. 99) and also in the Economic Notes-Review of Banking, Finance and Monetary Economics, volume 37 issue number 2, pages 141-154. In this regard, I would like to thank the respective anonymous referees for their valuable comments and suggestions. The preliminary results of chapter four were presented at the Economic Research Southern Africa (ERSA) macroeconomic workshop held in Cape Town in February 2008. For this, I am grateful to ERSA for their invitation and financial support. I also thank the participants at this workshop for their valuable comments and suggestions. I also want to thank the Department of Economics at University of Johannesburg for inviting me to present the seventh chapter of this thesis in their seminar series in September 2008.

Lastly, I would like to thank my family for their encouragement, love, support and patience. To my wife Petty, i want to say you are wonderful. To my sons Talent and Anesu, I expect you to do even better. To my lovely daughter, Panashe Faith, I love you. To my niece, Charity, this should inspire you.

TABLE OF CONTENTS

Chapter 1: Introduction	2
1.1 Introduction	2
Chapter 2: Tax Evasion and Financial Repression: A Reconsideration	
Using Endogenous Growth Models	5
2.1 Introduction	5
2.2 Economic Environment	10
2.2.1 Consumers	11
2.2.2 Financial Intermediaries	13
2.2.3 Firms	14
2.2.4 Government	16
2.3 Equilibrium	17
2.4 Calibration	18
2.5 Welfare-Maximizing Monetary Policy in the Presence of endogenous Tax	
Evasion	22
2.6 Conclusions	25
Chapter 3: Misalignment in the Growth-Maximizing Policies under	
Alternative Assumptions of Tax Evasion	28
3.1 Introduction	28
3.2 Economic Environment	30
3.2.1 Consumers	31
3.2.2 Financial Intermediaries	33
