Supervisor: Professor Chris PISTORIUS
Department of Materials Science and Metallurgical Engineering
Master of Engineering (Metallurgical Engineering)

ABSTRACT

Measurements of oxygen activities in a matte at high-temperature could be useful to determine and control the repartition of different elements, such as iron, copper, and nickel between the oxidised phase, (the slag) and the sulphide phase, (the matte). Electrochemical measurement of oxygen partial pressure in equilibrium with the melt can be performed by using solid electrolytes such as the zirconia solid electrolyte. The oxygen measurements in Cu-Ni-Fe-S matte were studied experimentally by measuring the partial pressure of oxygen through the EMF, using a silica-saturated slag and either a CO-CO$_2$-SO$_2$ gas mixture or Ar gas, at 1250°C. The calculated equilibrium oxygen partial pressure varied from $1.53 \times 10^{-8}$ to $2.64 \times 10^{-7}$ atm. Oxygen measurements were conducted by using fully stabilized zirconia as solid electrolyte. Two different solid reference electrodes were used: Cr/Cr$_2$O$_3$ and Fe/FeO. EMF measurements obtained with Cr/Cr$_2$O$_3$ solid reference electrode were less stable and accurate compared to those with Fe/FeO solid reference electrode. Therefore, EMF measurements on oxygen concentration point out that the Fe/FeO is more suitable solid reference electrode for this application than Cr/Cr$_2$O$_3$.

Analyses were obtained using the SEM, (scanning electron microscope) and the electron probe microanalyser.

The measured oxygen concentration was found to be sensitive to the iron content in the matte.

KEYWORDS: Activity, matte, slag, solid electrolyte.
ACKNOWLEDGEMENTS

The author would like to express his sincere appreciation to the following:

- His supervisor, Professor P.C. Pistorius, for the opportunity to work under him, his guidance and for the advice, constructive criticism, and encouragement during his supervision of this research project. The education received under him will be cherished forever.

- The University of Pretoria especially the department of Metallurgy for funding and laboratory facilities available for the completion of this research work.

- Mr. Peter Gräser for the help provided, in the sample analyses with the electron probe microanalyser CAMECA SX 100 at the department of Geology.

- Mr. Carel Coetzee for his assistance with the SEM analyses of all the samples at the Industrial Metals and Minerals Research Institute (IMMRI).

- All the staff of the department of Materials Science and Metallurgical Engineering for their support.

- Finally, to his family for all their love and understanding, for being a source of constant encouragement and inspiration.
