Dissertation submitted in fulfilment of the  
requirements for the degree

of

**Doctor of Philosophy**

University of Pretoria

Chemistry Department

November 2009

Supervisor: Dr. K. I. Ozoemena

## DECLARATION

I declare that the dissertation, which I hereby submit for the degree of Doctor of Philosophy in the Faculty of Natural and Agricultural Sciences at the University of Pretoria, is my own work and has not previously been submitted by me for a degree at this or any other tertiary institution.

## DEDICATION

*To my dear friend and mentor Dr. Kenneth Ozoemena  
"thank you for believing in me from Hons to PhD"*

## **ACKNOWLEDGEMENTS**

I would like to express my sincere gratitude to my inspirational supervisor Dr. Kenneth Ozoemena for his uncompromising guidance that has helped me to improve in all aspects of my life. For his encouragement when I failed to get any results for almost a year, for his compassion whenever I had difficulties in my personal life but most of all for his confidence in me. It has been an honour and privilege to work alongside the best electrochemist in South Africa who has inspired me to continue research in this field.

I would like to thank my dad and Nitasha for their encouragement and support during this challenging period. I would also like to express my gratitude to every person I have met during my journey from undergraduate to PhD. I am extremely grateful to all the PhD (Solomon, Adekunle, Dudu and Wendy) and MSc (Alfred, Nsovu and Joel) students in Dr. Ken's group (07-09) as well as Dr. Bolade for their continuous advice, constructive criticism and suggestions. I also sincerely appreciate all the Naomi Steenkamp's administrative assistance.

National Research Foundation (NRF) and Mintek (AuTEK Project) for their financial assistance. Finally, I wish to acknowledge several colleagues for constructive criticism as well as the concerns raised by referees of the published works from this dissertation.

## ABSTRACT

### **Electrochemical properties of self-assembled films of single-walled carbon nanotubes, monolayer-protected clusters of gold nanoparticles and iron (II) phthalocyanines at gold electrodes**

by

**Jeseelan Pillay**

*Supervisor: Dr. K. I. Ozoemena*

*Submitted in fulfilment of the requirements for the degree Doctor of Philosophy, University of Pretoria, Department of Chemistry*

This dissertation investigates the heterogeneous electron transfer dynamics and electrocatalytic behaviour of the following molecules immobilized on gold electrode: **(a)** 2-dimethylaminoethanethiol (DMAET), with and without integration with *poly(m-aminobenzenesulfonic acid)* functionalised single-walled carbon nanotubes (SWCNT-PABS); **(b)** SWCNT-PABS and iron (II) phthalocyanine nanoparticles (*nanoFePc*); **(c)** Colloidal gold / Gold nanoparticles (AuNP) and *nanoFePc* **(d)**; water-soluble iron (II) tetrasulfophtalocyanine (FeTSPc) and SWCNT-PABS, and **(e)** novel monolayer protected gold nanoparticles (MPCAuNPs) by means of either (i) layer-by-layer (LBL) self-assembly or (ii) self-assembled monolayer (SAM) fabrication strategy.

Atomic force microscopy and electrochemical studies (cyclic voltammetry, and electrochemical impedance spectroscopic) were used to monitor the substrate build-up, via strong electrostatic interaction. The surface  $pK_a$  of DMAET was estimated at 7.6, smaller than its solution  $pK_a$  of 10.8. It is also shown that SWCNT-PABS is irreversibly attached to the DMAET SAM. For layered films involving SWCNT-PABS and *nanoFePc* (Au-DMAET- SWCNT-PABS-*nanoFePc*)<sub>n</sub> (n=1-5 layers) as the number of bilayers increase, the electron transfer kinetics of the [Fe(CN)<sub>6</sub>]<sup>3-/4</sup> redox probe decreases. On the contrary, LBL assembly involving AuNP and *nanoFePc* (Au-DMAET-AuNP-*nanoFePc*)<sub>n</sub> (n=1-4 layers) shows an increase followed by a decrease in electron transfer kinetics subsequent to the adsorption of *nanoFePc* and AuNP layers, respectively. For SAMs involving FeTSPc and SWCNT-PABS, the mixed hybrid (Au-DMAET-SWCNT-PABS/FeTSPc) exhibited fastest charge transport compared to other electrodes. For the novel MPCAuNPs, the protecting or stabilizing ligands investigated were the (1-sulfanylundec-11-yl) tetraethylene glycol (PEG-OH) and the (1-sulfanylundec-11-yl) polyethylene glycolic acid (PEG-COOH). Three different mass percent ratios (PEG-COOH : PEG-OH), viz. 1:99 (MPCAuNP-COOH<sub>1%</sub>), 50:50 (MPCAuNP-COOH<sub>50%</sub>) and 99:1 (MPCAuNP-COOH<sub>99%</sub>) were used to protect the gold nanoparticles. The impact of these different ratios on the electron transfer dynamics in

organic and aqueous media was explored. The average electron transfer rate constants ( $k_{\text{et}} / \text{s}^{-1}$ ) in organic medium decreased as the concentration of the surface-exposed  $-\text{COOH}$  group in the protecting monolayer ligand increased:  $\text{MPCAuNP-COOH}_{1\%}$  ( $\sim 10 \text{ s}^{-1}$ )  $>$   $\text{MPCAuNP-COOH}_{50\%}$  ( $\sim 9 \text{ s}^{-1}$ )  $>$   $\text{MPCAuNP-COOH}_{99\%}$  ( $\sim 1 \text{ s}^{-1}$ ). In aqueous medium, the trend is reversed. This behaviour has been interpreted in terms of the hydrophobicity (quasi-solid nature) and hydrophilicity (quasi-liquid nature) of the terminal  $-\text{OH}$  and  $-\text{COOH}$  head groups, respectively. The ionization constants of the terminal groups (i.e., surface  $\text{p}K_{\text{a}}$ ) was estimated as  $\sim 8.2$  for the  $\text{MPCAuNP-COOH}_{1\%}$ , while both  $\text{MPCAuNP-COOH}_{50\%}$  and  $\text{MPCAuNP-COOH}_{99\%}$  showed two  $\text{p}K_{\text{a}}$  values of about 5.0 and  $\sim 8.0$ , further confirming the hydrophilicity / hydrophobicity of these surface functional groups.

Hydrogen peroxide ( $\text{H}_2\text{O}_2$ ), epinephrine (EP) and ascorbic acid (AA) were used as model analytes to examine electrocatalytic ability of these nanostructured assemblies. The electrochemical reduction of  $\text{H}_2\text{O}_2$  at a constant concentration was amplified upon increasing bilayer formation of SWCNT-PABS and *nano*FePc, while SWCNT-PABS/FeTSPc showed the best response towards the detection of epinephrine.  $\text{MPCAuNP-COOH}_{99\%}$  showed an excellent suppression of the voltammetric response of the AA and an enhanced electrocatalytic activity towards the detection of EP compared to the other MPCAuNPs.

Figure 3.45: (a) CV and (b) SWV plots of bare-Au, Au-DMAET, Au-DMAET-MPCAuNP-COOH<sub>1%</sub>, Au-DMAET-MPCAuNP-COOH<sub>50%</sub> and Au-DMAET-MPCAuNP-COOH<sub>99%</sub> in 0.5M H<sub>2</sub>SO<sub>4</sub>. **210**

Figure 3.46: Nyquist plots resulting from bare-Au, Au-DMAET, Au-DMAET-MPCAuNP-COOH<sub>1,50,99%</sub>, in 0.5 M H<sub>2</sub>SO<sub>4</sub>. **211**

Figure 3.47: CV profiles showing bare-Au, Au-DMAET, Au-DMAET-MPCAuNP-COOH<sub>1,50,99%</sub>, in 1 mM Fe(CN)<sub>6</sub><sup>3-/4-</sup>. **213**

Figure 3.48: Nyquist plots resulting from bare-Au, Au-DMAET, Au-DMAET-MPCAuNP-COOH<sub>1%</sub>, Au-DMAET-MPCAuNP-COOH<sub>50%</sub> and Au-DMAET-MPCAuNP-COOH<sub>99%</sub> in 1 mM Fe(CN)<sub>6</sub><sup>3-/4-</sup>. **215**

Figure 3.49: Bode plots showing -Phase angle vs. log. f for bare-Au, Au-DMAET, Au-DMAET-MPCAuNP-COOH<sub>1,50,99%</sub> in 1 mM Fe(CN)<sub>6</sub><sup>3-/4-</sup>. **218**

Figure 3.50: Typical impedance spectral profiles showing nyquist plots of (a) MPCAuNP-COOH<sub>1%</sub>, (b) MPCAuNP-COOH<sub>99%</sub> obtained in PBS solutions of [Fe(CN)<sub>6</sub>]<sup>4-</sup>/[Fe(CN)<sub>6</sub>]<sup>3-</sup>. **220**

Figure 3.51: Plot of charge transfer resistance (R<sub>ct</sub> / kΩ) against pH for MPCAuNP-COOH<sub>1%</sub>, MPCAuNP-COOH<sub>50%</sub> and MPCAuNP-COOH<sub>99%</sub> obtained in PBS solutions of [Fe(CN)<sub>6</sub>]<sup>4-</sup>/[Fe(CN)<sub>6</sub>]<sup>3-</sup>. **221**

Figure 3.52: CV evolutions in 10 μM AA at Au-DMAET-MPCAuNP-COOH<sub>1,50,99%</sub>. **224**

Figure 3.53: (a) and (c) shows comparative CV evolutions of Au-DMAET-MPCAuNP-COOH<sub>1%</sub> and Au-DMAET-MPCAuNP-COOH<sub>99%</sub> in 10 μM EP pH7.4 and 9.68. (b) and (d) represent their corresponding CVs in their respective buffer solutions only. **225**

## LIST OF SCHEMES

- Scheme 1.1: Generalized schematic representation of electrocatalysis at an electrode modified with a catalyst **29**
- Scheme 1.2: Reaction scheme illustrating the one-step stabilization and functionalization of gold nanoparticles with –COOH and –OH PEG Ligands. **71**
- Scheme 2.1: A cartoon representation showing the synthesis of nano-structured Iron (II) phthalocyanine. **115**
- Scheme 3.1: Cartoon showing the schematic representation of the SAM formation of DMAET and DMAET–SWCNT-PABS. **125**
- Scheme 3.2: Schematic representation depicting the layer-by-layer assembly of *nano*FePc and SWCNT-PABS on gold surface. **138**
- Scheme 3.3: Schematic representation showing the fabrication route for Au-DMAET-FeTSPc, Au-DMAET-SWCNT-PABS and Au-DMAET-SWCNT-PABS/FeTSPc. **176**
- Scheme 3.4: Schematic of the self-assembly process via. electrostatic interaction between the positively-charged DMAET monolayer and the negatively-charged monolayer-protected clusters of gold nanoparticles. **197**

## LIST OF TABLES

Table 1.1: The diagnostic criteria for reversible, irreversible and quasi-reversible cyclic voltammetric processes.	<b>21</b>
Table 3.1: Summary of the EIS evolutions of the electrodes ( $n = 5$ ), percentage errors from fitting the raw EIS data are shown in bracket.	<b>148</b>
Table 3.2: Comparative analytical data for the detection of EP using gold based electrodes	<b>165</b>
Table 3.3: Comparative EIS parameter data obtained for Au-DMAET, Au-DMAET-SWCNT-PABS, Au-DMAET-FeTSPc and Au-DMAET-SWCNT-PABS/FeTSPc.	<b>192</b>
Table 3.4: Comparative EIS data obtained for Au-DMAET-MPCAuNP <sub>1,50,99%</sub> in CH <sub>2</sub> Cl <sub>2</sub> containing 0.1M TBAP.	<b>206</b>
Table 3.5: Comparative EIS data obtained for bare-Au, Au-DMAET-MPCAuNP <sub>1,50,99%</sub> in H <sub>2</sub> SO <sub>4</sub> .	<b>211</b>
Table 3.6: Comparative EIS data obtained for bare-Au, Au-DMAET-MPCAuNP <sub>1,50,99%</sub> in 1 mM Fe(CN) <sub>6</sub> <sup>3-/4-</sup> .	<b>217</b>
