DECLARATION

I hereby declare that the thesis submitted at the University of Pretoria for the award of PhD degree is my work and has not been submitted by me for a degree at any other university or institution of higher learning.

Charlotte Atsango Serrem
DEDICATION

This thesis is dedicated to my loving husband Dr. Cornelius Kibet Serrem for understanding and sharing my dreams, believing in my ability to achieve them and for the support and sacrifice to enable me achieve them.
ACKNOWLEDGEMENTS

I would like to express my deepest gratitude to my supervisor Prof. J.R.N. Taylor for his excellent guidance, constructive criticism and encouragement throughout my study. I also thank my co-supervisors Prof A. Oelofse for the timely advice on the nutrition study and Dr. H.L. de Kock for the valuable advice and support in sensory evaluation.

I am grateful to Dr Tamsyn Pulker of the Biomedical Research Centre of the University of Pretoria for her contribution to the rat study and Ilse Janse Van Rensburg for the technical support. I appreciate Dr Janet Taylor, for her help and advice during the rat feeding study and countless other times during this research.

I wish to thank Prof. A. Minnaar, Head of Food Science Department for her kindness and interest in my work. My appreciation is also extended to Dr N. Emmambux, Dr. G. Duodu and Prof E. Buys for their useful advice at different stages during this programme.

Mr E. Smith, of the Mamelodi campus and Dr. G. Bender of the University of Pretoria are thanked for linking me to Zakhele Primary school for the consumer acceptability study.

Marise Keneer, Tabia Mokhele, Lesedja Kgomo and Bheki Dlamini are thanked for their technical support at various stages of my study.

I am indebted to Vlaamse Interuniversitaire Raad (VLIR-UOS), Belgium and Moi University, Kenya for a PhD scholarship. My sincere gratitude is also extended to Prof. S. Shitote and Prof. B. Manderick for ensuring that my funding was sustained.

Special thanks to my friends Doreen Hikezi, Dr. Ann Mastamet, Anita Ongosi and my fellow postgraduate students with whom it was an honour to exchange ideas and learn from.

I would like to express my deepest appreciation to my husband Dr. C. Serrem for his unwavering support and my sons Kevin, Rodel and Edgar for their patience when I was away from home. I also thank my sisters for encouragement and mothering my sons in my absence.

Finally, but most important, I thank God for the gift of life and for giving me the strength, will and wisdom to complete this work.
ABSTRACT

Development of soy fortified sorghum and bread wheat biscuits as a supplementary food to combat Protein Energy Malnutrition in young children

By

Charlotte Atsango Serrem

Supervisor: Prof J. R. N. Taylor
Co-supervisors: Prof A. Oelofse
Dr H. L. de Kock

Protein Energy Malnutrition (PEM) due to under nutrition is a major public health problem among children in Africa and other developing countries. Sorghum and bread wheat, which are important dietary staples in the semi-arid tropics of Africa, are suitable vehicles for delivering proteins to alleviate PEM. Formulation of foods from these low-lysine staples fortified with legumes is a sustainable approach to improve the protein nutritional quality of foods for young children. Biscuits offer a valuable vehicle for fortification as they are nutrient dense, ready-to-eat, have a long shelf-life and are popular. Therefore, this study investigated the effect of complementing sorghum and bread wheat with defatted soy flour on the nutritional and sensory quality and consumer acceptability of biscuits.

Biscuits were formulated and developed by compositing sorghum and bread wheat flours with defatted soy flour at different ratios. To establish the nutritional characteristics of biscuits, proximate composition, lysine and reactive lysine contents and in vitro protein digestibility were determined. Protein Efficiency Ratio (PER), Food Efficiency Ratio (FER) True Digestibility and Biological Value (BV) of sorghum biscuits were determined using Sprague Dowley weanling male rats. The sensory characteristics of biscuits were evaluated using a descriptive panel and instrumental texture analysis. Acceptability was evaluated using eight to nine year old school children.
Compared to the 100% cereal biscuits, sorghum-soy and bread wheat-soy composite biscuits in a 1:1 ratio had at least double the protein, mineral and crude fibre contents. The lysine contents of biscuits increased by 500-700%. For the sorghum-soy biscuits, in vitro protein digestibility increased by 170% and Protein Digestibility Corrected Amino Acid Score (PDCAAS) was 8 times higher. Two such biscuits of 28 g each could provide 50% of the recommended daily protein intake for 3 to 10 year olds. In the animal study, PER and FER for sorghum-soy biscuits were equivalent to the reference casein. True Digestibility was high for all diets, 85 to 95% and BV of sorghum biscuits was higher than sorghum-soy diet by 20%.

Principal Component Analysis (PCA) revealed that 61% and a further 33% of the variation in sensory properties was due to the type of cereal and concentration of soy in biscuits, respectively. Maximum stress increased by 39% and 34% in sorghum-soy and bread wheat-soy biscuits, respectively at 1:1 ratio. Spread factor of biscuits increased by 7 to 32%. Biscuits were darker in colour (reduced L* value) by 14 to 56% and hardness increased by 84% in sorghum biscuits. Positive hedonic scores by 8 to 9 year old school children for fortified biscuits were sustained above 80% through 8 consumption occasions. This data shows that fortifying with defatted soy flour imparts positive sensory characteristics associated with biscuits to sorghum and bread wheat biscuits and the acceptance of such biscuits may be sustained over an extended period of time.

This study indicates that soy fortified sorghum and bread wheat biscuits have high nutrient density, protein quality, positive sensory properties and high acceptability if consumed over an extended period. Hence, the biscuits have great potential as protein-rich supplementary foods to alleviate PEM among children and to provide an income to small holder farmers in rural African communities through purchase of grain for the Home Grown School Feeding Programme.
