**OCTOBER 2003**

## ACKNOWLEDGEMENTS

During this study I have benefited from the inputs of a number of people and institutions. I wish to thank:

Professor Jan van Heerden who, as my study leader, provided me with direction and continued support throughout the study. I have benefited from his keen interest in CGE modelling and his desire to develop the CGE modelling capacity at the Department of Economics.

In the course of this study, I have been fortunate to meet Professor Mark Horridge of the Centre of Policy Studies in the University of Monash. I benefited from his assistance in the constructing of a CGE model and also his knowledge of CGE modelling. I appreciated his willingness to assist, and his interest in my studies.

My wife, Tessa, who approached this study with enthusiasm and support – this was truly a team effort! Apart from the infrastructure and moral support, I am also thankful for her assistance with the first round of proof reading of the document.

The study served to, once again, highlight the support that I have received from my family throughout my lifetime. Although each member played a unique part in this venture, I thank my mother in particular. For her example, her unwavering support and her complete disregard for herself with matters regarding her sons.

I am grateful for the funding that I have received from the Mellon Foundation. The funding assisted me in visiting the Centre of Policy Studies in Melbourne and a number of conferences.

I acknowledge that all of this, for which I am thankful, are blessing from God. All honour to Him.

Theuns De Wet

**The Effect of a Tax on Coal in South Africa: A CGE Analysis**

Probably the biggest concern for South African policy makers is the high level of unemployment that persists in the economy. There is thus an urgent need for policies that could increase employment growth. Any policy that could address these issues, would undoubtedly find favour with policy makers.

Despite high levels of unemployment and social imbalances, there are also concerns about South Africa's environmental management. It seems as if the debate of sustainable development, that has held the attention of policy makers in developed regions of the world for the past decade, has finally caught up with South Africa. One of the concerns that needs to be addressed is the relatively high level of CO<sub>2</sub> emissions created by economic activity in South Africa.

Given the issues discussed above, the purpose of this study is to determine whether policy makers in South Africa could introduce environmental taxation in the form of an intermediate tax on coal, without aggravating the problems of unemployment and the skew welfare distribution. The literature pertaining to the "double dividend" and the "Porter Hypothesis" motivates the possibility of achieving this result.

The results from this study indicate that South African policy makers should approach the problem of controlling the demand for coal with caution. It is shown that any policy that attempts to increase the price of coal would achieve very little environmental benefit. Although such a tax could serve as an attractive source of revenue for the government, the socio-economic benefits achieved through recycling of the tax would also be small and it is debatable whether they would warrant the administration and political debate that would accompany them.

It is therefore evident that policy makers will have to invest in research and development programs that will result in a reduction in the use of coal within the production process. Results from policy simulations have indicated that successful implementation of such an investment would not only reduce CO<sub>2</sub> emissions significantly, but could also increase economic growth, welfare and employment.

**CONTENTS**

<b>LIST OF TABLES</b>	<b>vi</b>
<b>LIST OF FIGURES</b>	<b>viii</b>
<b>1. INTRODUCTION AND BACKGROUND</b>	
1.1 Introduction	1
1.2 Objective of the study	2
1.3 Outline of the study	4
<b>2. THE USE OF COAL AND CARBON POLLUTION</b>	
2.1 Introduction	6
2.2 An introduction to the South African coal industry	6
2.3 The structure of the coal industry	
2.3.1 Coal production	8
2.3.2 Coal consumption and forward linkages	8
2.4 Coal consumption and the environment	11
2.5 Economic incentives for reduction of carbon pollution	14
2.6 Conclusion	15
<b>3 THE SOUTH AFRICAN LABOUR MARKET</b>	
3.1 Introduction	16
3.2 South African unemployment: a description of the market	17
3.3 South African unemployment: voluntary or involuntary?	21
3.4 South African unemployment: the reasons	24
3.5 South African unemployment: suggested solutions	27
3.6 Conclusion	29
<b>4 THE DOUBLE DIVIDEND HYPOTHESIS</b>	
4.1 Introduction	30
4.2 Defining a double dividend	32
4.2.1 The weak form of the double dividend	32
4.2.2 The intermediate and strong forms of the double dividend	33
4.3 The double dividend under partial equilibrium analysis	34
4.4 The double dividend under general equilibrium analysis	35
4.5 Requirements for attaining the second dividend	38

4.6	The double dividend: empirical findings	44
4.6.1	Results from the US economy	44
4.6.2	Results from the European economies	51
4.7	Conclusion	56
<b>5</b>	<b>TECHNOLOGICAL INNOVATION, THE ENVIRONMENT AND ECONOMIC GROWTH</b>	<b>58</b>
5.1	Introduction	58
5.2	Technological innovation and economic growth	58
5.3	The determinants of technological innovation	60
5.4	Inducing technological innovation	61
5.5	Funding technological innovation in South Africa	66
5.6	Conclusion	68
<b>6</b>	<b>INTRODUCTION TO AN APPLIED GENERAL EQUILIBRIUM MODEL</b>	<b>69</b>
6.1	Introduction	69
6.2	Introduction to general equilibrium modelling	69
6.3	A description of general equilibrium modelling	71
6.4	From a general equilibrium model to a computable general equilibrium model	72
6.5	Conclusion	73
<b>7</b>	<b>REVIEW OF THE STRUCTURE OF THE ORANI MODEL</b>	<b>74</b>
7.1	Introduction	74
7.2	The ORANI model and the equations for intermediate and primary factor inputs	75
7.3	A review of equations used for households and other final demand equations in ORANI	80
7.4	A review of pricing equations that relate commodity prices to costs in the ORANI model	89
7.5	A review of the market clearing equations in ORANI	93
7.6	Additional equations for explaining gross domestic product and allocation of investment across industries	96
7.7	Conclusion	98

<b>8</b>	<b>A CGE MODEL FOR SOUTH AFRICA: DATA BASE AND ELASTICITIES</b>	<b>99</b>
8.1	Introduction	99
8.2	Description of the South African database that will be used for the model	100
8.3	Elasticities required for a CGE model of the South African economy	102
8.4	Conclusion	116
<b>9</b>	<b>MODEL CLOSURES AND POLICY SHOCKS</b>	<b>117</b>
9.1	Introduction	117
9.2	A suggested short-run closure for performing revenue neutral coal tax shocks on the South African economy	118
9.3	The proposed short-run policy shocks	119
9.4	A suggested long-run closure for performing revenue neutral coal tax shocks on the South African economy	122
9.5	The proposed long-run policy shocks	122
9.6	Conclusion	123
<b>10</b>	<b>SHORT-RUN POLICY SIMULATION RESULTS</b>	<b>124</b>
10.1	Introduction	124
10.2	A fifty percent tax on coal	124
	10.2.1 Macroeconomic results	124
	10.2.2 The terms of trade	126
	10.2.3 Consumption	128
	10.2.4 The effect on the demand for coal	130
	10.2.5 Industry-specific results	130
10.3	A fifty percent tax on coal and lump sum transfer to low income households	131
	10.3.1 Macroeconomic results	131
	10.3.2 The terms of trade	133
	10.3.3 Consumption	133
	10.3.4 The effect on the demand for coal	135
	10.3.5 Industry-specific results	135
10.4	A fifty percent tax on coal and decrease in the intermediate taxation of food and agricultural products	136

10.4.1	Macroeconomic results	136
10.4.2	Terms of trade	137
10.4.3	Consumption	138
10.4.4	The effect on the demand for coal	139
10.4.5	Industry-specific results	140
10.4.6	A comparison of the short-run simulation results	141
10.5	Conclusion	142
<b>11</b>	<b>LONG-RUN POLICY SIMULATION RESULTS</b>	<b>144</b>
11.1	Introduction	144
11.2	A fifty percent tax on coal: the long-run consequences	144
11.2.1	Macroeconomic results	144
11.2.2	The terms of trade	146
11.2.3	Consumption	147
11.2.4	The effect on the demand for coal	148
11.2.5	Industry-specific results	148
11.3	A fifty percent tax on coal that is used to fund technological change	149
11.3.1	Macroeconomic results	149
