factor which weighs in on the side of the surgeon. It should rather be seen as supportive of the patient’s claim. Such cases are rare. One cannot help but ask why the patient as the layperson should carry the risk of this rare occurrence when it is the doctor, the expert, who is in the business of sterilisations and is profiting on the basis of his alleged expertise and skill? If the fact that such cases are rare counts in favour of the doctor who is an expert, who has held himself out as an expert to the patient, a layperson, and who is the only person who is likely to know what he actually did or failed to do in relation to a sterilisation operation, the chances of the patient’s ever being able to prove that the doctor acted in breach of contract are slim to non-existent. If the fact that such cases are rare counts in the patient’s favour, however, then the doctor must discharge an onus. He must have adequate records of what he did that day. He must be able to show that he used a surgical procedure that is generally accepted as being suitable for its intended purpose. If the doctor has not acted in breach of contract in such a situation it should not be difficult for him to show this on a balance of probabilities. In Thake the court observed that if the defendant had given his usual warning the objective analysis of what he conveyed would have been quite different.

In another context, the South African law of contract does not hesitate to impose the risk upon the person who is skilled or an expert and is trading on or in that skill or expertise. In Jaffe & Co (Pty) Ltd v Bocchi And Another243 the court observed at p 363:

"The seller who is an artifex is placed in a special category. See Voet, 21.1.10. He is fully liable for consequential damages even though ignorant of the latent defects. The South African Provincial Divisions have gone further. They have followed Pothier where he says in his treatise on the contract of sale:
‘There is one case in which the seller, even if he is absolutely ignorant of the defect in the thing sold is nevertheless liable to a reparation of the wrong which the defect causes the buyer in his other goods; and this is the case where the seller is an artisan or a tradesman who sells the manufacture of his own trade, or of the kind of dealing of which he makes a business.’
Then he quotes certain examples and proceeds:
‘It is the same in regard to a dealer whether he is or is not the maker of the articles which he sells. By the public profession which he makes of his trade he renders himself responsible for the goodness of the merchandise which he sells for the use to which it is destined. If he is the manufacturer he ought to employ in his business none but good workmen for whom he is responsible. If he is not the manufacturer he ought to expose for sale none but good articles. He ought to have knowledge of his wares, and ought to sell none but good.”"

243 Jaffe & Co 1961 (4) SA 358 (T)
The basis for this rule of contract law is clearly public policy244. Hiemstra J states at p 364:

“With humble respect I agree with the statement of Schreiner, J.A., in Hackett’s case at p. 692 where he said:

‘The decisions in the Provincial Divisions . . . broadly speaking recognise the justice of the generalisation that a seller who manufactures or deals in a kind of goods should be treated as having given the buyer of such goods from him his expert assurance that the goods are free from latent defects. It seems to me that this recognition accords with the present day needs of the community.’

In Ciba-Geigy (Pty) Ltd v Lushof Farms (Pty) Ltd En ’n Ander245 the court held that a merchant-dealer who publicly professes to have expert knowledge in respect of the type of product that he sells is liable to the purchaser under the actio empti if the latter should suffer consequential damage as a result of a latent defect in the res vendita. It said that a latent defect is defined as an abnormal quality or attribute which destroys or substantially impairs the utility or effectiveness of the res vendita for the purpose for which it has been sold or for which it is commonly used246.

Consequential damages are greater in extent than ordinary damages. Under the aedilitian remedies it is contrasted with redhibitorian relief which is relief for the return of the purchase price paid for the defective goods247.

---

244 In Holmdeene Brickworks (Pty) Ltd v Roberts Construction Co Ltd 1977 (3) SA 670 (A), Corbett IA observed at p 682:

“The legal foundation of respondent’s claim is the principle that a merchant who sells goods of his own manufacture or goods in relation to which he publicly professes to have attributes of skill and expert knowledge is liable to the purchaser for consequential damages caused to the latter by reason of any latent defect in the goods. Ignorance of the defect does not excuse the seller. Once it is established that he falls into one of the above-mentioned categories, the law irresistibly attaches this liability to him, unless he has expressly or impliedly contracted out of it. (See Voet, 21.1.10; Pothier, Contrat de Vente, para. 214; Kroonstad Westelike Boere Ko-op. Vereniging v Botha, 1964 (3) SA 561 (AD); also Bowler v Sparks, Young and Farmers Meat Industries Ltd., 1936 NPD 1; Odendaal v Bethlehem Romery Bpk., 1954 (3) SA 370 (O.) The liability is additional to, and different from, the liability to redhibitorian relief which is incurred by any seller of goods found to contain a latent defect (see Botha’s case, supra at p. 572).”

He then went on to question whether the legal foundation of the claim was in fact the lex of contract or the law of delict in the following words at p686-687: Counsel for both parties argued the matter on the basis that the liability of the manufacturer/seller for consequential damages arising from a latent defect in the res vendita is founded upon breach of contract. It is by no means clear that this is so. If the liability be regarded as one flowing from an implied warranty or undertaking, imported by law, that goods sold by a manufacturer are free of latent defects (see Hackett v G. & G. Radio and Refrigerator Corporation, 1949 (3) SA 664 (AD) at pp. 691 - 2; Jagle & Co. (Pty) Ltd v Boschi and Another, 1961 (4) SA 358 (T) at pp. 364, 368; cf. Minister van Landbou-Tegnieke Dianate v Scholtz, 1971 (3) SA 188 (AD) at pp. 196 - 7), then the remedy is contractual. If, on the other hand, the manufacturer/seller is held liable on the ground that he is taken to have knowledge of the defect (see Erasmus v Russell’s Executor, 1910 T.S. 365 at pp. 373 - 4; Seggie v Philip Bros., 1915 CPD 292 at p. 306; Marais v Commercial General Agency Ltd., 1922 T.P.D. 440 at pp. 444 - 5) and that the sale of defective goods with such imputed knowledge is treated as being a case of implied fraud or something cognate to fraudulent misrepresentation (see Mackeurten, Sale of Goods, 4th ed., p. 265; De Wet and Yenta, Kontrakteseg, 3rd ed., p. 235), or if the ground of liability be the fault, or culpa, of the seller in that, being the manufacturer of the goods, he ought to have knowledge of his wares (Hackett’s case, supra, judgment of Court a quo, cited in Kroonstad Westelike Boere Ko-op. Vereniging v Botha, supra at p. 570; also Button v Bickford, Smith & Co., 1910 W.L.D. 52; Evans and Fowes v Willis & Co., 1923 CPD 496 at pp. 503 - A 5), then the remedy would seem to be delictual rather than contractual. The question whether it be breach of contract or delict would affect the basis upon which damages are computed and in practice might lead to different results.

245 Ciba-Geigy 2002 (2) SA 447 (SCA)

Paragraph [48] at E 4650 - 1.

246 Consol Ltd vsa Consol Glas v Tswa Jonge Gezellen (Pty) Ltd And Another 2002 (6) SA 256 (C), Blignault J commented: “Mr Duminy (for plaintiff) submitted that, in the context of the clause in question, liability for consequential loss or
The question of the applicability of section 27(1) of the Constitution to the private health sector seems to be fairly clear in the sense that, if the services are available in the private health sector anyone should have access thereto. It is not even necessary to consider the provisions of section 8 of the Constitution in this regard and the vexed question of the horizontal application of the Bill of Rights. The state does not have the capacity to provide the health service needs of the entire population and the private sector is therefore an essential component of the health system in South Africa. The fact that the private sector can impose conditions upon such access, such as payment, does not detract from a general right of access and is perfectly acceptable up to a point. That point, it is submitted, is where the conditions imposed are so onerous upon the patient, or so biased in favour of the provider, that they effectively deny access without protecting any legally recognisable interest\textsuperscript{248} of the provider (or where the interest of the provider, when weighed against that of the patient does not justify, on constitutional and public policy terms, the undue preference given in the contract to the provider's interest) or where the conditions themselves are unconstitutional in the sense that they unjustifiably infringe or limit other constitutional rights of the patient such as the right to equality, the right to human dignity, the right to bodily and psychological integrity or the right to freedom and security of the person.

4.13 Summary and Conclusions

The law of contract, from the point of view of the patient in particular, is not an ideal vehicle for relationships involving health service delivery as the case discussions that follow in chapters five (public sector) and 6 (private sector) will demonstrate. The power of a patient to bargain is greatly diminished both as a result of the nature of the services involved and the patient's physical and mental status as well as the expert and economic power that health professionals and health establishments respectively hold to a much greater extent by comparison. It will be seen in the two subsequent

\textsuperscript{248} damage is anything which goes beyond the replacement of defective goods. As presently framed, he submitted, the entire counterclaim (as amended) is a claim for consequential loss. This is borne out by the formulation of the alternative claim, in para 3.8 of the counterclaim (as amended), where the full amount of the damages are described as consequential damages. In my view plaintiff's submission on this issue is correct. The meaning of the term consequential loss or damage is unfortunately not precise. In one sense it is contrasted with direct damage. Visser and Potgieter Law of Damages at 55 refers to a view that direct loss means the immediate or direct consequence(s) of a damage-causing event, while consequential loss is damage that flows from such direct loss. In the context of relief under the sedlilitian remedies, however, a claim for consequential damages is contrasted with redhibitorian relief, ie relief for the return of the purchase price paid for the defective goods."

As determined by public policy and the legal convictions of the community
chapters that concepts such as contractual fairness and public policy considerations with regard to contracts are issues that South African courts flirt with but show less convincing signs of espousing in a clear and systematic way especially in the area of health service delivery within the private sector. The Constitution it is submitted adds a distinct gloss on the law of contract concerning health care services generally and access to emergency medical treatment in particular. If the law of contract is to be the legal vehicle by means of which people exercise their rights of access to health care services, including reproductive health care, and emergency medical treatment, the courts are going to have to change their tendency to view such contracts as purely commercial transactions that are no different to contracts for any other kind of service. The Constitution does not preclude the horizontal application of the rights in the Bill of Rights and the fact that the language of section 27(1) refers to a right of access as opposed to a direct right to health care services suggests that private sector providers of health care services may well find themselves faced with fairly convincing arguments in the future that this right in particular has a horizontal application especially in circumstances where the state simply does not have the capacity to accommodate everyone who is in need of health care. The Constitution, it is submitted, strongly supports the inclusion of certain implied terms in contracts for the delivery of health care services that relate for instance, to quality of care as a feature of access and a patient’s right to be treated with due respect for his or her dignity and privacy. These points and others will be highlighted in the following two chapters as the relevant case law is discussed in more detail.
Chapter 5
Law of Contract in Health Service Delivery - Public Sector

5.1 Introduction

In the previous chapter the fundamental principles of the law of contract relating to the delivery of health care services were discussed in some detail. This chapter covers the relevant case law insofar as it involves public sector providers. In the following chapter the same exercise will be conducted with regard to private sector providers.

The question of whether a person enters into a contract with the state in seeking medical services from a public sector health facility is not one that is easily resolved with regard to both policy and law. The nature of the relationship between the patient and the state as a provider of health care services is complicated by the constitutional obligation of the state to achieve the progressive realisation of the right of access to health care services within the available resources. In South Africa, public health services are traditionally the safety net into which all patients can fall, including those...
within the private sector who have exhausted their medical scheme benefits or whose membership of a scheme has been terminated for some reason or another. In recent years attempts, such as the introduction of a compulsory package of minimum benefits to be provided by medical schemes, have been made to avoid adverse selection practices by schemes by means of which the risks posed by high cost, high risk health problems such as those suffered by the elderly or the chronically ill, are effectively transferred to public health facilities. Private funders previously were able to risk rate members and thereby secure for themselves the luxury of dealing only with the comparatively manageable funding risks presented by the relatively young and healthy. There is still, however, the problem of the increasing unaffordability of medical schemes for the significant majority of the population coupled with the hard fact that most people who retire from employment are unable to pay medical scheme contributions from their retirement income despite the fact that this is when they are most in need of funding for medical expenses. From a constitutional perspective the state cannot refuse access to health care services to a person who has no alternatives available to them. This is a baseline which materially alters the position of public providers of health care services in relation to their private counterparts. Private health care providers, unlike the state, are not tasked by the Constitution with the progressive realisation of the right of access to health care services within available resources. If there is an obligation upon the state to provide health care services to those who have nowhere else to go the next policy question is whether it should do so also for those who have. In other words should the state with its limited resources also provide medical treatment to medical scheme patients and others who are ‘externally funded’ and if so, on what basis? Since it is difficult in practice for the state to distinguish between medical scheme patients and other externally funded patients from those who are obliged to use public health services, most provinces have adopted a means test as a way of identifying different categories of patients according to their financial status. Many provinces are desirous of attracting externally funded patients as they see them as generators of much needed income for public health establishments. Of late there have been increased moves, including regulations to the Medical Schemes Act¹, to allow medical schemes to designate state facilities as preferred providers of health care services to members so as to increase the numbers

¹ Medical Schemes Act No 131 of 1998
of scheme members that are using state health facilities. The wisdom of this remains to be seen due to certain infrastructural problems of constitutional origin relating to financial management in government. There is also the problem of limited capacity in the public sector. If the latter treats private patients in such volumes that access for the indigent is compromised, then the constitutionality of treating private patients who can afford to go elsewhere could become questionable. Although there are many potential problems with the running of public hospitals as businesses the question of whether public hospitals owned by provincial governments may make a ‘profit’ and retain the revenue they generate to improve their services, resources and facilities rather than paying it into the provincial revenue fund is one of the most obvious at this stage. Legislation such as the Public Finance Management Act, read in conjunction with the Constitution,² is problematic when it comes to the creation of trading

² Act No 1 of 1999 read with Section 213 of the Constitution which stipulates:

(1) There is a National Revenue Fund into which all money received by the national government must be paid, except money reasonably excluded by an Act of Parliament.

(2) Money may be withdrawn from the National Revenue Fund only-

(a) in terms of an appropriation by an Act of Parliament; or

(b) as a direct charge against the National Revenue Fund, when it is provided for in the Constitution or an Act of Parliament.

(3) A province’s equitable share of revenue raised nationally is a direct charge against the National Revenue Fund.

Section 226 stipulates:

(1) There is a Provincial Revenue Fund for each province into which all money received by the provincial government must be paid, except money reasonably excluded by an Act of Parliament.

(2) Money may be withdrawn from a Provincial Revenue Fund only-

(a) in terms of an appropriation by a provincial Act; or

(b) as a direct charge against the Provincial Revenue Fund, when it is provided for in the Constitution or a provincial Act.

(3) Revenue allocated through a province to local government in that province in terms of subsection (1), is a direct charge against that province’s Revenue Fund.

(4) National legislation may determine a framework within which-

(a) a provincial Act may in terms of subsection (2) (b) authorise the withdrawal of money as a direct charge against a Provincial Revenue Fund; and

(b) revenue allocated through a province to local government in that province in terms of subsection (3) must be paid to municipalities in the province.

The Public Finance Management Act No 1 of 1999 provision for and regulates various kinds of state or stated owned entities and further elaborates on the principles of government finances laid down in the Constitution. Thus it allows for the creation of national and provincial government business enterprises. The Act defines ‘national government business enterprise’ as an entity which (a) is a juristic person under the ownership control of the national executive; (b) has been assigned financial and operational authority to carry on a business activity; (c) as its principal business, provides goods or services in accordance with ordinary business principles; and (d) is financed fully or substantially from sources other than (i) the National Revenue Fund; or (ii) by way of a tax, levy or other statutory money⁴. The definition of a provincial government business enterprise is similar. There is also provision for national and provincial public entities. ‘Provincial public entity’ is defined in the Act as (a) a provincial government business enterprise; or (b) a board, commission, company, corporation, fund or other entity (other than a provincial government business enterprise) which is (i) established in terms of legislation or a provincial constitution; (ii) fully or substantially funded either from a Provincial Revenue Fund or by way of a tax, levy or other money imposed in terms of legislation; and (iii) accountable to a provincial legislature. Under section 13 of the Public Finance Management Act, with relatively few exceptions none of which are relevant to the present discussion, all money received by the national government must be paid into the National Revenue Fund. Section 22 of the Act contains a similar stipulation with respect to provincial governments and Provincial Revenue Funds. Regulation 15.5 of the Treasury regulations under the Public Finance Management Act stipulates that all revenue received by a department must be paid daily into its Paymaster-General account or, for amounts less than R500, as soon as practicable, but at least by the last working day of the month. No provincial department may receive a transfer payment from a national department or public entity directly; such funds must be deposited into the nominated banking account of the province as required by paragraph 15.2.3. Money collected by a department, which is not classified as revenue, must be paid into the department’s Paymaster-General account and accounted for in its ledger. This includes money received for agency services provided to another department. Regulation 15.3.2 stipulates that
accounts and other mechanisms whereby health departments of provincial governments can generate and use funds that do not form part of their equitable share raised nationally to fulfil their constitutional obligations. Although these obstacles are not peculiar to a contractual relationship between public provider and patient since they would be applicable to funds generated in other ways as well, the contractual relationship more than any other is associated with the idea of trade and commerce and what in administrative law might be termed the managerialisitc approach to public health administration. The existence of a contractual relationship between patient and public provider, more than any other would promote the notion that the state is ‘selling’ health care goods and services and patients are ‘purchasing’ them creating a wealth of completely different legal and social implications for and perceptions of the relationship between the public provider and the patient and possibly even casting the public provider in the same light as the private provider of health care services to a much greater extent. It must be stated at the outset, however, that a contractual relationship does not necessarily imply a commercial objective. This would depend upon the government policy behind the promotion of a specifically contractual relationship as opposed to any other kind (i.e. the intention of the parties). There may be many reasons for preferring a contractual relationship as the basis for a public provider-patient relationship that are not related to revenue generation or profit. One of these might be to empower consumers to play a more active role in ensuring

money deposited into the Paymaster-General account must immediately be available to the relevant treasury for funding expenditure or investment according to its central cash management responsibilities.

According to section 227 of the Constitution -
(1) Local government and each province-
(a) is entitled to an equitable share of revenue raised nationally to enable it to provide basic services and perform the functions allocated to it; and
(b) may receive other allocations from national government revenue, either conditionally or unconditionally.
(2) Additional revenue raised by provinces or municipalities may not be deducted from their share of revenue raised nationally, or from other allocations made to them out of national government revenue. Equally, there is no obligation on the national government to compensate provinces or municipalities that do not raise revenue commensurate with their fiscal capacity and tax base.
(3) A province’s equitable share of revenue raised nationally must be transferred to the province promptly and without deduction, except when the transfer has been stopped in terms of section 216.
(4) A province must provide for itself any resources that it requires, in terms of a provision of its provincial constitution, that are additional to its requirements envisaged in the Constitution.

See Burns Y. 'Government Contracts and the Public/Private Law Divide' 1998 SA Public Law 13 p 234 where she observes that one of the significant changes to American administrative law as a result of the increasing privatisation of state functions is a market discourse which narrows the role of public interest values and replaces them with that of cost-benefit analysis. She notes that the cumulative effect of a market approach to regulation, regulatory structure and procedures is to introduce a new mix of public and private power. In South African law this would have considerable implications for state operations in ways that are not at obvious at first - for instance in the context of competition law. The Competition Act No 89 of 1998 applies to all economic activity within, or having an effect within, the Republic except collective bargaining in the labour relations context and significantly for purposes of the present discussion "concerted conduct designed to achieve a non-commercial socio-economic objective or similar purpose." The State is not per se exempt from the provisions of the Competition Act. The national government and the provincial governments and municipalities are not a single entity but may well be seen under the Competition Act as "firms" in their own right. The definition of "firm" in the Competition Act is disturbingly vague in terms of section 1 "firm" "includes a person, partnership or a trust."
they receive services of an appropriate and acceptable standard, another may be to foster a culture of competitive service provision between public health establishments for the benefit of patients. When a public provider provides health care services in its capacity as part of the executive branch of government as opposed to a capacity which is much closer to that of an ordinary private sector supplier of the same services, the dynamic has the potential to change quite considerably as illustrated later on in this section by experience in New Zealand.

As the dynamics of state operations change so too do the legal considerations governing them. Burns\(^5\) points out that if one accepts that an outsourcing contract, or service provision contract, is an administrative law agreement in the sense that the administrative authority retains a measure of state authority with the result that the relationship between the state and the other party is one of inequality), it may be argued that the agreement should be subject to principles of public law. The same is true of a contractual relationship in terms of which the state provides services such as health care. As was noted in the previous section on administrative law, the stage is already set, at least to some extent, in South African law for the application of administrative law to contractual relationships even where both parties to the contract are private entities. In terms of section 3 of the Promotion of Administrative Justice Act (PAJA)\(^6\), “administrative action” means any decision taken, or any failure to take a decision, by inter alia a natural or juristic person, other than an organ of state, when exercising a public power or performing a public function in terms of an empowering provision which adversely affects the rights of any person and which has a direct, external legal effect. It is submitted that the careful boundaries that were previously drawn between public and private law, and different areas of law under the previous legal order are becoming transparently thin\(^7\). This is as much the result of changing

---

5 Burns fn 4 supra
6 Promotion of Administrative Justice Act No 3 of 2000
7 Cockrell A 'Can you paradigm? - Another perspective on the public/private law divide' 1993 Acta Juridica p 227 points out that "...the rules of 'private law' are doctrinal artefacts by means of which the state regulates and coerces all civil society and as much might equally qualify to be categorized as a matter of 'public law'. That is to say, the community as a whole has a legitimate interest in the matter in which 'private' transactions are regulated, and this interest goes far beyond the minimalist enforcement of rules to which individuals have given their prior consent. The law of contract provides (trivially enough), the best example of this shift in emphasis. A long tradition in legal scholarship has sought to portray the rules of contract as being no more than the natural expression of the wills of the contracting parties. But this idea was subjected to a process of corrosive critique in the early part of the century by American Realists who sought to show that the real concern of contract law centred on the circumstances in which the sovereign power of the state would be put at the disposal of one party in order to coerce another. Seen in this light, the rules governing contractual liability begin to look remarkably like part of public law" See also Pretorius DM ('The Defence of the Realm: Contract and Natural Justice' 2002 South African Law Journal 119 p 374). He notes: "The audi alteram partem principle applies
views on how governments and the private sector should operate and interact as it is on the Constitutional legal order. Some of the changes are worldwide. Burns\textsuperscript{8} notes that the emphasis on global competition and economic growth coupled with the general weakness of any single individual state in the face of globalization processes encourages more negotiation on the part of the state as well as regulatory approaches more sympathetic to the cost conscious demands of multinational businesses and government as well. It is not so much the nature of the powerbearer as the nature of the power that is to determine which legal principles apply\textsuperscript{9}. Burns\textsuperscript{10} observes that South African law has not as yet fully recognised the administrative agreement, despite the conclusion of a large number of these agreements. She states that the question is whether these administrative agreements are ordinary commercial contracts, which are subject to the principles of private law and the provisions of the State Liability Act\textsuperscript{11} or whether they are subject to separate public law rules. The public sector is increasingly taking on every appearance of private sector style operations while the degree and nature of power that is being increasingly wielded by

\footnotesize{whenever a statute empowers a public body of official to perform an act or to give a decision prejudicially affecting a person in his liberty or property or existing rights, or whenever he has a legitimate expectation that he will be heard before that act is performed or that decision given. It is sometimes asserted that the application of the rules of natural justice is confined to the field of administrative law and, more specifically that the audi principle is not applicable to the exercise of "purely contractual rights". However this assertion is fallacious: the twin pillars of natural justice, as Sir William Wade famously declared, are statute and contract" (footnotes omitted). Pretorius observes that: "There is another difficulty with the public power/contractual rights dichotomy. It fails to draw an adequate jurisprudential distinction between powers and rights. It has been suggested that public authorities, like natural and juristic persons, may "acquire" powers by contract. It has also been said that the act of a public body would be subject to judicial review if the source of the power concerned is statutory but not if the relevant power is derived from contract. Statements of this nature are dogmatically unsound. Public bodies cannot "acquire" powers from contracts. Public powers are derived from statute, and, in England, also from the prerogative and, in the case of certain incorporated bodies, from their charters. A public body may have a contractual or common-law right to cancel a contract. A distinction must be drawn between a right and the antecedent powers that inhere in the body concerned by virtue of its constituent statute or charter or, in some cases, by virtue of the prerogative. If the body concerned were to exercise its contractual or common-law right to cancel a contract, it would ultimately be acting by virtue of some pre-existing power in much the same way as a company's contractual or common-law right to cancel a contract can only be exercised by virtue of the fact that its incorporation clothed it with juristic personality and conferred upon it the power or capacity to enter into contracts within the scope of its legal capacity, as determined by its memorandum of association. Thus, in Hohfeldian terms, the ability or capacity to conclude contracts is a power; the legally enforceable claims that are derived from contracts are rights" (footnotes omitted).

Burns fn 4 supra

But see Pretorius (fn 7 supra) who observes that: "There is another difficulty with the public power/contractual rights dichotomy. It fails to draw an adequate jurisprudential distinction between powers and rights. It has been suggested that public authorities, like natural and juristic persons, may "acquire" powers by contract. It has also been said that the act of a public body would be subject to judicial review if the source of the power concerned is statutory but not if the relevant power is derived from contract. Statements of this nature are dogmatically unsound. Public bodies cannot "acquire" powers from contracts. Public powers are derived from statute, and, in England, also from the prerogative and, in the case of certain incorporated bodies, from their charters. A public body may have a contractual or common-law right to cancel a contract. A distinction must be drawn between a right and the antecedent powers that inhere in the body concerned by virtue of its constituent statute or charter or, in some cases, by virtue of the prerogative. If the body concerned were to exercise its contractual or common-law right to cancel a contract, it would ultimately be acting by virtue of some pre-existing power in much the same way as a company's contractual or common-law right to cancel a contract can only be exercised by virtue of the fact that its incorporation clothed it with juristic personality and conferred upon it the power or capacity to enter into contracts within the scope of its legal capacity, as determined by its memorandum of association. Thus, in Hohfeldian terms, the ability or capacity to conclude contracts is a power; the legally enforceable claims that are derived from contracts are rights" (footnotes omitted).

State Liability Act No 20 of 1957

592
major multinational private sector corporations is in many cases greater than that of governments. It is submitted that the boundaries between state and private sector are becoming less distinct in South Africa where there is a comprehensive set of Treasury regulations governing public private partnerships. There are increasing numbers of these partnerships in the area of health services delivery. If the rigid split between public and private law is to be maintained, which branch of law will govern the relationship between a public-private partnership delivering health care services and its patients? One could argue that the definition of public-private partnership is such that the private provider is performing the functions of the public entity – i.e. a public function - and that therefore public law should apply even when it is a private provider that is performing it but this argument loses much of its logical impetus when that same private sector provider, operating outside of the public-private partnership, is delivering exactly the same health care services in a purely private capacity. The nature of the function of health care services delivery is not such that it is a uniquely or even routinely public function as opposed to a private one. The problems that arise with the classification of law into categories of public and private are demonstrated by the judgment of the court in Cape Metropolitan Council v Metro Inspection Services (Western Cape) CC. The criticism of this judgment by Pretorius has already been referred to earlier. To briefly recap, Pretorius argues that the court did not take sufficient cognisance of the fact that the contract effected the outsourcing of a public function to a private entity in terms of a statutory authorisation to do so.

---

12 See Treasury Regulations For Departments, Trading Entities, Constitutional Institutions And Public Entities Government Notice R740 in GG 23463 of 25 May 2002 which define 'public-private partnership' as a commercial transaction between an institution and a private party in terms of which:
(a) the private party either performs an institutional function on behalf of the institution for a specified or indefinite period; or acquires the use of state property for its own commercial purposes for a specified or indefinite period;
(b) the private party receives a benefit for performing the function or by utilising state property, either by way of:
(i) compensation from a revenue fund;
(ii) charges or fees collected by the private party from users or customers of a service provided to them; or
(iii) a combination of such compensation and such charges or fees.

13 A public-private partnership in healthcare, the first of its kind in South Africa, was launched on November 2002 when the Free State health department signed an agreement with Network Healthcare Holdings Limited (Netcare) and its empowerment partner Community Healthcare Holdings for the Pelonomi and Univenitas hospitals in Bloemfontein. The partnership involves the use of spare space between the two institutions. In terms of the agreement the Netcare/Community Healthcare Joint Venture consortium manage over 200 private beds and five operating theatres at the two hospitals, which are the largest public hospitals within the Free State. The consortium and its partners will invest R80-million in the project over the next two years. In terms of the agreement, Community Healthcare holds 40% shares of the consortium, Netcare holds 25% and the remaining 35% is held by black empowerment companies and groups consisting of healthcare practitioners, women's groups and other investors. See also Thomas A and Hensley M 'Public-Private Partnerships in Healthcare' (http://www.ip3.org/publication2002_013.htm).

14 Cape Metropolitan Council v Metro Inspection Services (Western Cape)CC and Others 2001 (3) SA 1013 (SCA)

15 Pretorius fn. supra
and that the purely commercial flavour of the contract was questionable. It is submitted that if one thinks about the law not in terms of compartments of public and private but in terms of the underlying constitutional principles and values upon which it rests then many of these problems can be avoided. Concepts of fairness, reasonableness, *bona fides*, public interest and due process are not unique to public law and the power wielded by some private entities these days exceeds that of the state so it seems illogical to argue that the principles of natural justice, for instance, are applicable only in the public sector because the parties on not on an equal footing and there is a need to recognise this and avoid abuses of power by the state. In many instances in the private sector the parties are also not on an equal footing and there are significant power imbalances against consumers. The courts have used exactly the same arguments when dealing with restraint of trade clauses in employment contracts where the employer and the employee are both private entities. Questions of power imbalances are not unique to the public sector and should therefore be a concern of the law in general as opposed to just ‘public law’. The distinctions between administrative action and other kinds of activity are valuable not so much because they seek to categorise actions into areas of public law as opposed to private law but because they identify acts and decisions in a context which significantly weights the power balance in favour of a particular entity and there is thus the potential for equally significant prejudice to those affected by its acts. A statutory power to act in a way that adversely affects the rights of others and which has a ‘direct, external legal effect’ must therefore be balanced out by considerations of fairness and reasonableness if it is not to be exercised in a way that is offensive to constitutional principles and values and detrimental to the public interest. This is why administrative law has a tendency to be more visible in the public sphere of operation as opposed to the private sphere. Most of the powers exercised in the former are statutory and peculiar to the entity upon whom they are conferred. There is no equivalent or balancing power held by those against whom it is exercised or those who are affected by its exercise. It is submitted that the definition of ‘administrative action’ in the PAJA supports this argument.

---

16 See the definition of administrative action in section 1 of the PAJA referred to previously.
Significantly, whether they are dealing with public or private sector issues, the language of the courts and the considerations they apply to public and private sector relationships are becoming increasingly similar. By way of example, there are a number of fundamental concepts which are being progressively applied within both the private and public spheres in keeping, it is submitted, with the South African constitutional order. They are canvassed briefly below but also come up for discussion elsewhere in this section.

5.2 Case Law

The relevant cases will be canvassed and discussed in this section in order to ground further discussion on the subject of the contractual relationship between public provider and patient in the sections that follow.

The case of *Behr v The Minister of Health*[^17] is of relevance to the question of whether the state can contract with a patient for the delivery of health care services although it does not directly deal with the question of the legal basis of the relationship between a public sector provider of health care services and the patient but rather a husband’s obligation to maintain his wife.

5.2.1 *Behr v Minister of Health*

*Facts*

Behr’s wife deserted him after some marital problems. When a reconciliation attempt went awry he shot her. She was admitted to a government hospital in Bulawayo suffering from a severe gunshot wound to the abdomen. The question was whether the husband or wife was responsible for the charges for the medical treatment in view of the fact that she had deserted him previously. As Murray CJ put it, “The present case

[^17]: *Behr* 1976 (2) SA 891 (T)
concerns a husband’s obligation to pay for what is conceded to be a necessary services supplied to his wife.”

Judgment

The court remarked that there was a difference between the English law and the Roman-Dutch law as followed in South Africa and Southern Rhodesia in regard to the basis on which a husband’s liability to pay for such household necessaries as have been supplied to his wife is founded. It noted that the Du Preez v Cohen Bros Wessels J expressed the view that the wife’s capacity to bind her husband’s credit for necessaries was not a result of the relationship of principal and agent but was an incident necessarily flowing from the mere fact of marriage. After considering other cases the court observed that-

“this legal obligation appears to be clearly established as existing while there is a common household and presumably also where the parties are living apart by mutual consent.”

At p 631 of the judgment Murray CJ said that he shared the view that the plaintiff must be held to his particulars as pleaded which placed the claim on the restricted basis that the defendant was liable *qua* husband for the cost of necessary medical attention supplied to his wife. In consequence, it would not be proper, he said, to base the court’s decision on various points discussed during the hearing relating to implied authority from Behr, ratification of the supply of services to the wife, whether it was obligatory on the defendant in order to escape liability, to have given notice of desertion prior to the supply of services, to the hospital authorities who had previously in 1958 rendered her hospital treatment for which he had paid them, and whether there was any obligation on him, not as husband, but as the person who had inflicted a serious injury upon her to recompense the hospital authorities for the medical treatment necessary to save her life. The court said rather than the ground for upholding the claim of the Minister of Health was based on the fact that though the wife had been a deserting party until the infliction of the injury upon her, this feature merely suspended the husband’s obligation of maintenance as long as the desertion continued. Thereafter if by reason of his wrongful action he either made it impossible

---

18 *Du Preez* 1904 T.S. 157
for her to return to the household, or gave her just cause for refusing to do so, his obligation revived. The court said that this was the immediate effect of his infliction of this serious injury upon her.

In his judgment Young J noted that on the hospital admission form the person responsible for the fee was given as Behr and that he at no time disputed liability until a letter of demand was sent to him, whereupon he referred the plaintiff to the wife for payment.

Discussion

As stated previously this case did not revolve so much around the nature of the relationship between the government hospital in Bulawayo and the patient as it did around the relationship of the husband and wife. However, a reading of the judgement indicates that there was a general assumption that the relationship was at least quasi contractual and that the government hospital was regarded in the same light as any other supplier of household necessities. There was talk of the wife’s being authorised by her husband to obtain the necessary medical treatment, alternatively, ratification (of the contract for) the supply of services to the wife. There was also some discussion as to whether the husband should have placed a notice in the paper warning potential contractants of his wife’s desertion so that they would know she no longer had the power to bind his credit. A husband’s duty to provide his wife with the necessaries of life is usually exercised by contracting with the suppliers of those necessaries – hence the debate about the basis of the wife’s authority to bind the husband contractually to pay for those necessaries. The fact that the court found that the husband was obliged to pay for the costs of the medical treatment his wife had received on the basis of the duty of maintenance he owed her rather than on the basis of the delictual claim which

---

19 Murray CJ observed at p 630: "This legal obligation appears to be clearly established as existing while there is a common household, and presumably also where the parties are living apart by mutual consent. Where, however, the wife has left the home without the husband’s consent, the right of a third party to recover from the husband the cost of necessaries supplied to her depends on whether the wife had or had not just cause for leaving the home. If she had such cause, the husband’s legal duty to support his wife and provide her with necessaries continues despite the cessation of the joint household, and the tradesman who supplies her with necessaries such as food or clothing, the landlord who lets her a lodging, the professional man who renders her necessary service, are entitled to recover from the husband. As it is put by Dr. Rubin in his handbook on Unauthorized Administration (negotiorum gestio) at p 62, the tradesman or landlord or professional man is discharging a legal duty resting upon the husband; he is a gestor who has administered the affairs of the dominus, i.e., the husband, and is therefore entitled to compensation from him. This is the basis upon which the judgment of Benjamin, J., in Gammon v McClure, 1925 CPD 137 at p. 139, is based, and the husband’s liability to pay compensation to the gestor was enforced in Coote v Higgins, 5 E.D.C. 352, a case which has subsequently been referred to with approval (see e.g., Eussell v Douglas, 1924 CPD 472 at p. 481)."
she clearly had against him is also of relevance since it indirectly supports the notion that the wife bound the husband contractually in exercising her right to obtain necessary medical treatment at his expense. The approach of the government hospital itself seemed to be in the usual contractual context. The admission form required the wife to state who would be responsible for payment of the hospital’s fee and when the husband subsequently failed to make such payment, it sent him a letter of demand. The government had clearly regarded the husband as directly contractually obliged to it for the fees for his wife’s medical treatment.

The case of Shiels v Minister of Health is also supportive of the notion that the public health sector can contract for the delivery of health care services to patients. In this case however, the health services also involved the sale of goods.

5.2.2 Shiels v Minister of Health

Facts

The respondent had obtained judgement in a magistrate’s court for the price of an artificial leg which has been manufactured for the appellant at a government institution. The appellant denied liability saying that while he admitted that the respondent had done certain work and manufactured an artificial limb for him it was a specific term of the contract that the limb to be manufactured by the appellant was to be a copy of a limb which had been previously manufactured for him in Glasgow and that it had to be double-articulated at the hip. He said that the limb which had been manufactured by the respondent was not a copy of the limb that had been made in Glasgow because it was not double articulated at the hip. The evidence showed that the making of an artificial leg is a highly skilled task involving a lengthy process of fitting and adaptation on the patient before it is finally completed. There was no question of the patient being able to obtain a ready-made leg to fit him. It emerged that the leg made by the respondent was in fact designed to be an improvement on the leg that had been made in Glasgow. The accounts department of the central hospital sent the appellant an account for the leg once it had been made and adjusted to fit him.

---

20 Shiels 1974 (3) SA 276 (RAD)
Judgment

The court found that the contract which had eventuated between the appellant and the respondent had not been for a leg the same as the one made in Glasgow. It considered whether the appellant was entitled to summarily reject the leg after a trial of a day or two and refuse to pay the account without affording the respondent the opportunity of adjusting the leg so as to make it fit. The court referred to the case of *Theunissen v Burns* dealing with 'almost identical facts' in which it was held that where a person had ordered three suits from a tailor and had been fitted by the tailor but had complained that they did not fit and refused to pay the bill, the tailor was entitled to a reasonable opportunity to take the suits back and make them fit. As the appellant in that case failed to afford the tailor that opportunity, he could not escape liability for the tailor's account and accordingly his appeal was dismissed. The court also referred to the case of *Kruger v Boltman* involving a contract for the fitting and supply of a set of artificial teeth. The teeth were finished off and sent to the customer who refused to pay the bill because they did not fit properly. In its judgment in that case the court said that unless and until the respondent had been given an opportunity of remodelling the set, his claim for payment on the contract could not be resisted. The court in *Shiels* case concluded that the principle established in those cases must apply to a contract such the present one involving the highly technical task of constructing an artificial leg and making it fit, particularly in the case of the appellant who, by his own admission was a difficult customer because he had a very short stump. It held that a reasonable opportunity must be afforded after the completed article has been despatched to the customer and that the appellant had not afforded the respondent that reasonable opportunity and that the appeal should be dismissed with costs.

Discussion

The important points to note about this case are that the court made no distinction between suppliers of goods in the private sector and the government as a supplier of goods. The same rules applied to both. It did not question the fact that a contractual

---

21 *Theunissen* 21 S.C 421  
22 *Kruger* 1933 (1) PH A3
relationship had arisen between the Minister of Health and Shiels. In fact it enforced
the contract that it found to have arisen between them. The contract could be said to
have been for a combination of sale of goods and for work because it was not only
for the manufacture of the leg but also for the fitting of the leg to the appellant. It is
therefore not only health care services which may be the subject of a contract between
the state and the patient but also goods. This would embrace not only artificial limbs
but also inter alia medicines, dressings and other consumables, wheelchairs, dentures,
spectacles and other assistive devices.

The most recent case to recognise a contractual relationship between a public provider
and a patient is that of Administrator Natal \( v \) Edouard. It is a South African case as
opposed to the two that were previously cited which were decided by then Rhodesian
courts with reference to South African legal principles.

5.2.3 Administrator, Natal \( v \) Edouard

Facts

The respondent’s wife was admitted to a provincial hospital for a Caesarian section in
order to give birth to their third child. The respondent and his wife requested that a
tubal ligation be performed on the wife at the same time as they could not afford to
have any more children and the wife wished to be sterilised. The tubal ligation was
not in fact performed and one year later the wife gave birth to a fourth child. The
respondent sued for damages on the basis of breach of contract including the cost of
supporting and maintaining the child born as result of the failure to perform the
sterilisation operation, and general damages for the discomfort, pain and suffering and
loss of amenities of life suffered by his wife.

International Encyclopaedia of Laws Vol 3 Blanpain R (ed)
24 Administrator Natal \( v \) Edouard 1990 (3) SA 581 (A)
25 Edouard fn 24 supra
The two issues submitted to the Court for adjudication were whether the Administration was in law obliged, because of its breach of contract, to pay (i) a sum representing the cost to the respondent and Andrae of maintaining and supporting Nicole, and (ii) general damages for the non-patrimonial loss suffered by Andrae. It was agreed that, should the Court find for the respondent on the first issue, an amount of R22 500 was to be awarded, and that an affirmative finding on the second issue would carry an award of R2 500.

Judgment

The court noted that the respondent’s claim under consideration was unique only in the sense that it is based upon a complete failure to perform a sterilisation operation. It said that in the wealth of foreign case law of which the court was aware, the plaintiff’s action was invariably based upon a failed sterilisation procedure (including a vasectomy), or a failure to warn that the procedure might not be 100% successful or that its effect might be reversible, and, on occasion, the incorrect dispensing of a prescription for birth-control pills. The court stated that in principle the precise nature of the breach of contract or neglect giving rise to the birth of an unwanted child is immaterial. Thus it can make no difference whether the breach of contract consists of a complete failure to carry out the agreed procedure, or of an ineffective surgical intervention. Van Heerden JA then canvassed in detail the various public policy issues surrounding claims for wrongful pregnancy in foreign jurisdictions. They are not canvassed here because they are not peculiar to the law of contract but can also be based on the law of delict. The court observed that the claim in Edouard was based on the law of contract. Van Heerden JA stated that because of the facts set out in the stated case, as amplified, it was common cause that:

- the respondent suffered damages in the form of child-raising expenses as a result of the breach,
- that such damages were a direct and natural consequence thereof, and
- that the loss was contemplated by the parties as a likely consequence of failure to perform the agreed sterilisation operation, more particularly

---

26 Edouard in 24 supra
because, to the knowledge of the Administration, the respondent and Andrae could not afford to support any more children.

He pointed out that the claim therefore satisfied all of the requirements of South African law for the recovery of damages flowing from breach of contract. Van Heerden JA noted that in the court a quo it was nonetheless contended that the claim should be disallowed because of considerations of policy and expediency but that in the appeal court, counsel for the appellant, correctly, in van Heerden JA’s view, did not rely on considerations of expediency. Van Heerden JA expressed agreement with the views of Thirion J in the court a quo on this subject saying that there was in any event in South African law no authority for denying a claim for the recovery of contractual damages merely because it may be expedient to do so. In the appeal against the judgment of Thirion J, however, counsel for the appellant did persist with the contention that the respondent’s claim should have been rejected by reason of the dictates of public policy. Van Heerden JA was not as ready as Thirion J to accept the idea that in appropriate circumstances public policy may stand in the way of the recovery of damages for breach of contract where the contract itself is valid. He assumed for the purposes of the case in question that in South African law public policy may require the disallowance of a claim for damages founded upon a breach of a valid and enforceable agreement. The appeal court then proceeded to examine more closely the public policy objections to a claim for wrongful pregnancy which it identified as running along two broad themes - i) that the birth of a normal and healthy child cannot be treated as a wrong against his parents, and (ii) that as a matter of law the birth of such a child is such a blessed event that the benefits flowing from parenthood as a matter of law cancel or outweigh the financial burden brought about by the obligation to maintain the child. The court observed with regard to damages that in South African law intangible loss is in principle awarded only in delict and then, apart from infringements of rights of personality, only in the case of a bodily injury. It said that if patrimonial loss is claimed, the tangible benefits accruing as a result of a breach of contract or the commission of a delict (other than those excluded by an application of the maxim res inter alios acta) must be brought into account and that the monetary value of those benefits must be set off against the gross loss. Van

---

27 Edouard In 24 supra at p 588
28 Edouard In 24 supra at p 589
Heerden JA noted that it has, however, never been suggested that benefits of a non-pecuniary nature must also be 'subtracted' from a patrimonial loss nor is there any foundation for such a suggestion in South African law. The court held that the 'wrong' consists not of the unwanted birth as such, but of the prior breach of contract (or delict) which led to the birth of the child and the consequent financial loss. It referred with approval to the Bundesgerichtshof which states that although an unwanted birth cannot as such constitute a 'legal loss' (i.e. a loss recognised by law), the burden of the parents' obligation to maintain the child is indeed a legal loss for which damages may be recovered. The court quoted from a number of American cases in stating its view that public policy did not preclude a claim for contractual damages for an unwanted pregnancy. Counsel for the appellant argued that an inevitable incident of birth is the creation of a legal duty obliging a parent to support the child and that statute law serves to reinforce the duty, eg s 6 of the Divorce Act.

He stated that while the pregnancy claim of the respondent was not one by which he sought to be relieved from his obligation to support the child, he did seek to have the Court determine the cost of that support and to obtain an order for recovery of that amount from the appellant. In the result the judgment of the court a quo served to transfer from the respondent to the appellant the obligation to maintain the child. He argued that this runs counter to public policy which demands that there be no interference with the sanctity accorded by law to the relationship between parent and child. Van den Heever JA expressed the view that there was a basic fallacy in this submission in that it in no way relieved the respondent (or his wife) from the

29 Edouard fn 24 supra at p591-592: 'In concluding my discussion of the two themes I can do no better than quote the following judicial pronouncements: 'It is not at all that human life or the state of parenthood are inherently injurious; rather it is an unplanned parenthood and an unwanted birth, the cause of which is directly attributable to a physician's negligence, for which the plaintiff seek compensation. Certainly there are positive aspects to child rearing and enduring benefits to parenthood, but that does not mean, to me, that parents who take measures to prevent the conception of a child should be burdened with all of the expenses that go along with raising that child - expenses that they would not have incurred had it not been for the negligence of another.' [Cochrum v Baumgartner 447 NE 2d 385 (1983) at 392-3 (dissent of Clark J)] And: 'I see no reason for departing from the rule that a negligent person is liable for the foreseeable consequences of his negligence. There is no justification for holding, as a matter of law, that the birth of an "unwanted" child is a "blessing": The birth of such a child may be a catastrophe not only for the parents and the child itself, but also for previously born siblings. The doctor whose negligence brings about such an undesired birth should not be allowed to say, "I did you a favour", secure in the knowledge that the Courts will give to this claim the effect of an irrefutable presumption.' [Terrell v Garcia 496 SW 2d 124 1973 at 131 (dissent of Cadena J)] And: 'We reject the proposition that as a matter of law and public policy no legally cognisable claim for child rearing damages can ever arise in such cases where the unplanned child is born normal and healthy. That... public policy... may foster the development and preservation of the family relationship does not, in our view, compel the adoption of a per se rule denying recovery by parents of child rearing costs from the physician whose negligence has caused their expenditure. In other words, it is not to disparage the value of human life and the societal need for harmonious family units to protect the parents' choice not to have children by recognising child rearing costs as a compensable element of damages in negligent sterilisation cases. We, therefore, decline to follow the majority rule of those jurisdictions which have held that in all cases, without regard to the circumstances, the benefits to the parents from the birth of a healthy child always outweigh child rearing costs and thus result in no injury or damage to the parents.' [Jones v Molinowski 473 A 2d 429 at 432 (1984)]

30 Divorce Act 70 of 1979
obligation to support the child. He said that at most it enabled the respondent to fulfil that obligation and that there could thus be no question that the obligation had in law been transferred from the respondent to the appellant.

The court did not allow the respondent’s claim for the discomfort, pain and suffering and loss of amenities of life suffered by the child’s mother in consequence of her pregnancy and the subsequent birth of the child on the basis of an absence of evidence of any such claim in the old authorities and that South African courts have in later years consistently indicated that only patrimonial loss may be recovered in contract.31

Discussion

The court a quo found that the agreement between the respondent and the appellant was partially in writing in that the respondent and his wife had signed a consent form which stated:

“I, Andrae Edouard, request and hereby consent to the performance of a surgical operation by tubal ligation on myself for the purpose of producing incapability of procreation.... I acknowledge that I am fully aware of and understand the purpose and consequence of the said operation including the fact that permanent sterility in all cases may not result.”

It is interesting that the court used the consent form as evidence of the existence of a contractual relationship between the parties because even in the absence of a contractual relationship, it would still be necessary in order to show that the operation had been performed with the informed consent of the patient and in order to preclude

31 See Edouard fn 24 supra at p 596. The court noted: “An alternative contention put forward by counsel for the respondent is that there should be an extension of liability for breach of contract so that the innocent party may recover intangible damages, and in any event damages for pain and suffering. On the assumption that a Court has the power, in exceptional cases, to modify or alter our common law, it is hardly necessary to say that there must be compelling reasons for doing so.”

It appears that since the middle of the present century English Courts have awarded an innocent party damages even in cases where he did not suffer physical inconvenience as a result of breach of contract. A striking example is to be found in the so-called holiday cases. In these the plaintiff had booked, through a travel agent, a holiday at a hotel. To his chagrin he discovered on arrival that the facilities available at the hotel were significantly inferior to the promised facilities. In consequence he claimed damages from the travel agent. It was held that he could recover an amount in respect of inter alia vexation and mental distress. In my view there is no sufficient reason of policy or convenience for importing into our law such an extension of contractual liability. To do so would be to graft onto a contractual setting elements of the actio injuriarum. Moreover, the party guilty of breach of contract would be liable to compensate the innocent party for loss which is not even recoverable by the Aquilian action. In any event, in most instances the principles of our law relating to liability for breach of contract appear to be adequate to afford the innocent party sufficient satisfaction. Take the holiday cases. The plaintiff would be entitled to claim the difference between the value of the promised facilities and those actually available to him. It is also conceivable that the latter facilities might have been virtually worthless, in which case the plaintiff could recover the full contract price. Holindana Brickworks (Pty) Ltd v Roberts Construction Co Ltd 1977 (3) 670 (A) at p 687; Novick v Benjamin 1972 (2) 842 (A) at p 860; Ranger v Wykerd and Another 1977 (2) SA 976 (A) at p 987; Dippenaar v Shield Insurance Co Ltd 1979 (2) SA 904 (A) at p 917.
a claim in delict based on lack of consent. The fact that a person requests treatment and consents thereto does not necessarily mean that there is a contractual intention. Written evidence of consent to treatment such as that in a consent form is primarily to ensure that the patient gives proper consent and to protect the provider from allegations of violation of the right to bodily and psychological integrity. In Edouard's case the plaintiff in the court a quo had no choice but to proceed on the law of contract because the plaintiff had failed to comply with the requirements of the Limitation of Legal Proceedings (Provincial and Local Authorities) Act in that he failed to give notice of his intention to institute legal proceedings for the recovery of delictual damages. This demonstrates the advantage to the patient in having both contract law and the law of delict to choose from when formulating a claim. It may be that in some cases a court for reasons of public policy, especially in circumstances where a delictual claim was precluded on a technicality such as the one in Edouard, would want to infer the existence of a contractual relationship if possible in order to afford the patient some relief.

Edouard's case falls into a particular category in that it involved a request that a particular elective procedure - namely sterilisation of the plaintiff's wife, be carried out and an undertaking on the part of the provider to do so. The provider failed to carry out this undertaking. This is a situation which is different in some respects to others in which health services are rendered for a number of reasons. Firstly, it is the health professional who usually proposes and recommends a particular course of treatment to the patient who then either accepts it or rejects it or asks for alternatives. This is not the case with sterilisation. Secondly, a sterilisation procedure is not a medical necessity. It falls into the same category as a limited number of other treatments such as cosmetic surgery. Thirdly, the patient's power to choose to have the treatment or not is not impaired by physical or mental suffering or threat of death or disability. The nature of the procedure is such that it implies and indeed contemplates a particular result or outcome and that the permutations, in terms of outcome, are much more limited than for other kinds of health services. Fourthly the procedure and its intended result is not what one would call therapeutic in the

---

32 Act No 94 of 1970
dictionary sense of “of or relating to the healing of disease.” Sterilisation is not a cure for an abnormal or pathological condition. It is submitted that these differences, when considered overall distinguish the dynamics of the provider-patient relationship in this context from the more common therapeutically based relationship. In Edouard’s case, unlike the cases in which sterilisation operations were performed and failed, the procedure was not even carried out. The question was not therefore the guarantee of a cure which the courts are so reluctant to impute to a medical practitioner, but rather an undertaking to perform a particular procedure which was never fulfilled.

In the context of run of the mill health care services, one of the ironies of health care contracts generally is that they are seldom read to guarantee to cure a patient but at the same time the sole purpose for entering into them is usually the hope, and even the intention, to be cured on the part of the patient and the hope, and even intention, to cure the patient on the part of the provider. The fact that this does not always materialise is irrelevant. The reasons for failure of medical treatment are many and varied ranging from the sheer negligence of a provider to the individual manner in which different patients react to treatment. Why would one undergo the hardships of chemotherapy or cardiothoracic surgery unless it was in the hope or even belief that they are likely to be effective? Surely contracts for medical services should not be considered in quite the same light as the purchase of a lottery ticket? Allopathic medical treatment in particular can sometimes cause more damage than the health condition from which the patient initially suffers. It is generally not without a price not only in financial terms but also in terms of physical and mental pain and stress. The stakes for the patient are usually much higher than the few rands it costs to purchase a lottery ticket. The question of whether a provider is in breach of a contract for health services should depend upon the reasons for treatment failure. If the reasons are outside of the control of the provider then they should be regarded in the same light as acts of God in insurance contracts. If the reasons are within the control of the provider and such control was not adequately or sufficiently exercised so as to ensure the expected outcome then it is difficult to see why the patient should not succeed in a claim for breach of contract. The obvious problem with this approach is that it is

---

33 Concise Oxford Dictionary
paralleled too closely by the requirements of a claim on the basis of the law of delict. Those who prefer to compartmentalise the law are likely to oppose such an approach.

5.2.4 Pizani v Minister of Defence

This case does not involve a contractual relationship between the provider and the patient but it does explore the relationship between a public provider and a patient based upon legislation. For this reason it is presented here in counterpoint to the previous cases referred to in order to more closely examine the alternative to the law of contract as the basis of a public provider-patient relationship.

Facts

The appellant, had instituted action against the respondent for damages arising out of alleged negligent medical treatment performed upon him whilst he was a member of the Defence Force, the treatment having been performed by military doctors in the Defence Force. The respondent had raised a special plea that the action was barred, in respect of part of the relief claimed, by the provisions of s 113(1) of the Defence Act in that the action had been instituted more than six months after the cause of action in respect of that part of the action covered by the special plea had arisen. The appellant replicated that it was impossible for him to have become aware of the facts giving rise to that part of the cause of action referred to in the special plea by reason of the fact that he was under regulation 11 of chapter XV of the General Regulations for the SA Defence Force and the Reserve and the Military Discipline Code obliged to accept the arrangements made by the Surgeon-General of the Defence Force for the provision and administration of any treatment to him and that he was not in law entitled to seek any treatment for his injury other than that arranged for him by the Surgeon-General. It was alleged that the appellant was not aware of the negligence of the military doctors before a date six months prior to the institution of the action and that it was therefore impossible for him to comply with the provisions of s 113(1) of the Defence Act before that date. It was alleged in the alternative that it would be unconscionable conduct for the respondent to raise the special plea based on s 113(1) of the Act. A Provincial Division had upheld the special plea.

34 Pizani 1987 (4) SA 592 (A)
Judgment

In its judgment the court made the following observations:

Regulation 7 imposes upon the Surgeon-General a general duty to arrange for the provision to a patient of, *inter alia*, the medical and hospital treatment which is required in respect of an injury from which the patient is suffering in order to effect his recovery. It provides that the Surgeon-General, or a medical officer designated by him for the purpose, shall from time to time determine the nature and extent of the treatment required by the patient and may authorise the provision or administration of such treatment.

Regulation 11 deals generally with the manner in which the Surgeon-General must provide treatment for a patient. Subparagraph (1) places on the Surgeon-General a general duty to provide treatment and to exercise control thereover. To this end he is required, as far as it is professionally and administratively possible, to make use of the facilities of the military medical service and such other state medical facilities as may be at his disposal. Treatment may be administered at the patient’s residence, a hospital, a clinic, an outpatients’ department of a hospital, the medical officer’s consulting rooms or any other designated place. In certain instances where military facilities are not available or suitable the Surgeon-General may authorise the treatment of the patient at any other designated hospital or institution. In addition, whenever the Surgeon-General considers that the treatment of a patient cannot be undertaken by a medical officer of the South African Medical Corps or a district surgeon or where a second opinion is required, he may designate a medical officer not employed on a full-time basis by the state for the treatment of the patient (subpara 2(g)). He may also accept liability on behalf of the state for the cost of any treatment provided to a patient by any practitioner or hospital in a case of emergency.

Regulation 12 deals with the provision of medical appliances, such as artificial limbs, dentures etc. In terms of the regulation, the Surgeon-General determines the specification, type or pattern of medical appliance to be provided for a patient, subject to the proviso that a patient may at his own request be provided with an article of a different specification, etc on condition (i) that this is approved by the Surgeon-
General or officer acting on his authority and (ii) that any additional expenses arising from this special provision are recovered from the patient concerned.

Regulation 13 deals with the defrayment of the cost of any authorised treatment or medical appliance and provides generally that such cost is to be met by the state. Provision is made for the payment of fees to practitioners not in the full-time service of the state who treat patients. It is also provided that where a patient is treated at a non-military hospital or institution he must be accommodated in a general ward, provided that in certain circumstances a medical officer may authorise at state expense accommodation in a ward other than a general ward and that

"this regulation shall not be construed as prohibiting a member from arranging, in terms of a private agreement between him and the hospital concerned, for the use of such other ward by him or his dependent on condition that such member shall pay any additional expenses arising from such agreement directly to the hospital concerned and that the State shall not be liable therefor."

The court noted that the appellant’s argument was that it is implicit in the regulations referred to above that it would be unlawful and a breach of the MDC for a member of the Permanent Force who suffered an injury to consult a private medical practitioner in order to get a second opinion or to check on the correctness of a diagnosis made by an army doctor.

It stated, however, that it was unable to discern such a necessary implication in the regulations in question and that the regulations make it obligatory for the Surgeon-General to provide at state expense medical treatment for an injured member of the Permanent Force and prescribe that the treatment shall be given by military doctors at military hospitals, etc. The court held that it was probably correct to say that it was implicit in the regulations that the patient concerned is in general obliged to accept treatment by military doctors and at military institutions. But this does not preclude him from seeking at his own expense a second opinion from a private medical practitioner. The court pointed out that the denial of the right of a member of the Permanent Force to consult a private doctor would constitute a serious derogation from his ordinary rights as an individual, especially where he suspected that the
treatment given to him by the army doctor might have been incorrect or even negligent, and it would require either an express provision in the regulations or a clear implication to establish the denial of this right. It found that there was no express provision and no such implication.

Discussion

Where regulations such as those applicable in *Pizani* impose a specific and detailed obligation upon the state to provide health care services at its own cost, it is submitted that this is highly likely preclude an inference of a contractual relationship between the public provider and the patient where the circumstances and scope of the services fall within the ambit of the regulations. Any attempt by the parties in such a situation to allege a contractual relationship between them would not only be unlikely but also superfluous since there is no need for such a contractual relationship in light of the existence of another legal basis for the provision of the health care services. It is difficult to conceive of a reason why the parties would wish to enter into a contractual relationship in circumstances where the law already imposes a specific obligation upon the provider to supply the relevant health care goods and services. The court was even prepared to accept a general obligation on the part of the patient to accept treatment by military doctors at military institutions. In this sense the military doctors and military institutions could almost be seen as having a right to treat the patient. The court refused, however, to accept the argument that this right was exclusive.

It is significant that the court refused to read into the regulations an interpretation which precludes the patient from entering into a contract at his own expense with a private doctor since such a provision would constitute a serious derogation from his ordinary rights. The case was decided prior to the advent of the Constitution in terms of which everyone has a right to have access to health care services. It would have been interesting to see the view of the court had the Constitution been applicable at the time. It may nevertheless be argued that the judgment contains the kernel of a notion that even where someone has access to health care services, he is not precluded from questioning or rejecting them, especially where there is a reasonable belief that they may be defective or inadequate, although there may be a general positive legal obligation upon him to receive such services. In the language of the Constitution one
might say that the right to bodily and psychological integrity will not easily be taken to have been restricted by way of a purported narrowing of a person’s choices concerning health services.

5.3 Provincial Health Legislation and the Intention of the State

Since health care services are rendered largely by the provinces, it will be instructive to examine more closely some of the provincial legislation that governs the rendering of health services in order to establish whether or not a contractual relationship is intended. It is not sufficient to assume that if one province excludes the possibility of a contractual relationship with a patient that they all do. However, as will appear from the more detailed consideration below it would seem that even the provinces with the most comprehensive legislative provisions on the delivery of health care services have not consciously contemplated the possibility of a contractual relationship with patients but seem to base the relationship rather on administrative law and regulatory provisions.

The Eastern Cape Provincial Health Act\textsuperscript{35} states that health service users are entitled, within provincial government, financial and human resources, to right of access to available comprehensive provincial health care services (section 12(c)). Section 13 stipulates that “Except to the extent limited by financial and human resources, health service users shall be entitled, as health service users, to access to comprehensive provincial health care services offered by designated provincial and district health care establishments” and that all health service users entering the comprehensive provincial health care system shall, subject to regulations promulgated in terms of the Act be entitled on the basis of need and subject to available provincial, financial and human resources to comprehensive provincial health care services including, but not limited to primary health care and secondary and tertiary health services on the terms and conditions specified in the regulations.

It would seem that although the possibility of contracting is left open by the use of terminology such as ‘access’, a contractual relationship is probably not contemplated

\textsuperscript{35} Act No 10 of 1999
between the public provider and the patient because the access is to be “on the terms and conditions specified in the regulations”. The regulations are likely, practically speaking, to preclude the need for contractual terms and conditions to govern the provider patient relationship and their existence would tend to support an inference or conclusion that a contractual relationship is not intended by the private provider. In the absence of evidence of an intention to contract, one would not usually infer that a contract has been entered into. The health services in this instance are comprehensive and include services at primary, secondary and tertiary level. A restriction is represented by the fact that the services are only available at designated facilities but this is likely in practice to mean that not every level of service is available at every facility simple because certain facilities may be designated purely as tertiary services providers while others are designated as purely primary services providers for obvious reasons. Not every rural clinic can have a magnetic resonance imaging scanner or a laminar flow operating theatre.

The KwaZulu-Natal Health Act states in section 29(2) that “a health care user is entitled to the progressive realization, within the Province’s available resources, to the right –
(a) of access to available primary health care services.”
(b) of access to available primary health care services.”
The Act defines “primary health care services” as “accessible first level health services included as part of the package of basic essential health services as prescribed by the Minister in regulations.” Section 30(1) states that “[E]veryone is entitled within the Province’s available resources and funds allocated to the Department and as a matter of right, to the progressive realization of access to primary health care services offered by designated public health care establishments.”
To the extent that these provisions seek to narrow the constitutional right of access to health care services to purely primary health care services they are probably unconstitutional. If only primary health care services were available in the province due to a lack of resources this might not be the case but the KwaZulu-Natal Department of Health in fact provides as a matter of course, secondary and tertiary

---

36 Although see the later discussion on tacit contracts.
37 Act No 40 of 2000
level services in many of its hospitals. The manner in which this legislation is worded could give rise to the understanding that while a contractual relationship is not intended with regard to primary health care services because these are available as of right in terms of the legislation, this is not necessarily true for secondary and tertiary health care services which are not apparently governed by the legislation. In other words while a contractual relationship is not envisaged with regard to primary health care services it is a possibility with regard to secondary and tertiary services. In terms of the regulations to the KwaZulu-Natal Health Act, a “free public health care user” means a public health care user who is deemed a free public health care user in terms of Departmental guidelines and does not pay for public health care services on the basis of a means test as determined by the Department. The regulations define a “full-paying public health care user” as “a public health care user who by virtue of his or her financial circumstances, is neither a free nor a part paying public health care user and is treated as a full-paying public health care user in terms of Departmental policy.” There is no mention of the level of health care, i.e. primary, tertiary or secondary, in this context. Regulation 3 of the regulations to the KwaZulu-Natal Health Act makes provision for the classification of public health care users by the head of the public health care establishment. If one examines the provisions of

3. (1) The head of the public health care establishment or his or her designee must, at the time of the public health care user’s admission to or treatment in a public health care establishment or as soon thereafter as possible, classify the public health care user as a -

(a) free public health care user;
(b) part-paying public health care user;
(c) full-paying public health care user; or
(d) private health care user.

(2) A person is deemed to be a full-paying public health care user until he or she proves that he or she qualifies as a free or part-paying public health care user.

(3) A part-paying public health care user, full-paying public health care user or private health care user treated at public health care establishment must sign an acknowledgement of debt for fees incurred in the course of receiving health care services at the public health care establishment.

(4) The head of a public health care establishment or his or her designee may, where necessary, make an assessment of the financial circumstances of the person responsible for the payment of the fees of the person to be admitted or treated.

(5) For purposes of subregulation (4), the head of the public health care establishment or his or her designee may require the person responsible for payment of public health care establishment fees to furnish relevant information or documentation which the head of the public health care establishment may deem necessary.

(6) A person who is required to furnish any information or document contemplated in subregulation (5) and a dependent of that person may not be admitted to or treated in a public health care establishment unless the information or documentation has been furnished: Provided that, a person may be treated where, in the opinion of the head of the public health care establishment or his or her designee, refusal to admit or treat a person could have dangerous or detrimental consequences to the person seeking admission or treatment.

(7) The head of a public health care establishment or his or her designee may, at any time, reassess the financial circumstances of a person responsible for fees of a public health care user.

(8) The head of a public health care establishment or his or her designee may, after reassessing the ability of a person to pay fees as contemplated in subregulation (7), determine that a public health care user should be treated as a full-paying public health care user where the public health care user -

(a) fails to provide the necessary documentation of his or her financial circumstances within the period stipulated by the head of the public health care establishment or his or her designee; or

613
regulation 3 in detail the following is noteworthy in terms of the question of whether or not there is an intention to contract –

(1) Patients who in terms of the regulations are required to pay fees must sign an acknowledgement of debt for such fees in respect of health services received;

(2) The head of a public health establishment can require certain documentation of a patient’s financial circumstances in order to classify the patient as a free public health care user, a part-paying public health care user, a full paying public health care user or a private health care user and may reassess such classification at any time;

(3) The patient can be refused admission to a public health establishment unless the financial information required for the purposes of the assessment and classification of the patient is furnished;

(4) The head of a public health establishment can determine that the fees must be paid at a higher rate but not exceeding the prescribed rate;

(b) has been classified or reclassified as a free or part-paying public health care user where the health care user or person liable for the payment of fees is a member of a medical aid scheme: Provided that -

(i) the public health care user must be reclassified as a part-paying public health care user when the benefits enjoyed under the health care user’s medical aid scheme are depleted;

(ii) no charge other than that applicable to part-paying public health care users may be charged for any service, treatment, appliance or prosthesis not covered by the health care user’s medical aid scheme; and

(iii) the charge, other than the charge applicable to part-paying public health care users, for any service, treatment, appliance or prosthesis not fully covered by the health care user’s medical aid scheme, must not exceed the amount covered by the health care user’s medical aid.

(9) Subject to subregulation (10), the head of a public health care establishment or his or her designee may determine that the fees be paid at a higher rate not exceeding the prescribed rate.

(10) The head of the public health care establishment or his or her designee must satisfy himself or herself that owing to any change in the financial circumstances of the person responsible for fees, the person is able to pay fees at a rate higher than the rate previously assessed.

(11) A head of a public health care establishment or his or her designee may not reassess fees when the person responsible for payment is deceased.

(12) A person who is aggrieved by an assessment or re-assessment made by a designee of the head of a public health care establishment may appeal to the head of the public health care establishment.

(13) A person who is aggrieved by an assessment or re-assessment made by the head of a public health care establishment may appeal to the Head of Department.

(14) An appeal to the Head of Department contemplated in subregulation (13) must be accompanied by the recommendations of the head of a public health care establishment.

(15) The decision of the Head of Department on the appeal contemplated in subregulation (13) is final.

(16) The Head of Department may bring an action against a person for damages incurred by the Department as a result of the person knowingly or wilfully furnishing any information or documentation which is false, incorrect or misleading.
(5) A person who is aggrieved by an assessment or re-assessment made by the head of the public health establishment may appeal to the Head of the provincial health Department whose decision is final;

(6) The Head of Department can bring an action against a person for damages incurred by the Department as a result of the person knowingly or willfully furnishing any information or documentation which is false, incorrect or misleading.

It is submitted that the fact that signature of an acknowledgement of debt for fees by the patient or other person responsible for payment is a regulatory requirement is not necessarily indicative of an intention to contract with regard to the delivery of health services on the side of the public provider or the patient since the patient is apparently bound by law to sign it. It is more likely an attempt to ensure that the patient or other person responsible for payment is aware of his or her obligation to pay the fees and to shift the risk of the costs of the collection of such fees from the province to the person responsible for payment. This is borne out by the fact that the patient cannot negotiate the fees payable. They are determined on the basis of objective evidence as assessed by the head of the health establishment. The head of the health establishment can unilaterally decide to alter the level of fees payable within the limits of the prescribed rate and the remedy provided for a decision of the head of the health establishment is an administrative one as opposed to a contractual one. The legal basis for the debt, in the absence of a contract, would be the regulations themselves since regulation 5 lists the circumstances in which a person is not required to pay for treatment and services at a public health care establishment.

The nature of the damages for which the Head of Department can bring an action is not specified but if one looks at the basis of the damages they tend to suggest civil wrongdoing rather than breach of contract. Although deliberate misrepresentation is a ground for damages in the law of contract, the fact that the regulations do not allow

---

39 The wording of the regulation suggested that an element of culpability is required. By contrast, in certain circumstances under the law of contract even an innocent misrepresentation is grounds for a claim for damages. See Pham (Pty) Ltd v Patnes 1973 (3) SA 397 (A). See also Labuschagne v Fodgen Insurance Ltd 1994 (2) SA 222 (N). This is not true of the law of delict. In Ericson v Cermie Motors (Edms) Bpk 1986 (4) SA 67 (A) the court stated: "There is in our law no basis for an action for damages in delict founded upon an innocent (ie non-fraudulent or non-negligent) misrepresentation."
a contractual remedy to a patient who is aggrieved by a decision as to what fees he should pay suggests that the damages contemplated might be in terms of the law of delict. It would be administratively unjust to allow a contractual remedy to one party to the contract – i.e. the provincial government, while denying a remedy of the same nature to a patient. Of course one would have to consider the circumstances of each case before ruling out the possibility of a contractual relationship.

The Gauteng District Health Services Act\(^{40}\) defines ‘primary health care services’ as “comprehensive health care services that includes preventative, promotive, curative and rehabilitative health care within the context of community participation, intersectoral collaboration and an adequate referral system”. The Act seeks to transfer the responsibility for the delivery of primary health care services to municipalities in terms of section 19. Such assignments of functions are contemplated in section 156 of the Constitution. This raises the question, however, that if a municipality is liable for the rendering of primary health care services, does this mean that a provincial health facility that offers secondary and tertiary level health care services is lawfully entitled to refuse to treat a person requiring primary health care services who has not availed themselves of those services at the local municipal health clinic? If the answer is that such a patient may not be refused such primary health care services by the provincial facility this would render the delivery of appropriate levels of health care by facilities at a level that can most appropriately, efficiently and effectively deliver those services highly problematic from the point of view of the practical organization of health services delivery. Primary health care services delivered at facilities that are designed for the rendering of more complex secondary and tertiary levels of health care are much more expensive than those same services rendered at their proper level within the health care system such as community based clinics and health care facilities. Gauteng appears not to have enacted any legislation resembling that of KwaZulu-Natal that specifically grants a patient a right to a particular level of health service. In terms of the Hospitals Ordinance Amendment Act\(^{41}\), Gauteng legislation provides for a similar system of classification of patients into part paying and private as does the KwaZulu-Natal legislation. Section 31(2) of Ordinance 14 of 1958 as amended by the

\[^{40}\text{Act No 8 of 2000}\]
\[^{41}\text{Act No 4 of 1999}\]
1999 Act stipulates that the superintendent, chief executive officer or his or her designee may call for such information or documents as he or she may deem necessary or as may be prescribed in any regulation and no person shall be admitted into any provincial hospital or receive treatment thereat unless such information or documents have been furnished by or on behalf of such person. The Gauteng legislation contains the same exception as the KwaZulu-Natal legislation to the effect that a patient can be admitted where in the opinion of the superintendent, treatment cannot be deferred without danger or detrimental consequences to the patient. In General Notice 7867 of 2000 entitled: “Amendment To The Regulations Relating To The Classification Of And Fees Payable By Patients At Gauteng Provincial Hospitals, Mortuary Fees, And Fee Pertaining To Ambulances And The Amendment Of Hospital Tariffs, Mortuary And Ambulance Tariffs With Effect From 1 November 2000” the statement is made with regard to financial principles that:

“All health services rendered by the state are chargeable. However, no emergency service may be refused if a patient cannot pay for it and no patient, including an externally funded patient, will be required to meet all costs of essential medical services should such costs place an excessive financial burden on her/him.”

The liability of an externally funded patient is stated as follows:

“Externally funded patients will pay the full rate prescribed by the UPFS. In cases where services are rendered to patients by a private health care practitioner, the patient or her/his funder will be liable for the facility fee component of the UPFS tariff to the public health facility concerned. It is the responsibility of the private practitioner to render an account to the patient or her/his funder for any professional fee due to the private practitioner.”

The proposed regulations also state the following “Administrative Principles”:

- Patients who are not externally funded are eligible to pay reduced fees for services received. The onus rests on the patient to prove her/his eligibility to be categorized as a subsidized patient. If a patient refuses to do this, then he/she must be regarded as a full paying patient.

42 Provincial Gazette No 174 Part 1 13 November 2000
• The eligibility of a patient to pay reduced fees will be based on a standard means test or the membership of the patient to certain groups exempted from paying for public health services.

• Patients paying reduced fees will be encouraged to pay cash. In such cases a payment receipt but not an invoice will be produced. In cases where the reduced fee cannot be paid in full and the patient is not reclassified into a group exempt from payment, a credit agreement must be entered into with the patient or her/his guardian.

• Patients funded by a medical scheme registered in terms of the Medical Schemes Act, are governed by the provisions of that Act with regards to the minimum benefits for which the funder is liable. For the purposes of charging for services not covered by the funder, the patient will be classified as provided for in principle 7 and will be liable for the payment of the applicable fees.

• A facility fee plus a professional fee will be charged for each procedure group. The professional fee will not be charged where a patient utilizes the services of his/her private clinician.

It seems in view of these similarities that the position is much the same for Gauteng as it is for KwaZulu-Natal and that there is apparently no intention to contract with patients on the part of the provincial government of Gauteng. The fact that a credit agreement, which is undoubtedly a contract, must be entered into where the patient cannot pay the fee in full and is not reclassified, does not necessarily mean that initial relationship involving the rendering of health services by the provincial government is contractual. It could be argued that the requirement of the credit agreement is based upon the need to establish the amount and frequency of the payments that must be made by the patient over time and also to facilitate debt collection procedures by the province should the patient fail to pay. The need for the contract in other words arises not so much in order to facilitate the delivery of and payment for health services but to ensure payment as required by regulations. The health services themselves may

43 Medical Schemes Act fn 1 supra
already have been rendered by the time that the credit agreement becomes necessary. If the credit agreement is as a matter of routine practice entered into in advance of the rendering of the health services, for instance as part of the admission procedures to the hospital, then it could be argued that the relationship between the patient is of a contractual nature. However, in this instance there would still be a strong administrative law element in the relationship given the imbalance of power between the contracting parties and the fact that many of the essential terms of the ‘contract’ are determined by regulations.

As far as the Western Cape is concerned the Health Act\textsuperscript{44} still applies. It effected some minor amendments to the provisions of this Act insofar as they affect the Western Cape Province in 2002\textsuperscript{45}. The Western Cape has made entitled ‘Regulations Relating To The Uniform Patient Fee Schedule For Health Care Services Rendered By The Department Of Health: Western Cape For Externally Funded Patients,’\textsuperscript{46} primarily concerning public sector patients who are members or beneficiaries of medical schemes and other funds that pay for health services. The Regulations apply only to ‘externally funded patients’ and define this phrase as follows:

“externally funded patient’ means a patient whose health services are funded or partly funded in terms of-
(a) the Compensation for Occupational Injuries and Diseases Act, 1993 (Act 130 of 1993), or
(b) by the Road Accident Fund created in terms of the Road Accident Fund Act, 1996 (Act 56 of 1996), or
(c) a medical scheme registered in terms of the Medical Schemes Act,1998 (Act 131 of 1998), or
(d) another state department, local authority, foreign government or any other employer, or who exceeds the generally accepted income means test as implemented by the Provincial Government: Western Cape;”

They set tariffs for various categories of health facilities and health services delivered by the public health sector in the Western Cape to persons who are externally funded patients. Regulation 3 states that an externally funded patient who receives any medical treatment or any medical service, listed and categorised in Schedule 2, from a department of health facility, must pay the applicable tariff for such medical treatment

\textsuperscript{44} Act No 63 of 1977
\textsuperscript{45} Western Cape Health Act Amendment Act No 6 of June 2002. Notice No 164 in Provincial Gazette No 5891 of 18 June 2002
\textsuperscript{46} Provincial Gazette No 5977 Notice No 21 of 29 January 2003
or medical service received in accordance with the tariff of fees and charges as set out in Schedule I of the regulations.

The Northern Province Health Services Act\(^\text{47}\) states in section 34 that subject to the provisions of section 36 every manager must admit for treatment in or at any health service or facility in his or her charge so far as adequate and appropriate accommodation is therein available, persons suffering from or subject to any of the diseases, injuries or conditions for the treatment of which such health service or facility is established. Section 36 deals with classification of patients and contains similar provisions relating to documentary proof of financial status as the legislation of KwaZulu-Natal and Gauteng. In terms of section 35, the remedies for a person who is aggrieved at the classification are administrative. The Member of the Executive Council for Health of the province is given the power to prescribe fees for the treatment of a person in a health service or facility in section 41 of the Act.

The North West Health Bill, which seems not to have been passed into law at the time of writing simply states in section 24 that the medical administrator or head of clinical services of a provincial hospital shall, subject to any regulations, determine the order in which persons shall be admitted to such hospitals having regard to the urgency of their need for treatment as far as adequate and appropriate accommodation is available. The Mpumalanga Hospitals Bill\(^\text{48}\), which also seems not to have been passed into law, leaves matters such as fees for health services to regulations. It contains provisions that are similar to the North West Health Bill. The Free State Provincial Health Act\(^\text{49}\) provides in section 36 that the MEC shall by notice in the Provincial Gazette regulate the package of health care to be provided. It stipulates that the health care package at each level of care shall be accessible, acceptable, affordable, efficient, comprehensive and integrated with promotive, preventative, curative and rehabilitative services. It requires the Department of Health in the province to ensure progressive implementation of health services at all levels of care in order to avoid and remove duplication and fragmentation of health services.

\(^{47}\) Act No 5 of 1998 Provincial Gazette No 4 of 1999
\(^{48}\) A 1997 Bill
\(^{49}\) Act No 8 of 1999
improve and maintain the quality of health services within the available resources and remove all barriers to access to health services where possible. The Department is also tasked with reviewing and monitoring the efficiency of the respective health packages on a regular basis. The user is not expressly given any specific rights relating to access to health services in this Act although there are rights to information, informed consent, confidentiality and to complain. Section 35 states that health care providers shall fulfil every duty owed to each patient including the duty inter alia to “provide the best quality care appropriate”. There is no suggestion of a contractual relationship between the province and the patient for the provision of health care services to the patient.

In view of the foregoing it seems that whilst provincial governments may be free to contract with patients for the provision of health services they generally seem to prefer the expression the public provider patient relationship in terms of regulations, thereby bringing it within the scope of administrative law. This said, one must bear in mind the distinctions made between paying and non-paying patients and between the different levels of services in some of the provincial legislation and regulations. It may well be that in particular circumstances the facts may indicate that there is sufficient evidence of a contractual relationship with the patient and the existence of such a relationship can thus never be completely discounted. The fact that provinces enter into contracts with medical schemes to treat medical scheme patients on certain terms and conditions may lead to a conclusion that a patient is a party to the contract because it is a contract for the benefit of the patient. However this would depend on the nature of the terms of the particular contract between the scheme and the provincial government in question.

Even if provincial governments had indicated more strongly a preference for a contractual basis for the provider-patient relationship, if one considers the circumstances, with the Constitution as backdrop, in which a private health care provider may legitimately refuse to treat a person, they are no different in principle to the circumstances in which a public health care provider may refuse to treat one. The freedom of a private provider of health care services to refuse treatment is not as wide, in legal terms, as it may first appear. The Constitution prohibits unfair
discrimination in general and upon a number of specific bases. A health care provider 
who turns away a patient on the grounds of his or her race, age, gender, disability sex, 
sexual orientation, culture, religion, language, belief, birth, marital status, ethnic or 
social origin or pregnancy is likely to be in violation of that patient’s constitutional 
right to equality as well as his or her right of access to health care services. If a private 
health care provider cannot supply a good reason on legal or ethical grounds for 
turning a patient away, such as the provider’s own ill health, disability, lack of 
competence in a specialised area, non-compliance with licensing requirements or lack 
of capacity, it is submitted that unfair discrimination is likely to be raised as a 
possibility or even a probability for the private provider’s refusal to treat the patient 
on the premise that if there is no good reason why the provider does not wish to treat 
the patient and there must be a reason for the provider’s refusal, one must start 
looking to other kinds of reasons as possibilities. It is submitted that the range of 
acceptable reasons, other than those based on legal and ethical principles, for a private 
provider’s turning away a person needing health care services given the foregoing is 
likely to be fairly narrow. It is also submitted that the same holds true for public 
health care service providers except that, to the extent that their decision constitutes 
an administrative one, they will be obliged to give reasons in terms of the PAJA and 
these are open to interrogation in terms of administrative law. It is important to 
remember, however, that this Act also applies to private persons, natural and juristic, 
when exercising a public power or performing a public function in terms of an
empowering provision which adversely affects the rights of any person and which has a direct, external legal effect.

5.4 Arguments in Favour of Contractual Relationship

It is submitted that there are a number of aspects about the public provider-patient relationship that support the idea that it is contractual. The concept of informed consent, for instance, tends to strengthen the idea of a contractual relationship rather than diminish it even though informed consent is traditionally discussed rather more in the context of the law of delict than of the law of contract. Informed consent requires that the patient is fully informed of the nature of the proposed treatment, its consequences and the consequences of not having it, the risks associated with it and alternatives to it. In this sense it is very much akin to the contractual principles of meeting of minds\(^2\), contractual capacity\(^3\) and of involuntary reliance\(^4\). The

52. In Sefki commercial And Industrial Properties (Pty) Ltd v Silverman 2001 (3) SA 952 (SCA) at p958 the court notes that: “A basic rule is that -

‘an acceptance of an offer made ought to be notified to the person who makes the offer, in order that the two minds may come together’. (Per Bowen LJ in Carlill v Carbolic Smoke Ball Co [1893] 1 QB 256 (CA) at 268. See also R v Nel 1921 AD 339 at 344; Reid Bros (South Africa) Ltd v Fischer Bearings Co Ltd 1943 AD 232 at 241.) If the patient does not understand what it is that the health care provider is proposing in terms of treatment then any consent given will not be properly informed. The health care provider and the patient must be ad idem as to what it is that the health care provider is permitted to the patient to do to him or her.

53. Minors are generally not recognised as being capable of giving informed consent in much the same way that they are not recognised as having contractual capacity until they have reached a certain age. Strauss SA, Doctor, Patient and the Law: A Selection of Practical Issues at p 5 observes that “Obtaining a legally ‘safe’ consent where the patient is a minor, i.e. an unmarried persons below the age of 21 years, is a matter of general concern to medical practitioners. Where a parent or guardian is available to give consent there are no problems”. In terms of section 39(4) of the Child Care Act, No 74 of 1983 “Notwithstanding any rule of law to the contrary -

(a) any person over the age of 18 years shall be competent to consent, without the assistance of his parent or guardian, to the performance of any operation upon himself; and

(b) any person over the age of 14 years shall be competent to consent, without the assistance of his parent or guardian, to the performance of any medical treatment of himself or his child.”

In terms of the law of contract, “In Roman Dutch law the judgment of a minor is considered immature throughout his minority and he is consequently not bound by his contracts” (Edelstein v Edelstein 1952 (3) SA 1 (A)). In Dhanabala v Subramanian 1943 AD p 160 the court stated at p 167 that: “According to the common law a minor cannot bind himself by contract without the assistance of his guardian subject to certain qualifications.”

54. Christie The Law of Contract 4th ed at p 322, referring to Pretorius v Natal South Sea Investment Trust Ltd 1965 (3) SA 410 (W) where the court observes that: “There is an ‘involuntary reliance of the one party on the frank disclosure of certain facts necessarily lying within the exclusive knowledge of the other such that, in fair dealing, the former’s right to have such information communicated to him would be mutually recognised by honest men in the circumstances’” states as follows: “The test of involuntary reliance here applied is in accordance with the principle underlying the requirement of disclosure of material facts in contracts of insurance. The insured must disclose all material facts because the insurer involuntarily relies on him for information on such facts: it might theoretically be possible to ascertain these facts by other means but it would not be practical in the business sense”. It is submitted that the patient is in the same position more or less as the insurance company. He or she is involuntarily reliant upon the health care professional who knows his or her unique situation as well as being in possession of expert medical knowledge that may not be readily available elsewhere, to disclose the material facts. Whilst it may be possible to obtain the relevant information from other sources or health care providers it is not always practically or financially possible for the patient to do so. See also Absa Bank Ltd v Fosche 2003 (1) SA 176 (SCA) where the court observes that: “I am prepared to assume, though not without some hesitation, that the information about the alarm and the guards can be classed as falling within the exclusive knowledge of the branch officials. My hesitation stems from the fact that information which is, if desired, as readily ascertainable as this was, should not be categorised as exclusive knowledge. ‘Exclusive knowledge’ in this sense is knowledge which is
classification of patients into various categories and the requirement that they must pay a certain amount for such services could be indicative of an intention to contract, especially where there is a requirement that if the fee cannot be paid in a single cash amount, the person responsible for the payment must enter into a credit agreement with the provider. Although it is not necessarily sufficient to ground the inference of a contract on its own since the doctrine of consideration is not part of the South African law of contract, it is submitted that in certain circumstances the requirement of payment for health services may be an indicator of a contractual intention. Other circumstances which may be indicative of a contractual relationship are where the patient has requested a specific procedure for a particular reason such as those in Edouard. The fact that the procedure is elective as opposed to essential to the health or wellbeing of the patient may also have a bearing. In practice a court is unlikely to refuse to acknowledge a contractual relationship between a public provider and a patient where this can be demonstrated on a balance of probabilities where the provider itself asserts that there was no intention on its part to contract. Clearly the inference of a contract between the parties will depend upon the circumstances of each case and also public policy considerations. The question of the existence of a contractual relationship between a public provider and a patient is rarely likely to arise outside of the context of litigation in any event given the nature of the delivery of health care services in the public sector and the absence of any form of negotiation between the parties in most instances. It is, however, of some significance that in the South African cases many of the parties seem to have chosen to base their claims on the law of delict as opposed to that of contract. Of the four cases discussed in this section only one South African case, that of Edouard, is based squarely upon the law of contract. If a court should find that there is a constitutional obligation upon the state specifically to deliver health care services, especially if this obligation is reinforced by national health legislation, then the likelihood in the abstract, of the existence of a contractual relationship between the patient and the public provider is diminished since there may be no logical need for it – particularly in circumstances where the patient has no choice but to use the public health system and is not obliged to pay for health care services in terms of a means test.

55 inaccessible to the point where its inaccessibility produces an involuntary reliance on the party possessing the information (Christie RH The Law of Contract 4th ed at 322)."

56 Edouard fn 24 supra

Edouard fn 24 supra
5.5 Arguments Against Contractual Relationship

Since the existence of a contract is fundamentally dependent upon the intention of the parties to enter into a contract, however, it does not necessarily follow that a contract arises in every instance in which a public provider of health care services renders such services to a patient. In *Magware's* case\(^{57}\) the Minister of Health when faced with a claim for damages arising from the negligent application of a plaster cast by hospital staff, in his plea denied the existence of a contractual relationship between the parties. The court decided the case in the absence of a contractual relationship on the basis of the law of delict.

In *Dube v Administrator, Transvaal*\(^{58}\) (W) Trollip J noted that the plaintiff's action was founded on negligence and not on contract. This does not necessarily mean, however, that a contract did not exist between them. The fact is that a plaintiff can choose the legal basis of an action for damages when the circumstances support both a claim in terms of the law of contract and one in terms of the law of delict. Similarly the Administrator Transvaal may have chosen to deny the existence of a contract with the patient for strategic reasons in order to make it more difficult for the plaintiff to prove his claim, placing upon him the onus of proving the existence of a contract if this was the route that he chose to go. The plaintiff's claim in *Mtetwa v Minister of Health*\(^{59}\) was based upon three alternative causes of action, namely:

(a) an implied contractual agreement between the parties, with a breach of a material term of that agreement by one of the defendant's employees and the resultant liability of the defendant on the basis of the actions of a servant conducted within the course and scope of his employment with his principal; alternatively

---

\(^{57}\) *Magware v Minister of Health* NN0 1981 (4) SA 472 (Z) (see later for detailed discussion of the facts and the judgement).

\(^{58}\) *Dube* 1963 (4) SA 260 (W)

\(^{59}\) *Mtetwa* 1989 (3) SA 600 (D) at p601-602
(b) a claim in delict arising from the failure by the defendant's employees to employ reasonable skill and care in their treatment of the plaintiff, by treating her negligently, with the resultant liability of the defendant being based upon the actions of a servant acting within the course and scope of his employment with his principal; alternatively

(c) a wrongful, unlawful and intentional assault on the plaintiff by one or more servants of the defendant, the liability of the defendant being based upon the actions of an employee-servant acting within the course and scope of his employment with his principal.

The case is discussed in more detail under the section on the law of delict due to the fact that it essentially revolved around the question of vicarious liability. It is clear from this, however, that the basis of a claim for damages in the health care context can range from contractual to delictual and even criminal law. The fact that a contract arises between a provider and a patient does not by any means preclude a delictually based duty of care. Neither does it preclude the possibility of a criminal action for assault, in the absence of the informed consent of the patient although this point will be discussed in more detail at a later stage. As stated previously the existence of obligations on the basis of constitutional and administrative law, to render health care services to a patient may preclude an inference that a contractual relationship arose between them. The question of the administrative contract, which is something of a hybrid straddling administrative law and the law of contract, appears not to have found total recognition in South African law at present judging from the statements of the writers referred to previously. It is submitted that this is a prime example of the reluctance of some South African courts to allow cross-pollination of one area of law by another. In fact it is even more than that since it constitutes a failure to recognised that constitutional principles and values are fundamental to all areas of law and that there is a positive constitutional obligation upon the courts to develop the common law in accordance with these. There may be circumstances in which a contract is implicitly precluded as the basis of the relationship between a public provider and a patient. The case of *Pizani v Minister Of Defence* offers an example of this.

---

60 *Pizani* in 34 supra
5.6 Conclusions Regarding Health Care Relationships

In the context of health services delivery, one must consider the law holistically whilst at the same time retaining an awareness of its different facets. It would be a mistake to think only in terms of the law of contract or only in terms of the law of delict or administrative law when considering the provider-patient relationship. This is demonstrated by a series of cases in which relationships which began essentially by way of a contract between the parties gave rise to obligations based upon the law of delict\(^6\). The boundaries between these different areas of law are permeable because

\(^6\) Beginning with Van Wyk v Lewis 1924 AD 438 and ending most recently with Pinshaw v Nexus Securities (Pty) Ltd and Another 2002 (2) SA 510 (C). In Van Wyk v Lewis the defendant performed an emergency operation on the plaintiff but accidentally left a swab in her body. Some twelve months later, the plaintiff excavated the swab through her bowel into which it had found its way. The plaintiff alleged that the defendant had acted negligently and unskilfully in failing to remove the swab and sued him for two thousand pounds. The Appellate Division confirmed the judgment for the defendant of the trial court and held that the action was based on tort, the defendant had been obliged to act with reasonable skill, having regard to the general level of skill and diligence possessed and exercised at the time by members of the branch of his profession to which he belonged. It held further that the onus of establishing negligence lay with the plaintiff and that the latter could not, in the circumstances of the case, rely on the maxim res ipsa loquitur. The Appellate Division found that the defendant had acted reasonably and had therefore not been negligent, in relying upon the theatre sister to count the swabs used in the surgery and that if the theatre sister had been negligent, her negligence could not be attributed to the defendant in any way. Innes CJ in discussing the basis of the plaintiff's claim observed that the line of division where negligence is alleged is not always easy to draw, "for negligence underlies the filed both of contract and of tort. Cases are conceivable where it may be important to decide on which side of that line the cause of action lies. But the present is not such a case..." Wessels JA stated in his judgment at 455 that "...The case... is one of those... where the relationship between the parties arises out of a contract but where the act complained of is an injury or delict done in consequence of carrying out the contract. The delict grows out of a breach of duty which the law implies from the contract between the parties - the duty of the surgeon who contracts to operate not to do so negligently..." In Pinshaw the plaintiff was an elderly widow who had taken up permanent residence with her family in Australia. Exchange control regulations did not permit her to remit sufficient funds and assets to that country and she therefore entered into a contract with the first defendant, dealing in this context with the second defendant, who signed on behalf of the first defendant. In terms of the contract the plaintiff agreed to invest R1 million in stock market equities to be managed and controlled by the first respondent. The funds were placed under the control of the second defendant, who was the director of the first defendant in charge of private client portfolio management. The contract included a clause which indemnified the first defendant or any of its directors or employees against any losses and liability or damage for claims brought by the client by reason of the operation of his or her account unless the claims were attributable to fraud, bad faith, dishonesty or gross negligence on the part of the first defendant, its directors or its employees. The plaintiff's entire portfolio was invested in one stock (C Ltd), of which the second defendant was the senior manager. The portfolio dropped in value to approximately R343 000 as a result of the investment. The plaintiff instituted action for pure economic loss and alleged that the defendant was the director of the first defendant liable for the conduct of the second defendant. The second defendant took exception to the plaintiff's particulars of claim transfer as they related to the alternative cause of action based on alleged recklessness or gross negligence, claiming them to be vague and embarrassing, lacking averments necessary to sustain the cause of action. The basis of the exception was that the second defendant alleged that he did not owe the plaintiff a legal duty to act with care and, without this duty of care being established, the cause of action could not succeed. The second defendant alleged that it was the first defendant, not himself, which was contractually bound and obligated to the plaintiff and that she should seek redress there. The court stated that it was apparent that the pleading had been so framed in order to meet the exclusionary clause, clause 16, of the contract. This clause excluded the liability of Nexus and its directors and employees (of whom Van Zyl was one) 'unless the claims are attributable to fraud, dishonesty or gross negligence' or unless the losses are attributable to 'fraud, bad faith, or gross negligence'. The existence of clause 16, said the court, may have an impact on the substantive question of unlawfulness. In deciding whether Van Zyl owed Mrs Pinshaw a legal duty, the court said that it must have regard to all the circumstances, including the existence and terms of the contract with Nexus and including clause 16 itself. If in all the circumstances Van Zyl owed Mrs Pinshaw some duty, there were two ways of looking at the position. The duty might be a duty qualified by clause 16. Alternatively, it might be a wider duty to exercise reasonable care in the management of the portfolio. In that case it would be for Van Zyl, who was not a party to the contract, to show that he was entitled to the benefit of clause 16. Mrs Pinshaw, however, had impliedly conceded the entitlement and so the court did not take this aspect further. Conrie J then went on to discuss the case of
they are based upon the same grundnorm – the Constitution. There should be general recognition by the courts of the substantive and fundamental objects and purposes behind the legal principles to be found in the various areas of South African law so as to facilitate the development of the common law by the courts in a manner which will ensure a single totally internally consistent and coherent system of law. Whilst the division of the law into different branches and legal disciplines facilitates complex analyses of legal principles within those branches and disciplines it does not further the development of the common law by the courts as envisaged by the Constitution and does not promote consistency, justice, reasonableness or fairness within the South African legal system as a whole. A certain level of legal synthesis, as opposed to analysis, is necessary in order to achieve this. In the real world, people do not operate businesses or fulfil public functions in terms of only one particular area of law. Health

Lillicrap, Wassenaar and Partners v Pilkington Brothers (SA) (Pty) Ltd 1985 (1) SA 475 (A) as follows at p 518-519:

"Lawyers will know that this case was preceded by Administrator, Natal v Trust Bank van Afrika Bpk 1979 (3) SA 824 (A) which held that in our law Aquilian liability could in principle arise from negligent misstatements which caused pure financial loss, but cautioned against an extension which was either too wide or too rapid. In 1985 Lillicrap's case came before the same Court of Appeal. It was a claim for pure economic loss arising out of a contract by a firm of consulting and structural engineers to render professional services to Pilkington Brothers. There were two complications: first, at some stage Salane had been interposed as the contracting party, and the engineers had become in effect subcontractors to Salane; second, any claim against the engineers in contract had apparently become prescribed. So Pilkington Brothers sued the engineers in delict for damages for alleged negligent performance of their duties undertaken initially in terms of the direct contract and later in terms of the sub-contract. Two principal questions arose for decision. The first was the question of concurrency. Given the antecedent contract, could the claim for pure economic loss be brought in delict? The Court answered affirmatively at 496F: 'In modern South African law we are of course no longer bound by the formal actions of Roman law, but our law also acknowledges that the same facts may give rise to a claim for damages ex delicto as well as one ex contractu, and allows the plaintiff to choose which he wishes to pursue. See Van Wyk v Lewis 1924 AD 438; Hosten (op cit at 262); R G McKerron Law of Delict 7th ed at 3; J C Van der Walt in Joubert The Law of South Africa vol 8 para 5 at 7 - 11. The mere fact that the respondent might have framed his action in contract therefore does not per se debar him from claiming in delict. All that he need show is that the facts pleaded establish a cause of action in delict.'

That this conclusion applied also to a claim for pure economic loss appears from the very next sentence of the judgment of Groskopf AJA: 'In the present case we are concerned with a delictual claim for pecuniary loss...'. Given that concurrency was in principle permissible, the second question which arose was whether in the circumstances of Lillicrap’s case (as alleged, the case having been decided on concurrency) the engineers owed Pilkington Brothers a legal duty of care in delict over and above their contractual duties. This depended on whether the engineers had acted wrongfully, as distinct from culpably. The Court of Appeal, by a majority, held against Pilkington Brothers for what were essentially reasons of policy. The Court was being invited to extend Aquilian liability, and should react cautiously; there was no need for delictual liability as the position was governed by the contractual arrangements; the parties reasonably expected that such arrangements would apply, and not be circumvented by action in delict; and (distinquishing Van Wyk v Lewis 1924 AD 438) there was no infringement of rights of property or person. Groskopf AJA said at 5010: 'To sum up, I do not consider that policy considerations, require that delictual liability be imposed for the negligent breach of a contract of professional employment of the sort with which we are here concerned.' 

Conrie J then went on to make a statement which it is submitted is of considerable significance in the context of the delivery of health care services. He said at 519-520: "It may be noted that Lillicrap was, by the terms of the majority judgment, confined to the case of the negligent performance of a contract to render professional services. It was not put so widely as to refer to persons professing skill in a calling. While many persons financial services have excellent qualifications, I am not aware that they are required to undergo graduate study and rigorous training of the kind which are sine qua non of the right to practice as a professional engineer. It seems to me that on this ground too, Lillicrap’s case is technically distinguishable from the present matter."

It must be borne in mind that the judicial debate embodied in these cases centred around Aquilian liability for pure economic loss flowing from a contractual relationship. However, as Conrie J pointed out at the start of his review of the cases that had been decided on this subject since Lillicrap: "As far as possible I shall confine the review to cases of pure economic loss, actual or inferred, though it will be seen that such a neat compartmentalisation is not readily achievable."

For the sake of convenience, further discussion of the judgment in Pinshaw is to be found later on in this chapter in the context of the law of delict. It must be noted however, that the decision in Lillicrap came in for significant criticism (See Bobey, The Law of Delict Vol 1: Aquilian Liability p 15-16 and the criticism there listed) much of it for precisely the reason that the approach of the court assumed that compartmentalisation of the law at any level is not only possible but also necessary for reasons which, in distillation, seem to amount to little more than a predilection for purism.
services delivery is a good example of this because it contains elements of constitutional, statutory and common law - this last most notably in the areas of contract and delict. When a public provider is considering its obligations and options in any given situation it needs to know what these are across all of the relevant legal disciplines. The same applies for the patient. Since one particular area of law impacts upon another and may even modify a particular conclusion drawn on the basis of only one legal discipline it is logical to view the issue from a global perspective. Before one can identify the point of law upon which a particular unique situation hinges, one has to examine all of the possibilities. The law of contract is particularly versatile and flexible in terms of relationships *inter partes*. They can exclude the operation of certain legislative provisions by agreement, they can also expressly include them by agreement, they can exclude or include certain legal consequences arising not only from the law of contract but the law of delict and other areas of the common law, the nature of the relationship in contractual terms is very much dependent on the power balance between them and the dynamics of the situation in which they come together which raises all kinds of public policy issues. They may agree on things that are impermissible in terms of public policy or the Constitution or contrary to certain overriding statutory provisions. It would be overly simplistic to consider their relationship only in terms of the law of contract - especially in the context of health services delivery which is so essential to the wellbeing of both the individual and the collective.

5.7 Summary and Conclusions

It seems that while the state undoubtedly as the capacity to enter into contracts with patients for the delivery of health care services it is not often that it does so and indeed, it is likely, as for instance in the case of *Edouard*\(^{62}\), that conscious thought was only given to the existence of a contractual relationship once it became apparent that there was a need to litigate against the state in this matter. The intention to contract is central to the question of whether or not a contract in fact came into being and whilst it may be relatively simple to establish that intention on the part of the patient it is not nearly as simple to do so in respect of the state. Generally speaking,

---

\(^{62}\) *Edouard* in 24 supra
from the point of view of the state, only officials having a sufficient degree of seniority and who have been delegated the power to do so can bind the state contractually.

Medical officers and nurses employed within public hospitals to render health services to patients generally do not occupy sufficiently high ranks within the public service to have the delegated authority to bind the state contractually. They would have no need, as employees of the state, to enter into contracts with patients themselves and it is unlikely that in the normal course of their daily activities that they would apply their minds to entering into contracts with patients on behalf of the state. Hospital superintendents, who may well have the power to enter into contracts on behalf of the state in terms of delegations from the head of the relevant provincial department of health, do not consult with patients for this purpose and indeed do not have much direct dealings with patients except possibly where there is a problem.

In terms of the Public Finance Management Act\textsuperscript{63} the head of department is the accounting officer of a government department and his or her responsibilities are set out in section 36 of this Act. One of the obligations of an accounting officer is to must settle all contractual obligations and pay all money owing, including intergovernmental claims, within the prescribed or agreed period. In terms of the Act, an accounting officer may not commit a department, trading entity or constitutional institution to any liability for which money has not been appropriated.

There are strict rules with regard to contracts entered into by the state. For instance in terms of section 86(3) of the Public Finance Management Act:

"any person, other than a person mentioned in section 66 (2) or (3), who purports to borrow money or to issue a guarantee, indemnity or security for or on behalf of a department, public entity or constitutional institution, or who enters into any other contract which purports to bind a department, public entity or constitutional institution to any future financial commitment, is guilty of an offence and liable on conviction to a fine or to imprisonment for a period not exceeding five years". [writer’s italics].

The nature of the responsibilities of an accounting officer in terms of the Public Finance Management Act are such that the accounting officer is unlikely to want to

\textsuperscript{63} \textit{Fn 2 supra}
delegate the power to bind the state contractually to a large number of much lower ranking officials such as those who are employed at the 'coal face' in the delivery of health care services. For this reason it is submitted that it is largely a legal fiction to say that a patient contracts with the state for health care services.

The most likely legal scenario is that there is no contractual relationship at all and that patients receive health care services from the state in terms of empowering statutes such as the Health Act\textsuperscript{64} and the National Health Act\textsuperscript{65} read in conjunction with legislation such as the PAJA. There is legally speaking no need for a contract to govern the relationship between provider and patient since there is sufficient legislation governing the situation already. For instance patients are obliged to pay fees to public hospitals in terms of regulations and they are entitled to health care services in terms of the Constitution and other relevant national and provincial legislation. They would have a claim in delict for damages suffered in consequence of medical malpractice by the state. This said, it is submitted that to the extent that the contractual fiction within the public health sector serves its purpose, as it did in the case of \textit{Edouard}, it is a useful one whose demise is not likely in the foreseeable future.

The position with regard to the private sector is very different as will be shown in the following chapter. The law of contract is alive and well, although flourishing in a somewhat Victorian fashion, with regard to health service delivery in the private sector. Contractual relationships are perhaps more necessary in a milieu in which, in contrast to the public sector, few if any functions and powers regarding health service delivery are derived directly from specific empowering legislation. There is no law that requires private entities to provide health care services. They do so of their own volition. Similarly there is no law which states the nature of the services they must provide. It is largely only the 'how' that is regulated within the private sector as opposed to the 'what' and the 'why'.

\textsuperscript{64} Act No 63 of 1977
\textsuperscript{65} Act No 61 of 2003. It is not yet effective.

6.3 Summary and Conclusions ........................................... 738

6.1 Introduction
In the preceding two chapters the fundamental principles of the law of contract as it related to health service delivery were discussed and the case law on this subject involving the private sector. This chapter deals with the case law relating to health service delivery in the private sector.

Contract is generally regarded in the private health care sector as the usual legal basis on which a patient obtains services from a provider. This is despite the fact that in the context of the relationship between a medical practitioner and a patient, documentation reflecting the agreement is seldom created and there is usually no negotiation of the terms between the contracting parties. The contract between provider and patient are therefore often verbal. This obviously does not detract from the validity of such contracts but it does make their terms harder to prove. Where the provider is a health care institution such as a private hospital, the agreement is more likely than not to be reduced to writing, but again there is precious little negotiation between the patient and the provider concerning its terms, even the essential terms.

The question of how the constitutional rights of access to health care services and the right not to be refused emergency medical services apply in the context of the law of contract and to private sector providers of health care services has so far not been canvassed in much significance except in the case of *Strydom v Afrox Healthcare*\(^1\) in which the arguments of the court in finding for the plaintiff were, with respect, not particularly well constructed although its finding, it is submitted, was just and effectively correct. The law of contract in South Africa seems still to be premised on business concepts, perceptions of the manner in which markets operate and the kinds of goods and services within those markets that were relevant a hundred years or more ago. At that time, people could afford to enter into litigation at the level of the High Court for non-payment of an account for dentures\(^2\). There are few dentists in the present day who would litigate at High Court level for non-payment for a set of false teeth since the cost of the litigation exponentially exceeds that of the teeth. One hundred years ago, the primitive ancestors of what we know as medical schemes were just beginning to take shape. One hundred years ago, organ transplants were a dream of the future and there was no such thing as renal dialysis. X-ray machines were a

---

\(^{1}\) *Strydom* (2001) 4 All SA 618 (T)

\(^{2}\) Whether this implies that the cost of dentures has decreased phenomenally relative to the costs of litigation or whether it means that the cost of litigation has risen phenomenally relative to the cost of a set of dentures is left to the reader to decide.
radical new technology and some people still believed that the brain was made up of thirty-seven organs, each controlling a different part of the personality. One hundred years ago aspirin was formulated from salicylic and acetic acids. It was the first drug to be synthesised and its formulation is regarded as the foundation of the modern pharmaceutical industry. One hundred years ago, patent medicine men roamed the countryside selling all kinds of concoctions that were supposed to cure nearly any ailment. The claims made were fantastic and the sales pitch excellent; so, naturally, people bought the concoctions. The medicine man was careful to tell people that the effect was not immediate so as not to arouse suspicion while he was still in town. Faughnan and Lagace write that it is easy to forget that we have had scientific medicine only for a short time. Biomedical sciences began their great surge only sixty years ago, and the clinical sciences have gained strength only in the past twenty or thirty years. Those who would turn away from science now should first review a medical textbook from only one hundred years ago. It is filled with as many worthless remedies as any medieval text, or modern herbal. One hundred years ago it was thought that a physiological basis for female insanity existed in the reproductive organs and that the obvious solution was surgery. For example, women underwent hysterectomies for “calming” purposes; the word “hysteria” is derived from the Greek word for uterus. The medical world has changed considerably in the last hundred years and so, it is submitted, has the nature of health care services, their capacity to prolong or sustain life and the central role they play in our society. Diseases that were fatal to one’s ancestors one hundred years ago are now little more than inconveniences thanks to the enormous advances in medical technology, skill and knowledge over the last century.

The law of contract in South Africa, however, seems not to have moved with the times. It does not take into account the significant sociological, economic and cultural

8. Engel C notes in 'Healthy Intentions' that one hundred years ago, the leading causes of death in the industrial world were infectious diseases such as tuberculosis, influenza, and pneumonia. Since then, the emergence of antibiotics, vaccines, and public health controls has reduced the impact of infectious disease. [http://www.firstscience.com/SITE/ARTICLES/healthy.asp](http://www.firstscience.com/SITE/ARTICLES/healthy.asp)
changes and challenges brought about by these advances. It does not take into account that the milieu in which health care services are nowadays delivered has changed dramatically. So far, the Supreme Court has failed to take into account even the express legal changes surrounding the delivery of health care services contained in the Constitution.

It is submitted that health care services these days are about a lot more than just a private bargain between a purveyor of medical goods or services and a consumer of those goods or services. There is a very real public interest in the manner in which health care services are delivered, in the nature of those services and in the extent to which they are available to those who cannot afford to pay for them. Notions of social responsibility are central to the philosophies of many large corporates including the need to uplift the poor, protect the environment and promote the health of the communities within which they operate. In legal philosophical terms it is no longer 'every man for himself' but the need to balance the interests of the individual (which includes not only men, but also women and children in these enlightened times) against those of society as a whole that is important. It is not so much 'bargains' that should be the concern of contracts between provider and patient in the health care context but quality, safety and efficacy and a fair price to the consumer for something that is starting to be regarded by economists and other disciplines as a public good.

---

9 Merson M in 'SARS Proved Health is Global Public Good' YaleGlobal Online states that globalization facilitated both the spread and the containment of SARS causing coronavirus. He points out that modern travel and labour migration patterns helped spread the disease, and global links amplified its political and economic impact. Simultaneously, modern communication and science alerted the world to the disease and facilitated a strong public health response. SARS thus imported a fundamental reality: health is a global public good. It demonstrated that domestic and global healthy policy can no longer be divided because local health problems can have global repercussions. The IHDP in 'Health - a Global Public Good' Bulletin Number 10: January 2002 notes that the World Health Organization is calling for a massive investment by the rich governments of the world into the health of the world’s poor. This was the conclusion of a report by the Commission on Macroeconomics and Health launched in London on 20 December 2001. It observes that this argument has strong similarities with calls from the United Nations Development Programme (UNDP) for health to be considered a public good. The Commission itself refers to global public goods and defines them as "goods whose characteristics of publicness (nonrivalry in consumption and nonexcludability of benefits) extend to more than one set of countries or more than one geographic region". The article considers the nature of public goods as follows:-

"The concept of dividing goods into ‘public’ and ‘private’ goods arises from classical economics and can be dated back to the 19th century. According to this concept, characteristics of public goods include:

- Non-rivalry in consumption which means that one person’s use of a good does not prevent another person from using it. This is termed by some as non-divisibility'
- Non-excludability, i.e. use of item is available to all people/groups of people...
- Non-rejectability, individuals are unable to choose to forgo consumption...

However this distinction between private and public goods is not always that clear cut. Although some goods might be purely private or purely public, there will be some that are mixed/impure. Goods which are non-rival amongst a certain group of people can be termed ‘club goods’ and those which are available to all but are rival can be termed ‘common pool resources’. These impure goods are more common than the pure type. Consequently the term public good is often used to include both pure and impure public goods...Commonly five sectors of public goods can be identified, namely environment, health, governance, security and knowledge... According to neo-classical economic theory, attempting to provide pure public goods through competitive markets will lead to sub-optimal quality, quantity and price... Two reasons for this can be identified... First, individuals motivated by self-interest only will tend to ‘free ride' concerning
Research and development of medicines that is purely profit driven leads to the marginalization of diseases and conditions that, should they break out on a global scale, could seriously impact upon the world economy. The comparatively recent SARS scare is a good example of how a relatively obscure disease can suddenly become of global significance\textsuperscript{10}. Taking all this into account it is submitted that one cannot justifiably conclude that health care goods and services are no different to any other goods and services. This in turn carries the implication that contracts in the private health sector should be regulated to reflect these differences as should those who provide health care services and goods within this sector. The South African government has in recent years started to give legislative recognition to these same

\textsuperscript{10} Pablos Menendez, A, of the Rockefeller Foundation Centre for the Management of Intellectual Property in Health Research and Development has pointed out that globally from 1975 to 1997 although 1233 new chemical entities were registered only 11 were products for tropical diseases of poverty and half of these were for veterinary purposes. http://www.mrc.ac.za/conferences/I/pablosmendez.pdf

Vandermeiren W of Government & Public Affairs, SmithKline Beecham Biologicales stated some of the dynamics of the problem in a presentation during Session 46, Global Public Goods in Health: Developing AIDS, Malaria & Other Priority Vaccines Washington, February 28 - March 1, 2000 World Bank Human Development Week that: "The fiduciary responsibility towards shareholders must guide all investment decisions in a vaccine company. This includes finding ways to reconcile the contradictory requirements posed by the development of vaccines that are public goods with high social value but little or insufficient return on investment. Good corporate citizenship requires seeking solutions that do not deny the benefits of a company’s know-how and expertise to the less well-to-do people and countries of the world. These solutions require public-private partnerships that help the development, distribution and use of such vaccines. The introduction and expanding use of a new vaccine will follow a typical pattern: during a period of early demand, the vaccine will be launched in the private market of industrialised countries; later, it will be integrated into public health policy of industrialised markets. Finally, the vaccine gets to be generally used, with massive purchases in the public markets of developing countries. During this evolution, that may take 15-20 years, the average selling price and profit margin per dose decreases. This has lead to the expectation that all vaccines will end up becoming very cheap, and that efforts must be deployed to hasten the evolution. However, this reduces the timespan over which a manufacturer can recoup his investment. Under this traditional market evolution pattern, vaccines with little or no private market will not be attractive. The advantages and disadvantages of the various market segments through which a vaccine moves can be easily summarized: the more a market segment is characterised by reasonable margins and by a high degree of predictability (or a predictability that can be influenced by a dedicated marketing and distribution effort), the more attractive that market segment is. Financial analysis will show the net present value of expected gross profit in private and public markets of industrialized countries to be a manifold of the modest contribution that can be expected from even very large volumes of sales at low prices in developing nations. Support from public sources is required to power the development of public good vaccines for which the market is deemed unattractive. The discovery effort is generally funded by public monies, and has yielded over the past decade a very high number of potential vaccine candidates through existing and well-performing academic research. Predilinical and clinical development needed for the eventual registration must however associate industry’s expertise and contribution with public support: the so-called "push" mechanisms that are available from public sources. Simultaneously, steps must be taken to ensure an industrial production process is developed and a production unit of appropriate capacity is constructed. Finally the vaccine will not reach its end-users if there is no financial support form rich countries to help poor nations to purchase the vaccine. The latter “pull” mechanisms would allow UN procurement agencies such as UNICEF to continue playing their role as buyers and distributors of the vaccine. Push mechanisms are therefore a way to solve the dilemma posed by public good vaccines that do not have attractive market terms. They are also a desirable mechanism to share the risks inherent to the development of a vaccine for which the scientific odds are, in the present state of our knowledge, highly uncertain. A particular case where push mechanisms would be desirable is the need for the establishment of a vaccine plant of adequate capacity. As the output of a plant of e.g. a malaria vaccine will be directed almost exclusively to the less attractive markets, the financing of such a capital investment would obviously benefit from specific push mechanisms. It must be noted that the decision to invest for any given global capacity, must be taken several years before the vaccine eventually is registered."

635
perspectives on health service delivery. The amendment\textsuperscript{11} to the Medicines and Related Substances Act\textsuperscript{12}, made express provision in section 22G for a transparent system for the pricing of medicines including a single exit price which is the only price at which medicines may be sold to persons other than the state. The intention behind the section is evidenced by other sections of the Act as amended notably sections 18B and section 18A. The regulations envisaged by this section have been written relatively recently and it is clear that the idea of trading in medicines is no longer supported by government policy or legislation. Those who supply medicines are entitled to a professional fee for services rather than a mark-up on the cost price of the medicine. In legal terms this means that the provider-patient contract where the former is a dispensing doctor or retail pharmacist will be a mixed one – for goods and services in the majority of cases - in which both elements are clearly visible to the consumer in terms of what he is paying for. Systems of bonusing, rebates and volume or bulk discounts and sampling that are common trade practices in other sectors have been outlawed by the Medicines and Related Substances Act, emphasising the idea that medicines are no ordinary commodity. Over and above this, however, provision is made for the prescription by the Minister of Health of the fees that wholesalers, distributors, retail pharmacists and dispensing doctors may charge with regard to the activities that surround the supply of medicines, once again making the point that health services are also different to services in other sectors.

The National Health Act provides for a system of licensing of all providers of health care services taking into account \textit{inter alia} the need to ensure consistency of health services development in terms of national, provincial and municipal planning; the need to promote an equitable distribution and rationalisation of health services and health care resources, and the need to correct inequities based on racial, gender, economic and geographical factors; the need to promote an appropriate mix of public and private health services; the demographics and epidemiological characteristics of the population to be served; and the need to ensure the availability and appropriate utilisation of human resources and health technology.

\textsuperscript{11} Act No 90 of 1997
\textsuperscript{12} Act No 101 of 1965
It is submitted that it is against these legislative and policy backdrops that one must construe the delivery of health care services within the private sector. Socio-economic rights have been recognized by the constitutional court as being justiciable. The subject matter of these rights in South Africa can never again be seen as mere commodities in trade.

6.2 Case Law

6.2.1 *Argus Printing and Publishing Co v Dr Van Niekerk*

Facts

The appellant, the Argus company, the owner of a printing establishment in Johannesburg, had in its employment a youth, Richard Eagleson, who was very seriously injured while at work in the appellant’s printing room. The father of the youth sued the appellant in his son’s name for damages for the bodily injury suffered by him through the negligence of two engine drivers in the company’s employ and obtained judgment for £500 on the boy’s behalf. Immediately after the accident Dr van Niekerk was called in on the instructions of a director of the company to render medical assistance to the youth. He found him in a very dangerous condition and caused him to be conveyed immediately to the Johannesburg hospital where he was treated by the respondent during December 1894 and January and February 1895. The respondent claimed payment from the company for his services to its young employee on the ground that he had acted on the request of one of the directors. Shortly after the accident, a director had sent one of the workmen to fetch the doctor and that the managing director of the company had given the respondent the assurance that he would place his memorandum of fees before the Board of the company and that he need not worry as far as his fees were concerned as payment would be made after completion of certain negotiations with a view to settlement between the company and the father of the injured youth in which they were then engaged. The father, however, refused to accept the company’s proposal and obtained judgment in his

13 *Soodramoney v Minister Of Health, KwaZulu-Natal 1998 (1) SA 763 (CC); Government Of The Republic Of South Africa And Others v Groothoom And Others 2001 (1) SA 46 (CC); Minister of Health and Others v Treatment Action Campaign and Others (No 2) 2002 (5) SA 721 (CC)

14 *Argus (1895) 2 OR 40*
favour against the company. After the judgment, the managing director, Darmer, denied that the company was responsible for the respondent's fees because the company had been discharged by the judgment of the court awarding damages to the father of the boy from all further liability arising out of the accident. The respondent then sued for the recovery of his fees of £52 10s due to him for medical services and the Judicial Commissioner gave judgment in his favour on the ground that Darmer, as the managing director of the company had confirmed the action of the director in calling the doctor out and had undertaken to pay the respondent's fees.

**Judgment**

Kotze CJ stated that the question whether the appellant was liable for the respondent’s fees depended on the special circumstances of the case. He ruled that the court could not accept the contention that the company was not liable for the respondent’s fees because Sheffield, the director on whose instructions that youth had been taken to hospital, must have supposed that the doctor would continue to treat him at the hospital and it could not be argued that the doctor had only been called in to give on the scene medical treatment. The court noted that it is the custom in the hospital for a private doctor to visit the patients who are admitted there and that when a director of a company causes a doctor to be called in to render professional assistance to an employee of the company who has been injured in its service, there are reasonable grounds for the doctor to suppose that the company makes itself responsible for his fees. Admitting that the assurance given by Darmer to the respondent that he would be paid does not either directly or indirectly make the appellant company liable, said the court, its liability can still be deduced from the fact that Darmer agreed to lay the respondent’s bill before the Board of the company and also from his letter to Eagleson’s father in which he expressed his willingness to pay the expenses caused by Eagleson’s illness. The appeal was dismissed.

**Discussion**

It is interesting to note that in this very old case the court did not once make reference to a contract between the doctor and the company although, technically speaking, it
could be argued that one did arise. There is no mention made as to whether the court in awarding judgement in favour of Eagleson, the injured youth, including in its award the costs of medical expenses incurred as a result of the accident. It may be that it was on this basis that the company adopted the view that it had already paid its debt in respect of the boy’s injuries and may even have felt that the doctor should claim his fee from the boy’s father. Unfortunately there is no reference to the relevant facts in the judgment and so the foregoing comments are mere speculation. In contractual terms it could be argued that the liability of the company to the doctor existed independently of its liability to the youth for his injuries and that the judgment of the court in favour of Eagleson in the allied action did not extirpate the liability of the company to the doctor on the basis of their contractual arrangements because even if the company did consider that its debt to the boy had been discharged by the other judgment the fact remained that it was still indebted to the doctor for his fees. It would not be fair or reasonable to expect the doctor to require payment of his fees from the boy or his father, in view of the agreement that had arisen between the doctor and the company, even if it was for the benefit of a third party. Even in the absence of a contract between the doctor and the company, it is submitted that on the basis of the actions of the director and the managing director, it would be estopped from denying liability for the doctor’s fees since he was entitled to rely on the representations (or misrepresentations) that were made to him by two senior officials in charge of the company’s affairs. The undertaking to lay his bill before the Board of directors could not be seen as diminishing the undertaking that the doctor was given because he was told not to worry about his fees as payment would be made after the settlement had been negotiated with the boy’s father.

6.2.2 Tulloch v Marsh

Facts

In this case a dentist supplied and fitted a set of artificial teeth made from his own material for an inclusive charge to the defendant’s wife. He sued the defendant for the amount of £10 10s. The defence was that the claim, being for professional services was prescribed by virtue of the Placaat of Charles V. The plaintiff after taking an

15 Tulloch 1910 TPD 453
impression of the mouth, made a vulcanite plate to which he fixed suitable teeth purchased by him. The material costs were in all about £1.

**Judgment**

Innes CJ stated that the question to be decided is whether an account rendered by a dental surgeon in respect of a plate and artificial teeth supplied in 1905 is prescribed by the Placaat of Charles V. The Placaat was repealed by an Act of 1908 but its provisions were still in force in cases where prescription had run before the passing of the Act. In this case it had run before that date. According to the Placaat, the fees of advocates, doctors and ‘other workers’ prescribed after two years and the magistrate used the case of *Lowle v Johnstone*\(^{16}\) to support the interpretation that ‘other workers’ meant those who did similar work to the professional and clerical work done by the persons enumerated in the Placaat. The question was thus whether the contract was one for sale of the finished teeth, manufactured by the skill of the dentist employed, or whether it was a hiring by the client of the skilled labour of the dentist. Innes CJ stated that contracts of sale and of letting and hiring resemble one another and referred to a rule in the Digest (19,12,3 and 18,1,20) and also a passage from the *Institutes* referred to in argument and stated that it was a very simple one. When the client supplies the material and the other party the work then it is letting and hiring. When the workman produces an article manufactured by himself out of his own material which he supplies to the customer then the contract is one not of letting and hiring but of sale. He observed that this rule was approved by Pothier and was simple and easy of application. It was founded, said Innes CJ, upon a real distinction of legal principle and he could not see that there was any weight of Roman-Dutch authority against it. He said he did not think that the passage quoted from Grotius rightly interpreted, is the other way and the only writer that adopts a contrary view is Huber. Innes CJ stated that it did not differ from the rule followed by the English courts in *Lee v Griffin*\(^{17}\). There the principle was stated in this way: Does the contract result in the sale of a chattel? If so, it is a contract of purchase and sale. It can only so result, said Innes CJ, when the material is supplied by the person who does the work. That is exactly the same principle as is laid down in the *Digest*. That principle, he said, was

\(^{16}\) *Lowle* [1907] TS 1069

\(^{17}\) *Lee* 30 L.J. Q.B. p254
far more satisfactory than the rule that the contract should be included in the one category or the other, according as the value of the labour, or the material, happens to preponderate. Because that rule is not founded upon any principle at all whereas the other is. The passage in the *Digest*, 19.2.22, deals with the building of a house. That, said Innes CJ appeared to be a contract standing very much by itself. It could be a contract of sale, because the contractor does not sell the bricks and mortar and stone which he puts into the house; nor does he sell the completed house, because it never belonged to him. It approximates to a contract of letting and hiring, and was therefore, held Innes CJ, rightly included by the Digest in that class of contracts. He stated that it does not, however, affect the general rule laid down in the other passages of the Digest to which he referred. Innes CJ did not agree that a distinction should be drawn between cases where articles are bought ready made and prepared for the general market and those where they are ordered specially by the customer at his own special direction and according to his own special measurement or choice. He said he could see no distinction in principle in that rule either. Innes CJ conceded that there may be difficult cases on the borderline – as for instance where both the customer and the person who does the work supply a portion of the material. It would be difficult, he said, to determine in such a case within which category the contract fell. That would be a case where one would have to take into account the difference between the value of the material and the value of the work. Innes CJ decided that the contract in the present case was one of sale and that although the dentist applied a great deal of skill in the making of the false teeth, he supplied the material, he made the plate and it was bought by the client. The appeal therefore succeeded.

In his judgment Solomon J concurred that the appeal should be allowed. He stated that contracts of sale and *locatio conducti* are very near akin to one another and that it is sometimes difficult to distinguish whether a contract is one of sale or of letting and hiring. Each case, he said, must depend on its own circumstances. He agreed that the principle in the English case of *Lee v Griffin*\(^\text{18}\) was substantially the same as that laid down by the Digest. Where the material is supplied by the person making the finished article by his skill, and he supplies it when it is finished, then the contract is one of sale. When the material is supplied by the person for whom the article is made and the

---

\(^\text{18}\) *Lee* fn 17 supra
other party to the contract employs his skill upon the material of another, then the contract is one of letting and hiring.

**Discussion**

The decision in *Tulloch v Marsh* was subsequently applied in *SA Wood Turning Mills (Pty) Ltd v Price Bros (Pty) Ltd*; *S v Progress Dental Laboratory (Pty) Ltd And Another*; *Carpet Contracts (Pty) Ltd v Grobler*; *Forsyth And Others v Josi* and in *Polpark Dispensary (Pty) Ltd v SA Pharmacy Board*.

Strauss comments with regard to *Tulloch* that legally speaking the contract between a doctor and a patient would be for the letting and hiring of work (*locatio conductio operis*) but that the court decided that with regard to dental services in this case that the transaction legally amounts to a sale and not one of letting and hiring of services. He notes that one of the interesting implications of this ruling is that the equitable relief of the dentist claiming a reduced amount for the work done by him, irrespective of its shortcomings, does not apply in respect of dentures and points out that the patient who complains of a patently defective denture would be entitled to reject it, cancel the contract with the dentist and claim damages for breach. In the case of latent defect, says Strauss, the patient would be able either to claim recission of the contract or retain the denture and claim a reduction on its price. He states that these legal remedies are available to the patient even if the dentist did not expressly guarantee satisfaction. Contracts for the sale of goods therefore have somewhat different implications to contracts for the letting and hiring of services in the health care context. Whilst generally speaking contracts for the letting and hiring of services in relation to health care come with no guarantee of a cure or undertaking as to the end result of those services, contracts for goods must meet the reasonable expectations of the purchaser and the seller can be held liable for latent defects. It has previously been

22 *Forsyth* 1982 (2) SA 164 (N)
23 *Polpark* 1978 (2) SA 816 (A).
24 Strauss *Doctor Patient and The Law: A Selection of Practical Issues* at p 69
observed that where the seller professes expertise in the good sold he can also be held liable for consequential damages.25

In modern dental practice it is rarely the dentist who makes up the dentures but more commonly the dental technician. The dental technician currently has no direct contact with members of the public as customers. His customers are the dentists who extract the teeth of the patient, take the moulds for the dentures and subsequently fit them into the patient’s mouth once the dental technician has constructed them. The dentist in effect therefore sub-contracts the work of constructing the dentures to the dental technician. Strauss comments that the Tulloch decision was interpreted by dentists as meaning that a fee cannot be recovered unless the patient is satisfied with the denture. He makes the point, however, that whether or not the denture is suitable must be objectively ascertained and the patient’s view on the subject is but one factor. Where a dentist supplies a denture to a patient that has been constructed by a dental technician it is submitted that the contract is a mixed one for both the letting and hiring of services and the sale of the denture. The dentist himself only provides the services while the dental technician supplies the dentures through the dentist. He offers the view that where a crown or a bridge is supplied to a patient the contract is unlikely to be one of sale but is rather one of the letting and hiring of services on the basis that the crown or bridge is fixed into the patient’s mouth. It is submitted, however, that it might be more realistic to regard such a contract as a mixed one since the ownership of the crown or bridge, which is a physical object, hopefully passes to the patient upon payment of the dentists fee.

25 See Kroonstad Westelike Boere-Koöperatiewe Vereniging Bpk v Botha and Another 1964 (3) SA 561 (A); Jaffé & Co (Pty) Ltd v Bocchi and Another 1961 (4) SA 358 (T); Holmdene Brickworks (Pty) Ltd v Roberts Construction Co Ltd 1977 (3) SA 670 (A). In the latter case it was held that broadly speaking, a defect may be described as an abnormal quality or attribute which destroys or substantially impairs the utility or effectiveness of the res vendita for the purpose for which it has been sold or for which it is commonly used. Such a defect is latent when it is one which is not visible or discoverable upon an inspection of the res vendita. See also Langeberg Voedsel Bpk v Sarculum Bpk 1996 (2) SA 563 (A); Sentrochem Ltd v Prinsloo 1997 (2) SA 1 (A); Ciba-Geigy (Pty) Ltd v Lushof Farms (Pty) Ltd en ’n Ander 2002 (2) SA 447 (SCA) in which it was held that a merchant-dealer who publicly professes to have expert knowledge in respect of the type of product that he sells is liable to the purchaser under the actio empti if the latter should suffer consequential damage as a result of a latent defect in the res vendita. A latent defect is defined as an abnormal quality or attribute which destroys or substantially impairs the utility or effectiveness of the res vendita for the purpose for which it has been sold or for which it is commonly used. A manufacturer produces and markets a product without conclusive prior tests, when the utilisation thereof in the recommended manner is potentially hazardous to the consumer, such negligence on the part of the manufacturer may expose him to delictual liability to the consumer. Where the consumer does not acquire the product directly from the manufacturer, and the manufacturer is thus a third party, such liability amounts to what is sometimes termed ‘product liability’. A contractual nexus between the manufacturer and the consumer is not required. Although the historical origin of the manufacturer’s liability is an agreement between the manufacturer and the distributor, the liability, which arises from the manufacturer and distribution of the product, extends via the other contracting party to any third party who utilises the product in the prescribed manner and suffers damage as a result thereof. It follows as a matter of course that a manufacturer who distributes a product commercially, which, in the course of its intended use, and as the result of a defect, causes damage to the consumer thereof, acts wrongfully and thus unlawfully according to the legal convictions of the community.
In *Polpark Dispensary (Pty) Ltd v SA Pharmacy Board* the crisp question was whether the business that the appellant, a body corporate, wanted to conduct on certain premises in Springs was that of “a retail pharmacist” within the meaning of s 22 (1) (e) of the Pharmacy Act (“the Act”). If it was, it could not be carried on, for appellant would then not be entitled to be registered as a pharmacist under the Act and hence could not practise as such. It then followed too that the respondent, the South African Pharmacy Board (“the Board”), would have correctly declined appellant’s application for registration under the Act; that the Transvaal Provincial Division rightly dismissed the appellant’s appeal to it under section 24 and that appellant’s present appeal must be dismissed. The converse would apply if the answer to the above question was in the negative: appellant’s present appeal must then succeed and its registration as a pharmacist be ordered.

Trollip JA held that the essence of “retail” in its less wide sense is the selling of commodities in small quantities to the ultimate consumers, whether directly or through agents of either the seller or the consumers, and whether to the public at large or to an exclusive or limited body of consumers. The court stated that a dispensary to a nursing home located inside its administrative section and conducted solely and exclusively for the nursing home and its patients, all medicines to be dispensed and supplied by it on prescriptions for patients in the home and sold and supplied to the nursing home and not to the patients, the nursing home paying the dispensary for them but thereafter receiving its disbursements from the patients is a “retail pharmacist” within the meaning of s 22 (1) (e) of the Pharmacy Act which provides that no corporate body shall be registered as a retail pharmacist unless it “shall have been carrying on business as such immediately prior to the commencement of this Act”. It was argued that, according to the above dictionary definitions, the essence of “retail” is trading, i.e. the selling of commodities; that, by merely supplying medicines to order on prescriptions a pharmacist, a professional man, does not sell and thus trade in them; that a “retail pharmacist” therefore can only connote one who, in addition to compounding and/or supplying prescribed medicines, trades by selling the other

---

26 *Polpark in 23 supra*
27 *Pharmacy Act No 53 of 1974*
miscellaneous goods previously mentioned; and that, as appellant will not trade in such goods, it will not be a retail pharmacist. In support of that argument counsel relied on In re Medicaments, a decision in the English Restrictive Practices Court. There the learned president (Buckley J) said at 1344H:

"The business of retail chemist consists of: (a) dispensing in response to prescriptions from doctors or dentists, (b) the sale of proprietary medicines, and (c) the sale over the counter of a large number of miscellaneous goods, such as cosmetics, photographic material, toiletries and so forth, which have become traditionally connected with the trade of a chemist."

The argument, said Trollip JA is untenable. To start with its major premises are fallacious. Where a pharmacist uses his own chemical substances in compounding a prescribed medicine and supplies the finished product for a price to the consumer, he undoubtedly, according to the law, sells it... That also applies, of course, where he supplies the prescribed medicine from his stock. He thus trades in all such medicines. That he also trades or does not trade in the other miscellaneous goods mentioned above is irrelevant to the question whether or not he is a retail pharmacist in terms of the Act. For the Act is concerned with the pharmacy profession, not with the extra-pharmaceutical or general dealer activities of pharmacists. Hence the question under consideration is to be answered by reference to a pharmacist’s activities with medicines and not with the other miscellaneous goods. The fact therefore that appellant will not trade in the other miscellaneous goods is of no significance. The court held that the above-quoted dictum in the Medicaments case did not further counsel’s argument at all. It said that the learned president there was not construing the phrase “the business of retail chemist” as a matter of law; he was merely stating the kind of business that retail chemists in fact ordinarily carry on in the United Kingdom, as revealed by the evidence before the Court.

The element of selling to the public mentioned in the definitions of “retail” in the Afrikaans dictionaries, and the aspect of such selling usually occurring from a shop or a place otherwise accessible to the public, as mentioned above in the HAT definition of “retail”, were also relied on. Counsel argued that the appellant, in selling the prescribed medicines only to the patients in the clinic, would not be trading with the public; and that the appellant’s dispensary is not a shop or similar premises, but, on
the contrary, they are private premises and not accessible to the public at all. Counsel also relied on *Turpin v Middlesborough Assessment Committee* and other similar cases that all deal with the expression “a retail shop” in an English rating statute. This argument said the court, is also untenable for these reasons. Selling to the public is not an essential ingredient of a retail trade. In any event, the patients in the clinic, to whom the appellant sells the medicines prescribed for them all come from the public; while in the clinic they can thus be regarded as members of the public, albeit only an exclusive or limited section thereof; so this particular point made by the appellant’s counsel, said the court, loses its force. Moreover while retail trade is usually conducted from a shop on a street or in a place open to the public, that too is not essential in respect of a retail pharmacist or pharmacy. According to s 1 of the Act, “pharmacy” means “any place where is performed any act specially pertaining to the profession of a pharmacist”. A retail pharmacist can therefore carry on his business at any place or premises and not necessarily in a shop. *Turpin’s* and the other cases referred to *supra* were therefore all inapplicable to the problem in hand. In *Turpin’s* case the question was whether for rating purposes under the English Rating and Valuation (Apportionment) Act, certain premises were primarily occupied and used for the purposes of a “retail shop”. That expression was defined as including “any premises of a similar character” (i.e. similar to the character of a retail shop) “where retail trade or business... is carried on”. The premises in question were held to be “a retail shop”, *inter alia*, because “the public can resort (to them) for the purpose of having - particular wants supplied therein”. The court noted that on the other hand in *Toogood and Sons Ltd v Green*, the premises were held not to be “a retail shop” because the premises were not such that the public could resort to them for that purpose if they wanted to. It observed that in *Dolton Bournes and Dolton Ltd v Osmond* a similar conclusion was reached. But, said the court, in these and other like cases that were quoted, an entirely different statutory provision was being construed and applied. There the inquiry wits into both the character of the premises and the nature of the trade or business conducted on it. It referred especially to *Ritz Cleaners*

---

29 *Turpin* 1931 AC 452 at 470 et seq
30 1928
31 *Toogood* 1932 AC 663
32 *Dolton Bournes* (1955) 1 WLR 61 (CA)
where this nature of the inquiry was emphasised. The basic consideration was whether or not the premises were those of a shop, which ordinarily means a place to which the public resort for their wants. In the present case the court found that the premises were of no materiality. It was the nature of the business to be conducted in them that was decisive. For these reasons, said the court, those cases were inapplicable and the argument was untenable. It noted that whilst the appellant would also supply the clinic direct with its own medical requirements, referred to above as ward stock, some would be supplied on, and others without prescriptions. The clinic would keep them and would in turn supply them to its patients in terms of s 29 (3) (e) of the Act. The court assumed, without deciding in favour of appellant, that the clinic could not be regarded as the ultimate consumer of these commodities, that this part of appellant’s activities would not be negligible and that it would not constitute retail trading. Nevertheless, it said, that did not assist the appellant. It was clear that a substantial, if not the main, part of its activities would be the selling of prescribed medicines to the patients in the clinic. So long as this situation prevailed, said the court, it would be a retail pharmacist. This was the part of its proposed activities that offended against s 22 (1) of the Act and precluded its being registered as a pharmacist. The court found that that flaw in its application for registration was not remedied merely because it would also carry on other activities that were non-retail. The final conclusion therefore was that the appellant would be a retail pharmacist within the meaning of s 22 (1) (e) of the Act, that the Board correctly so decided and correctly refused its application for registration, and that the TPD rightly dismissed its appeal.

The intention of the government as evidence from the provisions of section 22G of the Medicines and Related Substances Act three as amended is to change the emphasis within pharmacies and wholesalers from of trade in medicines to professional services in respect of which fees are payable. In such an environment the pharmacist will be in much the same position as the dentist selling dentures constructed by a dental technician and, it is submitted, the contract will be a mixed one for the sale of goods and the letting and hiring of services.

6.2.3  
*Sutherland v White* 35  

**Facts**  
The plaintiff, a dentist, extracted the teeth of the defendant and agreed to supply him with a set of false teeth for an amount found by the magistrate to be £22 10s. A temporary set was supplied at the beginning of August 1909. In September 1910 the plaintiff supplied the defendant with a permanent set. On October 17th 1910, the plaintiff wrote demanding payment. The defendant replied by letter to say: “Then again I only got my teeth on 28th September, which unfortunately are not correct yet. Independent of that I shall carry out my part and will let you have what I can this month…” In February or March 1911 the defendant wrote to the plaintiff’s assistance, Nisbet, and complained of the fit of the lower case of the set supplied by the plaintiff. Nisbet took a fresh cast and remade the lower case. Two or three weeks later the defendant returned and Nisbet adjusted the ‘bite’ of the back teeth and lower jaw. In June 1911 the upper case was remodelled by Nisbet who stated that the defendant at the time seemed satisfied. In August 1911 the defendant again told Nisbet that the teeth were not comfortable. During that month an account was sent by the plaintiff to the defendant who wrote on 8th August: ‘I am in receipt of your account today. Please send me a correct statement and I shall remit an instalment as per our agreement.” The defendant paid £15 on account. The plaintiff sued for the balance which he alleged to be £12 10s. The defendant counterclaimed that, if the plaintiff had failed to supply him with a properly fitting set of false teeth, he should be ordered to repay the defendant the amount already paid by the latter to the plaintiff, the defendant tendering to return the set of false teeth. Judgement was given in the court a quo in favour for the plaintiff because the defendant made no complaint as to the teeth after July 1911 and did not return them or take steps to have them altered by the plaintiff after that date. He was therefore taken to have accepted them in spite of their being unsatisfactory and was therefore liable for an amount of £7 10s.  

**Judgment**  

35  
*Sutherland 1911 EDL 407*
Kotzé JP stated that it was necessary to look at the nature of the contract and the conduct of the parties. He observed that it may be quite true on the authority of *Le Roux v Visser* and *Thurston & Co v Judlin & Co* and many other cases decided by the courts that if a person keeps an article after has become aware of a defect or that the quality of the article is not according to sample, or according to contract in some other respect and does not with reasonable promptness return the article, then the inference may fairly be drawn that he has waived whatever objection he could otherwise have raised by way of a legal defence and that he can no longer resist a claim for payment if he is sued for the value of the goods. The circumstances of the present case, were, he said, peculiar and that the nature of the work and of the undertaking which had to be performed by the dentist should be looked at. He noted that it appeared that he himself considered that the teeth not fitting in the first instance it was his duty, as he had undertaken to supply a proper and usable set of teeth, from time to time so to adjust them that they might fit the mouth of the defendant and answer the purpose for which they were originally ordered. This went on up to June and when in August, the account for the teeth was sent in, Sutherland met Nisbet in the street and told him that the teeth were not yet comfortable. The judge president stated that it seemed to him that when a man undertakes to do such a delicate matter as to supply a full set of false teeth, that it is his duty to supply such teeth as to answer the purpose intended. That is his contract which he has to perform. The court found that it could not fairly be said from the evidence that the defendant when he wrote the two letters had in mind the fact that the plaintiff had not performed adequately in terms of the contract. It found that he was in fact saying that he accepted that he owed the money and that the dentist would adjust the teeth so that they fitted properly. The court said, however that it was not clear that the defendant intended to convey by the letters that he intended at all events, whether the teeth fitted or not, to pay the dentist the full amount agreed upon. Consequently it was held that the magistrate erred in ruling that, as the teeth had not been promptly returned the defendant must pay in full. It ruled that the plaintiff could not recover on a contract which he had not properly carried out unless he could show clearly that, notwithstanding that, the defendant undertook to pay for the defective set of teeth. The expert evidence showed that the

36 *Le Roux* [1911] EDL 381
37 *Thurston* [1908] TH 79
false teeth were in fact worthless to the defendant. Consequently the appeal was allowed with costs and the judgment in the court below altered to one of absolution from the instance.

**Discussion**

This case, it seems, was also decided largely on the basis of a contract of purchase and sale. However the court also acknowledged the need of the services of the dentist in adjusting the dentures until they fitted properly. The remedy granted was, however, based on the unsuitability of the teeth for their intended purpose and the court effectively permitted the recission of the contract of sale between the patient and the dentist. It is submitted that in reality there is no difference between the nature of the relationship between a dentist and a patient and a doctor and a patient in the sense that the dentist provides mainly services to patients in the form of cleaning, filling and repairing teeth, not to mention the infamous root canal treatment and the treatment of abscesses and similar infections within the mouth and gums. It sometimes happens that due to the nature of the treatment, a product or good is also included in the transaction. The cases involving the sale of dentures clearly do not mean that every contract between a dentist and a patient involves a contract of sale. Dispensing doctors sell medicines to their patients but they also, hopefully, provide diagnostic and other services such as advice to the patient on his or her health condition, the taking of blood pressure and pulse rates etc which means that the contract is a mixed one for goods and services. In situations where a medicine is not suitable for the purpose for which it was sold, the patient should similarly be able to return it to the doctor (provided of course that it has not been opened or substantially consumed) in much the same way as the patient of a dentist can return a set of dentures. Unfortunately in the case of medicines the proof of the pudding is often in the eating and it is only once the medicine has been partially or completely consumed that it becomes apparent that it is not effective or suitable for its intended purpose. However, it is submitted that where a doctor sells a patient a medicine that has expired for example and the patient happens to notice the expiry date on the container prior to using it, he or she is perfectly entitled to return it to the doctor with a request for one that has not expired or a refund for the fee paid for the medicine.
The court in *Smit v Workmen’s Compensation Commissioner* set out the distinction between a *locatio conductio operis* and a *locatio conductio operarum* as follows. Joubert JA noted that in Roman law the letting and hiring of the labour or services of free men (*liberi*) could be regulated by two species of *locatio conductio*, viz *locatio conductio operarum* and *locatio conductio operis* (*faciendi*). Since a slave was a mere thing (*res*) he himself was incapable of letting his labour or services but if his owner did so then such a contract was construed as a letting of the slave as a thing (*res*), i.e. *locatio conductio rei*. He stated that *locatio conductio operis* (*faciendi*), involved the letting and hiring of a particular piece of work or job to be done as a whole (*opus faciendum*). This was a consensual contract whereby the workman as employee or hirer (*conductor or redemptor operis*) undertook to perform or execute a particular piece of work or job as a whole (*opus faciendum*) for the employer as lessor (*locator operis*) in consideration for a fixed money payment (*merces*). The workman who undertook to perform or execute the work was deemed to be the hirer of the work (*conductor or redemptor operis*) whereas the employer who undertook to pay the *merces* for the execution of the work was considered to be the lessor of the work (*locator operis*). What the parties to the contract contemplated was not the supply of services or a certain amount of labour but the execution or performance of a certain specified work as a whole. Here the subject-matter of the contract was not the supply of services or labour as such but the product or result of labour. The *conductor operis*, as it were, hired the execution or performance of the work (opus) from the *locator operis*. The contract was principally utilized in the following ways, viz:

(i) in the building industry where the *conductor operis* undertook to erect a house or building with his own materials on a building site provided by the *locator operas*;

(ii) in the manufacturing industry where the *conductor operis* undertook to manufacture or construct some object from material supplied to him for the purpose by the *locator operis*, eg the building of a ship; the commissioning of a goldsmith to fashion rings from gold delivered to him for the purpose;

(iii) where articles were handed to craftsmen to work on, or to repair or to clean, eg jewels sent to a jeweller to be set or engraved, clothes handed to a fuller to be cleaned;

---

38 *Smit 1979 (1) SA 51 (A)*
(iv) in the transportation of goods or passengers;
(v) in the training of slaves.

In all these instances the conductor operis undertook to produce a certain result on a person or physical thing which was handed to him by the locator operis. The conductor operis was bound to complete the work properly according to the specifications and terms of the contract. Inasmuch as he undertook to produce the promised result or product he was not bound to obey the orders or instructions of the locator operis in regard to the manner of carrying out the work. It was moreover not incumbent on the conductor operis to perform the work himself unless otherwise agreed upon. The nature of the work often necessitated the employment of assistants by him, eg to man a cargo or passenger ship, to erect a building, to construct an irrigation canal. There was in principle nothing to prevent him from subcontracting (subject to contrary agreement) since he remained contractually responsible for the finished product. He was liable for all defects in the work (opus vitiosum), whether due to his own lack of skill (imperitia) or carelessness (culpa), or to that of his assistants. It was often agreed that the work had to be performed to the satisfaction or approval (adprobatio) of the locator operis or a third party who had to judge the quality of the work according to an objective standard (arbitrium viri boni). The locator operis had to pay the merces agreed upon provided the work was satisfactorily executed. The merces could be fixed as a lump sum (per aversionem) payable upon completion of the work, or could be calculated according to the measure of work done or by time (per diem).

Locatio conductio operarum is known in Dutch as “dienstcontract” or “huur en verhuur van diensten”. In Roman-Dutch law it covers all contracts of letting and hiring of personal services in respect of domestic servants (dienstboden, famuli domestici), workmen (werklieden), labourers (arbeyders, arbeidsmannen), apprentices, (ambagtsjongen), sailors (bootgesellen, schipgesellen, schiplieden, schipliën, matrozen) and other types of employees. The contract of service was not restricted to unskilled services as in Roman law but extended to include skilled services. It should be noted, however, that liberal services (operae liberales) rendered by professional men, such as advocates and doctors, fall outside the ambit of locatio conductio operarum owing to historical reasons stemming from Roman law. The legal
relationship between such professional men and their clients is construed and treated as a contract of mandate.

In most cases the contract between a health professional and a patient would be a *locatio conductio operis*. It is unlikely that the relationship between health professional and the patient would ever be a *locatio conductio operarum* which is essentially a contract of employment. It is possible that a nurse might be employed to take care of an elderly person by that person or his or her family in which case the nurse might be seen as an employee of a patient. However in many instances such nurses tend to the employees of agencies that supply nurses to persons requiring their services in which case the contractual relationship of employment would be between the nurse and the agency rather than the nurse and the patient.

### 6.2.4 *Oates v Niland* \(^{39}\)

**Facts**

The plaintiff was a dentist who lived at Somerset East but who made periodic visits to Adelaide in which district the defendant lived. In June 1911 the defendant consulted the plaintiff who made for him a plate containing a certain number of teeth. The defendant was informed that there was generally some difficulty in getting accustomed to the plates and that he must persevere in wearing his. From this time until August 1912 the plaintiff heard nothing further until apparently by accident, the parties met in the town of Adelaide. Between June 1911 and August 1912 the defendant had had a tooth extracted and this had been followed by shrinkage of the gum. During that period of over a year no complaint whatever had been received that the teeth were not fitting and no notice of any dissatisfaction with the plate was given to the plaintiff. The defendant knew where the plaintiff was living yet sent no letter to him. Even in August 1912, he did not repudiate the contract and the teeth showed signs of having been considerably used. He further acquiesced in the plaintiff’s suggestions that another tooth should be added to the plate to fill the vacancy caused by the extraction of the tooth referred to.

---

\(^{39}\) *Oates* 1914 CPD 976
Judgment

Under all these circumstances said Juta JP, it would be going very far to say that the defendant had not accepted the teeth. The additional tooth was subsequently added to the plate which was then sent to the defendant and another year passed with not a word communicated by the defendant to the plaintiff to the effect that the plate did not fit. The court said that he could not wait until 1914 when he was sued for payment to complain that he never accepted the plate and that it did not fit. The appeal was allowed with costs and the judgment of the court below altered to one of judgment for the plaintiff with costs.

Kotze J agreed with the judgment of Juta JP saying that it was the duty of the defendant to notify the plaintiff that the teeth were not suitable and did not fit. Instead he says that he waited for the plaintiff to visit Adelaide. He said it was too late to say that the teeth were unsuitable and distinguished the present case from that of Sutherland v White stating that the circumstances in that case were very different to those of the present case.

Discussion

In this case the contract was also essentially one of sale. The patient was, however, using the teeth and made no effort to pay the dentist despite the fact that they were clearly serviceable. If the patient accepts the goods and uses them, it does not lie within his mouth to say that he should not be obliged to pay for them. This case is clearly different from that of Sutherland v White due to the fact that the teeth in the latter case were unsuitable. Where the product is of such a nature that it is required to be fitted or adjusted to suit the patient, a proper opportunity to do so must be given to the supplier.

6.2.5  

Hewatt v Rendel

---

40  Shiels v Minister of Health 1974 (3) SA 276 (RA)  
41  Hewatt 1925 TPD 679
Facts

A surgeon undertook to remove a growth from the patient for the main purpose of obtaining a bacteriological report from the South African Institute of Medical Research. She had been suffering from an affection of the nose and throat and had consulted several specialists. When it became clear that she was not making progress she was referred to the plaintiff for an operation to remove a specimen from her nose for the purpose of obtaining the report. The operation was done at the Kensington Sanatorium and during the procedure, some of the growth was removed and placed in a bottle which was in turn handed to the theatre sister in attendance. She was instructed to send it immediately to the Institute for testing. When the operation had been completed the plaintiff asked the sister if the specimen had been sent away and she confirmed that it had. That was the last that was seen of the bottle containing the specimen. It never reached the Institute. At the same time Dr Hewat had taken a slide for private examination at his rooms and upon which he based his opinion at the trial as to the plaintiff’s condition. After waiting for several days for the report to arrive from the Institute, the defendant’s husband was eventually informed that the specimen had been lost. The defendant stated that on hearing of the loss, her condition became worse. She was very ill from the shock of hearing that the specimen was lost and could not sleep. A further operation was undertaken to remove yet another specimen and this was sent to the Institute for examination. The reports were duly obtained. The second operation would not have been necessary if the specimen taken at the first had not been lost.

Judgment

De Waal J observed that the question to be determined was whether the loss of the specimen taken at the first operation was attributable to the plaintiff and whether it is such proof of negligence that justifies a verdict for the defendant on the claim in reconvention. On the one hand the plaintiff contended that he had complied with the terms of the agreement as soon as he had removed the specimen, placed it in the bottle and handed it over to the theatre sister with instructions. He argued that the practice of doing so was reasonable and universally adopted by the profession and that all that was required of him, after having in attendance a duly qualified theatre sister, was to
comply with the procedure not unreasonable in itself and usually adopted at the sanatorium where the operation was performed, which was that the operating surgeon hands the specimen in a bottle to the theatre sister, that she in turn hands it to the nurse in attendance who gives it to the porter for transmission to the Institute by a carrier. On the other hand, observed the judge, it was contended for the defendant that the contract which the doctor had undertaken was specifically for the purpose of ensuring that the specimen reached the Institute and not merely for the purpose or removing it and that the sanatorium through its nurses and porter, never became her agent for that purpose. It was argued that they were intermediaries or agents employed by the plaintiff and that the plaintiff was responsible in law for any loss or damage cause through their negligence. The court stated that if there was an absolute contract undertaken by the plaintiff to transmit or deliver, and if in law the sanatorium became his agent for that delivery, it would seem that his reliance on the practice universally obtaining at the sanatorium, and the fact that the practice was reasonable, was no defence to a counterclaim. The court found that there was no evidence that the practice was universal. A witness from the Institute testified that it did business with doctors only and that a specimen from a layperson would not be accepted. When a specimen was received from a nursing institution the doctor’s name had to accompany it and the report was directed to the doctor. As far as the Institute was concerned it was the doctor who sent the specimen. Doctors also daily handed the witness specimens by hand and the Institute also received specimens by post. De Waal J stated that it was not in his opinion the usual concern of either the sanatorium or its theatre sister to see to the despatch of specimens to the Institute.

The court observed that reliance was placed on *Perionowsky v Freeman*². In that case a patient was scalded after having been placed in a bath heated to an excessively high temperature and by being kept therein for an improper length of time. The defendant who had given the instructions to the nurses to give the patient a hot bath pleaded the negligence of the nurses over whom they had no control and it was moreover the usual practice to leave the baths to the nurses. In charging the jury Cockburn CJ said “The defendants cannot be held liable for the negligence of the nurses unless they were near enough to be aware of it and to prevent it”. He also relied on *Van Wyk v__

---

² *Perionowsky (4 F & F 977)*
Lewis⁴. In that case the plaintiff sought to claim damages on the following grounds: the defendant, a surgeon, performed a difficult abdominal operation on the defendant. The operation took place at the hospital at night, defendant being duly assisted by a qualified theatre sister. At the conclusion of the operation one of the swabs used by the defendant was overlooked and remained in the patient’s body for a period of twelve months. It appeared that at the conclusion of the operation the defendant on being satisfied upon the nurse’s assurance that she had duly accounted for all the swabs used, proceeded to stitch up the patient. It also appeared that the system adopted at the hospital at the operation for checking and counting the swabs used was one usually adopted and reasonable. It was held that the surgeon was not liable even if it could be proved, a point not decided, that the sister had been guilty of negligence.

But, said De Waal J, to his mind the principles underlying the decisions in those cases did not apply in the present case for these reasons: Where a difficult operation has to be performed, a patient who employs a surgeon to perform the operation must be deemed to have consented to the employment of the services of a theatre sister as it is manifestly impossible for a surgeon, concerned as he is mainly with the success of his operation and the safety of his patient, to attend to the many details, some of them merely mechanical, which are ordinarily relegated to the sister. Supposing therefore, Dr Heat had, after removing the specimen from the respondent’s nose, handed it to the theatre sister and she had negligently dropped it on the floor so as to render it useless for examination by the Institute, he would not be liable. The negligence would be that of the theatre sister for which the operating surgeon could not be held liable as at that stage, i.e. during the operation, she would not be the agent of the surgeon but rather of the patient, who must be deemed to have consented to her present and employment. If therefore the operation is such as to necessitate the presence of a theatre sister, the surgeon would not be accountable for the negligence during the operation. But where the main object of the operation is to remove a specimen from the body of the patient for subsequent analysis, the theatre sister ceases to be the agent of the patient at the conclusion of the operation in so far as the specimen is concerned. Thereafter it becomes his duty, and his alone, to ensure that the specimen reaches its proper destination. That duty he cannot delegate nor has he discharged it until the specimen

⁴ Van Wyk 1924 AD 438
has been delivered to the Institute. In any failure in that regard, therefore, he is responsible to the patient. If he, instead of making sure that the specimen reaches the Institute, hands it over to another and through the failure of that other it becomes lost, he is answerable to the patient for that loss. It is he who elects to employ an agent for the purpose of transmitting the specimen to the Institute and not the patient, and for the negligence of his agent he is liable to the patient. The theatre sister, the nurse, the porter or the carrier at the Kensington Sanatorium were none of them at any time the agent of the respondent. On the other hand, the appellant cited them as his agents and relied on them to deliver the specimen at the Institute. It was, however, argued that in adopting this means of delivering the specimen the surgeon was not acting unreasonably and that as a reasonable man, he was entitled to assume that the specimen would reach its destination in due course: But, said De Waal J, it is not a question of reasonableness at all. The appellant contracted with the respondent to remove a specimen from her nose and to deliver it at the Institute and he failed to perform one important obligation imposed upon him by the terms of the contract. Had he, for instance, handed the specimen to his own trusted servant who lost it in transmission, he would be allowed legally to plead the reasonableness of this act in employing that servant as a defence to an action by the respondent based on breach of contract. Consequently, said De Waal J, he had come to the conclusion that the appellant was liable to the respondent in damages for the loss of the specimen and that the appeal must be dismissed with costs. Tindall J gave a concurring judgment.

Discussion

This case is a useful illustration of the difference between the law of contract and the law of delict. Failure to perform a legal duty imposed by the law of delict can be defended on the grounds that the tortfeasor was reasonable in his or her actions. Failure to perform a contractual duty cannot since the parties had undertaken the contract with a view to achieving a specific result and the failure of one of the parties to perform a particular act which was a sine qua non for that result would constitute breach of the contract. It is quite common these days for the private hospital or other institution to ensure that tissue samples removed in theatre are sent to pathology laboratories or are collected by pathology laboratories were these are remote from the hospital premises. The position of the doctor in such cases would have to be
ascertained from the circumstances of the agreement with the patient since it is unusual these days for doctors to go driving off to pathology laboratories to deliver their tissue samples for testing. If a doctor specifically undertook to remove tissue for the purpose of a biopsy and it was not explained to the patient that the division of work between the doctor and the hospital meant that the latter would be responsible for ensuring that the specimen reached its destination then it is quite likely that the doctor could still be held responsible by the patient for breach of contract in the event of the failure of the specimen to reach its intended destination. Where the object of the treatment was not specifically the removal of a specimen for testing and this was rather an incident of a surgical procedure undertaken for other, albeit related purposes, the loss of the specimen may not necessarily be regarded as a breach of contract on the part of the medical practitioner who removed it for testing. It is likely that in practice in the private sector, litigation due to the loss of a specimen would include both the hospital and the medical practitioner as defendants. The division of labour between doctor and hospital may not be clear to the patient and indeed certain functions might even constitute a joint responsibility. The terms of the contract with the doctor and the circumstances of the treatment in each case would be the determinants of whether or not the doctor was in breach. The decision in this case does not contradict that of *Van Wyk v Lewis* since the court in that case came to the conclusion that it was the responsibility of the nursing sister and not that of the surgeon to count the swabs. The court in that case almost stated in so many words that the patient had sued the wrong person but refused to comment further on the actions or omissions of the theatre sister because they were not before the court. In *Van Wyk v Lewis* there was no express or even implied term in the contract that the surgeon was responsible for the removal of the swabs and it was normal practice for the surgeon and the nursing staff employed by the hospital to work as a team. The removal of swabs from the patient's body in the operating theatre was not the focal point of any contract that the patient and the doctor in *Van Wyk v Lewis* may have entered into. In *Hewatt*, on the other hand, the dispatch of the specimen to the testing facility was part of the raison d'être of the contract. The patient would not have agreed to undergo the surgery if she had known that the specimen would not reach its intended destination.
Facts

The plaintiff, a doctor, performed an operation on the father on the defendant, without obtaining what he knew to be the necessary authority of the defendant and in defiance of the express instructions of the defendant that the operation should be performed by two other doctors, Z and P. The defendant’s father subsequently died. The defendant was not informed of the time and place of the operation but on visiting the hospital found that his father was in the operating theatre and the plaintiff was dressing in preparation to operate. The defendant asked where Z and P were and the plaintiff told him that they could not be obtained. The defendant told the plaintiff that he should have carried out his instructions. The plaintiff replied that nothing could be done about it and that Dr A was administering the anaesthetic. The defendant was angry and the plaintiff was evasive and embarrassed. In an action against the defendant, as executor of the deceased’s estate, for fees in connection with the operation, the magistrate, though he found that the plaintiff knowingly operated upon the deceased against the defendant’s necessary and express instructions, found for the plaintiff on the ground of acquiescence, based on the defendant’s failure to stop the operation and on the fact that he allowed the plaintiff to attend the patient for six weeks after the operation.

Judgment

The plaintiff argued that he had operated on the deceased with the full consent of the latter and that no further consent or authority from anyone was necessary to entitle him to payment.

Lewis AJ noted that with regard to the question as to whether the deceased had himself consented to and authorised the plaintiff’s operating personally upon him, reliance was placed upon two facts – the “form of consent to operation” signed by the deceased and the direct evidence of the plaintiff. The plaintiff attached great
importance to the form and contended that the object of obtaining the signature of the patient to this form was not only to cover the doctor performing the operation but to bind the patient to the doctor whose name appears on the case sheet i.e. in this case the plaintiff. The evidence of Drs Ziervogel and Phillips, however, disposed of this contention. Their evidence was to the effect that the signature of the patient on the consent form does not bind the patient to any particular doctor whose name appears on the case sheet and that the primary purpose of obtaining the signature of the patient to such a form is to protect the hospital authorities by procuring in advance the consent of the patient to submit to an operation; the very wording of the form shows that the patient agrees “to leave the nature and extent of the operation to the discretion of the surgeons.” Lewis AJ stated that in his reply to the request for particulars the plaintiff had relied on the “form of consent to operation” in so far only as the date thereof enabled him to fix the date when the deceased had given his express consent to the plaintiff operating upon him; that express consent was there stated to be a verbal consent only. It was alleged that the deceased made no stipulation as to who should consent to the operation when it was discussed with him and that when the plaintiff advised him that he would perform the operation the deceased raised no objection. Lewis AJ said that it did not necessarily follow that because the evidence of the plaintiff on this point was uncontradicted, it should necessarily be accepted. There was only the plaintiff’s evidence in support of his allegations. The plaintiff’s evidence stood alone and though there was no rule of law that a claim against a deceased estate must be corroborated, it is a sound rule of practice that when such a claim depends on the oral and uncorroborated testimony of the claimant is should be very strictly scrutinised. It was not necessary, said Lewis AJ to decide where this evidence should be accepted because even assuming that it was accepted, this did not conclude the case in his favour. Lewis AJ said it was true that ordinarily the consent of an adult in full possession of his mental faculties (as was admitted to be the case of the deceased) would be sufficient authority for the performance of a surgical operation upon him. But there were some very special features of this case which took it out of the ordinary run of cases and a perusal of the evidence of the plaintiff as a whole satisfied the court that on his own admission he was well aware that in order to perfect his mandate to operate upon the deceased, he required not only the consent of the

45 Savory v Gibbs 20 CTR 600; Freshman v Yates [1923] WLD 9; van der Walt v Crockes [1941] CPD 244

661
deceased but also the consent and authority of the defendant. The evidence of the
defendant was that the deceased was an elderly man of 68 years of age and in bad
health. The defendant says he managed his father's affairs generally on account of his
father's insufficient knowledge of English and Afrikaans and he said further that he
had undertaken financial responsibility for the expenses of his father's illness. The
court said that it did not seem unlikely in these circumstances that the defendant
should have been consulted in regard to the proposed operation upon the deceased and
that the consent and authority of the defendant should have been regarded as being as
essential, if not more essential, than that of the deceased himself. There was also very
strong evidence on the part of the plaintiff that he too regarded the proposed operation
in this light. The plaintiff admitted that he debited his fees to the defendant and that
there was no account against the deceased in his books. He also admitted to
discussing the treatment of the deceased with the defendant and that the deceased
usually consulted with his son before treatment was carried out. Lewis AJ observed
that the fact that there was no account in the name of the deceased in the books of the
plaintiff coupled with the defendant's statement that he had undertaken financial
responsibility for his father's illness afforded some ground for the view that the action
should have been brought against the defendant personally and not against the estate
of the deceased. He stated that it at all events lent strong support to the case set up by
the defendant that he had a very material, as well as a moral, interest in the proposed
operation on his father, that his consent to the operation was in the circumstances
necessary and that the plaintiff was fully aware and recognised this. Indeed, said
Lewis AJ, the case for the defendant on this point was conceded in the most express
terms by the plaintiff himself when he said "the instructions for the operation came
from the defendant and his father. I would not have operated without their consent."

In the face of these admissions the court found that it was quite impossible to hold
otherwise than that the plaintiff was well aware of and fully accepted the fact that
before operating personally on the deceased he required the consent and authority, not
only of the deceased but of the defendant as well. In giving judgment the magistrate
stated that "it seems to me that plaintiff acted precipitately and without due
consideration for the patient and his relatives. His haste was not justified. The
probability is therefore that he intended to operate himself against the wishes of the
defendant." Lewis AJ said that the only criticism of the court of this remark of the
magistrate is that what the magistrate stated to be a probability appeared on the evidence to be a practical certainty. Lewis AJ stated that on the evidence the plaintiff performed the operation on the deceased without having obtained what was to his knowledge the necessary consent and authority of the defendant and in defiance of the express instructions of the defendant that the operation should be performed by Drs Ziervogel and Phillips.

On the question of whether the defendant acquiesced to the operation Lewis AJ noted that Halsbury Laws of England said of acquiescence that: “in its proper legal sense, it implies that a person abstains from interfering while a violation of his legal rights is in progress and that “acquiescence operates by way of estoppel. It is quiescence in such circumstances that assent may reasonably inferred and is an instance of estoppel by words or conduct”. Lewis JA stated that bearing this in mind it was difficult to hold that the conduct of the defendant in the circumstances to which the magistrate referred could be called acquiescence even in the popular sense of the word. The defendant was in no position to stop the operation because steps had already been taken and the patient was already under anaesthetic and had undergone a certain amount of risk. Dr Meine said that nothing further could be done about it and he took the view that if there was a possibility of stopping the operation without danger to his father it was up to Dr Meine on his (the defendant’s representations, to stop the operation. The defendant said that he did not consent while in the changing room to the plaintiff’s performance of the operation. On the contrary he made it clear that he had no authority. Lewis AJ held that if acquiescence operates by way of estoppel it is impossible to see how or what the events which took place at the hospital could or should estop the defendant from resisting the plaintiff’s claim on the ground that the plaintiff had no authority to operate on the deceased. He said that the magistrate erred in regarding the fact that the defendant allowed the plaintiff to continue to care for the patient for a period of six weeks after the operation and to perform a post-mortem examination on his body as evidence of acquiescence. The defendant gave two reasons for this. The first was that after an operation, post-operative treatment is necessary and he did not think any other doctor would have taken on the post-operative treatment. The second was that once he had operated on the deceased without the patient’s consent, his confidence was shaken. He allowed the plaintiff to continue to treat the deceased because he was in a bad way after the operation and he

663
was afraid that a change of doctors would shock the deceased in his weak condition. The court said this last reason did not appear at all to be an unreasonable one because the plaintiff had been in attendance on the deceased for several months and the reason why he had originally been called in to attend to the deceased was that he was able to converse with him in German. In any event, said the court, the acquiescence had to be proved in relation to the operation and the fact that the defendant acquiesced in the plaintiff continuing with the care of the deceased after the operation was no evidence of acquiescence to the operation itself. Consequently the court held that the plaintiff was not entitled to any fee for the operation which he performed without the necessary authority of the defendant. It also held that he could not successfully claim the fee of the anaesthetist or the consultant employed in connection with the unauthorised operation assuming that the consultation did in fact take place. The appeal was allowed with costs and the judgment of the magistrate altered to one in favour of the defendant with costs.

Discussion

In this case the contract was not between the patient and the medical practitioner. If it had been then the court should have found that the patient’s deceased estate was liable for the costs of the surgery to the patient. It was if anything between the patient’s son and the medical practitioner since the former had taken financial responsibility for his father’s medical expenses. The case illustrates the importance of the need to distinguish between informed consent to treatment and the acceptance of contractual liability for payment for that treatment. The patient informed consent of the patient in this case to the surgery performed upon him did not save the medical practitioner from the repudiation of his claim in contract for the expenses incurred. In fact the court in this case suggested that it was not the patient’s deceased estate that should have been the defendant in this case but the patient’s son in his personal capacity since the medical practitioner knew full well that it was in his personal capacity that he was contracting for his father’s medical expenses. The contract between the medical practitioner and the patient’s son could have been seen as a stipulatio alteri but for the fact that it was apparently never the intention of either the patient or his son that the former should become a party to the contract with the medical practitioner. In fact it was the intention of the son that no contract at all between the
plaintiff and himself or the patient should arise in respect of the surgery to be conducted on his father since the son had expressly stated that he wanted two other medical practitioners to carry out the surgery. There was thus no intention on the part of the son ever to contract with Dr Meine for the surgery on his father. Dr Meine’s legal counsel no doubt knew this and it was probably one of the reasons why the action was launched against the deceased estate of the patient rather than against the son in his personal capacity. Technically Dr Meine may have had a claim for unjust enrichment against the patient in the absence of a contractual relationship between them but it seems that this was never pleaded and in any event it would probably have been quite difficult to prove enrichment given the fact that the patient appears to have died not long after the operation was performed. The case is interesting because no legal relationship seems to have arisen between the medical practitioner and the patient despite that fact that the former performed surgery upon the latter.

In any event the decision of the court seems to have been a just one since it appears that Dr Meine deliberately and unethically prevailed upon a weak and ailing old man, in the absence of his son’s protective presence and in the full knowledge that the son had requested other doctors to perform the operation, to allow him to perform it instead. Ordinarily, in the absence of a duty of support owed by a child to its aged parent, there would be no liability on the part of the child for the medical expenses of the parent due to the legal requirements of privity of contract and the fact that one adult person cannot in the absence of a legal duty of support be held liable for the debts of another. However, in this particular case the son had clearly taken it upon himself to contract for his father’s medical treatment as evidenced by the fact that invoices had previously been sent to the son in respect of such treatment of the father by Dr Meine.

The Medical Schemes Act defines a dependant as follows:

46 In Smith v Mutual & Federal Insurance Co Ltd 1998 (4) SA 626 (C) the court noted that: “The question whether the parent is so indigent that a child becomes liable to support his parent depends on all the circumstances of each case. Furthermore, the parent must show that he or she is in want of what should, considering his or her station in life, be regarded as necessities. It must also be mentioned that a parent is not entitled to claim support from a child if the parent is able to maintain himself.” See also Oosthuizen v Stanley 1938 AD 322

47 See for instance Atlas Organic Fertilizers (Pty) Ltd v Pikkewyn Gwano (Pty) Ltd and Others 1981 (2) SA 173 (T); Manousakis and Another v Renpal Entertainment CC 1997 (4) SA 552 (C); Aussenkehr Farms (Pty) Ltd v Trio Transport CC 2002 (4) SA 483 (SCA)

48 Medical Schemes Act No 131 of 1998
'dependant' means-

(a) the spouse or partner, dependent children or other members of the member's immediate family in respect of whom the member is liable for family care and support; or

(b) any other person who, under the rules of a medical scheme, is recognised as a dependant of a member;

The question as to whether a member of a medical scheme can be held liable for the costs of medical expenses incurred by an adult family member who is a registered dependent of the member in a situation in which the medical expenses in question fall outside the scope of the benefits payable by the scheme is worthy of further examination. Assume that a son has registered his mother, the recipient of a modest pension, as a dependent with the medical scheme of which he is a member. The mother is admitted to hospital for treatment and the medical scheme pays only part of the bill. Can the hospital, in the absence of an express undertaking by the son to stand surety or on some other basis pay his mother's hospital fees, be held liable for the balance of the account? Paragraph (a) of the definition of dependent seems to suggest that in order for a person to be registered as a dependent of a member of a medical scheme there must be some pre-existing legal liability in terms of a duty of support. Where there is a duty of support the argument that the son in the example under discussion is liable for his mother's medical expenses becomes stronger. However, the duty of support, including the legal obligation to pay for medical expenses, lies between mother and son and not necessarily between the son and the hospital. If the son did not consent to his mother's admission to hospital because he knew that the medical scheme would not pay for certain procedures and instead stipulated that she should be admitted to a government hospital were the costs would be fully covered by the medical scheme, it is difficult to see how he could be held liable for the balance of the private hospital account. His mother, as an adult of sound mind and full contractual capacity had the power to enter into a contract with the hospital in her own right. The son would not be a party to that contract and there can thus be no
claim against him by the hospital merely because his mother is registered as his
dependant with his medical scheme. The duty of support of a child to a parent is very
much dependent both for its nature and content on the circumstances of each case and
is generally quite different to the duty of support owed by a parent to a child.
Furthermore, paragraph (b) of the definition of a dependant in the Medical Schemes
Act tends to suggest that a person can be registered as a dependant of a member in the
absence of a legal duty of support owed by the member to that dependant. Thus the
registration of a person as a dependant of a member of a medical scheme is not
necessarily proof of a legal duty of support owed by the member to the dependant. A
hospital or health professional who tries to hold an adult child liable for medical costs
incurred by his mentally competent parent would have to show in the circumstances
of the particular case that there was a legal duty of support owed to the parent by that
child. If there is more than one child, as is often the case, then technically the duty of
support may have to be proven against all of the children and not necessarily just the
member of the medical scheme who had registered his mother as a dependant since
the duty to support a parent cannot rest on the shoulders of only one child and not
those of other siblings. There is a reciprocal duty of support between
sib lings. There is a reciprocal duty of support between
siblings.

In certain circumstances there may even be a duty of support owed by a grandchild to a

49 In Smith v Mutual & Federal Insurance Co Ltd 1998 (4) SA 626 (C) Ghwala AJ observed that: “If parents are indigent,
their children, even if minors, are liable to support them in whole or in part, according to their ability: see Oosthuizen v
Stanley 1938 AD 322, in which Tindall JA said at 327 in finis: “The liability of children to support their parents, if
these are indigent (inopes), is beyond question; see, Voet 25.3.8; Van Leeuwen Censura Forensis 11.0.4. The fact that a
child is a minor does not absolve him from his duty, if he is able to provide or contribute to the required support; see In
re Knoo 10 SC 198. Support (alimenta) includes not only food and clothing in accordance with the quality and
condition of the person to be supported, but also lodging and care in sickness; see Voet 25.3.4; Van Leeuwen Censura
Forensis 11.0.5; Bruneman in Codious 5.2.5. Whether a parent is in such a state of comparative indigency or
impoverishment that a court of law can compel a child to supplement the parent's income is a question of fact depending
on the circumstances of each case.”

50 Voet, 25.3.11 states: “But in a crowd of a number of persons under obligation for maintenance who ought to be forced to
provide it? Are grandsons to be forced to maintain a grandfather if the intermediate father can maintain him, or some
wealthy son besides is still in existence…? Can the whole burden of maintenance be imposed upon a single one of a
number of children or brothers? It appears that these questions and many others of the same kind cannot so much be
settled by definite rules as that they ought rather to be determined in accord with the manifold variety of circumstances,
and so ought to be entrusted with the discretion of a cautious and fair minded judge. Those who have avowedly written
about maintenance should be consulted on these questions.” (Quoted in Barnes v Union And South West Africa
Insurance Co Ltd 1977 (3) SA 502 (E))

51 Frejo J observed in Fourie v Santam Insurance Ltd 1996 (1) SA 63 (T): “The authorities in our law, stemming from
Voet 25.3.6 and 8 and numerous decisions confirming these duties, are conveniently collected in Jodeika in Jodeiak
1976 (1) SA 784 (W) by Jouber J at 788H-788B. As to the former, the learned Judge states: ‘One of the legal
consequences of marriage, whether in or out of community of property, is that the spouses owe each other a reciprocal
duty of maintenance according to their means.’ ‘Another legal consequence of marriage, whether in or out of
community of property, and whether stante matrimonio or after dissolution by divorce, is that the duty of maintaining
their minor children is common to the parents and must be borne by them according to their means.’
The duties are consistent with one another. They do not conflict, even potentially. This means, in my view, that
they exist alongside each other and must be accorded equal status. I shall have occasion at a later stage in this judgment
to refer to decided cases in which this co-existence is affirmed. I have found no authority (and none has been cited to
me) which suggests that one or the other is to predominate.” See also Dawood and Another v Minister of Home Affairs
And Others; Shalabi and Another v Minister of Home Affairs and Others; Thomas and Another v Minister of Home Affairs
And Others 2000 (1) SA 997 (C) and Dawood and Another v Minister of Home Affairs and Others; Shalabi and
Another v Minister of Home Affairs and Others; Thomas and Another v Minister of Home Affairs and Others 2000 (3)
SA 596 (CC)
grandparent. If a private hospital or a medical practitioner contracts with a person without seeking surety from the member of the scheme who has registered that person as his or her dependant in terms of the Medical Schemes Act then it takes the risk of the patient’s inability to pay any amounts for which the scheme is not liable. There can be no presumption of a duty of support owed to a parent by a child simply because the latter has registered the former as a dependant.

6.2.7 Friedman v Glicksman

Facts

The allegations made by the plaintiff were:

1. That when pregnant, she consulted the defendant, a specialist gynaecologist, to advise her apropos of the risk that she might have been pregnant with a potentially abnormal and/or disabled infant.

2. It was understood between the plaintiff and the defendant that the plaintiff wished to terminate her pregnancy if there was any risk greater than the normal risks of the infant being born in an abnormal and/or disabled condition.

3. An agreement was concluded in terms of which the defendant would provide such advice in order that the plaintiff might make an informed decision on her...
own behalf and on behalf of Alexandra whether to terminate the pregnancy or not.

4. In the alternative the defendant, by virtue of his professional status, was under a duty to provide the advice to the plaintiff both in her personal capacity and on behalf of Alexandra for the purpose set out in 3 above. In this regard he had to act with the skill, knowledge and diligence normally exercised by other members of his profession.

5. The defendant, having carried out certain tests, advised the plaintiff that there was no greater risk than the normal risk of having an abnormal and/or disabled child and that it was quite safe for her to proceed to full term to give birth.

6. The defendant’s advice was erroneous and Alexandra was born disabled on 5 March 1991.

7. The defendant in giving his advice had acted negligently in a number of respects. Had he not acted in this negligent manner he would have concluded that there was a greater than normal risk of the child being born disabled and would have advised the plaintiff of this fact.

8. Had she received the correct advice the plaintiff would have terminated her pregnancy forthwith.

9. The defendant’s negligence was a breach of his duty of care as well as a breach of the agreement concluded.

Based on these facts plaintiff brought two claims:

(a) A claim in her personal capacity for the expenses of maintaining and rearing Alexandra as well as all future medical and hospital treatment and other special expenses.
(b) A claim in her representative capacity on behalf of Alexandra for general damages as well as a claim for future loss of earnings.

The defendant excepted to the claims which were made against him by the plaintiff in her personal capacity and in her capacity as mother and natural guardian of her minor child, Alexandra. He contended that the allegations made by the plaintiff did not disclose a cause of action cognisable in South African law.

The defendant excepted to the claim on the following independent grounds:

1. In so far as the plaintiff’s claim was based on a breach of contract, Alexandra was not a party to such contract and cannot be affected by any such breach.

2. The defendant did not owe Alexandra a duty of care which would lead to the termination of her existence.

3. The defendant did not in law act wrongfully against Alexandra.

4. There was no legal basis in South African law for the damages claimed on behalf of Alexandra. A Court is not able to evaluate damages by comparing the value of non-existence and the value of existence in a disabled state.

5. The action was contra bonos mores and against public policy.

Judgment

Goldblatt J referred to the numerous legal articles on the subject that had been made available to him by counsel and observed that originating in America and used by most writers and jurists the terminology set out hereunder is useful shorthand for the issues raised. He stated that the phrases however do contain certain emotional and apparent value judgments which can detract from a proper judicial approach to the issues raised.
‘Wrongful pregnancy’ refers to those cases where the parents of a healthy child bring a claim on their own behalf for damages they themselves have suffered as a result of giving birth to an unwanted child.

‘Wrongful birth’ are those claims brought by parents who claim they would have avoided conception or terminated the pregnancy had they been properly advised of the risk of birth defects to the potential child.

‘Wrongful life’ actions are those brought by the child on the basis that the doctor’s negligence - his failure to adequately inform the parents of the risk - has caused the birth of the disabled child. The child argues that, but for the inadequate advice, it would not have been born to experience the pain and suffering attributable to the disability.

Thus, said Goldblatt J, different considerations apply to the claims instituted by the plaintiff in that the one claim is a ‘wrongful birth’ claim and the other a ‘wrongful life’ claim. The defendant argued that it would be against public policy to enforce the contract entered into between the plaintiff and the defendant because it would encourage abortion and thus be inimical to the right to life enshrined in section 9 of the Constitution of the Republic of South Africa Act\(^5\) as well as to the generally recognised sanctity accorded by society to life and the process by which it is brought about.

Goldblatt J stated that in his view there was no substance in this submission, which flew directly in the face of the Abortion and Sterilisation Act\(^5\)\(^5\). In terms of s 3(c) an abortion may be procured ‘where there exists a serious risk that the child to be born will suffer from a physical or mental defect of such a nature that he will be irreparably seriously handicapped’. Thus, he said, the Legislature has recognised, as do most reasonable people, that cases exist where it is in the interests of the parents, family and possibly society that it is better not to allow a foetus to develop into a seriously defective person causing serious financial and emotional problems to those who are

\(5\) Interim Constitution (Act No 200 of 1993)

\(5\) Act No 2 of 1975
responsible for such person's maintenance and well being. However, said Goldblatt J, it must be stressed that the election to proceed with or terminate the pregnancy in these circumstances rests solely with the mother, who bears the moral and emotional burden of making such election.

Referring to the decision of the Appellate Division in *Administrator, Natal v Edouard*\(^6\), in upholding a ‘wrongful pregnancy’ claim and its finding that such claim was not contrary to public policy, Goldblatt J noted that in his view the contract entered into between the plaintiff and the defendant was sensible, moral and in accordance with modern medical practice. The plaintiff was seeking to enforce a right, which she had, to terminate her pregnancy if there was a serious risk that her child might be seriously disabled. Goldblatt J observed that the defendant submitted, *inter alia*, that the plaintiff had no cause of action in that Alexandra’s condition was not caused by any act or omission on his part but was a congenital defect arising at the time of conception. He stated that this submission misconstrues the nature of a ‘wrongful birth’ claim. The claim is based upon the fact that, but for the defendant’s negligent advice, the plaintiff would have had her pregnancy terminated. Thus, said Goldblatt J, the defendant was responsible and caused the child, with her disabilities, to be born. He stated that the plaintiff’s contention was analogous to a would-be defence in a ‘wrongful pregnancy’ case that the doctor did not inseminate the patient, i.e. did not cause the pregnancy. In these cases the defendants were employed to sterilise the patient and thereby prevent the birth of a child. The negligent failure to implement medical procedures properly was causative of the birth of the child - the very event that the defendants were called upon to prevent.

Goldblatt J held that in the present case the defendant was employed to prevent - by way of giving proper medical advice - the birth of a disabled child. Because of his negligence that event had taken place, causing the plaintiff to incur considerable expenses which she would not otherwise have had to incur. He quoted the words of Van Heerden JA in *Edouard* as follows -

\(^6\) *Administrator, Natal v Edouard* 1990 (3) SA 581 (A)
“(T)he “wrong” consists not of the unwanted birth as such, but of the prior breach of contract (or delict) which led to the birth of the child and the consequent financial loss. Put somewhat differently, . . . although an unwanted birth as such cannot constitute a “legal loss” (ie a loss recognised by law), the burden of a parents’ obligation to maintain the child is indeed a legal loss for which damages may be recovered.”

Goldblatt J noted that in America a claim for ‘wrongful birth’ is commonly recognised. This claim was first recognised by the Supreme Court of New Jersey in *Berman v Allan*⁵⁷. At p 14 Pashman J said the following:

“The Supreme Court’s ruling in *Roe v Wade* clearly establishes that a woman possesses a constitutional right to decide whether her fetus (sic) should be aborted, at least during the first trimester of pregnancy. Public policy now supports, rather than militates against the proposition that she not be impermissibly denied a meaningful opportunity to make that decision. As in all other cases of tortious injury, a physician whose negligence has deprived a mother of this opportunity should be required to make amends for the damage he has proximately caused. Any other ruling would in effect immunize from liability those in the medical field providing inadequate guidance to persons who would choose to exercise their constitutional right to abort fetuses (sic) which, if born, would suffer from genetic defects. (Notes omitted) Accordingly, we hold that a cause of action founded upon a wrongful birth is a legally cognizable claim.”

In his view, the reasoning of the American Courts was sound and fitted comfortably within the Aquilian action. The requirements for such an action are a wrongful act committed with the fault (either negligent or intentional) of the defendant which causes the plaintiff to suffer some harm. Goldblatt J held that a doctor acts wrongly if he either fails to inform his patient or incorrectly informs his patient of such information she should reasonably have in order to make an informed choice of whether or not to proceed with her pregnancy or to legally terminate such pregnancy. He said that the fault element of the delict is to be found in the foreseeability of harm which the doctor-patient relationship gives to the doctor. Once proper disclosure is not made and the patient is deprived of her option, the damages she has suffered by giving birth to a disabled child are clearly caused by the fault of the doctor, provided she would have terminated the pregnancy if the information had been made available to her. Goldblatt J found that in regard to her claims in her personal capacity the plaintiff’s particulars of claim contained averments sufficient to sustain an action. He stated that this cause of action was a logical extension of the principle enunciated by the Appellate Division in *Edouard*⁵⁸.

⁵⁷ *Berman* 404 A 2d 8 (1979)
⁵⁸ *Edouard* fn 56 supra
Goldblatt J agreed with the defendant that the plaintiff could neither enter into a contract on behalf of Alexandra prior to Alexandra’s birth or at such time make any election on Alexandra’s behalf. He said it was trite law that an agent cannot act on behalf of a non-existent principal and that it was similarly trite that legal personality only commences at birth. In these circumstances the allegation that the plaintiff acted on Alexandra’s behalf whilst she was still in utero was legally untenable. Further, he said, it could not be argued that this was a contract for the benefit of a third party as such party could only accept the benefit, if it be one, at a time when the alleged benefit, ie termination of pregnancy, was no longer possible. Thus it was necessary to consider whether Alexandra had a delictual claim against the defendant for allowing her to be born with her disabilities instead of giving the plaintiff such advice as would have caused her to terminate her pregnancy and cause Alexandra never to have existed in the legal sense.

Goldblatt J referring with approval to *Pinchin and Another NO v Santam Insurance Co Ltd*\(^9\) noted that the first question to be answered in relation to the delictual claim was whether a person has an action in respect of injury inflicted on him while he was still a foetus in his mother’s womb. This question was posed by Hiemstra J in that case and answered in the affirmative. Goldblatt J was of the opinion that in the instant case, at least, it is not necessary to invoke the so-called nasciturus rule because Alexandra’s action did not arise when the pregnancy was not terminated, but when she was born. The plaintiff argued that, once the mother is entitled to sue, on the basis that fault and causation are proved, there is no reason in law or logic why a child should not equally be able to sue for its damages, including general damages for pain and suffering, disability, loss of amenities and loss of earnings since these consequence flow directly and foreseeably from the initial delict. Further, the plaintiff submitted that the proper measure of damages is the amount necessary to compensate the child for having to live in a disabled state and not the difference between non-existence and existence in a disabled state. Goldblatt J observed that the action for ‘wrongful life’ has been considered in a number of American cases and has in the

\(^9\) *Pinchin* 1963 (2) SA 254 (W)
main failed. He referred to the judgment of Cercone J in *Speck v Finegold*\(^60\) where he said:

“In the instant case, we deny Francine's claim to be made whole. When we examine Francine's claim, we find regardless of whether her claim is based on ‘wrongful life’ or otherwise, there is a failure to state a legally cognizable cause of action even though, admittedly, the defendants' actions of negligence were the proximate cause of her defective birth. Her claims to be whole have two fatal weaknesses. First, in appellate judicial pronouncements that hold a child has no fundamental right to be born as a whole, functional human being. Whether it is better to have never been born at all rather than to have been born with serious mental defects is a mystery more properly left to the philosophers and theologians, a mystery which would lead us into the realm of metaphysics, beyond the realm of our understanding or ability to solve. The law cannot assert a knowledge which can resolve this inscrutable and enigmatic issue. Second, it is not a matter of taking into consideration the various and convoluted degrees of the imperfection of life. It is rather the improbability of placing the child in a position she would have occupied if the defendants had not been negligent when to do so would make her non-existent. The remedy afforded an injured party in negligence is intended to place the injured party in the position he would have occupied but for the negligence of the defendant. Thus, a cause of action brought on behalf of an infant seeking recovery for a ‘wrongful life’ on grounds she should not have been born demands calculation of damages dependent on a comparison between Hobson's choice of life in an impaired state and non-existence. This the law is incapable of doing.”

Goldblatt J noted that in *Philips v United States*\(^61\) the District Court of South Carolina dismissed a “wrongful life” claim after considering all the then reported American cases on the basis of the fundamental policy of the preciousness and sanctity of human life. They accepted it as basic to the beliefs of society that life, with or without a major physical handicap, is more precious than non-life.

In California in *Curlender v Bio-Science Laboratories*\(^62\) the Court of Appeal allowed a wrongful life claim for damages on the basis that there should be a remedy for every wrong committed. This approach, said Goldblatt J, was in his view illogical and contrary to legal principles in that it ignores the central question of whether a wrong had in fact been committed. He observed that in England the question of whether or not a claim for ‘wrongful life’ existed was dealt with by the Court of Appeal in *McKay and Another v Essex Area Health Authority and Another*\(^63\) and that the court found that no cause of action existed for a number of reasons.

\(^61\) *Philips* 508 F Supp 537 (1980)

\(^62\) *Curlender* App 65 Cal Rptr 477

\(^63\) *McKay*[1982] 2 All ER 771 (CA)
Firstly, the court held that the defendant was under no duty to the child to give the child's mother an opportunity to terminate the child's life. Whilst such a duty may be owed to the mother it could not be owed to the child.

"To impose such a duty towards the child would, in my opinion, make a further inroad on the sanctity of human life which would be contrary to public policy. It would mean regarding the life of a handicapped child as not only less valuable than the life of a normal child, but so much less valuable that it was not worth preserving..."54

The court further held, as had many American courts, that it was impossible to calculate damages being the difference between an impaired life and no life.

"But how can a court begin to evaluate non-existence, ‘The undiscover’d country from whose bourn no traveller returns’? No comparison is possible and therefore no damage can be established which a court could recognise. This goes to the root of the whole cause of action"55

Goldblatt J said that in his view the reasoning of the American courts holding that no cause of action exists in regard to a ‘wrongful life’ claim and the very cogent reasoning of the English Court of Appeal along the same lines was correct and agreed both with the conclusions reached and the reasons therefor. He stated that South African law similarly cannot recognise that the facts alleged by the plaintiff on behalf of Alexandra are sufficient to sustain a cause of action. It would be contrary to public policy, said Goldblatt J, for courts to have to hold that it would be better for a party not to have the unquantifiable blessing of life rather than to have such life albeit in a marred way. Further, he said, to allow such a cause of action would open the door to a disabled child being entitled to sue its parents because they may have for a variety of reasons allowed such child to be born knowing of the risks inherent in such decision. Merely to state this proposition is to indicate the unacceptable burden that would be placed on such unfortunate parents. Finally, he said, to allow damages to be claimed on the basis alleged by the plaintiff was completely contrary to the measure of damage allowed for in the law of delict. The defendant was in no way responsible for the child’s disabilities and yet he was being asked to compensate the child for such disabilities. This proposition was, in his view, illogical and contrary to the South African legal system. The only measure of damages could be the difference in value between non-existence and existence in a disabled state. No criteria, in law, could

---

64 Per Stephenson LJ at 781e
65 Per Ackner LJ at 787h
exist, said Goldblatt J, in establishing such difference or even in establishing whether any damage had been sustained. Accordingly the exception to the plaintiff’s claims in her personal capacity was dismissed and the exception to plaintiff’s claims in her capacity as mother and natural guardian of her minor child, Alexandra, was upheld and such claims were dismissed.

Discussion

This case illustrates, inter alia, the thinness of the barriers between the law of contract and that of delict. The court did not distinguish between issues of public policy with regard to these two branches of law. It considered the question of whether the contract between the plaintiff and the defendant was contra bonos mores and found, interestingly with reference to statutory law, that it was not. The court’s reference to the provisions of a relevant statute in order to establish public policy is commendable and makes for consistency within the legal system as a whole. If it had found that the contract was contra bonos mores then there would have been an inexplicable and logically unacceptable divide between statutory and common law. In its judgment the court effectively upheld the contractual claim of the mother but denied the delictual claim of the child. The claim of the mother was, however, equally at home in the law of delict and the court did not specifically decide this claim on the basis of the law of contract or of delict but rather simply dismissed the exceptions to the claim of the mother raised by the defendant. It allowed the claim in contract in that it found that the contract was not contra bonos mores but it also did not preclude the claim based in delict. The question arises whether a claim in delict would have been viable had the contractual claim been found to be contra bonos mores. It is an interesting question because it addresses the relationship between these two areas of law. If the court had found that the defendant could not enter into an agreement in terms of which a pregnancy would be terminated should the foetus be found to be defective, then could it still have been said that there existed a duty of care, in terms of the law of delict, to inform the mother that the foetus was defective so that she could terminate the pregnancy? It is submitted that the answer is no. How can the exact same duty in terms of the law of delict be upheld when the contractual one is denied on the basis of public policy? Public policy does not change from one branch of the law to the other in these circumstances. Either the termination of pregnancy is wrongful or it is not. If
it is not, then a contract contemplating such termination is lawful and there is a
concomitant legal duty in delict to provide medical advice with a view to determining
the necessity of the termination. It is submitted that in the context of health care
service in particular, this kind of indivisibility between the law of contract and the law
of delict is particularly evident due to the nature of the services provided. The court
used the limitation of liability argument to preclude a claim for wrongful life in terms
of the law of delict. Strauss\textsuperscript{66} writing in 1991 observes that it is still an open question
whether South African courts will uphold a claim for wrongful life and that different
policy considerations may apply in respect of such a claim. He notes that liability for
wrongful life is a completely different story to claims for wrongful conception and
refers to Giesen\textsuperscript{67} who has pointed out that claims by the infants themselves have been
regarded almost universally with disfavour. Giesen comments that the child is not
claiming that the physician’s negligence caused its defects but that had he informed
its parents properly, it would never have seen the light of day at all. And the courts
have refused on policy grounds to hold that life, even if experienced with severe
handicaps, is or can be preferable to non-existence. The unarticulated conundrum in
these cases, it is submitted, rests in the fact that the purpose of a contractual award of
damages is to place the victim in the position in which he or she would have been but
for the breach. In the present context, taken to its logical conclusion it means to
compensate a person for the fact that he or she did not die. Effectively, therefore, it
means awarding damages for a death that did not occur and is rather more an attempt
to quantify the value of death, or non-existence, that it is to quantify the ‘loss’ arising
from a disabled life. Similarly, in terms of the law of delict, the object is to place the
plaintiff in the position in which she would have been but for the wrongful act or
omission of the defendant. In this instance, it would mean killing the plaintiff. This
goes contrary to public values and the legal convictions of the community with regard
to life. It is mirrored in the attitude of the South African law to euthanasia. A plaintiff
would not be able to bring an action in delict against a doctor who failed to eutanaze
him as requested, either on the basis of a contract or in terms of the law of delict,
since to cause or hasten the death of another, even if he or she is in any event dying, is
wrongful in terms of the legal convictions of the community. Any legal developments

\textsuperscript{66} Strauss in 24 supra at p 175, 179 -180 and p 197-198
\textsuperscript{67} Giesen D, \textit{International Medical Malpractice Law}
in favour of euthanasia would of logical necessity have to give rise to a review of the legal position in the case of wrongful life claims since in principle there is no difference between the two except that they usually occur at two different ends of the human lifespan. Strauss comments that judging by the views expressed by South African jurists, it is highly unlikely that ‘wrongful life’ claims will be upheld by South African courts as a cause of action. It turns out that this view was validated by the judgment in Friedman’s case. Claassen and Verschoor, also writing prior to Friedman, note that in Gleitman v Cosgrove the first wrongful life claim was instituted by a disabled child. The mother contracted rubella during the first three months of pregnancy and she was assured by the defendant paediatrician that the illness would have no prejudicial effect on her unborn child. On the strength of this advice she decided not to have an abortion. The child was subsequently born with brain damage and seriously defective sight, speech and hearing. Both the parents’ and the child’s unlawful life claims were rejected by the court. The court contended that no parallel could be drawn between human life and a state of non-existence and further that any life in any form whatsoever, was to be preferred to non-life. They also refer to Stewart v Long Island College Hospital and to the case referred to by Goldblatt J in Friedman, Berman v Allen. Claassen and Verschoor canvass the reasons for rejecting a claim for damages on the basis of wrongful life and note that Brownlie disagreed with Strauss that South African courts were likely to reject a claim for wrongful life.

Although, as the court pointed out with reference to Pinchin, injuries done to a foetus while in the womb do attract liability in terms of the law of delict, the point in this case seems to be that if the doctor did not cause the disability in the first place, he or she should not be held liable for the birth of a child with that disability. It was not
something he could have prevented except by killing the foetus and there is insufficient evidence that this last is any kind of solution in any event. There is a certain symmetry between the wrongful birth situation and the situation in S v Williams\textsuperscript{75} where the accused tried to argue that the act of taking the patient off the life-support system was a novus actus interveniens that caused her death and as opposed to the assault on the deceased by the accused. In the wrongful life situation the birth was inevitable according to the natural course of events just as the death in S v Williams\textsuperscript{76} was inevitable due to the natural course of events. In both situations the medical intervention that was required was supposed to avoid the anticipated outcome and divert the natural course of events from its logical conclusion. The difference is that in wrongful birth cases that logical conclusion is birth whereas in S v Williams\textsuperscript{77} it was death. The two cases are consistent in terms of their logical symmetry in that the courts in both cases rejected the idea that the failure to divert the natural course of events from its logical conclusion was unlawful. However these two cases are at the two extreme ends of a health care spectrum. In the middle of the spectrum and, in all likelihood to the majority of cases involving health care delivery, the opposite rule applies as illustrated by the Volkmann’s contracture cases\textsuperscript{78} and the sterilisation cases\textsuperscript{79}. In these cases the judgments of the court went against medical practitioners who failed to reasonably avert the consequences of the natural course of events. This apparent logical inconsistency need not necessarily be a problem since there are other examples of logical systems in which the rules that apply generally start to break down or have a different effect at extreme ends of a spectrum.\textsuperscript{80} It can also be argued that at the extreme ends of the spectrum the rights of the health professionals themselves and boundaries of reasonableness are more prominent features of the logical system. For example in cases involving the termination of pregnancy, the constitutional right of the health professional to freedom of conscience, religion, thought, belief and opinion starts to weigh in against the right to have a pregnancy

\textsuperscript{75} S v Williams 1986 (4) SA 1188 (A). It was held that where a person is wounded so seriously that it would, in the absence of prompt medical intervention, very soon lead to his death, and such person is kept alive artificially by means of a breathing apparatus (a respirator), the eventual disconnecting of the respirator cannot be seen as the act causing death. It is merely the termination of a fruitless attempt to save the life, ie a fruitless attempt to avert the consequences of the wounding. The causal connection between the wounding of the deceased and his eventual death exists from beginning to end and is not interrupted and eliminated by the disconnecting of the respirator.

terminated. Similarly the reasonableness of the expectation to be snatched from the jaws of death or to be consigned to oblivion before consciousness takes hold sits at the outer limits of human capacity to decide what is in fact reasonable.

In the case of *S v Williams*\(^{81}\) the court took the view that it is sometimes just not possible, despite every effort, to divert the natural course of events and that it does not lie within the mouth of the person who set that course of events in motion to say, when it reaches its logical conclusion, that someone else must be held liable for it.

In the health care context, the right of the a newborn dependant of a member of a medical scheme to benefit from that medical scheme is a more common example of similar boundary issues in the law of contract as it applies to health care services. A person is a member of a medical scheme and as such is entitled to certain benefits not only for him- or herself but also her registered dependants. The basis of the member’s relationship with the medical scheme lies in the law of contract\(^{82}\). Maternity benefits in respect of confinement costs for the pregnant mother and any medical treatment that may be necessitated by the birth process and attendant complications are usually offered by medical schemes. The baby is not yet born. It is not yet a dependent in its own right independent of its mother. Nonetheless, while the unborn child is in the mother’s womb, it can be given medical treatment that is specifically intended to address the health problems of the child and not the mother. An extreme example of such treatment is *in utero* surgery on the unborn child to correct conditions such as spina bifida, congenital diaphragmatic hernia and heart defects\(^{83}\). Since in South African law a foetus is not a person\(^{84}\) and only persons have contractual capacity, any

\(^{81}\) *Williams v Williams* (1975) 75 SANC 306, 325 – 327

\(^{82}\) *Johnson K 'Fetal Surgery and Option for a Range of Diagnoses' OB/GYN News August 1, 2000 notes that as prenatal diagnostic techniques become increasingly sophisticated, options for fetoscopic surgery and open fetal surgery are rapidly evolving as well according to Dr T Crombleholme in a meeting of the Society for Obstetric and Perinatal Medicine. Dr Crombleholme stated that: "We see a whole range of fetal problems, from choroid plexus cysts, to agenesis of the corpus callosum, complicated by CNS problems, sacrococcygeal teratomas, obstructive uropathy and even myelomeningocele, which is somewhat controversial because for the first time we are trying to treat a nonlethal condition." According to Dr Crombleholme about 10% of patients need to have a procedure done in *utero* but the vast majority of conditions can be managed postnatally. Among the procedures performed at the Center for Fetal Diagnosis and Treatment at Children’s Hospital of Philadelphia and the University of Pennsylvania is *in utero* treatment of congenital diaphragmatic hernia and congenital cystic adenomatoid malformation.

\(^{83}\) *Christian Lawyers Association of SA and Others v Minister of Health and Others* 1998 (4) SA 1113 (T). In this case the court held that he answer to the question of whether a foetus has a right to life did not depend on medical or scientific evidence as to when the life of a human being commenced and the subsequent development of the foetus up to the date of birth, nor was it the function of the Court to decide the issue on religious or philosophical grounds. The issue was a legal one to be decided on the proper legal interpretation of s 11 of the Constitution. The court noted that, as “pointed out by Professor Glanville Williams in an article entitled ‘The Foetus and the Right to Life’ (1994) 33 Cambridge Law Journal 681. 
contracts relating to such treatment cannot be with the foetus itself or even, as a stipulatio alteri, for the benefit of the foetus while still in its mother's womb.

Similarly the obligation of a medical scheme to provide benefits to a foetus in respect of such treatment cannot be with the foetus itself. In the context of medical scheme

Journal 71 at 78 ‘the question is not whether the conceptus is human but whether it should be given the same legal protection as you and me.’ McCreath J continued as follows: “In Van Heerden and Another v Joubert NO and Others 1994 (4) SA 793 (A) the Appellate Division of the Supreme Court (as it then was) considered various dictionary meanings of the word ‘person’ (inter alia ‘an individual human being’) and concluded (at 796F) that there is no suggestion in any of these meanings that the word ‘person’ can also connote a stillborn child, an unborn child, a viable unborn child, an unborn human being or a living foetus. The Court went on, however (at 797H-798B) to point out that there are a growing number of jurists who hold the view that the application of the nasciturus pro iam natae quæstiones de commodo eius apud regem of the Roman law amounts to predicting the legal subjectivity of the foetus. Thus, P J Olivier Legal Fictions: An Analysis and Evaluation (Doctoral Thesis, Leiden) and L M du Plessis ‘Jurisprudential reflections on the status of the unborn’ 1990 TJSAR 44 maintain that the foetus is recognised as a legal persona and is protected as such.

As pointed out by Professor Du Plessis, the decision in Pinchin and Another NO v Santam Insurance Co Ltd 1963 (2) SA 254 (W), in which a person’s right to claim, after birth, compensation for injuries sustained in utero, was recognised, makes sense only if it is assumed that that person was indeed in law a persona at the time when the injuries were sustained. The Roman law was left open here. The Appellate Division decided that, even if it is to be assumed that a stage has been reached in our legal development where the law recognises the foetus as a legal persona, the Legislature had no such legal persons in mind when it used the word ‘person’ in the legislation there under consideration, namely the Inquests Act 58 of 1959. There are South African decisions denying the foetus legal personality - see Christian League of Southern Africa v Roll 1981 (2) SA 821 (D) at 829 in fin; Friedman v Oelofse 1996 (1) SA 1134 (W) at 1140G. It is not necessary for me to make any firm decision as to whether an unborn child is a legal persona under the common law. What is important for purposes of interpreting s 11 of the Constitution is that, at best for the plaintiffs, the status of the foetus under the common law may, as at present, be somewhat uncertain.”

In Ex Parte Oppel and Another 2002 (5) SA 125 (C) the court referring to Wolman and Others v Wolman 1963 (2) SA 432 (A), observed that generally, a minor cannot conclude legally binding contracts unassisted. Likewise, the minor cannot institute legal proceedings without the assistance of his guardian. A parent can contract on behalf of a minor child in certain circumstances. Christie The Law of Contract at p 264-265 notes that a person is a minor, in terms of the Age of Majority Act No 57 of 1972, until he or she reaches the age of 21 or marries or is emancipated either under the 1972 Act or tacitly. A child under the age of 7 years has no contractual capacity at all so the only contracts that can be binding on him are those made by his guardian on his behalf. (See Voet 26 8 9). The court in Ten Brink NO and Another v Mota and Others 2001 (1) SA 1011 (D) the court stated that: “Counsel for the applicants contends, however, that where a person such as the second respondent signs in a representative capacity, that must appear ex facie the document itself. The contention cannot be sustained because in Cook v Alfred 1909 TS 150, Innes CJ had said at 151A: “Though a contract purport to be entered into in the name of the agent, parol evidence may be led to show that it was entered into on the principal’s behalf. Such evidence does not in truth vary the written contract, because the liability of the other party to the contract remains. It simply informs the Court that some other person is entitled to sue upon it, and that the principal desires to enforce his rights under it.”

If such evidence is permissible in the case of an agent, then the same must a fortiori apply to the case of a father and natural guardian signing on behalf of his minor child. Counsel’s contention is in any event in conflict with the decision in Van der Merwe v Kenks (Edms) Bpk 1983 (3) SA 909 (T), where a woman married out of community of property had sued on a contract for the purchase of fixed property. Her husband had signed the contract on her behalf without qualifying his signature, and it was held that extrinsic evidence would be admissible to prove that in signing the contract her husband had acted on her behalf. Counsel submits that the matter is otherwise in the case of a father signing on behalf of his minor child, but in my judgment there is no difference in principle.”

In Visser v Van Tonder 1986 (2) SA 500 (T) the court observed that a contract with a minor is an example of a lording contract with reference to Edelstein v Edelstein NO and Others 1952 (3) SA 1 (A). However, Christie RH The Law of Contract at p270 points out that minor’s unassisted contracts which call for performance only from the other party and not from the minor are also enforceable. Christie quotes the dicta of Van den Heever JA in Edelstein as follows: “It will be observed that Grotsis does not say that in exceptional cases mentioned by him the contract of a minor is valid. He approaches the matter from the point of view of obligations. In general, he states, a minor cannot assume an obligation; if he purports to do so, the obligation is not enforceable. Grotsis mentions two relevant exceptions: (1) a minor may validly stipulate for an advantage and (2)...What is meant by the former is perfectly clear from our authorities: an unassisted minor cannot validly make a promise to perform; he may, however, stipulate for a performance by the other party to the transaction. The type of stipulation appears from van der Keensoel (Dictatus ad Grot. 1.1.8): an unassisted minor may validly accept a donation or stipulate that a valid claim against himself be not enforced.” Christie says that that only quibble one can have with that passage is that it makes Grotsis state the general rule in the form “a minor cannot assume an obligation; if he purports to do so the contract is not enforceable.” Why then, one might well ask, is Grotsis’ first exception an exception since it does not involve the assumption of an obligation by the minor? The answer is that that is not how Grotsis states the general rule, so his first exception is a true exception to the rule as stated by him. What Grotsis says (1 2 5) according to Christie is: “any contract entered into by minors unassisted, even though confirmed by oath, has no binding force (buiten rechtwaardig) as unknown to the civil law: except that they may stipulate for something to their advantage.” A contract in terms of which a medical scheme is obliged to fund within the scope of its registered rules, the health care expenses of a minor child could arguably be seen as creating a contractual obligation between the scheme and that minor child because it is not the minor child that is obliged to pay the contributions but the principal member. There is no obligation on the minor child as such but there is an obligation upon
membership it may be argued that the relationship between a scheme and its members is not contractual but it is submitted that this argument is likely to succeed only in the most limited of circumstances. A member is entitled to register dependants with his medical scheme so that they too may receive benefits in terms of the scheme rules.

A number of questions arise in relation to the law of contract as applicable in this context. What, if any, is the obligation of a medical scheme to pay for in utero surgery? Is it on the basis that the foetus is still technically a part of the body of the mother since it has no separate and independent existence of its own? Assuming that a diligent father as principal member ensures that his newborn child is registered as a dependant on his medical scheme on the day of its birth, what is the relationship in law, if any, between the medical scheme and the infant? What is the legal relationship between the health professional and the foetus upon which he or she operates while the latter is in utero? From a legal perspective, is the foetus simply a part of the mother’s own body until it is born? If it is simply a part of the mother’s body until it is born, does the father have any say over whether or not in utero surgery should be conducted despite the fact that if a disabled child is born it will be as much his responsibility to maintain and care for the child as it will be that of the mother? If it is not regarded simply as a part of the mother’s body until it is born then on what legal basis is its independent existence justified given that, in terms of South African law, it is not a person until it is born? Because surgery in utero is at the forefront of medical science, the law relating to this issue is also largely undeveloped. It has been observed that one of the features of bioethics in the late 1900s was a rolling debate over surgery on foetuses still in the womb, a procedure conducted at only three institutions in the United States. When a programme chose to develop a surgical intervention for foetuses whose spina bifida defects were not lethal, much attention was focused on the difficulty of developing fetal surgery and on its ethical implications. Specifically, many wondered who the patient of foetal surgery should be, the foetus or the mother, since the foetus has no standing under US abortion law. Some argued that there is no

---

86 Where for instance membership of a medical scheme is not dependent upon the will or intention of the member to become a member and to be contractually bound to pay contributions to the scheme in return for funding of health care expenses.
room for this kind of surgery on foetuses as they cannot give consent. Development of fetal surgery promises to be a major source of new therapy and to increase pressure on policymakers and ethicists to define the difference between responsibilities to women and to future children. American courts have encountered some problems with the question of the legal basis on which to protect a foetus both from its own mother and from third parties. Prosecutors and judges in numerous states have begun to apply child abuse, neglect, support, endangerment and homicide statutes in an attempt to deter, punish or remedy maternal conduct during pregnancy deemed harmful to the unborn child. Many prosecutors and judges have relied on statutory authority when requiring pregnant women to undergo medical procedures thought “necessary to preserve fetal life or health.” It is clear that the closer the law comes to attributing a duty upon a mother, or to other persons, to act in a certain way towards an unborn child, the more significant become the contractual obligations between a parent and a third party for the benefit of that unborn child. From there it is a small logical step to recognising certain obligations to an unborn child directly. This chain of legal development however, is on a collision course with the notion that the unborn child is not a person. In South African law, the nasciturus rule at this stage applies only in the law of delict and the law of succession. It has not been extended to other areas of law. The question is whether, in the context of the law of contract, there is any substantial logical reason not to. The court in Friedman v Glicksmann used the possibility of a child’s suing its parents as one argument in favour of precluding a claim for wrongful

89 Cook fn 88 supra uses two case examples at the beginning of his article that dramatically illustrate the problems the law runs into in the context of balancing the interests of the mother against those of her unborn child. "Kawana was in her third trimester of pregnancy when someone showed her in the abdomen in an attempt to kill the child developing within her womb. Shortly thereafter, paramedics rushed Kawana to the hospital where an emergency surgery saved her life. However, the bullet managed to obliterate the tiny child’s wrist, and, as a result, the doctors were required to perform an emergency delivery. Kawana’s child grasped on to life for fifteen days before dying, its immature life extinguished as a result of the premature birth. Likewise Rena was pregnant when an attacker kicked and stabbed her in the abdomen in an attempt to kill her unborn child. After the assault, paramedics transported Rena to a local hospital where doctors successfully treated her life-threatening injuries. However, the fetal monitor indicated trouble for the unborn child. Doctors quickly performed an emergency caesarian section in an attempt to save the dying child’s life. Unfortunately, Rena received too great a trauma for the child to withstand. A medical examiner found that her child lived for only ten minutes. Although the facts of these two scenarios were similar, the legal outcomes were not. In the first example, the child’s mother fired the gun into her own abdomen, attempting to kill her unborn child. In State v Ashley [701 So. 2d at 338 (Fla. 1997)] the Florida Supreme Court upheld the common law rule that provided immunity to a pregnant woman for causing the death of her foetus. However in United States v Spencer 839 F. 2d at 1341, because the attacker was not the mother, the court reached a different result. Although the child survived for only ten minutes, it was considered, as the Spencer court articulated, the “killing of a human being”. Despite the fact that each child was born alive in both of these examples, the two cases illustrate a discrepancy found in both the United States’ federal and state judicial systems regarding the woman and her foetus. Namely even though a third person may be held criminally liable for causing injury or death to a foetus, the unborn child’s mother may not."

90 Friedman fn 53 supra
life. Whilst the writer is not arguing in favour of claims for wrongful life, whether based in delict or on a contract, the question is whether a child's capacity to sue its parents is problematic in terms of the legal convictions of the community? Child abuse is a delict as much as it is a crime. In South Africa in particular, children unfortunately need all the legal protection against abuse that they can get. Cook\textsuperscript{88} notes that courts have increasingly grappled with the subject of whether a woman has a maternal duty to guarantee the health of her foetus. As a result of these decisions prenatal tort liability has not developed primarily during the last few decades to the point where children may now bring personal injury actions against their mothers for harmful prenatal conduct. Cook points out that at the core of these personal injury actions is the belief that a child has "a legal right to begin life unimpaired by physical or mental defects caused by another's negligence. From the cold logical perspective, an unborn child that is dead as the result of an abortion cannot bring a delictual claim for harmful prenatal conduct because it is dead and it never became a person in the eyes of the law. The conundrum is that if the abortion fails and the child is born injured, it can. The writer has already pointed out the thinness of the boundaries between contractual and delictual obligations in the context of health care. It is submitted that in the context of the law of contract, to state that a foetus is not entitled to benefit from contractual obligations in its favour imposed upon a third party by its parents is no different to saying that a neonate is not entitled so to benefit. A contract for health care services is not enforceable on behalf of a foetus but it is enforceable on behalf of the neonate. The American system also recognises a rule similar to the nasciturus rule in South Africa. In general when an injured foetus is born alive, the child or those acting on behalf of the child may maintain an action to recover damages for negligently inflicted prenatal injuries caused by third parties\textsuperscript{92}. There seems to be no major differences in principle on this subject between the American legal system and our own. The writer has already pointed out that South African courts tend not to be too pedantic when faced with claims in delict and in contract in situations involving health care services where the cause of action is fundamentally the same. They have a tendency to end up resolving the case on the basis of the law of delict

\textsuperscript{88} Cook fn 88 supra

\textsuperscript{92} Cook fn 88 supra at p 1313. He points out at p 1314 that: "In the legal realm, allowing for recovery for prenatal injury to a foetus later born alive has become the "universal rule". For instance, during the last fifty years, virtually all jurisdictions have recognized tort actions against third parties for the infliction of prenatal injuries when the child is subsequently born alive."
rather than the law of contract but seem not to be unduly concerned with the finer
distinctions between the law of contract and the law of delict. It is submitted that these
finer distinctions are in any event becoming increasingly still finer over time. The
question of contractual capacity when one is dealing with health service delivery to
minors is no big hook upon which an analytical lawyer should get hung up when
considering health services to children in view of the provisions of section 28(1)(c)
section 28(2) and section 27(1) of the Constitution. The law of contract holds an
agreement with an unassisted minor binding when it is purely to the advantage of that
minor and when no reciprocal obligations are imposed on the minor him- or herself.
Similarly a parent can assist a child to enter in to a contract which is then also binding
upon both the minor and the third party. In other words, contracts with minors are
legally, technically possible despite the fact that they have no contractual capacity. In
this sense, therefore, it is difficult to distinguish between a minor and a foetus. When
it comes to the legal position of the unborn child, despite the fact that is not yet a
person in the eyes of the law, the position is not as clear cut as it would first appear.
The law does recognise, albeit in roundabout ways, the need to protect an unborn
child. The application of the nasciturus rule in the law of delict and the law of
succession is an example of this. Cook notes that the question of whether courts may
convict the slayer of a foetus under homicide statutes has been the subject of
controversy for many years. He states that at common law and in the absence of a
statute, there is no crime of a child dies before birth. However, under many state
statutes today, if the child is born alive and later dies, the culpability is the same as
that incurred in the killing of any other human being. The rationale is that a child who
has an “independent existence” separate from his or her mother is a human being.
Cook\textsuperscript{93} observes that recently courts have provided that damage inflicted in a foetus \textit{in
utero} is sufficient to support a homicide charge even without a live birth. At the
federal level, feticide statutes are receiving growing attention. Under the Unborn
Victims of Violence\textsuperscript{94}, United States attorneys can charge individuals who commit an
already defined federal crime of violence against a pregnant woman with a second
offence on behalf of the second victim, the unborn child. Currently the majority of
states already have “unborn victim laws”. It would seem that of late the American

\textsuperscript{93} See Cook in \textit{R v. supra} at p1320 to 1322.

\textsuperscript{94} Unborn Victims of Violence Act of 2001
legal position with regard to an unborn child, to which Grosskopf JA referred in *Van Heerden and Another v Joubert No and Others* has changed and continues to do so without necessarily conferring personhood on a foetus. In the context of health care services to a foetus Cook notes that the federal government has calculated that the average healthcare costs of a drug-exposed foetus total about one million dollars.
When a woman exposes her foetus to drugs, hospital charges for the infant are almost four times greater than they are for drug-free infants. Commentators have therefore urged that the state should provide adequate medical care for foetuses that will be brought to term. Accordingly, President George Bush announced a plan that would allow states to provide pre-natal care to low-income women thus recognizing the right of a foetus to receive adequate medical care. It has been argued that after a foetus reaches viability the state should be permitted to prohibit a woman from engaging in certain types of maternal conduct, such as the use of tobacco, alcohol and illicit drugs, when such use presents a serious risk of harm to her unborn child. Advocates of state intervention argue that the child has an interest not to be injured and this outweighs the woman’s interest in using both illegal and legal drugs during pregnancy. Moreover, says Cook, the state has a compelling interest in protecting potential human life throughout the woman’s pregnancy. Thus the state has a compelling interest in protecting potential human life just as it has a compelling interest in preserving the life itself. If the public policy position in South Africa is the same, and there is no reason to believe that it is not, and it is the same public policy that informs both the law of contract and that of delict then it is not difficult to see the direction in which South African law is headed. The Constitution has highlighted the importance of public policy in South African law and, it is submitted, even elevated it to a position of cardinal importance over more mundane technical considerations such as contractual capacity, questions of the appropriate barriers to be drawn between the various branches of law such as public and private and between different areas of law such as delict and contract, and indeed even the legal concept of personhood. It promotes a preoccupation with justice as much, if not more than, law itself. Whilst a South African court has held that the Constitution does not regard the foetus as a person, this does not mean that it is not human and that the underlying values of the Constitution, notably human dignity, equality and freedom do not have relevance in the context of foetal medicine. It would defeat the ends of justice to hold that although what happens to a foetus has the capacity to profoundly affect its capacity to exercise and enjoy fundamental human rights once it is born, acts and omissions affecting it whilst still in its mother’s womb cannot be subjected to legal sanction and there is no compelling interest on the part of society, in the protection of the unborn. Consequently a medical scheme should not be permitted to argue in terms of the law of contract, that simply because a foetus is not yet a person, and therefore cannot be
registered by a member as his or her dependant, its contractual obligations do not extend to payment of the costs of foetal surgery or other medical treatment of the foetus where such surgery or other medical treatment does not directly benefit the mother herself. Similarly a medical doctor who contracts to perform a certain procedure upon a foetus in utero for the benefit of that foetus should not be able to argue, in the absence of a claim in delict, that he or she had no contractual obligation to the foetus because it was not a person and that the child once born, cannot take legal action for breach of a contractual obligation that occurred while it was still in its mother’s womb. If needs be the nasciturus rule should in certain circumstances be applied within the law of contract, to ensure that society’s interests in the protection of potential human life are upheld. In the context of the law of succession a stipulation in a will in favour of an unborn child is enforceable by that child once he is born alive. It could be argued that the only reason that a will is not a contract is because it comes into operation upon the death of the testator and not beforehand. Whilst technically speaking, the dead cannot contract with the living, practically speaking they can, provided that there is someone in the land of the living who is able and willing to enforce that contract for the benefit of the living. The point is that practically speaking, there is not much difference in practical terms between a stipulation in a will for the benefit of an unborn child and a stipulation in a contract for the benefit of an unborn child.

Contracts for the benefit of a third person are possible in law but they generally have the result that when the third person accepts the benefit, he or she becomes a party to the contract97. Thus the court in Friedman98 held that a mother cannot claim, as mother and natural guardian of her abnormal or disabled child, general damages and loss of future earnings from the doctor who agreed to advise the mother, when pregnant, whether she was at greater risk than normal of having an abnormal or disabled child, so that she could make an informed decision whether or not to terminate her

97 The court in Wimbledon Lodge (Pty) Ltd v Gore No And Others 2003 (5) SA 315 (SCA) noted that in Joel Melamed and Hurwitz v Cleveland Estates (Pty) Ltd; Joel Melamed and Hurwitz v Vomen Investments (Pty) Ltd 1984 (3) SA 135 (A) at 172B - D Corbett JA quoted the following passage in Crookes NO and Another v Watson and Others 1956 (1) SA 277 (A) at 291E - F with approval: ‘(T)he typical contract for the benefit of a third person is one where A and B make a contract in order that C may be enabled, by notifying A, to become a party to a contract between himself and A. What contractual rights exist between A and B pending acceptance by C and how far after such acceptance it is still possible for contractual relations between A and B to persist are matters on which differences of opinion are possible; but broadly speaking the idea of such transactions is that B drops out when C accepts and thenceforward it is A and C who are bound to each other.’

98 Friedman In 53 supra
pregnancy, and who incorrectly informed her that she was at no greater risk than normal. There can be no claim in contract because the child’s legal personality only commences at birth and a principal cannot claim on behalf of a non-existent principal and also because the agreement cannot be a contract for the benefit of a third party since the third party could only accept the alleged benefit, i.e. the termination of pregnancy, when it was no longer possible. Similarly there could be no claim in delict because the doctor owed no duty to the child to give the child’s mother an opportunity to terminate the pregnancy, and it was impossible to calculate damages, being the difference between an impaired life and no life.

6.2.8  

Afrox Healthcare Bpk v Strydom

Facts

The appellant was the owner of a private hospital. The respondent had been admitted to the hospital for an operation and post-operative medical treatment. Upon admission, an agreement was concluded between the parties. An indemnity clause formed part of the agreement. It read:

“2.2 Ek onthef die hospitaal en/of sy werknemers en/of agente van alle aanspreeklikeheid en ek vrywaar hulle hiermee teen enige eis wat ingestel word deur enige persoon (insluitende "n afhanklike van die pasiënt") weens skade of verlies van watter aard ookal (insluitende gevolgskade of spesiale skade van enige aard) wat direk of indirek spruit uit enige besering (insluitende noodlottige besering) opgedoen deur of skade berokken aan die pasiënt of enige siekte (insluitende terminale siekte) opgedoen deur die pasiënt wat ook al die oorsaak/oorsake is, net met die uitsluiting van opsetlike versuim deur die hospitaal, werknemers of agente.”

According to the respondent, it was a tacit term of this agreement that the appellant’s nursing staff would treat him in a professional manner and with reasonable care. After the operation, certain negligent conduct by a nurse led to complications setting in, which caused the respondent to suffer damages. The respondent argued that the negligent conduct of the nurse had constituted a breach of contract by the appellant

99 A person also cannot act as an agent for a non-existent principal. In Commissioner For Inland Revenue v Friedman And Others NNO 1993 (1) SA 353 (A) the court stated that: “It is common, for example, to speak of someone who is ‘representing’ a company yet to be formed, or of a curator who is ‘representing’ unborn heirs under a will. As a matter of law we know, of course, that it is impossible for someone to enter into a valid contract as agent for a non-existent person...”

100 Afrox 2002 (6) SA 21 (SCA)
and instituted an action holding appellant responsible for the damages suffered. The admission document signed by the respondent during his admission to the hospital contained an exemption clause, providing that the respondent 'absolved the hospital and/or its employees and/or agents from any claim instituted by any person (including a dependant of the patient) for damages or loss of whatever nature (including consequential damages or special damages of any nature) flowing directly or indirectly from any injury (including fatal injury) suffered by or damage caused to the patient or any illness (including terminal illness) contracted by the patient whatever the causes are, except only with the exclusion of intentional omission by the hospital, its employees or agents'. The appellant relied on such clause to avoid liability. The respondent advanced several reasons why the provisions of the exclusion clause could not operate against him. The respondent contended that the relevant clause was contrary to the public interest, that it was in conflict with the principles of good faith or bona fides and that the admission clerk had had a legal duty to draw his attention to the relevant clause, which he had not done. The grounds upon which the respondent based his reliance on the public interest were the alleged unequal bargaining positions of the parties at the conclusion of the contract, as well as the nature and ambit of the conduct of the hospital personnel for which liability on the part of the appellant was excluded and the fact that the appellant was the provider of medical services. The respondent alleged that, while it was the appellant's duty as a hospital to provide medical treatment in a professional and caring manner, the relevant clause went so far as to protect the appellant from even gross negligence on the part of its nursing staff. This was contrary to the public interest.

The respondent argued further that s 39(2) of the Constitution obliged every court, when developing the common law, to promote the spirit, purport and object of the Bill of Rights. The effect of s 39(2) was therefore that, in considering the question of whether a particular contractual term conflicted with the public interest, account had to be taken of the fundamental rights contained in the Constitution. It was argued that the relevant clause conflicted with the spirit, purport and object of s 27(1)(a) of the Constitution, which guaranteed each person's right to medical care, and as such was accordingly in conflict with the public interest.
As an alternative, the respondent argued that, even if the clause did not conflict with the public interest, it was still unenforceable as it was unreasonable, unfair and in conflict with the principle of bona fides or good faith. As a further alternative it was argued that the respondent had, when signing the admission document, been unaware of the provisions of the clause. The evidence was that the respondent had signed the document without reading it, even though he had had an opportunity to do so. The respondent contended that the admission clerk had had a legal duty to inform him of the content of the clause and that he had failed to do so. The respondent’s reason for contending that such a legal duty existed was that he did not expect a provision such as the one contained in the relevant clause in an agreement with a hospital. The provincial division had found for the respondent:

**Judgment**

The court *a quo* took as its point of departure that the onus was on the appellant to show that the provisions of clause 2.2 were enforceable against the respondent. As authority for this position it cited *Durban’s Water Wonderland (Pty) Ltd v Botha and Another*101. The Supreme Court of Appeal (SCA) in *Strydom* stated that this case was, however, authority for the complete opposite as appeared from the dictum of Scott JA at 991C-D102

The respondent argued that the grounds on which clause 2.2 was not enforceable against him were –

(a) The clause was contrary to the public interest;
(b) The clause was in conflict with the principles of good faith;
(c) The admissions clerk had a legal duty to draw his attention to clause 2.2 at the time of the conclusion of the contract and he failed to do so

---

101 *Durban’s Water Wonderland* 1999 (1) SA 982 (SCA).
102 Scott JA stated: "The respondents’ claims were founded in delict. The appellant relied on a contract in terms of which liability for negligence was excluded. It accordingly bore the onus of establishing the terms of the contract. (The position would have been otherwise had the respondents sued in contract. See Stocks & Stocks (Pty) Ltd v T J Daly & Sons (Pty) Ltd 1979 (3) SA 754 (A) at 762E - 767C.)"
With regard to the public interest Brand JA stated that a contractual provision which is unfair on the basis that it is in conflict with the public interest is legally unenforceable and that this principle was accepted and applied in *Sasfin (Pty) Ltd v Beukes*\(^{103}\) and *Botha (now Griessel) and Another v Finanscredit (Pty) Ltd*\(^{104}\). Brand JA quoted the dictum of Smalberger JA in the former where he stated:

"The power to declare contracts contrary to public policy should, however, be exercised sparingly and only in the clearest of cases, lest uncertainty as to the validity of contracts result from an arbitrary and indiscriminate use of the power. One must be careful not to conclude that a contract is contrary to public policy merely because its terms (or some of them) offend one's individual sense of propriety and fairness. In the words of Lord Atkin in *Fender v St John-Mildmay* 1938 AC 1 (HL) at 12: . . .
‘the doctrine should only be invoked in clear cases in which the harm to the public is substantially incontestable, and does not depend upon the idiosyncratic inferences of a few judicial minds…’
In grappling with this often difficult problem it must be borne in mind that public policy generally favours the utmost freedom of contract, and requires that commercial transactions should not be unduly trammelled by restrictions on that freedom."

Brand JA pointed out that these cautionary words were emphasised more recently in *Brummer v Gorfil Brothers Investments (Pty) Ltd en Andere*\(^{105}\), *De Beer v Keyser and Others*\(^{106}\), *Brisley v Drotsky*\(^{107}\). He said that concerning exclusionary or indemnity clauses in South African law the position is that such clauses although valid and enforceable, must be restrictively interpreted.\(^{108}\) He observes that these types of clauses have become the rule rather than the exception in standard contracts and that the limits of such clauses are apparently determined largely by business considerations such as savings in insurance premiums, competitiveness and the possibility of scaring off prospective clients. Brand JA stated that the fact that exclusionary clauses as a category are enforced does not mean that a specific exclusionary clause cannot be declared by the court as being contrary to the public interest and therefore unenforceable. The standard used with regard to exclusionary clauses does not differ from that applicable to other clauses which are alleged, due to

108 Government of the Republic of South Africa v Fibre Spinners & Weavers (Pty) Ltd 1978 (2) SA 794 (A) at 804C - 806D and Durban’s Water Wonderland (Pty) Ltd v Botha and Another (supra op 989G - I).
considerations of public interest, to be unenforceable\textsuperscript{109}. The three grounds upon which the respondent based his arguments concerning the public interest were:

(a) the uneven bargaining position between the parties with respect to the agreement;
(b) the nature and circumstances of the actions of the hospital staff against which the appellant is being indemnified;
(c) the fact that the appellant was the provider of medical services.

With regard to (a) above Brand JA stated that it was not obvious on the face of it that an inequality in bargaining power between the parties does not in itself justify a conclusion that a contractual provision which is to the advantage of the stronger party will be in conflict with the public interest. At the same time, he said, it must be accepted that unequal bargaining power is indeed a factor which, together with other factors, can play a role in considerations of the public interest. Nevertheless the answer to the respondent’s invocation of this factor in the present case, is that there is absolutely no evidence to show that the respondent during the conclusion of the contract was in a weaker bargaining position than that of the appellant.

Brand JA stated that the respondent’s second ground of objection which has relevance to the potential scope of clause 2.2, links to some degree to his third ground. According to this ground the respondent’s objection was that while the appellant’s duty as a hospital is to provide medical treatment in a professional and careful manner, clause 2.2 goes so far as to indemnify the appellant against even the gross negligence of its nursing staff. The respondent submitted that this is in conflict with the public interest. The court said that although there is direct support to be found in Strauss, \textit{Doctor, Patient and the Law}\textsuperscript{110} for the view that the indemnification of a hospital against gross negligence of its nursing staff would be in conflict with the

\textsuperscript{109} At p 35 of the judgement: “Die feit dat uitsluitingsklausules as ‘n spesie in beginsel afgedwing word, beteken uiteraard nie dat ‘n bepaalde uitsluitingsklausule nie deur die Hof as strydig met die openbare belang en derhalwe onafwendbaar verklaar kan word nie. Die bekendste voorbeeld van ‘n geval waar dit wel gebeur het, is waarskynlik die beslissing in \textit{Wells v South African Alumenite Company} 1927 AD 69 op 72 waarvolgens ‘n kontraksklousule wat aanspreeklik vir bedrog uitsluit, as strydig met die openbare belang en derhalwe ongeldig verklaar is. Die maatstaf wat aangewend word met betrekking tot uitsluitingsklausules verskil egter nie van dié wat geld vir ander kontraksklousules wat, na bewering, weens oorwegings van openbare belang ongeldig is nie. Die vraag is telkens of die handhawing van die betrokke uitsluitingsklausule of ander kontraksklousule, het ek weens uiterste onbillikheid, het ek weens ander beleidsoorwegings, met die belange van die gemeenskap strydig sal wees.”

\textsuperscript{110} Strauss third edition at p305
public interest, it must be born in mind in the adjudication of the subjective ground of objection that the respondent did not in his pleadings rely upon gross negligence on the part of the appellant's nursing staff. He alleged nothing more than negligence. The question whether the contractual exclusion of a hospital's liability for damages caused by the gross negligence of its nursing staff would be contrary to the public interest, said Brand JA, was thus not the issue in the present case. Brand JA stated that even if one accepted the submission that it is indeed the case, this would not automatically invalidate clause 2.2. Apparently the provisions of the clause in this case would rather be interpreted so as to exclude gross negligence. Brand JA quoted the dictum of Innes CJ in *Wells v South African Alumenite Company* (supra) where he stated:

"Hence contractual conditions by which one of the parties engages to verify all representations for himself, and not to rely upon them as inducing the contract, must be confined to honest mistake or honest representations. However wide the language, the Court will cut down and confine its operations within those limits."

Brand JA noted with respect to the third ground upon which the respondent relied that it was related to the fact that the appellant was a provider of medical services. According to this ground it is generally impermissible for providers of medical services to add an exclusionary clause such as clause 2.2 to a standard contract. In this regard the respondent relied on section 27(1)(a) of the Constitution in terms of which everyone has a right to medical care. Brand JA stated that, as he understood the judgment of the court a quo this was the main ground upon which the decision in favour of the respondent was founded. He noted that the respondent did not rely on the fact that clause 2.2 directly violates the constitutional values which are entrenched in section 27(1)(a). Brand JA held that even accepting that section 27(1)(a) is horizontally applicable in terms of section 8(2) of the Constitution and therefore binding on a private hospital – which question did not pertinently arise for decision in this case – clause 2.2 does not prohibit the access of any person to medical care. Even from the point of view that section 27(1) binds a private hospital, this section does not apparently prevent private hospitals from asking for payment for medical services or imposing legally enforceable

---

111 *Wells* fn 109 supra at p72-73
Conditions on the provision of such services. The question said Brand J, still remains whether clause 2.2 is such a legally enforceable provision or not. According to the respondent’s submission, the role of section 27(1)(a) is implied by the provisions of section 39(2) of the Constitution according to which each court is obliged in the development of the common law, to promote the spirit, purport and objects of the Bill of Rights. The effect of section 39(2), it was argued for the respondent, is that in the consideration of the question of whether a particular contractual provision is in conflict with the public interest, regard must be had to the fundamental rights which are set out in the Constitution. It was submitted with regard to the argument that clause 2.2 was enforceable prior to the Constitution, that it is now in conflict with the spirit, purport and object of section 2791)(a) and is consequently contrary to the public interest. Brand JA stated that seeing that the Constitution first came into effect on 04 February 1997 while the agreement between the parties arose on 15 August 1995, the first question in considering this argument is whether section 39(2) empowers and obliges the court to rely on constitutional provisions which were not in operation when the contractual relationship between the parties existed. Concerning direct breach, said Brand JA, the constitutional has no retrospective power. Transactions which were valid when it commenced are thus not rendered invalid retrospectively with regard to the direct application of the Constitution 112. Brand JA noted that the question concerning the possible retrospective influence of the Constitution in an indirect manner as envisaged in section 39(2) had not yet been expressly decided. He noted that the fact that this is not a simple question is evident from Ryland v Edros113 and Amod v Multilateral Motor Vehicle Accidents Fund (Commission for Gender Equality Intervening)114. Brand JA said he found it unnecessary to give attempt to provide a conclusive answer to this question. In the light of his opinion concerning the effect of section 27(1)(a) on the validity of clause 2.2, he was prepared to accept in favour of the respondent that the provisions of section 27(1)(a) should be taken into account although the relevant agreement was concluded on 15 August 1995 and there was also no matching provision in the interim Constitution. He noted that in Carmichele v Minister of Safety and Security and

113 Ryland 1997 (2) SA 690 (K) at 709G - 710C
114 Amod 1999 (4) SA 1319 (BCA) at 1329A - E para [22]
Another (Centre for Applied Legal Studies Intervening)\(^{115}\) it was decided that, on the application of section 39(2) of the Constitution the determination of what comprises the convictions of the community for the purposes of the law of delict could not take place without taking into account the values to which the Constitution subscribes. Brand JA stated that he had no doubt that the same principle also applied to a consideration of whether a particular contractual provision was contrary to the public interest. In this regard he quoted the dictum of Cameron JA *Brisley v Drotsky (supra)*\(^{116}\). On the application, said Brand JA, of this principle the only constitutional value upon which the respondent relies is that contained in section 27(1)(a). This leads immediately to the question: why is clause 2.2 in conflict with section 27(1)(a)?

He observed that it was indeed correctly conceded by the respondent that clause 2.2 does not stand in the way of the provision of medical services to anyone and that a hospital’s reliance on legally acceptable conditions for the provision of medical services is also not in conflict with section 27(1)(a). The respondent’s answer to the question posed was based on the point of departure while that the constitutional value embodied in section 27(1)(a) does not envisage the mere provision of medical services but includes the provision of such services in a professional and careful – in other words non negligent – manner, clause 2.2 is in conflict with the values embodied in section 27(1)(a) and is thus in conflict with the public interest. The answer to this argument, said Brand JA, is that it is constructed entirely upon a *non sequitur*. Firstly, the appellant’s nursing personnel are already bound by their professional code and they are already subject to the statutory authority of their professional body. Secondly, negligent acts by the appellant’s nursing staff would not be in the interests of the appellant’s reputation and competitiveness as a private hospital. Thirdly, the respondent’s argument comes down in effect to that fact that the appellant’s nursing staff due to the existence of clause 2.2 will be purposefully (or otherwise intentionally) negligent – something which by definition amounts to self contradiction. The court pointed out that article 27(1)(a) was not the only constitutional value which was relevant to the present case. It quoted again from Cameron JA in *Brisley v Drotsky (supra)* where it was stated:

---

115 Carmichele 2001 (4) SA 938 (CC) at para [35]

116 *Brisley* fn 107 supra. According to Cameron JA, "Public policy ... nullifies agreements offensive in themselves - a doctrine of considerable antiquity. In its modern guise "public policy" is now rooted in our Constitution and the fundamental values it enshrines."
“(T)he constitutional values of dignity and equality and freedom require that the Courts approach their task of striking down contracts or declining to enforce them with perceptive restraint . . . contractual autonomy is part of freedom. Shorn of its obscene excesses, contractual autonomy informs also the constitutional value of dignity.”

Brand JA stated that the constitutional nature of contractual freedom embraces in its turn the principle pacts sunt servanda. He noted that this principle was expressed by Steyn CJ in *SA Sentrale Ko-op Graanmaatskappy Bpk v Shifren en Andere*117 as follows:

“die elementêre en grondliggende algemene beginsel dat kontrakte wat vryelik en in alle ems deur bevoegde partye aangegaan is, in die openbare belang afgedwing word”.

In the light of these considerations, said Brand JA, the respondent’s position that a contractual provision in terms of which a hospital is indemnified against the negligent actions of its nursing staff is in principle contrary to the public interest cannot be accepted. Brandt JA noted the statement of the court a quo that -

“Section 39 of the Constitution implicitly enjoins every court to develop common law or customary law. In my mind the tendency of lower courts blindly following the path chartered many years ago until altered by the higher Court (stare decisis) is not consonant with the provisions of section 39 of the Constitution”

and said that if the trial court intended by this that the principles of stare decisis as a general rule are not to be used in the application of section 39(2) this was, at least concerning post-constitutional decisions, clearly wrong. He referred to the dicta of Kriegler J in *Ex parte Minister of Safety and Security and Others, In re S v Walters and Another*118 where stated:

“(T)he Constitution enjoins all courts to interpret legislation and to develop the common law in accordance with the spirit, purport and objects of the Bill of Rights. In doing so, courts are bound to accept the authority and the binding force of applicable decisions of higher tribunals”

and in para [61]

“High Courts are obliged to follow legal interpretations of the SCA, whether they relate to constitutional issues or to other issues, and remain so obliged unless and until the SCA itself decides otherwise or this Court does so in respect of a constitutional issue. It should be made plain, however, that this part of the judgment does not deal with the binding effect of decisions of higher tribunals given before the constitutional era.”

117  *Shifren 1964 (4) SA 760 (A)*

118  *In re S v Walters 2002 (4) SA 613 (CC)*
Brand JA stated that concerning preconstitutional decisions of the SCA with regard to the common law, in his view a distinction should be drawn between three situations that exist in the constitutional context:

1. The situation in which the High Court is convinced that the relevant rule of the common law is in conflict with the constitutional provision. In this instance the High Court is obliged to depart from the common law. The fact that the relevant rule of the common law was laid down pre-constitutionally by the SCA makes no difference. The Constitution is the supreme law and where a rule of common law is in conflict with it, the latter must give way.

2. The situation in which the pre-constitutional decision of the SCA was based on considerations such as boni mores or public interest. If the High Court is of the opinion that such decision, with regard to constitutional values, no longer reflects that boni mores or considerations of public interest, then the High Court is obliged to depart therefrom. Such a departure said Brand JA is not in conflict with stare decisis because in any event it is accepted that the boni mores and considerations of public interest do not remain static.

3. A situation in which a rule of common law which was laid down in a pre constitutional decision of the SCA, is not directly in conflict with any specific provision of the Constitution and is also not dependent on changing considerations such as boni mores or public interest. Nevertheless the High Court is convinced that the relevant rule, upon the application of section 39(2), should be changed in order to promote the spirit, purport and objects of the Constitution. Is the High Court in such a situation empowered to give effect to its convictions or is it still obliged to apply the common law as it was preconstitutionally in terms of the principles of stare decisis? The answer, said Brand JA is that the principles of stare decisis still apply and that the High Court is not empowered by section 39(2) to depart from the decisions of the SCA whether they are pre- or post- constitutional. He noted that section 39(2) of the Constitution must be read in conjunction with section 173. According to the latter recognition is given to the inherent competence of the High Court –
together with the SCA and the constitutional court – to develop the common law. In exercising this inherent competence, said Brand JA, the provisions of section 39(2) are of relevance. Before the Constitution, said Brand JA, the High Court just like the SCA, had the inherent competence to develop the common law. This inherent competence was, however, dependent upon the rules which found expression in the doctrine of stare decisis. In the opinion of Brand JA, this rule was neither expressly nor impliedly set aside by the Constitution. Section 39(2), he said, contains the underlying implication that the relevant court has the power to amend the common law. The question of whether the relevant court has that capacity is determined by inter alia the *stare decisis* rule. Brand J pointed out that the provisions of the Constitution are not just a set of rules but an entire value system. Brand JA observed that there is sometimes mutual tension between the values of the system which can only be resolved by careful consideration and reconciliation. In implementing this value system, individual judges will differ from each other. In such circumstances the granting to every judge of the capacity on the grounds of his individual perspective in accordance with the application of this value system the power to deviate from the decisions of the SCA would necessarily lead to a lack of uniformity and certainty.

On the subject of good faith as an alternative basis of the respondent’s case, Brand JA observed that this principle finds its origin in a minority judgement by Olivier JA in *Eerste Nasionale Bank van Suidelike Afrika Bpk v Saayman NO*119. He observed that the SCA in its majority decision in *Brisley v Drotsky (supra)* put the judgement of Olivier JA in perspective. With regard to the place and role of abstract ideas such as good faith, reasonableness, fairness and justice, the majority of the court in Brisley held that although these considerations underlie the South African law of contract, this does not make them an independent, or ‘free-floating’, foundation for the setting aside of contractual provisions. Put differently, said Brand JA, these abstract considerations represent the foundation and raison d’être for the present legal rules and can also lead to the formulation and alteration of rules of law but that are not themselves rules of law. When it comes to the enforcement of contractual provisions, the court has no discretion and does not deal in abstract ideas but rather on the basis

---

119 *Saayman 1997 (4) SA 302 (SCA)* at 318
of crystallised and established rules of law. Thus, said Brand JA, the alternative basis upon which the respondent relies is in reality not an independent basis for his case.

With regard to misrepresentation and mistake Brand JA stated that consideration of this alternative required that the factual background be set out in more detail. He noted that the respondent’s evidence was that he signed the admission document without reading it in the place indicated with a cross. The respondent’s attention was not drawn to clause 2.2. In the absence of any evidence to the contrary it must be accepted, said the court, that the respondent was not aware of the contents of clause 2.2 when he entered into the agreement. Nonetheless the respondent conceded that he knew that the admission document contained the terms of the contract between himself and the appellant and he did not dispute that he had full opportunity to read the document. In these circumstances the fact that the respondent signed the document without reading it does not lead, as a rule to the result that he is not bound by its contents. Brand JA then referred to the case of Burger v Central South African Railways\textsuperscript{120} in which it was held that a person who signs an agreement without reading it does so at his own risk and is consequently bound thereby as though he were aware of its provisions and expressly consented thereto\textsuperscript{121}. Brand JA conceded that there were certain exceptions to this general rule and referred in this regard to Christie\textsuperscript{122}.

The exception relied upon by the respondent was that the admissions clerk had a duty to inform him of the contents of clause 2.2 and that he failed to do so. The respondent conceded that as a general principles there is no legal duty upon a contracting party to inform the other of the contents of their agreement. The reason why the respondent alleged that such a duty existed on the admissions clerk was that he, the respondent, did not expect such a clause in an agreement with a hospital. Seeing that a hospital is supposed to supply medical and professional services in a professional manner, the respondent argued that he did not expect that the applicant would try to indemnify itself against the negligence of its own nursing personnel. The answer to this, said Brand JA, is that the respondent’s subjective expectations concerning the contract between himself and the appellant play no role in the question of whether there was a duty on the admissions clerk to point out clause 2.2. to him. What is of relevance to

\textsuperscript{120} Burger 1903 TS 571
\textsuperscript{121} Brand JA also referred to George v Fairhead (Pty) Ltd 1958 (2) SA 465 (A)
\textsuperscript{122} Christie RH The Law of Contract 4th edition at p 202
this question said Brand JA, is whether a provision such as clause 2.2 could reasonably be expected or, if it was objectively speaking, unexpected. He stated that indemnity clauses such as clause 2.2 are presently the rule rather than the exception in standard contracts these days. Notwithstanding the respondent's submission to the contrary, the court said that it could see no reason in principle to distinguish between private hospitals and suppliers of other services. Thus it cannot be said that a provision such as clause 2.2 was, objectively speaking unexpected. There was thus no duty, said Brand JA, upon the admissions clerk to bring the clause to the attention of the respondent. Therefore the respondent was bound to the terms of the clause as if he had read it and expressly agreed to it. The court concluded that the appeal must succeed with costs and that the decision of the court a quo should be reversed.

Discussion

It is submitted, with respect, that the decision of the Supreme Court of Appeal in this case is both unfortunate and regrettable for the reasons set out below - not least of which is the fact that the court saw fit not to distinguish between suppliers of health care services and any other kind of supplier. The most obvious way to demonstrate the problems with this decision is to apply it within the public sector. On this basis of this decision would and should an exclusion clause of the nature used by Afrox Healthcare be applicable by government hospitals in respect of the people to whom they deliver health care services? If suppliers of health care services are the same as any other, then the government, as a supplier of health care services, should be able to include such a clause in its admission documentation. The fact that patients, as non-lawyers, may not understand the nature or import of such a clause, clearly does not make a difference to the Supreme Court of Appeal. The fact that health care professionals are ethically obliged by their professional rules to take due and proper care and exercise their professions with diligence was used by the Supreme Court of Appeal to justify the presence of such a clause, when it is submitted, it should have been used to strike it down. The professional rules and standards which are applied to health professionals are an indication of what it means to be a professional in the first place. Members of the public expect to be treated in a professional manner and up to a certain standard when they seek out the services of a registered professional because if they did not, they might as well go to Joe Public for those same services. What
would be the reason for seeking out professional help if it meant that the professional in question was not bound to follow certain ethical rules and standards of practice associated with his profession? The Medical Protection Society has different rates for different types of indemnity cover depending on whether a health professional is self-employed or employed by a third party. The rates for the latter are much lower on the assumption that the employer either self insures (in the case of the state) or takes out some form of public liability insurance\(^2\). If a nurse’s professional indemnity cover

\(^2\) In fact some years ago Dr John Hickey of the Medical Protection Society and actuary Tony Mason wrote a paper entitled “Funding of Clinical Negligence Liabilities in the Public Sector” (obtained from Dr John Hickey, Medical Protection Society 33 Cavendish Square, London W1G GPS, UK) in which they argue why doctors in public sector employment should not be required to purchase professional indemnity protection. Insurance in the public sector is particularly problematic due to the fact that government self insures. A number of provincial governments in South Africa were considering legislation to compel publicly employed doctors to purchase professional indemnity cover against claims of clinical negligence. The current position is that other than in cases of gross negligence, the hospital will assume vicarious liability for the acts or omissions of its employees and will indemnify those employees against such claims. The paper was prepared at the request of the South African Medical Association and sets out to show that by implementing such a change the costs to the public purse of clinical negligence would be greater than is currently the case. It further seeks to show that there is also a significant risk that the cost of professional indemnity protection for individuals employed in the public sector will be prohibitive, particularly for high risk specialties and is likely to reduce the recruitment of those specialties. In fact, it is submitted, the same arguments are applicable to professionals in the private sector although in the case of medical practitioners, these are generally self-employed. The authors stated that medical negligence probably has one of the longest ‘tails’ of all types of insurance (another contextual difference of which Brand JA was clearly unaware) and most insurance companies refuse to underwrite this type of business or will only offer the more limited claims made coverage. The ‘tail’ refers to the delays that occur between the occurrence of an adverse incident (that will probably give rise to a claim) and the time it is first reported and the further delay until that claim is eventually settled. The average delay between incident and settlement may be as long as 6 or 7 years and increases for the larger more complex claims which, in some cases, take decades. When it is appreciated that the rate of claims inflation (particularly in the cost of settling large claims) may be 1-2% higher than earnings inflation, it is perhaps not surprising that so few insurers are interested in this business and that the cost to purchasing cover is so high. Apart from claims inflation, the other noticeable trend over the last 15 years has been the steep increase in the number of claims and it is clear that the general public has become more consumerist and litigious. Because of the average delay of several years between an incident and the time it is reported as a claim, the underlying claims frequency can often be masked so that the experience appears more favourable than it actually is. The authors point out that there are many disadvantages to compelling publicly employed staff to purchase their own indemnity protection and these have been recognised in recent years by governments around the world. State indemnity schemes are now in place in England, Wales, Scotland, Australia, Malaysia, Hong Kong and many European and American States. The reasons they give are:

Cost of cover: This can be substantial, particularly for high-risk specialties such as obstetrics, gynecology, orthopaedic surgery, neurosurgery and plastic surgery. The authors give the example of a submission by the MPS to the Irish Department of Health in which it was reflected that specialist obstetricians in Ireland comprised 5% of MPS membership, contributed 9% of income and were responsible for 20% if reported claims by number and 33.3% of liabilities. They state that similar ratios are likely to exist in South Africa. Claims experience in South Africa is deteriorating i.e. increasing although not as dramatically as elsewhere in the world. Therefore in all likelihood rates will rise year on year.

Demands by staff for reimbursement of subscriptions: Staff tend to demand reimbursement from the employers for subscriptions. Reimbursement, say the authors, means that effectively the public hospitals move from a pay as you go basis (as is currently the case) to claims made or occurrence based funding, diverting public funds from the provision of care to the indemnifying company.

Affordability in certain specialties: If there is no reimbursement of subscriptions, then the paradox occurs that doctors in different specialties who are paid the same will have to pay significantly different subscription rates, leading to demands for differing salary levels for different specialties. For junior staff in the very high-risk specialties their subscription rates may be higher than their salaries.

Adverse effect on recruitment into specialties: If the cost of protection so very much higher in certain specialties and there is no reimbursement, it will be increasingly difficult to recruit those specialties.

Risk of no cover and complexity: If staff choose to purchase cover on a claims made basis, there is a very real risk of gaps in cover if they change indemnifiers or choose for any reason not to purchase run off cover when the leave the hospital’s employ. This leads to exposure of the hospital to clinical negligence liability and the possibility of uncompensated patients.

Administration and claims management costs: In the experience of the MPS claims arise from a sequence of systems failures or errors some of which are the responsibility of the employing hospitals rather than the individual staff member, for example equipment failures. In circumstances such as these the hospital feels compelled to instruct its own lawyers leading to arguments over apportionment of responsibility. The increased expenditure on legal fees is one of the reasons cited by the Irish government for introducing a State indemnity scheme.

It is submitted that for present purposes there is likely to be no difference between the public and private health sectors in South Africa with regard to nurses since in both sectors they tend to be employees rather than self-employed. 703
takes into account the vicarious liability of her employer and is lower than would have been the case had she been self-employed, then this judgment of the Supreme Court of Appeal may effectively have left patients who are the victims of negligence of nurses without recourse to compensation. A disciplinary hearing by a professional council even assuming any sanction is imposed, is cold comfort to a patient that has lost the ability to work or to function in society or that has experienced considerable pain and suffering and become liable for extra medical expenses as a result of professional negligence. If is submitted with respect that the confidence of the Supreme Court of Appeal— that the existence of professional bodies to discipline professionals who do not practise their professions according to acceptable standards is a sufficient deterrent of professional negligence and adequately reduces the attendant risks to patients is naive to say the least. It is tantamount to saying that a system exists for the prosecution of crime. The court as long ago as 1957, by a hospital should not attract vicarious liability for their employer. It is not being

Furthermore on the salaries paid to nurses, relative to those received by medical practitioners, it is quite likely that nurses would not be able to afford professional indemnity cover at all on the basis of the arguments above.

See Estherhuizen v Administrator, Transvaal 1957 (3) SA 710 (T) and Duke v Administrator, Transvaal fit 78 supra. See also the discussion of this subject in Mteuwv Minister of Health 1989 (3) SA 600 (D) and the discussion there of Lower Umfolozi District War Memorial Hospital v Lowe 1937 NPD 31 and St Augustine's Hospital (Pty) Ltd v Le Bréton 1975 (2) SA 530 (D). In Mteuw the court expressly refused to follow the approach of Peetham J in Lower Umfolozi that: "I accept the proposition that in the performance of their professional duties nurses are not under the control of the hospital authority so as to become its servants, and that the obligation of the hospital authority in regard to the professional work of its nurses is limited to taking reasonable care to assure itself of the professional competence of the nurses whom it employs. No question as to the competence of the nurses employed arises in this case, because there is an admission on the record to the following effect: 'Mr Lowe, attorney for plaintiff, admits that there was no negligence on the part of the Board in the appointment of the nurses, and that he is satisfied that the nurses are all duly qualified.'"

And again, at p 42: "Now I differ from the conclusion at which he arrives. It seems to me that, on his own showing, it is perfectly clear that the placing of this hot bottle in the patient's bed, and the subsequent supervision of the patient while recovering from the anaesthetic with the hot water bottle in his bed, were professional duties on the part of the nurse or nurses concerned. It is irrelevant to say that, when the patient is in a normal condition and not disabled, he can place the hot water bottle where he likes. The dominating fact in regard to this case is that the patient was recovering from an anaesthetic after an operation. For that purpose he required a hot water bottle in his bed in order to provide conditions necessary for his proper recovery. He was not in a condition to protect himself from the hot water bottle, or to judge the heat of the hot water bottle, he was entirely in the hands of the nurse or nurses, and they were in charge of him, not as domestic servants, but as nurses responsible for seeing that proper conditions were provided in which he could recover from the effects of the anaesthetic; and in regard to the whole of this business in connection with the placing of the bottle in the bed, the heating of the bottle, the wrapping of the bottle and the supervision of the patient, they were bound to use their professional skill; their professional training taught them that it was necessary for the patient to have a hot water bottle, that he was incapable of protecting himself from the bottle, and that, owing to possible movements on the part of the patient in the condition in which he was, supervision was necessary. They were setting, therefore, in a professional manner and not as domestic servants insofar as they dealt with the hot water bottle, and, that being so, they failed in the carrying out of professional duties for the discharge of which the hospital authority was not responsible."

Niehman J noted in Mteuw that because Lower Umfolozi was a judgment of two Judges, Fannin J, in a later Natal case, St Augustine's Hospital (Pty) Ltd v Le Bréton 1975 (2) SA 330 (D), regarded himself as bound by it, notwithstanding some strong misgivings he expressed about its correctness. That case also involved negligence on the part of the nursing staff. A 92-year-old patient fractured her leg when, in the middle of the night, she fell out of a hospital cot. The Court stated, apropos of the earlier judgment and the English cases cited in it, at 536H - 537A: 'The effect of these cases is to render liable a hospital authority for the negligence of doctors, surgeons and nurses, employed by them on a full- or part-time basis, in the performance of the professional duties they are employed to perform. The later view now adopted in

Furthermore on the salaries paid to nurses, relative to those received by medical practitioners, it is quite likely that nurses would not be able to afford professional indemnity cover at all on the basis of the arguments above.

They were setting, therefore, in a professional manner and not as domestic servants insofar as they dealt with the hot water bottle, and, that being so, they failed in the carrying out of professional duties for the discharge of which the hospital authority was not responsible."

Niehman J noted in Mteuw that because Lower Umfolozi was a judgment of two Judges, Fannin J, in a later Natal case, St Augustine's Hospital (Pty) Ltd v Le Bréton 1975 (2) SA 330 (D), regarded himself as bound by it, notwithstanding some strong misgivings he expressed about its correctness. That case also involved negligence on the part of the nursing staff. A 92-year-old patient fractured her leg when, in the middle of the night, she fell out of a hospital cot. The Court stated, apropos of the earlier judgment and the English cases cited in it, at 536H - 537A: 'The effect of these cases is to render liable a hospital authority for the negligence of doctors, surgeons and nurses, employed by them on a full- or part-time basis, in the performance of the professional duties they are employed to perform. The later view now adopted in
argued here that the court in Afrox was even suggesting that a hospital employer cannot be held vicariously liable for the delicts of its employees. The point being made is rather that the statement of Brand AJ to the effect that the entire argument that clause 2.2 would promote negligent and unprofessional conduct on the part of the nursing staff is built on a non sequitur, firstly because the nursing staff are still bound to observe their professional code of conduct and secondly because action against an employee of the applicant for negligent acts would adversely impact on its reputation and competitiveness, does not take into account the practical realities of the situation.

Real life, it is submitted, is far more complicated than this. Brand JA has seized only upon those factual elements within a larger factual matrix, which suit his particular viewpoint irrespective of how they impact in reality upon the other elements of the matrix to produce a result which Brand JA could not anticipate without more in-depth knowledge of the business of health service delivery than he apparently has. The

England seems to me to be the more correct one, and McKerron The Law of Delict 7th ed at 92, expresses the view that "there can be no doubt as to the correctness of these decisions". It seems probable that, had this Court in 1937 had before it the 1942 and later English decisions, the result of the Lower Umfolosi case might well have gone the other way."

And again, at 537H - 538: "That being so, I must apply the law as stated in the Lower Umfolosi case and hold that as in that case, so in the present case, in the absence of any special term in the contract between the hospital and the patient, the ordinary contract between patient and hospital does not cast upon the hospital an obligation to do more than take reasonable steps to ensure itself of the professional competence of the nurses it employs to attend to the patient."

And, finally, at 538D: "I think I should add that had I been free to do so, I would have been disposed to accept as more in accordance with our law the later English decisions, and to have applied the law as there applied and as applied in Esterhuizen v Administrator, Transvaal 1957 (3) SA 710 (T), and Dube v Administrator, Transvaal 1963 (4) SA 260 (T), in neither of which, incidentally, do I find any reference to the Lower Umfolosi case."

Nienaber J observed that the two Transvaal cases, as well as Bults and Another v Tsatsarolakis 1976 (2) SA 891 (T), neither mention nor support the distinction, which is pivotal to the decision in the Lower Umfolosi case, between professional work over which the hospital is said to have no control and for which it is accordingly not liable, and managerial or administrative duties performed by an employee, for which it is responsible. In the Transvaal cases the issue was simply whether the particular member of staff was negligent in the exercise of his duties, regardless of whether he was part of a professional team or not. As long as the decision in the Lower Umfolosi case stands, that is not, however, the prevailing view in Natal. It was that consideration that prompted the defendant's exception.

Nienaber J found in Mtwalwa that: "The point on which the decisions in the Lower Umfolosi case hinged was that a member of the professional staff of a hospital was not a servant proper for whose misdeeds the hospital was accordingly responsible. At the time that was perceived to be a principle of law. Nowadays, I venture to suggest, the question is purely one of fact. The degree of supervision and control which is exercised by the person in authority over him is no longer regarded as the sole criterion to determine whether someone is a servant or something else. The deciding factor is the intention of the parties to the contract, which is to be gathered from a variety of facts and factors. Control is merely one of the indicia to determine whether or not a person is a servant or an independent worker." He held that: "To the extent that the judgment in the Lower Umfolosi case purported to enunciate a universal principle of law, namely that a hospital assumes no responsibility for the negligence of any member of its staff engaged in professional work, it has thus been overtaken by more recent authority, not only by the South African cases referred to but indeed by English cases as well. (See, for instance: Gold v Essex County Council [1942] 2 KB 293; Collins v Hertfordshire County Council [1947] KB 598; Cassidy v Ministry of Health [1951] 2 KB 334 (CA); Roe v Minister of Health [1954] 2 QB 66.) Professor J C van der Walt suggests (1976 THRHR 399 at 405) that the later English cases have undermined the foundation on which the judgment in the Lower Umfolosi case was based. I agree. The ratio decidendi of that judgment, in my respectful view, is outdated and accordingly no longer authoritative."

In a sense, Brand JA's assumption that providers of health care services are no different from any other supplier is the central pillar of error in his judgment because it closes off to his mind the possibility that the delivery of health care services has its own unique angles which should be taken into account when deciding cases such as Afrox. It is submitted that the days when general legal principles could be successfully applied across vast expanses of different practical contexts are largely gone. In the practice and development of law these days, cogence of context is critical if law is to remain rational and consistent within the larger legal system and relevant to society. In the context of information technology, for instance, the public policy principles around privacy and confidentiality of information as opposed to accessibility of information have been brought into focus in ways our forefathers would not have dreamt possible. Similarly in the context of the media in these days of satellite based communications and other high-speed telecommunication systems, the law has to take into account the value of such systems to businesses at both global and
local levels. They have changed the way that business transactions take place and the thinking of judges and other practical lawyers must keep pace with the implications of these developments in order to ensure that legal principles remain relevant. In the health care field there are similar technological developments and advances which require a whole new approach to particular issues rather than applying legal concepts transportable from other areas. A contract is a contract no matter what the services it contemplates. However technology is only one consideration. There are others such as the existence of intervening third parties – in the health care context examples would be medical schemes, medical scheme administrators, brokers, managed care service providers, independent practitioners associations, and other provider networks. Systemic imbalances between supplier and purchaser that are knowledge based and context driven, trade practices within a particular industry, accepted methods of doing business, the dictates of the professional world and the public – examples in the health care environment would be sterilisation of equipment, adequate storage conditions for dangerous substances, the importance of uninterrupted power supplies the levels of skill and length of training required to perform certain procedures etc.

In the context of the present discussion it is significant to note that in 1996 Rob Knowles, the Australian Minister for Health, stated the terms of reference for an inquiry into the liability of the State of Victoria and Health Service Providers of the Law Reform Committee as follows:

1. The Government is concerned that the increasing cost of professional indemnity insurance could affect access to medical services.
2. The Parliamentary Law Reform Committee is requested to investigate options with respect to the following:
3. the need to ensure medical services provided are of a high standard and that where standards are not maintained people have suitable redress;
4. the reduction of any disincentives to the provision of health services by fears of inappropriate liability; the use of structured settlements to maximise the benefit to an injured person of any financial compensation ordered by a court; and alternatives to the current system of court-based compensation for people injured in the use of health services.

The extent of the complexities of professional indemnity cover in the health care context is touched upon in the introduction to the report of the Law Reform Committee which reads as follows: "In September 1995, the Law Reform Committee was given a reference by the Governor-in-Council to inquire into, consider and report to the Parliament on issues arising out of court-based compensation for people who have suffered injuries as a result of services provided by a health service provider. The terms of reference for the Inquiry were amended in November, 1995. Four specific issues were identified as matters to which the Committee should direct its attention: the need to ensure that medical services provided are of a high standard and that where standards are not maintained people have suitable redress; the reduction of any disincentives to the provision of health services by fears of inappropriate liability; the use of structured settlements to maximise the benefit to an injured person of any financial compensation ordered by a court; and alternatives to the current system of court-based compensation for people injured in the use of health services. Following receipt of the reference, the Committee heard oral evidence from a number of individuals and considered some written submissions prior to undertaking research for the preparation of its Issues Paper No. 1 which was published in January 1996. Over thirty submissions were received prior to the initial closing date for receipt of submissions on the 18 March 1996. On 5 March 1996 the Parliament was dissolved for the state election and the Committee’s reference lapsed. Following the election a new Committee was appointed on 14 May 1996 consisting of two former members and seven new members, including a new Chairman. Terms of reference for the current inquiry were published in the Victoria Government Gazette on 20 June 1996. They were in identical form to those as amended in November 1995. The Law Reform Committee is a joint investigatory Committee of the Victorian Parliament with a statutory power to conduct investigations into matters concerned with legal, constitutional and parliamentary reform or the administration of justice. The issues embodied in the terms of reference are extremely wide in scope and raise fundamental questions as to the role which court-based compensation should play in ensuring that people who suffer injuries through medical misadventure are adequately and properly compensated. A number of other inquiries have been ordered and are considering similar issues. The most recent of these are the Commonwealth Department of Human Services and Health’s Professional Indemnity Review and the New South Wales Department of Health and the Attorney-General, Joint Working Party on Medical Liability. The Victorian reference arose out of a number of specific concerns which were identified concerning the manner in which people receive compensation for medical misadventure in Victoria. First, was the widespread perception that the amounts of money paid by health service providers to obtain professional indemnity cover had increased to such an extent for practitioners in some specialities, such as obstetrics and gynaecology, that practice in these specialities is becoming financially unviable. The situation of rural general practitioners who undertake obstetric services infrequently was cited as the area of major concern. Secondly, extremely large awards of damages which have occasionally reached over five million dollars, were said to have exceeded the maximum amount payable by the mutual funds in respect of professional indemnity cover, thus leaving health service providers at risk of personal liability and those who have suffered injuries at risk of going uncompensated. Thirdly, concern had been expressed that the basis upon which liability in negligence was determined by courts in Australia was inappropriate in situations where an adverse outcome is an expected, if unfortunate and rare, consequence of a procedure carried out in good faith and in a professional manner. The situation which arises in cervical screening is given as an example of this. Fourthly, there is the problem of defensive medicine; namely, that doctors may be providing services in such a way as to ensure that the risk of professional liability is minimised, even if this entails the provision of services which may not be clinically necessary for patient care. Finally, there is a view that it is inappropriate for a health user injured through medical misadventure to receive a substantial award of damages on the basis of an estimated life expectancy, where the individual in question may die earlier than expected, thus providing his or her estate with a financial windfall. Similarly, it was considered to be unfair for individuals to be required to shoulder the financial burden of caring for a person injured through medical misadventure where their circumstances have altered from the time when the damages were assessed. The issues raised during this inquiry are particularly important given the findings of a recent study into the incidence of adverse events (that is, unexpected injuries) arising out of the use of health services in Victorian hospitals. The study which was publicly released on the day before the Committee adopted its report, found
judgment almost gives the impression that nurses and other professional staff employed by a private hospital operate fairly independently, almost as contractors, of their employer and that the hospital itself has no authority to supervise them nor does it have any responsibility to control them in the same way that other employers control their employees. The impression is created that the fact that these employees are professionals and therefore subject to the disciplinary powers of their professional body somehow reduces the weight of the public policy considerations that the employer should be held vicariously liable. The employer should be permitted to reduce its insurance burden by shifting the risk onto the professional in question – an individual employee. From a professional indemnity cover perspective this idea has been rejected by many different countries around the world.

With regard to the former argument, it is submitted that the frequency with which nurses are disciplined by the South African nursing council and even the relatively lower frequency with which they are found guilty and struck off the roll or their names removed from the register, is such that it gives the lie to this argument. Furthermore, an employer who is not vicariously liable for the negligence of its employees may be less concerned about taking preventive action to preclude professional negligence - even if it takes action to discipline the nurse as an employee after the event. Once a nurse is subject to a disciplinary proceeding by her professional body it is too late. The negligent act has already harmed a patient. Given the nature of the services rendered by nurses, such harm can include death and permanent disablement. As to the latter argument, when the nursing council disciplines a nurse and removes his or her name from the roll the name of his or her employer is not mentioned when the relevant notice is published in the Government Gazette.

It is submitted that this argument, whilst it may have some attraction in the

---

that 62,949 patients experienced adverse events. This represents a five percent error rate. The total number of adverse events was 67,260. Most of these events consisted of complications arising out of surgical or medical procedures. Additionally, the study revealed that the death rate for persons experiencing an adverse event was 0.14 percent. Ross Wilson, the Director of Quality Assurance at the Royal North Shore Hospital in Sydney, described the rate of adverse events identified by the Victorian study as being 'of sufficient magnitude to demand action'. The Committee notes this is consistent with the findings of a study conducted in 1990. In light of this recent study, the Committee believes that the recommendations in this report will be significant not only to those who suffer an adverse outcome while using health services, and to health service providers, but also to the general community.

Hickey J and Mason A 'Funding of Clinical Liabilities in the Public Sector' fn 123 supra

The format of the notices is: "Notice is hereby given that in terms of section 29(1)(c) of the Nursing Act, 1978 (Act No 50 of 1978), the name of [name of professional] has been removed from the register of registered nurses and midwives following on a disciplinary inquiry by the South African Interim Nursing Council into her conduct on [date]." The most recent notices found by the writer in the Government Gazette were placed by the South African Interim Nursing Council.
abstract, does not reflect reality or the way in which disciplinary procedures and sanctions are in fact publicised. It is argued that even if the name of the employer had to be published in such a notice, the notices are usually issued singly, i.e. in respect of one nurse at a time.\textsuperscript{128} It would take a very diligent lawyer indeed, let alone a layperson, to search through the Government Gazettes to identify a trend in terms of which the nurses employed at one particular hospital are found being guilty of negligence more frequently than at any other hospital. Given that not every court decision is reported and that not many cases of this nature get to court to begin with, not least due to the high cost of litigation in South Africa, such a trend is unlikely to become public knowledge through even the law reports. Consequently, it is submitted with respect, that the argument of the Supreme Court of Appeal that there is adequate protection for the patient against the risks of professional negligence of the applicant’s employees because the applicant had a reputation and a competitive edge to maintain is based on a fallacy. Health services such as those provided by hospitals, are not in quite the same category as other services when it comes to word of mouth either. Most people do not regularly ‘shop’ at hospitals. They might be able to relate a good or bad experience whilst hospitalised at some stage of their lives but such anecdotal evidence is seldom if ever more influential upon a prospective patient than the advice of a medical specialist to the effect that they are seriously ill and must admitted to the hospital at which he practices even assuming that it relates to the same hospital to which the patient must be admitted. It may be that in some wards acceptable standards of nursing care are offered while in other wards in the same hospital, the same does not hold true simply due to the manner in which the particular-ward in question is run by the person in charge. It is submitted that the court failed to take into account the fact that Afrox Healthcare as a publicly listed company is highly likely to be engaged in costly marketing campaigns in terms of which it trades on the levels of

\textsuperscript{128} on the authority of the previous Acting Registrar in Gazette No 16949 dated 02 February 1996 Board Notice No 9 of 1996 dated 11 January 1996; Gazette No 17517 dated 01 November 1996 Board Notice 103 of 1996; Gazette No 17797 dated 21 02 1997 Board Notice 18 of 1997 dated 7 February 1997; Gazette No 17823 dated 07 March 1997 Board Notice No 23 of 1997 dated 24 February 1997. The Nursing Council has not published any such notices in the last few years and when enquiry was made to the Registrar of the Nursing Council as to the reason for this, it would seem that it simply has not been done by the relevant administrative unit within the South African Nursing Council. The Registrar did say that a public register was planned for the Council’s website but it is not clear when such a facility will be made available. The Council in any event does not usually remove the names of more than 3 professionals from the register each year following upon disciplinary proceedings which could be an indication that the council is not itself effectively and efficiently dealing with recalcitrant professionals. There has been public complaint about the efficacy of most of the health professional councils in South Africa and the Department of Health is in the process of substantially amending the relevant legislation to deal with some of these problems. A Forum has also been created in terms of the National Health Act to act as ombudsman and to call the professional councils publicly to account for their performance of their functions.

The notices referred to in the footnote immediately supra are each in respect of only one nurse.
professionalism of its staff when touting for business. This kind of information is very much publicly available. The company even boasts about its college of nursing. It is submitted that the publication of this kind of information by private

129 Presently on the website (http://www.afroxhealth.co.za/) is a document entitled "Core Values". It reads:

**Core Values**

Organisational values are principles or qualities considered worthwhile by an organisation. At Afrox Healthcare there is a fundamental commitment to these values throughout the entire organisation - merely posting them on a bulletin board and paying them lip service is not tolerated! "Living" these values in our day-to-day business activities provides us with the foundation of what is important to us - namely, providing world-class patient care.

**Accountability**

We ensure employees know what they are responsible for and are empowered to deliver.

**Collaboration**

We maximise our achievements as a group, not as individuals.

**Transparency**

We believe that visible problems can be solved and that informed people make better decisions.

**Stretch**

We continually push the boundaries of performance.

Another entry on the website reads:

**Quality**

Afrox Healthcare's quest is to maintain world-class quality standards at all its hospital facilities - to the benefit of its patients, employees, supporting medical practitioners and funders. A world-class quality management process

We believe that our unique process of managing quality standards in our hospitals matches and probably exceeds the best to be found anywhere in the world today.

The Afrox total quality management (TQM) process was launched throughout the company in 1993, exposing each and every employee to the company's vision for quality management. The Healthcare division then adapted the programme to satisfy the unique demands of the healthcare industry.

The programme incorporates a vision, policies and procedures, critical success factors with supporting key performance indicators and specified activities. It is reviewed and upgraded on an ongoing basis. Continued adherence to these standards has been maintained by encouraging each and every employee to participate fully in the process and contribute to the decision-making processes. All new employees are exposed to the process as part of their induction training.

Today, Afrox Healthcare and its member hospitals are reaping the rewards of this visionary approach to quality management. A culture of service excellence, a spirit of teamwork amongst all levels of staff and a continuous quest for improvement are now firmly entrenched. This, in turn, means that patients, funders and supporting medical practitioners can rely on our consistently high standards in all disciplines associated with hospital management, particularly nursing care.

We also embarked on a scientific quality improvement programme at the Eugene Marais Hospital during 1997. This ward resource management program has now been implemented in most Afrox Healthcare hospitals with both input and output measures based on quality improvement. This program ensures quality care through resource and standards management."

130 As article from the website (see fit above) states: "The Afrox College of Nursing has invested millions in the training of world-class nurses and the establishment of learner centres nationwide. After four years of offering accredited diploma courses and supplying Afrox Healthcare's hospitals with highly skilled nurses, the college has now opened its doors to external students.

"Undoubtedly, the most serious challenge to the healthcare industry is the drain on specialized and experienced nursing skills. As a member of the private healthcare sector, we accept responsibility to implement initiatives to develop and train nurses, which will contribute to the skills development and empowerment of our people, and to create an environment in our hospitals which will attract, support and retain quality nurses," said Michael Flemming, managing director of Afrox Healthcare Limited.

One such initiative is the Afrox College of Nursing, which entered into a groundbreaking partnership with the University of Port Elizabeth four years ago to ensure that the high nursing standards, which are a hallmark within the Afrox Healthcare group, are continued into the new millennium. Outcomes-based learning and training and the development of skills and competencies is a priority within the group's hospitals.

"The college has gone from strength to strength and we have taken up the challenge to ensure the ongoing provision of highly qualified nursing staff to the more than sixty Afrox Healthcare hospitals across the country. We want to pay tribute to our nurses for their exceptional level of professionalism and unwavering commitment towards quality patient care," said Sharon Vanheven, training manager, at a nursing diploma ceremony held in Johannesburg.

"Student numbers have increased dramatically. More than 1,000 nurses have graduated from the college by 2002, and 468 are enrolled at present. In the last week, 150 students graduated from the college, and for the first time, 30 external students have enrolled this year for the four-year diploma in nursing. We are now the largest private nursing training institution in South Africa with nine learner centres in Johannesburg, Pretoria, Bloemfontein, Durban, Witbank, Klerksdorp, East London, Port Elizabeth and Cape Town. All practical nursing training takes place in the Afrox Healthcare hospitals, which ensures that learners are exposed to new technologies and the highest standards of quality care."

"Our numerous successes last year include training more than double the number of critical care and theatre nurses than the previous year. We offer basic and post-basic diploma courses in areas such as critical care, operating theatre, emergency, orthopaedic and general nursing," Sharon said. "Community involvement is very important for us, and the group's community involvement projects will be extended to all nine learner centres this year. That fits in with Afrox Healthcare's philosophy of building sincere and meaningful partnerships with the communities in which we operate," Sharon said. Students at the learner centres are also actively involved with local organisations and regional initiatives.
hospitals in South Africa the norm and that they have been doing it for many years – certainly at the time when the case under discussion was decided. From a policy perspective and given this kind of advertising why should a layperson entering such a hospital as a patient expect a clause such as 2.2 to be contained in the admission documentation? It is submitted with respect to the Supreme Court of Appeal that entering a hospital for medical treatment and enlisting the services of a plumber to address a household plumbing problem are two extremely different activities on the basis of risk. One cannot thus say that all suppliers of services are the same and that what is good for one is good for all. The nature of the service they render directly affects the nature and extent of the personal risk to the customer represented by that service. The South African courts have distinguished between different levels of risk even within the healthcare environment for instance with regard to the mode of delivery of a medicine – intravenously or per mouth. The effect of this judgment of the Supreme Court of Appeal is that every single private hospital in South Africa will include such a clause in its admission documentation with the result that, even assuming a patient did have some degree of bargaining power, the chances patients ever having recourse in South Africa against a private hospital for the negligent acts of its employees are now – negligible. The salary levels of nurses in South Africa are likely to mean that a lawsuit against an individual nurse would not effectively assist any patient in the recovery of compensation for his loss. Most nurses are not millionaires whilst the damages arising from medical negligence can run into hundreds of thousands of rands, if not millions, in some cases.

The court’s failure to recognise the importance of the fact that private hospitals can be distinguished from other suppliers on the basis that the former provide services which are the subject of a constitutional right – a right moreover- which seeks to ensure access to those services- is also regrettable. The court chose to take a very narrow view of the issue of access holding that the clause did not interfere with access to health care services in that it did not have the effect of barring anyone from obtaining health care services. It is submitted with respect that this view of access is overly simplistic given the nature of the services one is dealing with. Health care services are generally required to promote, maintain or improve the health of a patient. When the
courts consider claims in delict on the basis of medical negligence they do not adopt an approach which says that if the patient would in any event have ended up in his final state if there had been no medical intervention then one cannot hold a health professional liable for his negligence in preventing this from happening. In other words the law expects a health professional to act in such a way as to improve the patient’s situation. Admittedly the improvement is not guaranteed but that is not the point. The point is that the health professional must act in the way in which any other reasonable health professional in the position of the health professional would act. Since such action is invariably geared towards and aimed at improving the patient’s condition, as opposed to aggravating it, the reasonable expectation of the person receiving health services is that they will be beneficial in some way – even if only to alleviate symptoms. Access to health care services is not access in the constitutional sense, where that access is not of such a nature that it is intended to, and administered in such a way as to, benefit the patient. It is submitted that a narrow construction of the meaning of access to health services, so as to permit them to be rendered in conditions which in themselves put the life or health of the patient at risk, defeats the object of the constitutional right contained in section 27(1) of the Constitution. Access to health care services requires access to skilled and diligent health professionals using tried and generally accepted or recognized techniques - not charlatans and mountebanks or even well meaning laypersons. It is submitted with respect, that to accept otherwise is to contradict the long established principles of the common law of delict as well as the Constitution. The courts do not uphold contracts which are contrary to public policy or to the legal convictions of the community as expressed in the boni mores. There are certain obligations which it should be inescapable and which should certainly not be applied in situations where the bargaining power of the contracting parties is so unequal as to be non-existent on the side of the one. The boni mores do not alter depending upon whether one is dealing with the law of contract or the law of delict. The public policy considerations are the same in both areas of law. It is extremely difficult to see why the broader community, as opposed to the business community with which the Supreme Court of appeal seemed primarily concerned in this case, would prefer the right to freedom of contract to the right of access to effective and properly delivered health care services. It is submitted that the Supreme
Court of Appeal demonstrates not only in this case but also in others such as *Carmichele* a surprising and unfortunate reluctance to take opportunities to align the more traditional common law principles with the Constitution and that within this court, judicial inertia is the order of the day.

Section 9 of the Occupational Health and Safety Act provides for general duties of employers and self-employed persons to persons other than their employees as follows -

“(1) Every employer shall conduct his undertaking in such a manner as to ensure, as far as is reasonably practicable, that persons other than those in his employment who may be directly affected by his activities are not thereby exposed to hazards to their health or safety.

(2) Every self-employed person shall conduct his undertaking in such a manner as to ensure, as far as is reasonably practicable, that he and other persons who may be directly affected by his activities are not thereby exposed to hazards to their health or safety.”

It is therefore a statutory as well as a common law liability that one is dealing with when considering the liability of private hospitals and other health care institutions for the professional negligence of their staff. It is submitted that the wording of section 9 is wide enough to include a responsibility of an employer of health care professionals to ensure that they are not negligent in the delivery of health care services to patients.

131 *Carmichele v Minister Of Safety And Security And Another* 2001 (1) SA 489 (SCA). See the criticism of the Constitutional Court in *Carmichele v Minister Of Safety And Security And Another (Centre For Applied Legal Studies Intervening)* In 115 supra in which it was held that since all Courts were constitutionally obliged to promote the spirit, purport and objects of the Bill of Rights when developing the common law, they were compelled to eliminate any common-law deviation from these aims. The proceedings in the High Court and SCA took place after the new Constitution had come into operation and both Courts had, in assuming that the pre-constitutional test for wrongfulness of omissions in delictual actions should be applied, overlooked the demands of s 39(2) of the Constitution. See also *Bannatyne v Bannatyne (Commission For Gender Equality, As Amicus Curiae)* 2003 (2) SA 363 (CC)

Brand D in *Disclaimers in Hospital Admission Contracts and Constitutional Health Rights: Afrox Healthcare v Strydom* ESR Review Vol 3 No 2 September 2002 published by the Socio-Economic Rights Project, University of the Western Cape states that: “The Court’s judgment puzzles. The Court’s finding that there was equality of bargaining power ignores the self-evident inequality inherent in the contractual relationship. It is submitted that the nature of the service at stake created an unequal bargaining position. One cannot do without health care services, which are a fundamental constitutional right. Since all private and public hospitals in South Africa use indemnity clauses, it is clear that the respondent had no bargaining power regarding the indemnity clause – if he objected to it he had nowhere else to go and would not have gained access to health care services. The Court’s reasoning on the clash between the indemnity clause and constitutional values is equally suspect. The Court concluded that, in the absence of the threat of action for damages, disciplinary action by professional bodies and concern for a hospital’s reputation ensure that hospitals avoid negligent conduct. The Court’s reasoning ignores the fact that the respondent litigated precisely because of negligence that occurred despite these sanctions and that caused the respondent damage, for which he cannot now be compensated. In addition, the case seemed significant because it concerned the indirect horizontal application of a socio-economic right. It allowed the Court an opportunity to demonstrate its regard for constitutional values. However, the judgment raises doubt as to the extent to which the Court considers these values. This observation is most evident in the consideration of whether the indemnity clause offends public policy. This consideration comes down to a balancing of the individual interests of the contracting parties and the general, constitutional interests of the public. The Court opted for the protection of individual (commercial) interests while ignoring almost completely the fact that the service the parties bargained about was a constitutional right. With regard to the scope of the limits envisaged by an indemnity clause, the Court held that those limits should be defined by business considerations such as saving in insurance premiums and competitiveness... The Court missed an opportunity: it again insulated that common law from constitutional infusion.”

132 Act No 85 of 1993

133
Every employer must conduct his undertaking in a particular manner. That manner is to ensure as far as is reasonably practicable that persons other than employees who may be directly affected by his activities are protected. The protection in question relates expressly to hazards to their health or safety. This Act provides expressly for the vicarious liability of employers for acts of their employees in certain circumstances in section 37. It is submitted that to the extent that legislation can be regarded as indicative of public policy concerns and the legal convictions of the community, the Supreme Court of Appeal erred in taking the opposite view that the employer could contract out of liability in these particular circumstances, relating as they did to the health and safety of persons directly affected by the employer's activity of running a private hospital and offering health care services to the general public therein. In terms of section 38(1) of this Act any person who contravenes or fails to comply with inter alia a provision of section 9 is guilty of an offence and on conviction is liable to a fine not exceeding R50 000 or to imprisonment for a period not exceeding one year or to both such fine and such imprisonment. It is pointed out in the chapter on the law of delict that the test for wrongfulness is the same for both

---

134 Acts or omissions by employees or mandataries

(1) Whenever an employee does or omits to do any act which it would be an offence in terms of this Act for the employer of such employee or a user to do or omit to do, then, unless it is proved that-

(a) in doing or omitting to do that act the employee was acting without the connivance or permission of the employer or any such user;

(b) it was not under any condition or in any circumstance within the scope of the authority of the employee to do or omit to do an act, whether lawful or unlawful, of the character of the act or omission charged; and

(c) all reasonable steps were taken by the employer or any such user to prevent any act or omission of the kind in question,

the employer or any such user himself shall be presumed to have done or omitted to do that act, and shall be liable to be convicted and sentenced in respect thereof; and the fact that he issued instructions forbidding any act or omission of the kind in question shall not, in itself, be accepted as sufficient proof that he took all reasonable steps to prevent the act or omission.

(2) The provisions of subsection (1) shall mutatis mutandis apply in the case of a mandatary of any employer or user, except if the parties have agreed in writing to the arrangements and procedures between them to ensure compliance by the mandatory with the provisions of this Act.

(3) Whenever any employee or mandatary of any employer or user does or omits to do an act which it would be an offence in terms of this Act for the employer or any such user to do or omit to do, he shall be liable to be convicted and sentenced in respect thereof as if he were the employer or user.

(4) Whenever any employee or mandatary of the State commits or omits to do an act which would be an offence in terms of this Act, had he been the employee or mandatary of an employer other than the State and had such employee committed or omitted to do that act, he shall be liable to be convicted and sentenced in respect thereof as if he were such an employer.

(5) Any employee or mandatary referred to in subsection (3) may be so convicted and sentenced in addition to the employer or user.

(6) Whenever the employee or mandatary of an employer is convicted of an offence consisting of a contravention of section 23, the court shall, when making an order under section 38 (4), make such an order against the employer and not against such employee or mandatary.

---

135 Section 39(2) of the Occupational Health and Safety Act stipulates that: "Any employer who does or omits to do an act, thereby causing any person to be injured at a workplace, or, in the case of a person employed by him, to be injured at any place in the course of his employment, or any user who does or omits to do an act in connection with the use of plant or machinery, thereby causing any person to be injured, shall be guilty of an offence if that employer or user, as the case may be, would in respect of that act or omission have been guilty of the offence of culpable homicide had that act or omission caused the death of the said person, irrespective of whether or not the injury could have led to the death of such person, and on conviction be liable to a fine not exceeding R100 000 or to imprisonment for a period not exceeding two years or to both such fine and such imprisonment."
criminal law and the law of delict. It is ironic that a patient in the position of Strydom who can show a violation of section 9 of the Occupational Health and Safety Act would not, in the presence of an indemnity clause such as that in *Afrox Healthcare v Strydom* be able to obtain damages in delict but the public prosecutor might be able to secure a criminal conviction in terms of occupational health legislation.

6.2.9  

*Oldwage v Louwrens*\(^\text{136}\)

**Facts**

The plaintiff was admitted at Panorama Medi-Clinic (Panorama) 7 June 2000, a day preceding the date of the operation. On that day the defendant performed an angiogram on him. The operation was performed the following day. The plaintiff was discharged from Panorama on Sunday, 11 June 2000. On discharge from hospital, the plaintiff was not relieved of pain he experienced prior to the operation. On Wednesday, 14 June 2000 the plaintiff consulted a Dr Kieck, a neuro-surgeon, in his rooms at Vincent Pallotti Hospital, Pinelands. Dr Kieck examined the plaintiff and diagnosed a prolapsed disc as the source of the pain that the plaintiff experienced at the time. On 21 June 2000 and at Vincent Pallotti, Dr Kieck performed a laminectomy on the plaintiff. The plaintiff remained in Vincent Pallotti until Sunday, 24 June 2000, on which latter date he was discharged and relieved of pain. A few days after his discharge from Vincent Pallotti and in an attempt to do some physical exercise, as he was accustomed to do prior to undergoing the vascular operation, the plaintiff went for a walk with his wife when he discovered that, after walking a short distance of about 30m, he experienced cramps and pain in his left leg. This obliged the plaintiff to rest, but the pain would recur as soon as he resumed walking. The plaintiff subsequently saw Dr Kieck for a follow-up operation on Monday, 3 July 2000. On this occasion Dr Kieck noted that the plaintiff 'claudicates'. Dr Kieck further noted that the plaintiff's left foot was cold to touch; that the pulses in the left leg were negative and that, according to the plaintiff, this symptom manifested after the

\(^{136}\) *Oldwage*: As yet unreported case no 10233/01 in the Cape Provincial Division of the High Court judgment handed down on 19 February 2004
vascular operation. In the course of trial it became apparent that when the plaintiff consulted the defendant and was subsequently operated on, the plaintiff presented with extensive vascular disease. When pain persisted after this operation, he consulted Dr Kieck who diagnosed a prolapsed disc in the L4/5 lumbar region as a source of pain necessitating a laminectomy which Dr Kieck performed on 21 June 2000. The plaintiff thus not having been relieved of the pain he experienced after the vascular operation, the primary issue the court had to determine, amongst other ancillary issues, is what medical intervention, if any, was reasonably required to address the pain the plaintiff experienced prior to the performance of the two operations on him.

The plaintiff's health history was such that except for a laminectomy which was performed on him at Dundee, in the Province of Kwazulu Natal during 1972, he was otherwise fit and healthy up until 27 April 2000 when he sustained an injury to his back in Cedarberg, Clanwilliam, Cape. At that stage the plaintiff and his wife occupied a flat in Milnerton. The flat was situated on the fourth floor of a block of flats and could only be accessed by four flights of stairs. The plaintiff utilized a flat on the second floor of the same building as an office. During December 1999 the plaintiff purchased two mountain bicycles – one for himself and one for his wife. This, so the plaintiff testified in evidence, was at the suggestion of his wife in order that they could exercise regularly. At regular intervals, the plaintiff and his wife would visit the Clanwilliam Dam area where they would either stay with the plaintiff's brother, George, or would stay at a house referred to in evidence as "The Thatch Roof House". During such visits, the plaintiff would undertake regular exercise activities such as walks and bicycle rides. On one such visit on the long weekend commencing 27 April 2000 the plaintiff and his wife went for a walk next to the Clanwilliam Dam when, during such a walk, the plaintiff slipped landing on his buttocks and hurting his lower back in the process. The plaintiff was laid up for the rest of that long weekend with significant backache. As a result of this incident, the plaintiff and his wife returned to Cape Town earlier than anticipated due to discomfort and inconvenience the plaintiff experienced subsequent to the slipping incident. On his return to Cape Town, the back injury was treated conservatively by way of bed rest and after a few days the plaintiff resumed work as before. Towards the end of May 2000 the plaintiff experienced increasing and later intense pain in his right leg.
On 5 June 2000 he visited Dr Simons, a general practitioner, for the first time. While waiting in the reception room prior to seeing Dr Simons, the plaintiff did not sit down, but leaned against the wall or a table. This was because of severe pain he experienced at the time. When the plaintiff subsequently consulted Dr Simons he complained of five days of pain in the lower aspect of the right leg which was preceded by numbness especially when getting out of bed; the pain was aggravated by movement and radiated up to the right buttock. Dr Simons performed a single leg raise test on the plaintiff. Dr Simons neither made notes regarding any complaint of claudication on the part of the plaintiff, any pain in the right foot, discolouration of the right foot, abnormal temperature in the right foot nor the precise nature of any neurological tests he may have performed. Dr Simons referred the plaintiff to the defendant for an appointment at the latter’s rooms at Panorama on Tuesday, 6 June 2000. The plaintiff duly visited the defendant as arranged. He took a taxi because it would have been too uncomfortable to drive because of pain. The plaintiff handed to the defendant a note sealed in an envelope given to him by Dr Simons. The contents of this note were not known as it was neither discovered nor produced in evidence. The defendant had in the meantime departed for a conference in America and had left Plaintiff in the care of Dr Michaelowsky. On discharge from Panorama, the plaintiff was seen by Dr Michaelowsky. Shortly before his discharge the plaintiff told Dr Michaelowsky that he continued to experience a similar pain in his right leg to that which he had experienced before the operation. According to the plaintiff Dr Michaelowsky’s response was that the plaintiff should give it time. The plaintiff’s wife, who had gone to the hospital to collect him, overheard this discussion. The discussion took place whilst Dr Michaelowsky examined the plaintiff prior to his discharge. On his discharge, the plaintiff was unable to walk very far and had to make use of a wheelchair when leaving the hospital. Upon returning to his flat that Sunday morning, the plaintiff ascended the flight of stairs with great difficulty. He had to be supported throughout by his wife. It was necessary for them to rest on a chair at each landing along the way. The plaintiff continued to complain about pain in his right leg until Monday, 12 June 2000. He directed various telephone calls to Dr Simons in an endeavour to discuss the ongoing discomfort with him. Dr Simons eventually spoke to the plaintiff late in the afternoon on Monday, 12 June 2000. The following day Dr Simons attended to the plaintiff who was then in his office on the second floor and examined him on a makeshift couch. The plaintiff’s wife testified that the plaintiff
complained to Dr Simons that the pain in the right leg was now worse than before and that, on this occasion, his left foot was cold. Dr Simons corroborated the plaintiff's wife's evidence in this regard. He prescribed certain analgesic drops and told the plaintiff to give the leg time to recover. In a state of frustration, the plaintiff then proceeded to telephone a number of medical specialists in an attempt to obtain advice regarding his pain. He eventually made contact with Dr Freddie Kieck's rooms whereafter an appointment was set up for the following day. The plaintiff saw Dr Kieck in his rooms at the Vincent Pallotti Hospital in Pinelands on Wednesday, 14 June 2000. After a Magnetic Resonance Imaging (MRI) scan, Dr Kieck diagnosed a large rupture of the L4/5 disc with root compression. Dr Kieck advised that the plaintiff undergo surgery within the next week to alleviate the pain. Dr Kieck's handwritten notes taken in that consultation recorded a slight pain of approximately a week in the plaintiff's right lateral calf which got worse after three days; an "on/of" back problem which manifested for three to four weeks every few years; acute backache for two weeks in April 2000 when the back was out; the plaintiff's general practitioner thought he was suffering from peripheral vascular disease; the plaintiff had undergone iliac femoral by-pass the previous week; the original pain was still there; that it was terrible and presented in the buttock/thigh/calf and that the plaintiff was more comfortable at rest while bending was worse. Upon examination Dr Kieck noted that the plaintiff experienced pain; the leg-raise examination on the right leg was limited to 30 degrees and the plaintiff's pulses on the right were recorded as positive while those on the left were recorded as negative. On the same day, Dr Kieck addressed a letter to Dr Simons in which he set out full details of his observations and proposed management of the problem. Although the letter was addressed to Dr Simons at his fax number at his rooms, Dr Simons denied receiving the fax. The plaintiff continued to experience pain in his right leg for the following week. On Wednesday, 21 June 2000, Dr Kieck operated on the plaintiff's back and performed a right L4 laminotomy. Dr Simons assisted in that operation but did not see the plaintiff at any stage between 15 and 21 June 2000, nor did he inform the plaintiff that he was aware of the intended operation or of the fact that he had been invited by Dr Kieck to assist therein. The plaintiff was immediately pain free after the lumbar operation and was discharged from Vincent Pallotti on Saturday, 24 June 2000. When returning home on that occasion the plaintiff was able to ascend the four flights of stairs to his flat with much greater ease than after the first operation. A few days after the plaintiff
had been discharged from Vincent Pallotti he attempted to recommence exercising and went for a walk with his wife. The plaintiff would have proceeded very gingerly due to the operation wounds. During his first walk the plaintiff immediately showed signs of claudication in his left leg. After taking an oral history the defendant examined the plaintiff on his examination couch. The plaintiff did not remove his trousers as it was too painful to do so. The defendant examined the plaintiff in the groin by loosening the plaintiff’s trousers. The defendant examined the plaintiff’s right foot. In the consultation preceding the examination, the defendant did not ask the plaintiff whether he had experienced any symptoms of claudication nor did he take any record of the plaintiff’s exercise regime or eating habits. The defendant did not perform a Doppler test on the plaintiff. The plaintiff did not mention the fall in Cedarberg to the defendant, nor did the defendant direct any enquiry to the plaintiff which would have elicited that information. After examining the plaintiff, the defendant held the view that the plaintiff was suffering from a problem with his vascular circulation resulting in blockages in his arteries, that the problem could be addressed by the insertion of a balloon into the plaintiff’s arteries or a graft to replace certain of the blocked veins in the body with a plastic prosthesis and that further tests were required before the defendant could determine which surgical procedure would be appropriate. The plaintiff went home and returned the following day when an electrocardiogram (ECG) was performed and after he was given a sedative later in the day, the defendant performed an angiogram on him. The angiogram confirmed an occlusion of various arteries in plaintiff’s right iliac system, the internal iliac artery and the superficial femoral artery in the left leg. He was subsequently admitted to the ward. Plaintiff was informed that a by-pass operation was necessary to relieve him of his pain. An operation was performed on the plaintiff by the defendant some time between 08h45 and 12h45 on the morning of Thursday, 8 June 2000. As has already been pointed out, the plaintiff was discharged on Sunday, 11 June 2002 still not relieved of pain he experienced prior to the performance of the operation. The plaintiff saw Dr Kieck for a follow-up consultation on Monday, 3 July 2000. During that consultation Dr Kieck noted that Plaintiff claudicated in the left leg after walking a distance of 30 metres; that the left foot was cold to touch; the pulses in the left leg were negative and that the claudication had manifested after the vascular operation. In the meantime the defendant had returned from his trip abroad and was back at work on Monday, 19 June 2000. His appointment book for Tuesday, 20 June 2000 indicates
that an appointment he had with the plaintiff at 14h30 on that day had been cancelled. The defendant was to have telephoned Dr Kieck on that day. The defendant’s appointment book for Thursday, 22 June 2000, reflects that the defendant was to have telephoned Dr Kieck. Dr Kieck would have performed the laminectomy a day before. Judging by the tick next to Dr Kieck’s name and telephone number, it would appear that the call was indeed made. On Monday, 26 June 2000 the defendant wrote a letter to Dr Simons in which letter the defendant sets out details of the consultation he had with the plaintiff on Tuesday, 6 June 2000. An analysis of the angiogram performed on Wednesday, 7 June 2000 and the particulars of the by-pass operation performed on Thursday, 8 June 2000. The letter concluded that the defendant was aware of the lumbar surgery performed on the plaintiff by Dr Kieck and concluded with the following sentence:

"This may be a case of double pathology but I hope that he will now be able to return to work."

On Tuesday, 4 July 2000 the plaintiff saw the defendant in the reception area of his rooms. The plaintiff stated in his evidence that the defendant did not examine him whilst the defendant, was adamant that he examined the plaintiff on this last occasion. According to the plaintiff no examination was conducted but merely a discussion relating to the plaintiff’s then current complaint of claudication. The plaintiff, by all accounts, had lost confidence in the defendant by this time. According to the plaintiff the defendant informed the plaintiff that the claudication problem could not have been foreseen during the vascular operation and that there was nothing that could be done to remedy the problem. Instead the defendant advised the plaintiff to lead a healthier lifestyle. The plaintiff also informed the defendant of the back operation he had undergone and of the subsequent pain relief in his right leg. On the same day that the plaintiff saw the defendant, the latter wrote a further letter to Dr Simons in which letter he (the defendant), for the first time, mentioned the complaint of claudication. The letter further records that on examination all pulses were present in the right leg; only a femoral pulse was apparent in the left leg and that a total occlusion of the superficial femoral artery was the likely cause of the plaintiff’s symptoms of claudication.
The plaintiff claimed that in breach of the agreement between the parties the defendant failed to exercise the degree of care and skill required of a specialist vascular surgeon in that defendant:

1. failed to take a full and proper medical history, inter alia, regarding the “pinched nerve” complaint;
2. failed to examine Plaintiff adequately;
3. failed to diagnose Plaintiff’s symptoms correctly;
4. failed to appreciate that the Plaintiff’s symptoms were indicative of nerve compression in the lumbar region with referred pain down the leg;
5. failed to appreciate that the co-existence of vascular and neuropathic pathology is perfectly possible and not uncommon and that his symptoms at that stage were not related to vascular insufficiency;
6. failed to refer Plaintiff to an appropriate speciality for further treatment;
7. failed to procure Plaintiff’s informed consent by inter alia failing to advise, warn and inform Plaintiff that:
   8. The proposed femoro-femoral by-pass operation had a well known complication of possible claudication of the left leg;
   9. The status of the left leg (vascular occlusion) presented a high probability that the aforesaid complication would ensue;
   10. The alternative procedure of an aorto bifemoral plus femero-popliteal by-pass was available and much more appropriate under the circumstances;
8. Failed to perform the correct procedure in respect of the presenting complaint;
9. Failed to perform the more appropriate procedure to remedy the underlying vascular occlusion;

Alternatively, and in any event Defendant, in breach of his aforesaid duty of care, unlawfully and negligently acted as set out in the preceding paragraphs.

Alternatively the plaintiff averred that:

1. The plaintiff agreed to undergo the aforesaid femoro-femoral by-pass operation as a result of the defendant presenting to the plaintiff that such operation was essential and that, if the plaintiff did not undergo such operation, the plaintiff
would not recover from certain medical complications that the plaintiff was at the time experiencing.

2. The said representation was false in that the aforesaid procedure was not essential and in that the plaintiff did not require the said procedure in order to recover from the medical complaints that the plaintiff was suffering from;

3. The said representation was material and made with the intention of inducing the Plaintiff to agree to the aforesaid procedure. Relying on the truth thereof, the plaintiff did so agree;

4. The said representation was negligently made by the defendant, having regard to the defendant’s professional skill and expertise and the information which could, upon a reasonable enquiry, have been obtained by the defendant which would have shown that the said representation was untrue;

Alternatively to the foregoing, and in any event, by reason of the fact that the plaintiff was not informed of the aspects set out in paragraph 6.7.1 to 6.7.3 above, it was alleged that the plaintiff’s alleged informed consent to the operation performed on the 8th of June 2000 was not procured and such operation accordingly constituted an assault on the plaintiff.

**Judgment**

The court stated that the issues which, in the final analysis, call for determination are whether the defendant acted in breach of his obligation arising from the agreement entered into between plaintiff and the defendant, whether the defendant misrepresented to plaintiff that the vascular procedure performed would relieve plaintiff of the severe pain; whether the plaintiff consented to such procedure and if no consent was given or proved whether, in that event, the defendant’s conduct constitutes assault rendering him liable for whatever damages the plaintiff might prove. A finding on these latter issues, said the court, has to be preceded by a finding
as regards what medical intervention, if any, was reasonably required to address the plaintiff’s complaint regarding pain during the period Monday, 5 June 2000 to Thursday, 8 June 2000.

Yekiso J canvassed the disputes of fact and referred in this regard to the decision of the Supreme Court of Appeal in *SFW Group Ltd and Another v Martell et Cie & Others*137. He noted that as an alternative cause of action the plaintiff averred that he agreed to undergo the surgical procedure performed as a result of a false or negligent misrepresentation by the defendant, such misrepresentation having been made with the intention to induce the plaintiff to agree to the procedure performed, and, relying on the truth thereof, the plaintiff did agree to undergo the operation. The plaintiff thus averred that because of such false or negligent misrepresentation he acted to his detriment and consented to the vascular surgery performed and that such consent, because of such misrepresentation, was not properly informed. Yekiso J then made some observations about the general principles applicable to the question of breach of duty or otherwise negligence on the part of a medical practitioner both in his or her pre-operative advice, performance of surgery and in the post-operative treatment of a patient. He observed that Innes, ACJ, as he then was, held as far back as 1914 -

"that a medical practitioner is not expected to bring to bear upon the case entrusted to him the highest degree of professional skill, but he is bound to employ reasonable skill and care; and he is liable for the consequences if he does not. The burden of proving that the injury of which he complains was caused by the Defendant’s negligence, rested throughout upon the Plaintiff. The mere fact that the accident occurred was not itself *prima facie* proof of negligence." (See *Mitchell v Dixon*138)

and that at p526, the learned judge further observed -

137 *Martell* 2003 (1) SA 11(SCA) at p 141 par 5: “The technique generally employed by courts in resolving factual disputes of this nature may conveniently be summarised as follows. To come to a conclusion on the disputed issues a court must make findings on (a) the credibility of the various factual witnesses; (b) their reliability and (c) the probabilities. As to (a) the court’s finding on the credibility of a particular witness will depend on its impression about the veracity of the witness. That in turn will depend on a variety of subsidiary factors, not necessarily in order of importance, such as (i) the witness’ candour and demeanour in the witness-box; (ii) his bias, latent and blatant, (iii) internal contradictions in his evidence, (iv) external contradictions with what was pleaded or put on his behalf, or with established fact or with his own extracurricular statements or actions, (v) the probability or improbability of particular aspects of his version, (vi) the calibre and cogency of his performance compared to that of other witnesses testifying about the same incident or events. As to (b), a witness’ reliability will depend, apart from the factors mentioned under (a)(i), (iv) and (v) above, on (i) the opportunities he had to experience or observe the event in question and, (ii) the quality, integrity and independence of his recollection. As to (c), this necessitates an analysis and evaluation of the probability or improbability of each party’s version on each of the disputed issues. In the light of its assessment of (a), (b) and (c) the court will then, as a final step, determine whether the party burdened with the *onus* of proof has succeeded in discharging it. The hard case, which will doubtless be the real one, occurs when a court’s credibility findings compel it in one direction and its evaluation of the general probabilities in another. The more convincing the former, the less convincing will be the latter. But when all factors are equipoised probabilities prevail.”

138 *Mitchell* 1914 AD 519 at 525

722
“... a medical practitioner is not necessarily liable for wrong diagnosis. No human being is infallible: and in the present state of science, even the most eminent specialist may be at fault in detecting the true nature of a diseased condition. A practitioner can only be held liable in this respect, if his diagnosis is so palpably wrong as to prove negligence, that is to say, if his mistake is of such a nature as to imply an absence of reasonable skill and care on his part, regard being had to the ordinary level of skill in the profession.”

Yekiso J observed that as Strauss correctly points out, this *dictum* still holds good today although medical science has made tremendous strides since 1914 and today’s technological aids being vastly superior to those in 1914, that despite such technological advances of our century, medicine still is not - and probably never will be - an exact science comparable to mathematics. Much depends on the skill and experience of the individual practitioner139.

He noted that the principle enunciated in *Mitchell v Dixon* supra was followed in a number of subsequent decisions, notably *Buls and Another v Tsatsarolakis*140; *Correira v Berwind*41; *Castell v De Greeff*142 amongst others. Foreign case law, in particular judgments of the English courts, although generally do not constitute a binding precedent to our courts, have always had considerable persuade force and are often referred to by our courts143. In *Whitehouse v Jordan* the English Appeal Court held that a “mere error of judgment” on the part of a medical practitioner does not constitute negligence. In this regard Ackerman J in *Castell v De Greeff*44 said the following:

“It has on occasions been suggested that a 'mere error of judgment' on the part of a medical practitioner does not constitute negligence. In *Whitehouse v Jordan and Another* (1981) 1 All ER 267(HL) the House of Lords, *inter alia*, considered the correctness of the statement by Denning MR in the Court of Appeal that:

'We must say, and say firmly, that, in a professional man an error of judgment is not negligence.'

The House of Lords held this to be an inaccurate statement of the law. At 281a Lord Fraser of Tullybelton expressed the view that: "I think Lord Denning MR must have meant to say that an error judgment 'is not necessarily negligent'."

142 Castell 1994 (1) SA 408(C)
143 See *Castell v De Greeff* fn 142 supra at p 416 and a reference therein to the judgment of the English Appeal Court and the House of Lords in *Whitehouse v Jordan and Another* (1981) 1 All ER 267(HL)
144 *Castell* fn 142 supra at p416 E-H
Lord Fraser further observed as follows (at 281 b): "Merely to describe something as an error of judgment tells us nothing about whether it is negligent or not. The true position is that an error of judgment may, or may not, be negligent; it depends on the nature of the error. If it is one that would not have been made by a reasonably competent professional man professing to have the standard and type of skill that the defendant held himself out as having, and acting with ordinary care, then it is negligent. If, on the other hand, it is an error that a man, acting with ordinary care, might have made, then it is not negligent."

With these principles in mind, Yekiso J proceeded in the determination and the resolution of the areas of dispute adopting the approach as stated by the Supreme Court of Appeal in *SFW Group & Another supra*, and to determine whether the defendant’s conduct in his pre-operative advice, performance of surgery and post-operative treatment of the plaintiff, if any, was culpable, and if so, whether such culpability attracted any form of liability. There was conflicting evidence from the expert witnesses in this case. Yekiso J observed that the approach to follow in the evaluation of conflicting expert evidence pertaining to the alleged professional negligence of a medical practitioner was recently restated by the Supreme Court of Appeal in *Michael & Another v Linksfield Park Clinic (Pty) Ltd & Another*145. On a question of how one establishes the conduct and views of the notional reasonableness of a medical practitioner without a collective or representative opinion, the Court held as follows:

"That being so, what is required in the evaluation of such evidence is to determine whether and to what extent their opinions advanced are founded on logical reasoning. That is the thrust of the decision of the House of Lords in the medical negligence case of *Bolitho v City and Hackney Health Authority* [1998] AC 232 (HL (E). With the relevant *dicta* in the speech of Lord Browne-Wilkinson we respectfully agree. Summarised, they are to the following effect. The court is not bound to absolve a defendant from liability for allegedly negligent medical treatment or diagnosis just because of evidence of expert opinion, albeit genuinely held, is that the treatment or diagnosis in issue accorded with sound medical practice. The court must be satisfied that such opinion has a logical basis, in other words that the expert has considered comparative risks and benefits and has reached 'a defensible conclusion' (at 241G - 242B). A defendant can properly be held liable, despite the support of a body of professional opinion sanctioning the conduct in issue, if that body of opinion is not capable of withstanding logical analysis and is therefore not reasonable. However, it will very seldom be right to conclude that views genuinely held by a competent expert are unreasonable. The assessment of medical risks and benefits is a matter of clinical judgment which the court would not normally be able to make without expert evidence and it would be wrong to decide a case by simple preference where there are conflicting views on either side, both capable of logical support. Only where expert opinion cannot be logically supported at all will it fail to provide 'the benchmark by reference to which the defendant's conduct falls to be assessed' (at 243A-B)."

145 *Michael* 2001(3) SA1188 (SCA) at p1200 par 36
Yekiso J analysed the expert evidence and came to the conclusion that, based on these views and the probabilities based on evidence, the nature of pain the plaintiff experienced both pre and post the vascular operation was of a neuralgic nature and not of a vascular origin. On discharge from Panorama the plaintiff was not relieved of pain. The relief only came about after the plaintiff had undergone laminectomy at Vincent Pallotti. The pain was ongoing before and after the vascular operation and the relief only came about after the laminectomy was performed. Yekiso J observed that the plaintiff’s complaints, in his view, ought to have excited a suspicion that all was not well and that the source of the plaintiff’s pain could not have been from the source originally anticipated and, accordingly, would have justified a further investigation which probably would have involved referral of the plaintiff to a neurosurgeon. He noted that Professor De Villiers’ (one of the expert witnesses) evidence was that if the defendant had diagnosed the neuralgic pain, the defendant in all probability would have referred the plaintiff to a neurosurgeon, and if that had been done, the neurological problem would have been addressed first. He was thus of the view that when the plaintiff consulted the defendant on Tuesday, 6 June 2000, he presented two conditions, namely, that of an extensive vascular disease and a neurological problem arising from the nerve entrapment in the lumbar region, that it was the neurological problem which was the source of pain the plaintiff experienced at the time and that it was this condition which had to be treated for the relief of that pain.

Yekiso J stated that in the determination of whether the defendant took all reasonable steps in his examination of the plaintiff, it was appropriate to cite the remarks made in the introduction to the Medical Law Student Guide presented by Professors S A Strauss and M C Maré of the University of South Africa. Those remarks are to the following effect:

"... Of all the professions, none is more intimately involved with the law than the medical profession. Protecting man, his life, personality, physical integrity, health, honour and dignity is one of the fundamental objects of the law. Medical Science depends in no small degree on the law to create an atmosphere conducive to practice, research, and advancement, and calls on the law to determine the permissible limits within which it may operate."

He said if one were to look at the number of guidelines regulating every facet of medical practice, from the initial consultation, medical examination, ethical and professional rules, guidelines for good practice, seeking patients’ consent, one’s
The court observed that the plaintiff first consulted the defendant on Tuesday, 6 June 2000. The consultation could have taken place after 13h30 as the plaintiff had arranged to see the defendant at that time. According to the plaintiff, this was after he had handed over to the defendant a referral note given to him by Dr Simons a day before, being Monday, 5 June 2000. The defendant recalled having been handed Dr Simons’s referral note by the plaintiff. He could not recall what the contents of the letter were except to specifically recall that there was reference in it to a “vascular” problem. Furthermore, the defendant could not recall what was said or discussed during such consultation except to say he would have followed a normal pattern during such a consultation. He would have made notes of such a consultation at the back of the admission form and, at a later stage, would have gone through the notes, dictated a formal letter containing all the information gathered during such a consultation to the referring general practitioner and keep such a letter as his notes. He would then keep the handwritten notes for a period of time and, according to his evidence, once the load of paper has built up, he would then dispose of such notes by destroying them for purposes of recycling. Whatever notes he may have made in his consultation with the Plaintiff, so did the defendant say in his evidence, he may either have destroyed or disposed of for recycling.

Yekiso J noted that the guidelines applicable to medical practitioners and dentists on keeping of patients’ records, define a “medical record” as follows:
"A medical record is constituted by any record made by a medical practitioner at the time of or subsequent to a consultation with, an examination of, or the application of a medical or surgical procedure to his or her patient and which is relevant to thereto."

The notes referred to by the defendant fell squarely within the definition of a medical record in terms of this definition. Yekiso J observed that paragraph 4 of the guidelines under the heading "Compulsory Keeping of Records" provides that a medical practitioner shall, amongst other things, enter and maintain records relating to the assessment of the patient’s condition and the proposed clinical management of the patient. Paragraph 6 of the guidelines provides that such records shall be stored for a period of not less than 6 years from the date they became dormant. The guidelines further provide that other personal records should be kept for a period of eight years after the conclusion of the treatment. The defendant did not have any record relating to the consultation he had with the plaintiff other than a reference to such a consultation in a letter addressed to Dr Simons dated 26 June 2000. He did not have a copy of Dr Simons’s referral letter nor did Dr Simons have it in his file.

The defendant did recall, based on a letter addressed to Dr Simons dated 26 June 2000, that the plaintiff complained of pain on the outer part of the lower leg, just above the ankle; that his foot was painful; that the pain was severe for the past five days; that stepping on the foot made the pain worse. He recalled that the plaintiff informed him that he smokes 30 to 40 cigarettes a day. He suspected that the plaintiff had a vascular problem as he could not feel any pulses in the right leg, which, according to him, was abnormal. He did feel pulses in the left leg; he could not feel the right pulse at all so that he could not compare the two pulses. He recalled that the plaintiff was limping as he walked into the examination room and that he clearly was in pain.

According to the defendant’s evidence, both as regards the initial consultation and the physical examination of the plaintiff, the enquiry during such consultation seems to have focussed on the plaintiff’s professed vascular disease as the proximal cause of the pain the plaintiff experienced at the time. The court observed that this was not surprising in view of what the defendant did recall of a reference to a “vascular” problem in a referral letter addressed to him by Dr Simons. It noted that the defendant
directed no enquiry to the plaintiff as regards his ability to exercise, or his ability to perform the ordinary daily physical functions which would be expected of a normal healthy person. No enquiry was made as regards whether the plaintiff had a history of claudication or whether there was a particular incident linked to the cause of the plaintiff's complaint. When the defendant suggested to the plaintiff that the angiogram be performed it was with a view to establishing what the defendant referred to in his evidence as the "geography" of the plaintiff's arteries in the iliac system so as to obtain the appropriate sites for the location of the bypass prosthesis and not for purposes of diagnosing the extent of the plaintiff's blood flow in the right lower leg. After the angiogram had been performed the defendant performed surgery on the plaintiff the following day, Thursday, 8 June 2000.

Yekiso J noted that the defendant did not make contemporaneous handwritten notes when he consulted and physically examined the plaintiff and, if he did, as he claims to have done in his evidence, he had these destroyed shortly after he had despatched his letter dated 26 June 2000 to Dr Simons or such notes may have been disposed of for recycling. The only indication of the symptoms the plaintiff manifested shortly before the operation by the defendant was the handwritten notes by Dr Simons made during the consultation he had with the plaintiff on Monday, 5 June 2000. It was accepted by all the parties concerned that when the plaintiff consulted with the defendant on Tuesday, 6 June 2000, he manifested an extensive vascular disease which required surgical intervention. The issue to be determined, said Yekiso J was whether, on the probabilities, the vascular disease the plaintiff manifested at the time was the source of pain and discomfort the plaintiff experienced at the time and if so, whether it required urgent surgical intervention. The court observed that under cross-examination the defendant initially testified that after he had physically examined the plaintiff he had determined that the plaintiff's vascular disease needed urgent attention. This he said in an explanation as to why he had booked the theatre for an operation the following day, 8 June 2000. Asked why he was of the view that the disease needed urgent intervention he responded that his earlier reference to urgency was a mistake and all that he had meant to convey was that an attempt had to be made to assist the plaintiff as expediently as possible. In his letter to Dr Simons dated 26 June 2000 the defendant stated that the plaintiff's right foot was clearly "ischaemic" with blue discolouration and decreased temperature. He diagnosed a severe peripheral
“ischaemia". The defendant held this view despite the presence of sufficient collateral blood supply as is clearly evident in the angiographic images. Yekiso J said, in the absence of clear indication of lack of blood supply to the body extremities such as the right foot in the instance of this matter, he could not see how the defendant could determine that the source of pain and discomfort that the plaintiff experienced at the time of his examination could be of severe peripheral ischaemic origin requiring urgent surgical intervention. Yekiso J observed that the defendant omitted to enquire into the plaintiff's ability to exercise. He failed to establish if the plaintiff’s complaint was linked to any particular incident; the symptoms the plaintiff manifested at the time were suggestive of a neuralgic disease; he failed to diagnose the neuralgic disease when symptoms suggestive of “sciatica” were glaring; he failed to inform the plaintiff that the vascular operation was not urgent; that the plaintiff could undergo vascular surgery at a later stage probably when he could afford the procedure of his preference; he failed to keep contemporaneous notes when consulting and examining the plaintiff. The cumulative effect, said Yekiso J, of all these factors justified no other conclusion other than that the standard adopted by the defendant did not measure to the reasonable standard expected of a man of his calling.

Whether the plaintiff consented to the procedure performed, was the next issue to be determined. In this regard Yekiso J made the following observations. For a medical practitioner to be able to invoke a patient’s consent as a ground of justification, it must be shown that the patient not only consented to the injury and the medical intervention proposed, but that the patient also consented to the risks and consequences consequent upon such medical intervention. Consent will therefore only be valid where it is based on essential knowledge regarding the nature and the effect of the proposed treatment. This entails that consent must be informed. Consent to treatment will only be “informed” if it is based on substantial knowledge concerning the nature and the effect of the act consented to. Thus a medical practitioner is obliged to warn a patient of the material risks and consequences which may ensue during and consequent to the proposed treatment. In Castell v De Greef, Ackerman J formulated the following test in the determination of whether or not consent has been given in any set of circumstances and whether such consent is informed:

“For consent to operate as a defence, the following requirements must, inter alia, be satisfied:
a) the consenting party must have had knowledge and been aware of the nature of the harm or risk;

b) the consenting party must have appreciated and understood the nature and extent of the harm and risk;

c) the consenting party must have consented to the harm and assumed risk;

d) the consent must be comprehensive, that it extend to the entire transaction, inclusive of its consequences.

There is a duty on the medical practitioner properly to inform the patient of the risks attendant on his or her treatment and its dangers. The object is to enable the patient to decide whether or not to run the risk of consenting to the treatment or procedure proposed (see Chester v Afshan146). In Richter and Another v Estate Hamman147 the court held that a doctor’s conduct in informing a patient of the material risks attendant to the proposed treatment or procedure should be adjudged by the standard of the reasonable medical practitioner faced with a problem concerned. The court postulated this approach as follows-

“In reaching a conclusion (as regards the disclosure of a risk by the doctor) a court should be guided by medical opinion as to what a reasonable doctor, having regard to all, the circumstances of the particular case, should or should not do. The court must, of course, make up its own mind, but it will be assisted in doing so by medical evidence,”

Yekiso J noted that the full bench in Castell v De Greef did not follow the approach in Richter. It held that a medical practitioner is obliged to warn the patient consenting to a medical treatment of a material risk inherent in the proposed treatment holding that “a risk is material if, in the circumstances of a particular case:

a) a reasonable person, in the patient’s position, if warned of the risk, would be likely to attach significance to it or

b) the medical practitioner is or should reasonably be aware that the particular patient, if warned of the risk, would be likely to attach significance to it.”

This standard which, in the view of Yekiso J, and as was indeed held in Castell v De Greef, focuses on patient autonomy rather than the views of the medical profession, is in conformity with the fundamental right of individual autonomy and self-determination. He found that he was thus bound to follow this approach unless satisfied it is clearly wrong, which it is not. The question, said Yekiso J, as to whether or not consent was given in any set of circumstances is one of fact. The law does not,

146 Chester (2002) 3 All ER 552 at 572E
147 Richter 1976(3) SA 226(C)
save in certain specific instances, prescribe how the required consent should be procured. Based on this approach he proceeded to determine, on basis of evidence, if the consent purportedly procured from the plaintiff was an informed one.

It appeared from the evidence that arising from a consultation and the subsequent examination of the plaintiff, the latter was offered the aorta-bifemoral procedure to address his problem. This offer, was subject to an angiogram being performed on the plaintiff which was done on Wednesday, 7 June 2000. Shortly after the angiogram was performed, the plaintiff was admitted to the ward. According to the plaintiff’s evidence no further discussion took place after the angiogram was performed until the early evening when the defendant was called into the ward and the discussion of the cost implications of the proposed treatment ensued. It also appears that a Mrs Cloete, who was in the employ of Panorama at the time, was present when the discussion took place. The plaintiff stated in his evidence that it was not clear to him what was being discussed in this discussion except to say only one procedure was suggested to him. Nothing was said to him, according to his evidence, about the precise nature of the procedure suggested or any material risks attendant on the procedure proposed.

When the defendant was asked when the plaintiff’s informed consent was obtained to the procedure performed the defendant replied that as far as he could recall, the required consent was obtained in the evening of Wednesday, 7 June 2000 after a lengthy discussion about the cost implications. When further asked if the consent was obtained on Wednesday evening in the ward, the defendant’s response was that he was not certain, that it could have been in the evening or it could have been the next morning, that is the morning before the operation. It either could have been late in the evening of Wednesday, 7 June 2000 or the following morning, so the defendant said. The defendant stated further that the required consent was discussed with the plaintiff verbally and once consent was given the patient would sign a form. The defendant was then referred to the form the plaintiff signed in the morning of 8 June 2000 and asked if that is the consent form relied on and the defendant replied in the affirmative. The defendant stated in evidence that the procedure performed on the plaintiff was ilio-femoral by-pass operation but, on basis of the consent form, the plaintiff consented to a femoro-femoral by-pass operation. Yekiso J noted that the defendant further stated in his evidence that the procedure required to be performed on the
plaintiff was not urgent despite the fact that the plaintiff experienced severe pain at the time. There was no evidence to suggest that the defendant did discuss this lack of urgency or that the procedure could be performed at a later stage in order for the plaintiff to decide when it would be appropriate and convenient for him to undergo the proposed operation.

The plaintiff's version was that in the discussion he had with the defendant, in the presence of Mrs Cloete, only one procedure was suggested to him and no other procedure was discussed with him other than the one the defendant offered. Yekiso J observed that if consent to the alternative procedure was offered and accepted in this discussion, it would have been accepted and, therefore, procured in the presence of Mrs Cloete. Mrs Cloete who could have corroborated the defendant's version was not called to testify nor was she amenable to be subpoenaed by the plaintiff. The judge said that the inference was thus irresistible that either her evidence would have supported the plaintiff's version or would not have supported the defendant's version. But if she would have supported the defendant's version it was inconceivable why she was not called. Yekiso J found that on the evidence he could not find that the plaintiff was properly counselled before the vascular operation was performed, that other options, other than the procedure performed, were properly discussed with him, in particular that he did not need to undergo the vascular operation immediately, that he was advised of the material risks attendant to such operation and that he had given an informed consent to such operation. He then turned to the question of whether the defendant's failure to obtain the informed consent of the plaintiff amounted to an assault. In this regard Yekiso J noted that in a number of decisions the courts have always held that in instances where a medical practitioner administers treatment to a patient without the patient's informed consent, such conduct constitutes assault. The judge then noted that there is a school of thought that such conduct on the part of a medical practitioner, if it falls short of assault, it nonetheless could amount to a violation of a right to privacy. The court noted that in Broude v McIntosh & Others Marais JA considered it a strange notion that this type of conduct should be juristically characterised as an assault. He made the following remarks:

148 He referred specifically to Esterhuizen v Administrator, Transvaal 1957(3) SA 710(T), Lampert v Hefer N.O. 1955 (2) SA 507(A) and Stoffberg v Elliot 1923 CPD 148
149 Broude 1998(3) SA 60 (SCA)
"Pleading a cause of action such as this as an assault to which the plaintiff did not give informed consent is of course a familiar and time-honoured method of doing so. However, I venture to suggest with respect that its conceptual soundness is open to serious question and merits re-consideration by this Court when an appropriate case arises."

It was the view of Yekiso J that these remarks were no more than an obiter dictum so that, bound as he was by the ratio of the Full Bench of the Cape High Court in Castell v De Greef he therefore found that the defendant's conduct, to the extent that whatever consent which may have been given was not properly informed, constituted assault.

Yekiso J observed that Prof De Villiers ascribed the plaintiff's current state of claudication to a "steal syndrome" caused by the diversion of blood flow from the donor limb to the diseased limb, that this "steal phenomenon" is an inherent risk to the type of operation the defendant performed on the plaintiff and that this complication should have been anticipated irrespective of whether there is a proximal or distal stenosis. The view held by the defendant and his experts was simply that if the take-off site of the graft was located on or below a proximal stenosis, it would have no effect on the donor limb, and in view thereof, no diversion of blood flow will ensue. This contention caused the court great difficulty. In the first instance, the very procedure which the defendant claimed to have performed was in itself in dispute.

The consent form signed by the plaintiff indicated that the plaintiff consented to a femoro-femoral by-pass operation. The defendant, on the other hand, contended he had performed an ilio-femoral by-pass operation. No operation notes were either produced or discovered to verify the kind of procedure the defendant performed on the plaintiff. The court observed that there was a significant difference between the two operations although both were classified or fell into the category of so-called "cross-over" operations, the point of departure being that the graft was at differing places, with the ilio-femoral being performed higher up than the femoro-femoral procedure. It was therefore difficult, said Yekiso J, to uphold the defendant's contention without, in the first instance, being in the position to determine which procedure was performed. The defendant was assisted by Dr Charl Dreyer. According to the defendant Dr Dreyer would have been in a position to testify as to the take-off
site of the graft on the left leg and also confirm the type of operation performed. But Dr Dreyer was not called to give evidence on behalf of the defendant. Yekiso J noted that claudication, according to The World Book Medical Encyclopaedia: Your Guide to Good Health, is limping that is usually caused by pain. Intermittent claudication, which was the symptom the plaintiff was experiencing, is pain or cramp in the calf muscle after exercise. It is relieved by rest, but the pain recurs when the muscle is again exercised. The cramp like pain is the result of inadequate blood supply with the resultant inadequate amount of oxygen to the calf muscle. The plaintiff contended that he did not experience this symptom prior to an operation and that this symptom only manifested immediately he had undergone vascular surgery.

There was a further difference of opinion amongst experts as regards the cause of the plaintiff’s current symptoms, Prof De Villiers holding the view that the plaintiff’s current symptoms were as a direct result of the vascular surgery performed on the plaintiff by the defendant. Prof de Villiers postulated the position as follows in his evidence:

“...there is less blood supply to the left leg and therefore you get claudication. So in that respect, in respect of the operation done by Dr Louwrens, in that respect he is responsible for it.”

In support of this view Prof de Villiers relied on the view expressed in a recent publication Vascular Surgery. The passage relied upon read as follows:

“It is possible to produce steal in the donor extremity after femoro femoral bypass if there is outflow occlusive disease (eg. Superficial femoral artery occlusion) on the donor side. Even if this is not likely to become clinically manifest, however, unless there is greater flow demand (eg. with exercise), donor iliac artery stenosis or poor cardiac function.”

Dr de Kock, whose view was supported by the defendant and as well as the defendant’s other experts said the following in his expert summary:

“When after femoro-femoral bypass procedure, the blood supply to his right leg was significantly improved, he became more mobile as a result of which he developed claudication in the left leg and possibly exerted himself to the extent where he suffered a disc prolapse.”

---

150 Rutherford RB (5th ed) at p 983
Dr de Kock was further of the view that, because the plaintiff had an occlusion of the left superficial femoral artery and relying on the angiographic images of the plaintiff’s blood supply, there is no way that the plaintiff could have been active enough prior to undergoing surgery to precipitate symptoms of claudication.

Prof De Villiers stated in his evidence that the risk of steal arising following an ilio-femoral or femoro-femoral by-pass operation is in the order of 15%. In support of this contention he referred to a clinical study of war veterans, the Veterans Administrative Co-operative Study and the Veterans Administration Hospitals. In this study, so Prof de Villiers testified, three hundred and seventeen patients who had femoro-femoral by-pass surgery were examined for post-operative vascular changes that developed in the donor limb. Unmasked claudication developed in 7%; new claudication related to steal developed in 3.5%; prognosis of pre-operative claudication developed in 1.7% and concluded that the donor limb pressure measurements post-operatively is in the order of 15%. Yekiso J stated that in his view the opinion expressed by Professor de Villiers was based on logical reasoning, had a logical basis, accorded with the objective evidence and was capable of logical support. He was further of the view that the symptoms of claudication the plaintiff was experiencing were as a consequence of the vascular operation performed by the defendant, that the plaintiff’s current symptoms were an inherent risk of a significant nature and that the defendant failed to inform the plaintiff of this risk adequately or at all.

Yekiso J concluded that the defendant, in his consultation and pre-operative advice to the plaintiff, acted in breach of his contractual obligations in the respects set out in paragraph 6 of plaintiff’s particulars of claim and, in particular, the defendant failed to procure the plaintiff’s informed consent in respect of the operation performed on the plaintiff and, in absence of consent which is properly informed, the defendant’s conduct constituted assault. In the light of this finding, he said, it was not necessary to determine the issue of misrepresentation alleged in paragraph 7 of the plaintiff’s particulars of claim.

He found that as a result of the defendant’s breach of his contractual obligations, the plaintiff suffered damages as more fully set out in paragraph 9 of the plaintiff’s particulars of claim the extent and quantum of which, per agreement between the
parties, was still to be determined and which damages were as a result of failure by the defendant to discharge his contractual obligations. Consequently Yekiso J ruled that the defendant acted in breach of his contractual obligations arising from the oral agreement entered into between the plaintiff and the defendant on 6 June 2000 and ordered the defendant to pay the plaintiff’s costs on a party and party scale, such costs to include the qualifying expenses of the expert witnesses.

Discussion

It is submitted that the decision in this case is an exemplary one that clearly illustrates a number of the points that have been made earlier in this chapter. Unlike the decision in *Afrox Healthcare v Strydom*, the court in this case had no difficulty in recognising the contextual differences between contracts involving provider and patient and those involving providers and users of other kinds of services. Yekiso J expressly referred to the fact that the medical profession deals with protecting man’s life, personality, physical integrity, health and dignity that it is precisely for this reason the medical profession is the focus of a constant search light and appears to be one of the most over regulated professions in the world. The facts of the case indicate the lack of regard in which medical practitioners in South Africa hold their patients, their inattention to the complaints of patients and their failure to adequately monitor and evaluate the patient’s condition before and after treatment. One might not unreasonably describe the attitude manifested by the medical practitioner on the facts of the present case as a lack of regard for the human dignity of the patient. He apparently did not inform him of the true nature of the operation to be performed on him, he did not take sufficiently seriously the patient’s complaints of continued pain despite the treatment administered, treatment alternatives where not discussed with him, the circumstances in which the patient’s consent was sought were clearly unimportant to the medical practitioner treating him and the risks attendant upon the proposed surgical procedure were not explained. It is submitted with respect that Yekiso J’s view that such handling of a patient could in certain circumstances constitute assault and his refusal, whether for reasons of precedent or not, to take up the suggestion which the court seemed to have raised in *Broude v McIntosh &
Others that failure to obtain informed consent should not be regarded as assault is laudable and entirely consistent with the importance of the constitutional right to human dignity and the fact that dignity is a fundamental value upon which the Constitution is based. It is submitted that it is necessary and appropriate both in light of the current climate of health services delivery in South Africa, as evidenced by the manner in which the plaintiff in the present case was handled by the defendant, and in view of the manner in which the medical profession in South Africa has in the not so distant past condoned or overlooked violations of the right to bodily and psychological integrity, to continue to label medical treatment in the absence of informed consent as assault. Such a label aptly conveys the gravity of the failure to obtain such consent and the level of public disapproval of such failure in terms of the legal convictions of the community.

The court’s censure of the defendant for his failure to keep proper medical records is also worth noting. Failure to keep proper medical records not only acts to the detriment of a health professional when he or she has to defend claims of breach of contract or medical negligence but also impairs his or her ability to adequately treat a patient since there is no record of the patient’s complaints, what was or was not done to address them and the extent to which treatment was effective. When coupled with the health practitioner’s obvious inability in this case to remember even important details such as the nature of the operation that was in fact performed and whether or not the informed consent of the patient to that particular operation was obtained, this suggests a potentially irrational and piecemeal basis for the treatment of a patient that falls far below the standard of care required of a person holding himself out as an expert and a professional. If a medical doctor cannot remember from visit to the next the nature of the treatment administered to a patient, and does not record such details how can he possibly claim to be treating the patient with due care and skill? Many health conditions are ongoing as for instance in the case of chronic conditions. Patients develop immunity or become resistant to certain treatments over time so that they become ineffectual necessitating a variation in the treatment regime. Some treatments are unsuccessful for certain patients whilst successful for others which means there may be a treatment list that one has to work through to establish what

---

151 Broude v McIntosh and Others fn 149 supra
works for a particular by process of elimination. Other treatments are only effective in the absence or presence of certain medication, certain allergies, certain socio-economic factors etc while still others preclude the possibility of subsequent administration of alternatives. If a provider of health care services does not recall the nature and extent of previous treatments he has administered to a patient, this can have potentially serious consequences for that patient which is no doubt why proper record keeping is an ethical and professional requirement. The failure to keep a proper patient record could, in its own right constitute professional negligence in certain circumstances. In the present case the defendant could not apparently even prove conclusively the exact nature of the operation that he had performed on the patient. In the context of a claim for medical negligence it would be extremely difficult to show that he acted reasonably in doing the operation that he in fact performed.

6.3 Summary and Conclusions

The law of contract as it is currently interpreted and applied by the courts does not take cognisance of certain practical realities in the context of health services delivery. It is most unfortunate that the Supreme Court of Appeal has persisted in regarding health care services in the same light as any other service and suppliers of health care services the same as suppliers of any other service. The writer has made the point elsewhere, but it bears repeating here, that the law is only relevant in context. If law is to be meaningful the context in which it is applied must inform and if needs be modify the broad general principles in order to ensure that justice is done. To elevate legal principles above the need for justice and above the precepts of public policy as evidence within the Constitution is to diminish the value of law to society. The law of contract should not be construed or applied in the same way that it was one hundred years ago because although legal precedents evolve slowly, the context in which they must be applied has changed drastically. New developments in the funding and delivery of health care services, different ways in which relationships between provider and patient have come to be structured, the profound changes to the South African legal system wrought by the Constitution, and more specifically in the present context the fact that access to health care services is now a constitutional right have all contributed significantly to a very different ‘commercial’ context for the delivery
of health care services. There is widespread international recognition of the need to protect consumers from unconscionable, unfair clauses in contracts. There is also considerable international debate and discussion concerning contract theory and the directions in which the law of contract, and indeed the concept of contract, needs to evolve in order to remain meaningful to society. It is fairly obvious to anyone prepared to devote even a little thought to the subject of contracts and the environment in which they operate to appreciate that the world has changed

---

Heffey P, Peterson J and Robertson A Principles of Contract Law point out that recent research on contracts "shows that parties to relational contracts are not the hard-nosed, profit-maximizing individuals engaged in the traditional exchange that classical contract theory and neo-classical economics would have us believe. Parties to contracts are often engaged in long-term relationships with one another, or as part of a close-knit industry, and that has a significant impact on the way in which they deal with one another. These empirical insights have given rise to a whole new way of looking at contracts. Rather then viewing contracts as discrete exchanges between utility-maximizing individuals, relational contract theory views contracts as a more complex social interaction. Macaulay identified the need to view contracts in a different way which took into account the relations between the parties. Ian Macrell then explore what it meant to look at a contract from a relational perspective." They observe that Macrell's analysis of contracts is based on recognition of the fact that contractual relations are conducted within a social matrix. Exchange is only possible within a society that provides: firstly a means of communication (so that the parties can understand one another) secondly: a system of order so that the parties use exchange rather then force to get what they want; thirdly, a payment mechanism for the enforcement of promises. Since a contract can only be made against such a social background, all contracts are relational, in the sense of involving social relations and being embedded in a much broader social web. Some contracts are, however, more relational than others in the sense that they are more deeply embedded in social relations. Macrell has suggested that there exists a spectrum of contractual behaviour with highly relational contracts at one end and discrete transactions at the other. A relational contract is one in which social relations play a significant role. This may be because the performance of the contract is so closely integrated with the parties' other activities, because parties are relying heavily on social conventions or because the parties are involved in a long-term relationship. In a highly relational contract the parties are less likely to be able to predict and deal with future contingencies. The more relational the exchange the less the parties will plan and allocate risks. Thus more flexibility will be required during the course of the relationship... Social relations may play a significant role in an exchange because the parties expect each other to behave in accordance with social customs and conventions which define their respective roles. The role of a medical doctor for example, is defined by social convention. A patient consulting a doctor about a particular medical problem would find it very difficult to spell out in advance the doctor's obligations in respect of diagnosis, treatment and referral. Instead of attempting to define the doctor's obligations in advance, the patient relies on the doctor to operate within and fulfill the doctor's socially understood role.

It is submitted that where the role of the doctor as socially understood, has in fact departed from that social understanding, for example with regard to the fiduciary relationship of a doctor to a patient where the doctor himself no longer considered it evidence of a need for his legislative, judicial or regulatory protection of the patient. The arguments of the patient in Axford (fn 100 supra) in terms of his perceptions of the manner in which a private hospital is supposed to behave towards its patients as opposed to the approach of the hospital itself to its patients is a case in point. The patient had a relational perception of his contract with the hospital whereas the hospital itself perceived the transaction as discrete and structured it that way. It is submitted that to permit contracts structured on the basis of discrete transactions that more appropriately belong in the relational setting, as the court did in Axford, can lead to the unfair application of the rules of the law of contract and an unacceptable disregard for clear principles of public policy.

Heffey et al note that: "At the discrete end of the contractual spectrum are transactions that are more isolated from the social context in which they are made. A relatively discrete transaction does not involve any significant co-ordination between performance of the contract and the parties' other activities, requires less flexibility and co-operation between the parties and does not draw so heavily on social conventions and understandings. A one-off exchange will usually be relatively discrete, but this will not always be the case. A single visit to a doctor is likely to be highly relational, for the reasons discussed above, even if the patient has not seen the doctor before and never does again. Macrell's example of a highly discrete transaction is a motorist making a cash purchase of petrol at a service station on a highway on which the motorist rarely travels. This transaction involves the simultaneous (or almost simultaneous) exchange of goods and money, and does not involve any ongoing obligations. Even this transaction is deeply embedded in a broad, complex social web consisting of such things as social conventions regarding behaviour, brand loyalty (possibly involving loyalty reward schemes) and credit card or electronic payment mechanisms. The authors point out that the relational perspective identifies a deficiency in classical and economic approaches to contract law because the discrete exchange is at the heart of both understandings of a contract. They note that Ouel ("Relational Contract Theory and the Concept of Exchange") (1990) 46 Buffalo Law Review p 763 has observed: "Contract law was and is relatively well adapted to dealing with discrete transactions. However, it was and is ill-equipped to deal with problems arising out of contract relations. To put it another way, contract law has had a powerful bias in favour of discreteness, and discrete legal doctrines applied to relational contracts often produced results that were intuitively unfair."
considerably since Roman times and that contracts are instruments used to regulate highly complex, socio-economic, as opposed to purely economic, relationships between parties. The interests of broader society in contracts between two parties have intensified in many instances to the point where legislation governs the standard terms and dictates whether or not terms introduced by the parties themselves are socially and legally acceptable. Fuller and Perdue\textsuperscript{153} observe that the proposition that legal rules can be understood only with reference to the purposes they serve would today scarcely be regarded as an exciting truth. The notion that law exists as a means to an end has been commonplace for at least half a century. They point out, however, that there is no justification for assuming that because this attitude has now achieved respectability, and even triteness, that it enjoys a pervasive application in practice. We are still all too willing, they say, to embrace the conceit that it is possible to manipulate legal concepts without the orientation which comes from the simple inquiry: toward what end is this activity directed? It is submitted that nowhere in South African law is the truth of this statement more evident than in the judgment of the Supreme Court of Appeal in Afrox Healthcare v Strydom\textsuperscript{154}. Relational contract theory contests the idea that promise is at the heart of contract. In more relational exchanges, since the parties do not plan in a comprehensive way, their promises are likely to be incomplete (which is exactly the case in most health care settings) and so their association will be governed by relational norms\textsuperscript{155}.

In the context of health care services in particular, the contractual relationship, as opposed to the delictual one is problematic in South African law. The law of contract does not recognize damages for non-patrimonial loss and yet does not satisfactorily

\textsuperscript{154} Afr ox fn 100 supra  
\textsuperscript{155} Hillman, 'The Crisis in Modern Contract Theory' 1998 67 Texas Law Review 103 as referred to by Heffey, Paterson and Robertson (fn 152 supra). See also Kraus J 'The Methodological Commitments of Contemporary Contract Theory' University of Virginia School of Law, Law and Economic Research Paper Series Working Paper No. 01-2 May 2001 http://papers.ssrn.com/ ; Schwartz A and Scott RE 'Contract Theory and The Limits of Contract Law'. These two authors observe that contract law has neither a complete descriptive theory, explaining the law that is, nor a complete normative theory, explaining the law that should be. They say that these gaps are unsurprising given the traditional definition of contract as embracing all promises that the law will enforce. "Even a theory of contract law that focuses only on the enforcement of bargains must still consider the entire continuum from standard from contracts between firms and consumers to commercial contracts between business firms. No descriptive theory has yet explained a law of contract that comprehends such a broad domain. Normative theories that are grounded in a single norm – such as autonomy or efficiency – also have foun dered over the heterogeneity of contractual contexts to which the theory is tropically. Pluralist theories attempt to respond to the difficulty that unitary normative theories pose by urging courts to pursue efficiency, fairness, good faith and the protection of individual autonomy. Such theories need, but so far lack a meta principle that tells which of these goals should be decisive when they conflict."
address the question of why exactly the risk of these damages should, in the case of a contract for health care services, lie with the patient rather than the provider of such services. The risk of pain and suffering is integral, rather than incidental, to the services contemplated in a health care contract. It has been noted that the South African courts seem to have a preference for dealing with claims involving health care services on delictual rather than contractual grounds where both are an option. It is submitted that one of the reasons why the delictual relationship possibly lends itself more readily to resolution of a case is because it is more expressly contextualised within the society in which it operates with concepts such as unlawfulness being overtly decided with reference to public policy and the legal convictions of the community and with no possibility of the exclusion of these factors by means of a condition agreed between the parties as would be the case in the contractual setting. The 'commercial' flavour of the law of contract in South Africa does not sit comfortably in the context of health services delivery since considerations involving bargains and bargaining power, the relative autonomy of the contracting parties to dictate the terms of the contract and the importance of freedom of contract are not central issues when it comes to access to health service delivery.

In the context of the public health sector, the notion of a contractual relationship between provider and patient is seldom if ever essential to the delivery of health care services. Regulations determine the fees payable by the patient and public policy and public health planning determine the range of health services available to the patient and the circumstances in which they may be accessed. Within the private sector, the notion of a contract between provider and patient seems to be relatively more important in the sense that it gives the provider a legal right to claim payment from the patient but in reality, the majority of patients cannot afford the costs of medical treatment, especially in private hospitals, in the absence of funding by a third party such as a medical scheme. The promise of recovery of payment from a patient through the enforcement of contractual obligations in the event of the failure of a medical scheme to pay is often hollow and for the provider, represents the risk of a bad debt. Then there is the other socio-economic aspect which involves the attachment by a provider of major assets of the patient such as a house or a car in order to recover payment on the debt owed by a patient who, often through no fault of his own, is left in the lurch by a medical scheme or insurance company when both he
and the hospital were under the impression at the time of treatment, that the funds therefor were available. Is it really in accordance with constitutional principles, rights and values that a person must sacrifice one socio-economic right (such as the right to housing or shelter) in order to be able to exercise another (the right of access to health care services)?

It is clear that unless South African courts are prepared to depart from antiquated views of the contexts in which the law of contract operates and to accept modern socio-economic and relational realities, the law of contract in the health sector at least, has a very limited future as between provider and patient. Contracts between corporate funders of health care services and providers of those services may serve to largely replace the need for contracts between the individual patient and the provider in many instances as the South African government is presently considering a system of Social Health Insurance which will operate as much within the private sector as in the public sector. Legislation tends increasingly to govern relationships between providers and patients in such environments. The beginnings of such legislation, in the form of the provisions of the Medicines and Related Substances Act concerning the licensing of dispensing doctors and the pricing of medicines are concrete examples of such a trend. More advanced approaches to the law of contract clearly indicate that contracts still have much to offer in the regulation of relationships between private individuals and entities even in the context of health service delivery. If the South African law of contract was capable of embracing such advanced approaches and developing in a way that effectively and realistically meets the needs of South African society there is no doubt that it could still be a useful way of understanding and upholding various kinds of relationships in civil law. Unfortunately there seems to be little promise of such developments locally.

156 Fn 12 supra
Chapter 7
Law Of Delict: Health Service Delivery

7.1 Introduction

Civil wrongdoing in the context of the law relating to health services delivery introduces the question of the balance of power between provider and patient and whether the fact that the provider usually has a considerable advantage over the latter should have any bearing on the manner in which the law addresses claims in delict. The patient is often in a position of vulnerability in relation to the health care provider similar to very few consumers of other goods and services. It is obvious that health services are of such a nature that they are extremely personal to the consumer. The vulnerability of the patient as consumer of health care goods and services manifests on a number of fronts –

- The knowledge of the service provider usually far exceeds that of the patient. The latter is, most of the time, in no position to disagree with the service provider on technical points such as the likelihood of success of a particular form of treatment vis-à-vis other treatment options and the relative levels of risk involved;
The quality and efficacy of service provided is often dependent as much upon the level of personal skill and expertise of the service provider, which the patient is usually incapable of assessing in any meaningful way, as it is upon the selected treatment modality;

In the case of surgical procedures, services are delivered while the patient is unconscious and therefore completely oblivious of what is happening to him or her;

The services are usually rendered in circumstances where the patient is already weakened either physically or psychologically, or both, by a health condition;

The service provider is often party to the most intimate details of the patient’s life and may know more about him than even his spouse;

The patient often has no option but to trust the service provider, especially in the public sector where choice of providers is usually extremely limited, if it exists at all.

The consequences of failure by the service provider to perform in accordance with acceptable and recognised standards can be extremely costly to the patient in the sense that no amount of money can compensate for what is lost. In some instances, the negligence of the service provider can command the highest price of all – the life of a patient.

There are a number of rights in the constitutional Bill of Rights that are impacted by this relationship. They are the rights to life and human dignity, the

3 Constitution section 10
right to privacy⁴, the right to freedom and security of the person⁵, the right to bodily and psychological integrity⁶, the right of access to health care services⁷ and the right to equality⁸ - to name those rights most directly involved.

The manner in which the provider relates to the patient is itself a part of the services the former is rendering and can influence the outcome of the treatment. Patients are therefore uniquely vulnerable in the provider-patient relationship. In an obvious example, that of psychiatry, the manner in which the psychiatrist relates to her patients could literally mean the difference between whether they commit suicide or commit to long term therapy for depression⁹. In a less obvious example, a doctor may have to convince a patient that it is in the patient’s best interests to undergo an HIV test. The patient is unlikely to consent to this if the doctor comes across as being critical of HIV positive people as immoral or inferior to others or more concerned for his own safety in treating the patient than in the patient’s wellbeing. In other provider-purchaser relationships, the relationship itself is not necessarily a material factor influencing the quality and efficacy of the services. An evil tempered plumber is capable of fixing a broken pipe as well as an even tempered one and apart from some extra unpleasantness for the customer in the case of the former, the

⁹ The Royal College of Psychiatrists in “Vulnerable Patients, Vulnerable Doctors: Good Practice in Our Clinical Relationships” http://www.rcpsych.ac.uk/publications/cr/council/eq/101/pdf dated April 2001 recommends that the clinician should develop self awareness – the ability to monitor and understand his or her own feelings and actions within the therapeutic relationship. They state that the clinician is in a particularly powerful position in any relationship with a patient and that the patient trusts the clinician to handle that power with sensitivity. It notes that in certain circumstances the clinician is charged with taking over responsibility for deciding what is in the patient’s best interests, sometimes against the will of the patient. Such action should be taken only when there is no alternative, in the least restrictive manner possible with reciprocal benefit to the patient, strictly within the law and with due consultation. It observes that it is not in the patient’s best interest for the clinician to hold on to knowledge about the patient’s condition or to “invent” certainty where there is none, for the clinician’s own comfort. The Society states that the ability to decide how to impart difficult information sensitively – both the certainty and uncertainty of diagnosis and prognosis – is a skill that the clinician must acquire and observes that therapeutic relationships are founded on mutual respect and that respect breaks down when the expectations of the patient exceed the capabilities of the therapist and vice versa. In the document it is recognized that all patients are vulnerable by virtue of being patients needing help. See also Strauss SA “Geneesheer Pasiënt en Reg: ‘n Delikate Driehoek” 1987 TSAR 1
outcome is still the same and the pipe is fixed. The area of clinical trials is another one in which patient vulnerability has been recognised.

In other contexts the law does take cognisance of such imbalances between suppliers and purchasers and attempts to redress them. For instance in **Consol Ltd T/A Consol Glass v Twee Jonge Gezellen (Pty) Ltd And Another** the court had the following to say on the subject of consequential damages:

"In my view plaintiff's submission on this issue is correct. The meaning of the term consequential loss or damage is unfortunately not precise. In one sense it is contrasted with direct damage. Visser and Potgieter *Law of Damages* at 55 refers to a view that direct loss means the immediate or direct consequence(s) of a damage-causing event, while consequential loss is damage that flows from such direct loss. In the context of relief under the aedilitian remedies, however, a claim for consequential damages is contrasted with redhibitorian relief, ie relief for the return of the purchase price paid for the defective goods. See **Holmdene Brickworks (Pty) Ltd v Roberts Construction Co Ltd** 1977 (3) SA 670 (A) at 682in fine - 683C: 'The legal foundation of respondent's claim is the principle that a merchant who sells goods of his own manufacture or goods

10 See for example Perkins H S 'Balancing Self and Patient in the Physician-Patient Relationship' *Chest* April 2002 (http://www.findarticles.com) in which he observes that: "Certain sensitive relationships involving unequal parties demand a higher motivation than self-interest. The stronger party has a special duty to ignore self-interest and serve the interests of the weaker party. Such relationships are called fiduciary because the weaker party must trust the stronger. Physician power and patient vulnerability make the physician-patient relationship necessarily a fiduciary one. The physician must promote the patient's legitimate medical interests, sometimes at a cost to the physician's own interests. The rational for such a fiduciary duty is clear: a patient will not come for care without trusting the physician to promote the patient's interests." Perkins refers to the issue of clinical trials funded by pharmaceutical companies and performed by practising physicians and a specific trial comparing a new inhaled corticosteroid, a proven inhaled corticosteroid and a placebo for treating moderate persistent asthma. He notes that there is convincing argument that by withdrawing patients with stable asthma from proven treatment and randomising some to the placebo, the trial risks patients' serious clinical deterioration. In response to the question as to why the trial was approved he notes the speculation that self-interest was the driving force – that the sponsoring company may have expected marketing advantages from the results and the participating physicians their fees for subject recruitment. Perkins makes the point that if physicians received bounties for recruiting patients to the study then this creates a serious conflict of interest since the profit motive may have tempted physicians to recruit their patients despite the medical risks involved. He also points out that there were consistent references in the trial report to subjects as 'patients' and to research interventions as 'treatments'. He says that this blurred the critical distinction between research and therapy. Research subjects should expect no benefit and possibly some harm from research interventions. Furthermore, he says, research physicians owe subjects only the few services detailed in consent forms. In contrast, patients can expect benefit from therapy and treating physicians owe them extensive, often unwritten, fiduciary services. Not grasping this distinction, says Perkins, many patients mistakenly expect therapeutic benefit from research and physicians often do not think to correct the misunderstanding.

See also Puttagunta PS, Caulfield, T A, Griener G, 'Conflict of Interest in Clinical Research: Direct Payment to the Investigators for finding Human Subjects and Health Information' *Health Law Review* Vol 10 no 2 p30 (www.law.unibertsu.eu) who note that the recent death of a teenager in a drug therapy trial has drawn attention to how financial conflicts of interest may compromise patient protection. They state that while research institutions throughout the world have instituted a variety of conflict of interest guidelines, the potential conflicts associated with investigators receiving direct payment from private companies for both recruitment of patients and the running of clinical trials in pharmaceutical research remains a relatively unexplored area. They note that more and more doctors in private practice are being recruited to run industry sponsored trials and that this trend arose in the last twenty years when government funding for clinical drug trials declined and industry funding increased. "They note that the conflicts include erosion of informed consent, compromise of patient confidentiality and enrolment of ineligible subjects in clinical trials." **Consol Ltd 2002 (6) SA 256 (C)***
in relation to which he publicly professes to have attributes of skill and expert knowledge is liable to the purchaser for consequential damages caused to the latter by reason of any latent defect in the goods. Ignorance of the defect does not excuse the seller. Once it is established that he falls into one of the abovementioned categories, the law irrebuttably attaches this liability to him, unless he has expressly or impliedly contracted out of it. (See Voet 21.1.10; Pothier *Contrat de Vente*, para 214; Kroonstad Westelike Boere Ko-op Vereniging *v* Botha 1964 (3) SA 561 (A); also Bower *v* Sparks, *Young and Farmers Meat Industries Ltd* 1936 NPD 1; Odendaal *v* Bethlehem Romery Bpk 1954 (3) SA 370 (O).) The liability is additional to, and different from the liability to redhibitorian relief which is incurred by any seller of goods found to contain a latent defect."

Whether the law of delict takes sufficient cognisance of the peculiarities of the health services context is a matter for discussion in the pages that follow.

Another question that arises with regard to the law of delict, especially in the context of health services delivery, is whether the scope and ambit of the obligations of the provider in terms of the law of delict are similar to those imposed in terms of the law of contract or whether they are different and if so, in what way. Contracts for health services are in some respects different from contracts for other goods and services. Medicines, for example, often come with no guarantees of efficacy and no promises of a cure despite the fact that one of the criteria for the registration of a medicine in South Africa in terms of the Medicines and Related Substances Control Act12 is efficacy. Consequently damages for breach of a contract for health services tend in many instances to resemble quite closely those that are payable in terms of the law of delict in the same context. It has been argued elsewhere in this thesis that one of the most obvious tacit or implied terms of a health care services contract is that the provider will take due and proper care not to harm or injure the patient’s person since this is one of the usual risks of medical treatment. If such a term is breached then the nature of the damages should it is submitted, be very similar to those for a delict in the same circumstances. This issue is discussed in more detail below.

---

12 Medicines Control Act No 101 of 1965
From a public sector perspective one must ask about the delictual liability of the Medicines Control Council if it negligently approves the registration of a medicine which subsequently proves to be ineffective, unsafe or of low quality. What also would be the liability of the retailer of the medicine or the prescriber of the medicine in these circumstances? Would they be protected by the argument that because the medicine is registered with the Medicines Control Council they are entitled to assume that it is safe, effective and of a suitable quality for the purpose or indication for which it was registered? If one medicine is prescribed in the public sector in preference to another because the former medicine has been donated and is therefore supplied at no cost to the state, what is the liability of the state in a situation in which the donated medicine turns out to be defective or where it is effective but less so than the other medicine? Where logistics in the public health sector break down to the point where persons requiring chronic, life-sustaining medication, such as insulin for diabetes, are unable to obtain their medication would such a failure constitute a delict on the part of the state? In a factual situation such as that in *Minister of Health and Others v Treatment Action Campaign and Others (No 2)*\(^{13}\) could the state be held liable in delict for the infection with HIV of a neonate who together with her HIV positive mother was not given Nevirapine as prophylaxis for mother to child transmission of the disease? Could the state be held liable in delict for its refusal in principle to supply a certain drug to patients in the public health sector or to allow the transplantation of organs into HIV positive patients? In other words, does the law of delict extend to policy decisions that are taken by the government in the public health care context? Organs of state are explicitly bound by the Constitution and the Bill of Rights whilst this is not necessarily the case for private persons. If the state's actions in violating a constitutional right fit the legal framework for the law of delict then technically speaking, a violation of constitutional rights can constitute a delict in certain circumstances.

\(^{13}\) *TAC 2002 (S) 721 (CC)*
From a private sector perspective, is the right of access to health care services in the Bill of Rights horizontally applicable and if so, would a violation of that right by a service provider in that sector give rise to a claim in the law of delict? Is there a different duty of care implied in this right for the public provider as opposed to the private provider or is it the same for both? If defective health care services are rendered by a private provider can this constitute a violation of the patient’s right of access to health care services? This question relates to the meaning of the term ‘access’ in that context of section 27(1) of the Constitution.

Section 38 of the Constitution recognises the possibility of class actions\(^\text{14}\). The decisions and actions of organs of state can affect large numbers of people whereas those of private entities tend, on the whole to affect smaller numbers. There are, of course, exceptions to this general feature in that the decision of a pharmaceutical company to discontinue the production of a medicine can have a significant effect on millions of people but on the whole individual transactions within the private sector tend to be limited in the risk they pose for the participants. For example a decision by the state to use a particular medicine for a particular health condition will impact on large numbers of patients treated by the state for that condition whereas in the private sector, whilst the use of drug formularies is on the increase, health professionals, and to a lesser degree their patients, still have a fair degree of choice in the medicines that are used and prescribed.

In *Carmichele v Minister of Safety and Security*\(^\text{15}\), the constitutional court said that where the common law is deficient, courts have an obligation, not a discretion, to develop the common law and that while this does not mean that

---

\(^\text{14}\) The section provides: Anyone listed in this section has the right to approach a competent court, alleging that a right in the Bill of Rights has been infringed or threatened, and the court may grant appropriate relief, including a declaration of rights. The persons who may approach a court are-

(a) anyone acting in their own interest;
(b) anyone acting on behalf of another person who cannot act in their own name;
(c) anyone acting as a member of, or in the interest of, a group or class of persons;
(d) anyone acting in the public interest; and
(e) an association acting in the interest of its members.

\(^\text{15}\) *Carmichele* 2001 (4) SA 938 (CC)
courts must in each and every case embark on an independent exercise as to whether the common law is in need of development, instances may arise where a court is obliged to raise the matter on its own and require full argument from the parties.¹⁶

In this chapter the fundamental aspects of the law of delict are discussed in relation to health service delivery. These aspects are conduct, causation,
unlawfulness, fault and loss. Other relevant concepts such as vicarious liability, the maxims *imperitia culpae adnumeratur* and *res ipsa loquitur* and necessity are also covered. Specific attention is given to delicts involving medicines and the prospect of class actions is considered.

### 7.2 Fundamental Concepts

The State Liability Act\(^\text{17}\) recognises the liability of the state for delictual acts including its vicarious liability for the wrongful acts of state employees.

In terms of section 1 of the Act, any claim against the state which would, if that claim had arisen against a person, be the ground of an action in any competent court, shall be cognizable by such court, whether the claim arises out of any contract lawfully entered into on behalf of the state or out of any wrong committed by any servant of the state acting in his capacity and within the scope of his authority as such servant.

Unlike the private health sector in South Africa, the state employs not only nurses, physiotherapists, and pharmacists but also general practitioners and medical specialists. The private sector employs nurses but physiotherapists, pharmacists, general practitioners and medical specialists tend to be in independent practice in the private sector. Consequently the scope of the risk of vicarious liability to which a private hospital is exposed could be significantly smaller than the scope of the same risk for a public hospital owned by a provincial government. It might be possible, however, to hold a private provider liable for its own negligence in allowing an incompetent surgeon to continue to operate within its premises since such provider has the power to refuse admission privileges or other forms of access to its facilities. In this instance, it would be not so much a question of vicarious liability for the delicts of an

---

\(^{17}\) State Liability Act No 20 of 1957
independent third party as much as direct liability for the provider's own negligence.

The fundamental elements to establish a claim in delict in South African law are causation, wrongfulness, fault (consisting of negligence [*culpa*] and intention [*dolus*] but more commonly negligence), voluntariness (conduct)\(^1\) and loss.\(^2\)

Both acts and omissions may found a claim in delict. Delictual actions are generally regarded as private law actions. The principal difference between private law and public law is that private law is directed at the protection of the individual or private interest, whilst public law aims to preserve the public interest. Delictual remedies are compensatory in nature, compensating the prejudiced person for the harm the wrongdoer has caused.\(^3\)

### 7.2.1 Conduct

Only an act of a human being, in contrast to that of an animal or a force of nature, is accepted as conduct. A juristic person may act through its organs (humans) and may thus be held delictually liable for its actions. Conduct only qualifies as such for the purposes of the law of delict if it is voluntary i.e. subject to the control of the will of the person engaged in the conduct. The person concerned must not be acting under some form of compulsion and must be able to exercise his or her own will in acting or refraining from action.

---

\(^1\) The term 'conduct' includes both a positive act and an omission. See Neethling, Potgieter and Visser, *The Law of Delict* 3rd ed p 2 who state that for the purposes of the law of delict, conduct may be defined as a voluntary human act or omission. See also the discussion on the subject in Boberg *PQR The Law of Delict: Aquillian Liability Vol 1*; Burchell *Principles of Delict*; Mckerron *The Law of Delict*, Van der Walt *IC and Midgley JR Delict: Principles and Cases*.

\(^2\) These are expressed in different ways. For instance the South African law Commission (Discussion Paper 97, Project 82, "A Compensation System for Victims of Crime in South Africa") has observed that: "There are five elements of a delict: namely an act, wrongfulness, fault, harm and causation. If one of these elements is missing, no delict exists and, accordingly, no liability. In South African law, a distinction is made between delicts that cause patrimonial financial damage and those of an intentional nature, which cause injury to personality. The South African law of delict allows a third action for pain and suffering in terms of which compensation for injury to personality is allowed as a result of wrongful and negligent (or intentional) impairment of the bodily or physical-mental integrity (Neethling et al., 1990, p. 5)." See also *Geldenhuys v Minister of Safety and Security and Another 2002 (4) SA 719 (C)* in which the Davis J said "It is perhaps trite to set out the well-known elements of the modern Aquilian action, but for the purposes of analysis, a recapitulation assists to promote the internal coherence of this judgment. The six elements are (i) voluntary conduct; (ii) unlawful or wrongful; (iii) capacity; (iv) fault in the form of dolus or culpa; (v) causation; (vi) loss." [Footnotes omitted]

\(^3\) SA Law Commission Discussion Paper 97, Footnote 427 at fn 9 *supra*
Although an act may be separate in time and space from its consequences, this does not mean that one can say that a delict arises in the absence of voluntary conduct. In the healthcare context the thalidomide disaster is a good example of conduct, in this case the release of the drug into the market, remote in time and space from the damage it caused. Thalidomide is a drug with anti-inflammatory and antiangiogenic properties that was sold mainly in 1962. Its use by pregnant women resulted in thousands of cases of serious birth defects and it was withdrawn from the market. In *S v Shivute*\(^2\), the court had to consider the issue of voluntariness in relation to a charge of culpable homicide against a nurse who administered an intramuscular injection of chloroquine into a four year old child as opposed to the prescribed chloroquine syrup which was to be administered orally. The child died. The nurse who worked in a busy camp under apparently stressful conditions that dealt with returnees to Namibia, said that she knew that the administration of an injection of chloroquine would kill a child and that she was not consciously aware that she was administering the wrong prescription. She never raised the defence of mental illness or defect in her defence. The court noted that the law presumes that an accused is of sound mental health and is criminally responsible. It held that when the issue is whether the accused was not criminally responsible because of a mental illness or defect, the onus of proof rests on the accused and such onus must be discharged on a balance of probabilities. It stated that when the issue is raised in the absence of criminal responsibility which is not the result of mental illness or defect and if a proper basis is laid in the evidence for the absence of criminal responsibility, then the accused must be given the benefit of the doubt on the issue of criminal responsibility if a reasonable doubt exists at the close of the case for the defence in regard to the cause of the absence of criminal responsibility. The court said with regard to negligence that the requirement is that the accused ought reasonably to have foreseen the possibility of death resulting from his or her conduct and failed to take reasonable steps to avoid

\(^{21}\) See Neethling, Potgieter and Visser fn 18 supra at p 27-34 for a detailed discussion of the element of conduct.

\(^{22}\) *S v Shivute* 1991 (1) SACR 656 (Nm)
this eventuality. It found that in view of the fact that the accused was a qualified and experienced nurse taken together with the fact that she said she knew that to administer that quantity of chloroquine to that child would have been fatal the only reasonable inference to draw was that any reasonable person with the qualifications and experience of the accused and in the position of the accused would have known at the time of the injection at least that such a course could have been fatal and therefore would have taken reasonable care to pursue a course of conduct which would have prevented such a result. The accused, it found, had failed to act like a reasonable person and was thus either reckless or negligent. O’Linn J observed that at the end of the day the only defence raised on behalf of the accused was whether or not the accused was criminally responsible at the time of the alleged crime based on the possibility that she suffered some form of non-pathological mental aberration or defect at the time of the commission of the crime. There was expert evidence to the effect that the appellant suffered from a ‘non-pathological mental disintegration of a temporary nature’. It was submitted by counsel for the appellant that she was ‘momentarily impaired’. It was not expressly suggested that the accused acted in a state of automatism which would have eliminated the element of voluntariness from her action. The court considered all of the evidence and came to the conclusion that the decision of the court a quo in convicting the accused of culpable homicide was correct and that there was insufficient evidence that she had not acted out of her own volition in administering the lethal dose to the child. It would seem from some aspects of the judgment, that the nurse may have made an error due to stress and tiredness. At one stage, 400 returnees a day entered the camp where she was working and the day of the child’s death had been busy. She said that she did not know what happened to her at the stage that she administered the drug to the child incorrectly. However, the court noted that the excuse was nowhere made that she could not cope with the pressure of her work or that she was too tired to give proper attention to the patients or that she was suffering from some illness or defect affecting her physical and mental resources.
People may act involuntarily for a number of reasons. Those that have been recognised by the courts in the past include sleep, unconsciousness, a fainting fit, an epileptic fit, serious intoxication, a blackout, compulsion by human agency (vis absoluta), mental illness, hypnosis, strong emotional pressure, low blood sugar and heart attack. Automatism, i.e. that fact that a person acts mechanically and not of his or her own free will is recognised as a defence but it will not succeed if the defendant intentionally created the state of automatism in which he or she acted involuntarily in order to harm another.

In the healthcare context the defence of compulsion can become fairly complex. It is closely related to the defence of necessity sometimes referred to as ‘duress of circumstance’.

### 7.2.1.2 Assault

Medical treatment without consent can attract a criminal charge of assault. The court in *The State v Marx* noted that the definition of assault is as follows:

---

23 Cases of relevance in this regard are *S v Goliath* 1972 (3) SA 1 (A); *S v Johnson* 1969 (1) SA 204 (A); *R v Dhlamin* 1955 (1) SA 120 (T); *R v Du Plessis* 1950 (1) SA 297 (O); *R v Rossouw* 1960 (3), SA 326 (T); *R v Victor* 1943 TPD 77; *R v Schoonwinkel* 1953 (3) SA 136 (C); *S v Ramagoga* 1965 (4) SA 254 (O); *S v Bezuidenhout* 1964 (2) SA 651 (A); *S v von Rensburg* 1987 (3) SA 35 (T) and *S v Stellmacher* 1983 (2) SA 181 (SWA). They are discussed in more detail in Neethling, Potgieter and Visser (fn 18 supra).

24 Neethling, Potgieter and Visser (fn 18 supra). Burchell, fn 18 supra, notes at p 75 that for an act to be justified on the ground of necessity, (a) a legal interest of the defendant must have been endangered (b) by a threat which had commenced or was imminent but which was (c) not caused by the defendant’s fault, and, in addition, it must have been necessary for the defendant to avert the danger, and (e) the means used for this purpose must have been reasonable in the circumstances.

25 Compulsion or duress is a form of necessity and is recognized as a general defence. *S v Goliath* (fn 23 supra); *S v Mtetwa* 1977 (3) SA 628; *S v Kibi* 1978 (4) SA 173; *S v Alfieur* 1979 (3) SA 145; *S v Petersen* 1980 (1) SA 938.

26 This seems to be the situation in other jurisdictions as well. In Canada, for instance (Somerville MA ‘Medical Interventions and the Criminal Law: Lawful or Excusable Wounding’ (1980) *McGill Law Journal* vol 26 p82-96) section 45 of the Criminal Code specifically exempts surgical operations from criminal sanction stating that everyone is protected from criminal responsibility for performing a surgical operation upon any person for the benefit of that person if (a) the operation is performed with reasonable care and skill and (b) it is reasonable to perform the operation having regard to the state of health of the person at the time the operation is performed and to all the circumstances of the case. The Canadian Criminal Code is based on the common law which enforced a prohibition against maiming oneself or another. The word ‘maim’ was defined in Stephen’s Digest as follows: “A maim is a bodily harm whereby a man is deprived of the use of any member of his body, or of any sense in which he can use in fighting, or by the loss of which he is generally and permanently weakened; but a bodily injury is not a maim merely because it is a disfigurement”. Therefore any more than de minimis wounding was prima facie illegal, but some woundings could be justified. Section 198 of the Canadian Criminal Code provides that “Everyone who undertakes to administer surgical or medical treatment to another person or to do any other lawful acts that may endanger the life of another person or to do any other lawful acts that may endanger the life of another person, is except in cases of necessity, under a legal duty to have and to use
reasonable knowledge, skill and care in so doing." Somerville points out that in the Criminal Code if the phrase 'surgical or medical treatment' is intended to be qualified by the phrase 'lawful act' i.e. that medical or surgical treatment is lawful the prima facie assumption would be one of legality. She notes, however, that the difficulty with such an interpretation is that the forerunners of section 198 were first Stephen’s Digest and then section 212 in the first Canadian Criminal Code and there is no indication that such provisions were meant to alter the substantive law as it then stood. Rather, in all probability, they merely formulated the standard of care required in order to avoid criminal liability where persons undertook acts requiring special skill or knowledge which were of a dangerous character. Thus, she says, it may be argued that such an act was not contemplated by the legislature, and that the decision to be determined by a separate enquiry. She discusses the section in more detail and in doing so mentions the case of Re "Eve" P.E.I. Family Court No FDS-37, June 14, 1979 (The Supreme Court of Canada made a later decision on this matter in E (Mrs) v Eve 2 S.C.R. 388 (1986)) in which Justice McQuaid held that: "the benefit referred to in section 45 was thereby extended to include not only the health of the patient but as well the socio-economic and other considerations. The result that the surgery might be employed only to preserve and protect health, but as well to preserve the quality of life in a broader medical sense." Despite the use of the wide criterion, however, the judge refused to authorize the particular sterilisation procedure. There are similar issues that impact on questions of sterilisation in South African law and the National Department of Health is busy at the time of writing processing an amendment to the South African Sterilisation Act No 44 of 1998. Section 2 (e) provides that: 'Sterilisation may not be performed on a person who is under the age of 18 years except where failure to do so would jeopardize the person’s life or seriously impair his or her physical health.' No mention is made of the person’s mental health or human dignity, both of which are protected by the Constitution, the former in section 12(2) of the Constitution in the form of psychological integrity and the latter in section 10 of the Constitution. The amendment of this section of the Act is therefore necessary to align it with the recognition by the Constitution of these rights.

Somerville goes on to explore the practical realities and the question of whether non-therapeutic medical interventions are lawful. She says it has become a matter of increasing importance as such procedures have been more frequently undertaken and are even regarded as commonplace. She notes that the question of their legality first arose with the increased availability and effectiveness of cosmetic surgery. She says, however, that the law a little by asserting that these operations were within the traditional concept of therapeutic benefit because there was psychological benefit present. The problem became even more acute, however, with live donor organ transplants and after initial use of the psychological benefit test, most courts faced the reality that in many cases there was no therapeutic benefit to the donors. She says that even before the enactment of legislation authorising such donation, the operation was not in principle illegal, at least when performed on a competent consenting adult. Similarly non-therapeutic sterilization of consenting adults and non-therapeutic medical experimentation are frequent events in society that do not foment court actions by the mere fact of their performance. With respect to the latter practice Somerville says it is worth noting that in Huska v University of Saskatchewan (1996) 53 D.L.R (2d) 436 (Sask. C. A), one of the earliest cases involving non-therapeutic medical research, the question of the illegality of the intervention itself was not raised. She asks how this de facto legalisation of non-therapeutic interventions can be reconciled with the legal precedents which have been outlined? She states that a solution depends on determining how public policy and section 45 act and interact to legitimise medical interventions.

In the United Kingdom the starting point is also that intentionally touching a person is unlawful - the civil wrong of battery or even the crime of assault - unless that person has consented or there is other lawful authority (Oates L, 'The court’s role in decisions about medical treatment' British Medical Journal Nov 18 2000). Oates states that each year there are about 20 cases in the family division of the High Court in England and Wales concerning whether medical procedures should be carried out on people who are unable, or refuse, to consent to such treatment. Oates acts as a state funded lawyer brought in to represent those who need a guardian ad litem or litigation friend (primarily children and mentally incapacitated people) or as an amicus at the request of the court. He notes that there is a legal doctrine of necessity that provides lawful authority for emergency medical treatment that is both necessary and reasonable and designed to save life, assist recovery or ease suffering. According to Oates, the House of Lords in the case of R v Bournewood [1999] 1 AC 458 extended the doctrine of necessity to cover treatment for mental disorder when there has been an informal admission to hospital. Oates states that most instances where medical treatment is given to save life or to enhance the quality of life take place without the need for any reference to the court and that there is in fact a duty of care upon medical practitioners to treat the patient according to a judgment of his or her best interests. Once lack of capacity is shown, the test is one of best interests. This has been judicially defined, says Oates, to encompass medical, emotional, and all other welfare issues. He says that a court should draw up a checklist of the actual benefits and disadvantages and potential gains and losses, including physical and psychological risks and consequences, and should reach a balanced conclusion as to what is right from the point of view of the individual who is the subject of the proceedings.

It is submitted that the difficulties in the Canadian experience in even attempting (under one interpretation) to exclude medical interventions from the definition of assault and render them prima facie lawful demonstrate the value of the current approach of South African law that they are prima facie unlawful violations of well established and long recognised rights. If one starts from the premise that they are lawful it starts to become extremely difficult to define just what it is that is lawful and where that lawfulness begins and ends. In South African law this problem does not arise because the intervention is prima facie unlawful. The maxim volens non fit injuria provides a key element of this system of legal principle in that it both recognizes and supports the fundamental importance of such 'absolute' human rights as the rights to life, to human dignity, to freedom and
an assault is the act of intentionally and unlawfully applying force to another directly or indirectly or attempting or threatening by any act or gesture to apply such force to the person of another if the person making the threat has, or causes the other to believe upon reasonable grounds that he has, the present ability to effect his purpose. 27

In Stoffberg v Elliot 28 Watermeyer J observed that a man by entering a hospital does not submit himself to such surgical treatment as the doctors in attendance upon him might think necessary. He said that by going into hospital a person does not ‘waive or give up his right of absolute security of the person’ . He still has the right to say what operation he will submit to, and unless his consent to an operation is expressly obtained, any operation performed upon him without his consent is an unlawful interference with his right of security and control of his own body.

In Esterhuizen v Administrator Transvaal 29 the question of medical assault and the difference between South African and English law in this regard was canvassed by counsel for the plaintiff 30. Bekker J held in Esterhuizen that:

27 Marx 1962 (1) SA 848 (N). The definition was taken from Gardiner and Lansdown. S.A. Criminal Law and Procedure, 6th. ed. vol. 11 at p 1570. Williamson JP observed that “This definition, as pointed out by Innes, C.J, in Rex v Jolly and Others, 1923 AD 176 at p. 179, is substantially taken from the Transkeian Penal Code. ‘This definition,’ said Sir James Rose-Innes, ‘would appear to be satisfactory for all practical purposes. It recognises that the application of force may be indirect as well as direct - a conclusion which is logically unsaasailable, for it is evident that a person may cause force to be applied to the body of another without himself touching that other.’”

28 Stoffberg 1923 CPD 148

29 Esterhuizen 1957 (3) SA 710 (T)
Counsel's argument contains a useful survey of the case law and relevant authorities and is thus reflected below for the sake of convenience. "Plaintiff's claim for assault is based on the actio injuriarum. Any aggression upon the person of another is prima facie an injuria. By an injuria is meant an act committed in contempt of another's personality. See McKerron Law of Delict, 4th ed. pp. 66 and 67. See also Stoffberg v. Elliot, (fn 28 supra). All the plaintiff needs show in order to establish the existence of animus injuriandi is that the act complained of constituted an aggression upon his person, his dignity or his reputation and that the act was intentional. See Whitaker v. Ross, 1912 AD 131. See also the aspect of defamation. McKerron, supra at p 203. Defendant may, however, rebut the presumption by proving that he was unaware that his act would constitute an impairment of the plaintiff's personality. English Law with its categories of torts is no guide. In English law assault is dealt with under the broad heading of the trespass to the person. In SA law assault is dealt with under the actio injuriarum. In this case the onus is on the defendant to prove that the act complained of was not wrongful. There is a distinction between South African law and English law in regard to assault. As far as South African law is concerned the definition of assault in Criminal Law contains no reference to the words without consent. See the definition of assault in Gardiner & Lansdown Criminal Law & Procedure, vol. II, p. 1432. In English law the words 'without consent' are introduced. Therefore, in English law there can only be an assault if there is no consent, whereas in South African law the act of intentionally and unlawfully applying force to the person of another constitutes an assault. The word 'unlawful' presents no difficulty as it is always unlawful to invade the right of bodily safety of another. In South African law assault is an 'injuria' together with a large number of other acts which infringe the personal rights of safety, dignity, privacy or reputation. See Gardiner & Lansdown, supra, secs. 1 and 2. English law in this respect differs greatly from South African law. In South African law there is no onus on the plaintiff to prove that the assault was committed without the plaintiff's consent. The onus is on the defendant to prove that the plaintiff consented to the assault. See de Villiers Roman & Roman Dutch Law of Injuries pp. 24, 25, 27, 144, 145 and 146. See also Manfred Nathan Common Law of South Africa, vol. III, p. 1662 and vol. IV, p. 2584. See also Cohen Lazar & Co v Gibbs, 1922 T.P.D. 145. The defendant may rebut the presumption of injuria by establishing the defence of volenti non fit injuria. Consent to a surgical operation is treated on the basis of volenti non fit injuria. See McKerron, supra pp. 95, 96. See also Stoffberg v Elliot, supra, Ex partie Dixie 1950 (4) SA 748. English and American authorities also treat consent to an injury on the basis of volenti non fit injuria. See Halsbury Laws of England, 2nd ed. vol. 23 pp. 715 to 719. See also Re-statement of the Law of Torts American Law Institute, vol. I, p. 96, sec. 49. There cannot be consent by a person to a surgical operation unless the risk of the operation is explained. See Botha v. Rampel, 1958 T.P.D. 748. In English law it is on the defendant to prove that the plaintiff consented to the assault. See Lempert v. Heber, N.O., 1955 (2) SA 507. In order to establish the defence of volenti non fit injuria the defendant must establish knowledge of the danger, appreciation thereof, and consent thereto. See Waring & Gillow Ltd v Sherborne, 1904 T.S. 340. See also Union Government v Matthee, 1917 AD 703. The Courts will not find the existence of an implied agreement unless the person who is alleged to have made it had full knowledge of the nature and extent of the risk to be run. See McKerron, supra pp. 96, 97. See Stern v. Podfrey, 1947 (1) SA 350; Osborn v L & N. W. Railway, 1888 (2) Q.B.D. 220. See also Canadian Pacific Railway Co v Freethorne, 1915 A.C. 871."
motives might be - and should he act without having done so and without having secured the patient's consent, he does so at his own peril”.

In *Broude v McIntosh and Others* Marais JA questioned whether cases involving medical negligence and lack of patient consent should be pleaded as assault. His view is that it is a strange notion to suggest that the actions of a medical practitioner whose intention is to heal a patient should be labelled pejoratively in this way simply because he or she omitted to explain one or other material fact to a patient concerning the proposed treatment. It is submitted with respect that while the arguments of Marais JA have merit, they are based on somewhat emotional grounds rather than the importance of the right to bodily and psychological integrity. In South African law the term ‘assault’ includes a wide variety of activities that do not all suggest criminal violence. Whilst it may well have taken on such a connotation in the minds of laymen, to a lawyer, ‘assault’ is a technical term in law which for sound reason covers a range of activities which on the violence scale range from zero to infinity. The point is that the criminal law upholds what the court in *Stoffberg v Elliot* called ‘absolute security of the person’. It is a right that is fundamental to the state of being human and is akin to the right to life itself. Any suggestion

---

31 *Broude fn 26 supra*

32 At pages 67-68 of the judgment in *Broude supra* Marais JA stated: “Pleading a cause of action such as this as an assault to which the patient did not give informed consent is of course a familiar and time-honoured method of doing so. However, I venture to suggest with respect that its conceptual soundness is open to serious question and merits reconsideration by this Court when an appropriate case arises. To the average person, and I suspect to many a lawyer, it is a strange notion that the surgical intervention of a medical practitioner whose sole object is to alleviate the pain or discomfort of the patient, and who has explained to the patient what is intended to be done and obtained the patient’s consent to it being done, should be pejoratively described and juristically characterised as an assault simply because the practitioner omitted to mention the existence of a risk considered to be material enough to have warranted disclosure and which, if disclosed, might have resulted in the patient withholding consent. It seems to me to be inherent in the notion that, even if the risk does not eventuate and the surgical intervention is successful, the practitioner’s conduct would nonetheless have constituted an assault. That strikes me as a bizarre result which suggests that there is something about the approach which is unsound. There is no principle of law of which I am aware by which the characterisation as lawful or unlawful of an intentional act objectively involving the doing of bodily harm to another can be postponed until its consequences are known. Either it was an assault at the time of its commission or it was not. Events occurring ex post facto can logically have no bearing on the question. It is no answer to say that if the undisclosed risk does not eventuate, no damage will have been caused. That has nothing to do with the characterisation of the medical practitioner’s act in intervening surgically as lawful or unlawful. I mention this merely by way of example to explain why I consider that the validity of causes of action framed in this manner in circumstances similar to those which are said to exist in this case requires re-examination. (I emphasise the latter qualification; I leave aside cases in which *mala fides* is involved such as cases of deliberate fraud and deliberate misrepresentation of what is entailed in order to obtain consent which would otherwise not be forthcoming.) However, re-examination would be inappropriate in the present case. The matter was not argued and even if it be assumed in favour of appellant that the cause of action based upon an allegation of assault is conceptually sound in law, I agree with the trial Judge’s conclusion that the evidence does not bear it out.” See also Strauss SA “Bodily Injury and the Defence of Consent” 1964 SALJ 179; Strauss SA “Toestemming tot Benedeling As Verweer In Die Strafreg en Die Deliktersreg” (doctoral thesis) (1961)
that an unjustified interference with such a right is something less than criminal needs extremely careful consideration. In South Africa it is well known to anyone who works in the health sector that health professionals do not take the question of informed consent seriously in their daily practice. Health professionals still tend to have a highly paternalistic approach to their patients, especially, but not solely, to those who may be illiterate or have a low level of education. In the public sector they raise arguments about spending ‘unnecessary’ time talking to patients about their condition while in the private sector, informed consent if any, is relegated to the signature of a form on admission to a hospital which the patient may feel he or she has little or no choice in signing, or in the case of a private medical practice, a blanket consent which is signed when a person first visits the doctor’s rooms with the intention of becoming his patient. None of this is legally acceptable but it happens every day. All of this is with the threat of criminal assault in the event of failure to obtain consent hanging over the heads of providers. South African society, unlike American society, is largely non-litigious – a fact which is undoubtedly attributable to the fact that litigation is still an extremely expensive business and mostly beyond the means of the ordinary person and justice is a commodity that has to be purchased. The National Health Act\textsuperscript{33} specific provision for informed consent on the part of patients largely because of the failure by the health professions to adequately address this issue. It is noteworthy that the Bill contains an express requirement that the patient must be informed that he or she can refuse the proposed treatment\textsuperscript{34}. Strauss states that in the absence of an

\textsuperscript{33} National Health Act No 61 of 2003

\textsuperscript{34} Strauss SA Doctor Patient and the Law: A Selection of Practical Issues notes that to perform a medical operation upon or to administer treatment to a person against his will or even without his consent amounts to assault, for which the doctor may be held liable in a civil action for damages and be criminally prosecuted. He states that as far as a claim for damages is concerned a South African court will probably not award more than a nominal amount where it appears that the doctor has in fact saved the patient’s life. Where there has been injuria associated with the unauthorised treatment, damages may well be awarded in respect of such injuria. Strauss does state that if, however, a patient has suffered harm, for instance in consequence of a blood transfusion such as an infection with a serious disease on account of the blood having been contaminated, substantial damages may conceivably be awarded. The writer submits that where no damages can be proved, none will be awarded since damages in terms of the law of delict are not generally punitive but compensatory in nature. This subject was canvassed in detail by the constitutional court in \textit{Fose v Minister Of Safety And Security} 1997 (3) SA 786 (CC).

In \textit{G Q v Yedwa And Others} 1996 (2) SA 437 (TK) the plaintiff claimed damages for shock, pain and suffering, as well as injuria, arising out of his wrongful assault and circumcision by the defendants. The plaintiff was a
in the Defence Force. He had already gone through the Xhosa initiation rites, including circumcision, several years before the attack by the defendants, who were also members of the Defence Force. White J stated that “I have therefore turned to those cases in which the plaintiffs were assaulted, but did not suffer serious injury, for guidance in determining the quantum of damages. When doing so, the quantum of damages which is, and often insignificant, are the awards made by our courts for damages arising from personal injury and contumelia arising from an assault. I can only add my voice to the suggestion, which has been made from time to time, that such awards be increased substantially.” In this case the plaintiff did not suffer serious or lasting physical injuries. He did not require hospitalisation and the only medical treatment he received was the cleaning of the wound to his foreskin, and the application of ointment thereto. The pain he suffered was also not excessive. The removal of the remainder of his foreskin was undoubtedly painful and, as stated above, he thereafter suffered pain, which appeared to the court to be no more than discomfort, for a period of two weeks.

In all the circumstances an equitable award for shock, pain and suffering, which will be fair to both the plaintiff and the defendants, will be an amount of R3 000. White J observed that: “By far the most serious aspect of the assault, vis-à-vis damages, is the contumelia (insult) suffered by the plaintiff. Three aspects of the case exacerbated his humiliation. They were the nature of the assault, the imputation against his manhood, and the effect of that imputation on his subordinates. The first aggravating feature was the very nature of the assault. To have his trousers removed, his legs forced open and then to be circumcised, was manifestly an extremely degrading experience. The second aggravating feature was the symbolic imputation of the assault. Circumcision has great significance in Xhosa culture - it signifies the passing from boyhood to manhood, and the conferring on the recipient of the rights and privileges, and more particularly responsibilities, of manhood. A man who has not been circumcised has no standing in, and is denigrated by, their society. Circumcision is therefore a very emotive issue, especially when an uncircumcised man professes to have been circumcised and to be entitled to the privileges of manhood, and from time to time uncircumcised men, who act in this manner, are forcibly circumcised. Against this background it is clear that when the defendants assaulted the plaintiff they implicated him as a man who had not been circumcised. It is therefore not surprising that the plaintiff testified that he found this imputation against his manhood extremely offensive, degrading and humiliating. The third aggravating circumstance was that the imputation that the plaintiff had not been circumcised resulted in his being held in contempt by his subordinates, which caused him further degradation and humiliation. For the reasons set out above the Court must award a substantial amount as damages for contumelia, and I am of opinion that the amount claimed by the plaintiff under this heading is not excessive.”

The Court granted damages in the amount of R15 000. Of this amount R10 000 was for contumelia and R5 000 was for shock, pain and suffering.

In Minister Of Justice v Hofmeyr 1993 (3) SA 131 (A), Hoexter JA held that: “One of an individual’s absolute rights of personality is his right to bodily integrity. The interest concerned is sometimes described as being one in corpus, but it has several facets. It embraces not merely the right of protection against direct or indirect physical aggression or the right against false imprisonment. It comprehends also a mental element.” It is submitted that this is consistent with the manner in which the right to bodily and psychological integrity has subsequently been framed in section 12(2) of the Constitution.

Hoexter J stated that: “The general principles of the modern South African law of delict are essentially derived from Roman law. See Joubert (ed) Law of South Africa vol 8 at 11 para 6. Injuria is the wrongful and intentional infringement of an interest of personality. In an action for damages based on injuria the plaintiff must prove intent (dolus, animus injuriandi) on the part of the defendant. Intent and motive, however, are discrete concepts. As pointed out by Stratford JA in Ghuckman v Schneider 1936 AD 151 at 159: ‘Motive ... is the actuating impulse preceding intention.’ Intention is a reflection of the will rather than desire. The pertinent difference between the two concepts was stressed in the Whitaker case supra. At 131 of his judgment Solomon J stated: ‘It is not necessary in order to find that there was an animus injuriandi to prove any ill-will or spite on the part of the defendants towards the plaintiffs . . . .’ It is clear that without dolus the action for an injuria would lie neither in Roman law nor in Roman-Dutch law. See the remarks of Davis J in Wade & Co v Union Government 1938 CPD 84 at 86. It is equally clear, however, that in a limited class of injuriae the current of precedent has in modern times flowed strongly in a different direction. In this limited class of delicts dolus remains an ingredient of the cause of action, but in a somewhat attenuated form, in the sense that it is no longer necessary for the plaintiff to establish consciousness on the part of the wrongdoer of the wrongful character of his act. Included in this limited class are cases involving false imprisonment and the wrongful attachment of goods. The possibility that in the case of certain forms of injuriae involving constraints on personal liberty the wrongdoer’s legal liability might exist even in the absence of his appreciation of the wrongful nature of his injurious act, has been explicitly recognised by this Court. In Ramsay v Minister van Politie en Andere 1981 (4) SA 802 (A) Botha AJA (with whom the remaining members of the Court concurred) agreed with the order appearing at the end of the judgment of Jansen JA but was at pains to dissociate himself from certain observations in regard to animus injuriandi in the judgment of Jansen JA. At 81BE-H Botha AJA said the following: ‘Hy aanvaar, na aanleiding van die posisie by laaste, dat animus injuriandi, wat onregmatigheidsbewusyn verg, in die algemeen 'n element is van alle inbreuke op die persoonlikheid wat as injuriae aangemer word. Ek aanvaar dit nie. Ek laat die moontlikheid oop dat daar by bepaalde vorme van injuria na die eise van regsbesigheid aanspreeklikheid kan bestaan in die afwesigheid van onregmatigheidsbewusyn by die dader. In die waarheid word my benadering onderskei deur die huidige stand van die蚂蚁, dit is nie te betwyfel dat dit deur die Transvaal, waar tydperk van jare met betrekking tot sekere vorms van injuria 'n standpunt ingeburger is wat beteken dat by sekere injuriae onregmatigheidsbewusyn by die dader geen voorvereiste vir aanspreeklikheid is nie. Ek hooe nie daaroor op besonderhede in te gaan nie. By wyse van enkele voorbeelde verwys ek slegs na Birch v Ring..."
In the Cohen Lazar case supra a court messenger, on the instructions of a creditor who had no judgment, seized property of the debtor. A Full Court (Wessels JP and Gregorowski J) held that the seizure was an *injuria*. In the course of his judgment Wessels JP said at 144: 'The mere illegal and intentional interference with the liberty of a free man by seizing him or his property is a delict which will support an action for damages.' and later in his judgment at 145: 'It is revolting to one's common sense to think that a person unsupported by any judgment could induce a clerk to issue to him a writ, seize a person's property, and escape liability merely because he acted without malice and under the impression that no judgment was required. If a person by his own unauthorized act intentionally injures an innocent person in his property, the latter is prima facie entitled to damages for loss caused by him.' I have cited the majority judgment in the Ramsay case supra as an example of recognition by this Court of the fact that in cases involving the liberty of the citizen there may be liability for an injuria despite the wrongdoer's unawareness of the wrongful character of his act. No less significant, however, is the line of reasoning adopted by this Court more than 80 years ago in the Whitaker case supra. The same recognition, although not roundly expressed, is, I think, implied in the decision in the Whittaker case. It is clear from the judgments delivered therein that dolus, or intent, is necessary in any injuria, and by implication that dolus was predicated therein of the injuria with which the Court was concerned. Innes J in the course of his judgment (at 122) put the matter thus: 'I agree with Wessels J (who delivered the judgment of the Court below) in holding that the illegal treatment to which the plaintiffs were subjected amounted to a delict on the part of those responsible for it. And I think the delict was of the class dependent upon intent (dolus); in other words, that it constituted an injuria. The action of the Governor was a wrongful and intentional interference with those absolute natural rights relating to personality, to which every man is entitled.' And again at 124: 'I have already pointed out that the infringement of the rights of these persons amounted to an injuria; a necessary feature of which is the existence of dolus, or intent. But when an unlawful aggression of this nature has been proved, the law presumes that the aggressor had in view the necessary consequence of his conduct; that is, that he had the intention to injure, of the *animus injuriandi* (De Villiers Injuries 145). That does not mean that he was actuated by malice or ill-will, but that he deliberately intended that the operation of this unlawful act should have effect upon the plaintiff!' Turning to the judgment of Solomon J one finds the following remarks at 130-1: 'It seems to me that we have present here all the requisites which are necessary to found an action of *injuria*. Those requisites are well laid down by De Villiers in his work on the law of injuries as follows: First: The intention on the part of the offender to produce the effect of his act,' in other words, the *animus injuriandi*. It is not necessary in order to find that there was an *animus injuriandi* to prove any ill-will or spite on the part of the defendants towards the plaintiffs, and it is quite immaterial what the motive was or that the object which the defendants had in view was a laudable one. It is sufficient that the injuries suffered by the plaintiffs were inflicted by the defendants, not accidentally or negligently, but with deliberate intention. Neethling P in the Cohen Lazar case supra at p. 116 says at 116: 'Alhoewel onregmatige vryheidsberoving 'n *injuria* is waarvoor animus injuriandi 'n aanspreeklikheidsvereiste behoort te behou, het die regspraak uitdruklik verwerp. Mens kan onregmatige vryheidsberoving se vereiste vir onregmatige vryheidsberoving gestel word. Nietemin is die verweerders nie dalk geskiedende waardestande nie en kanmalice nie. Banvleg daaraan dat hierdie negering van die *injuria* op grond van onregmatige vryheidsberoving skuldloos is.' To which he adds (by way of footnote no 16 on the same page): 'Agiesien daarvan dat hierdie negering van die skuldvereiste aan die invloed van die Engelse reg toe skryf is, kom spesiale voorwegings wat sodanige afwyking regverdig nie nie met hier te pas . . . . In my opinion the succinct dictum in Smits v Meyerston Outfitters (supra) Prof Neethling comments: 'Die opsetselement, onregmatigheid, is onmisbaar, en by gevolg dwaling as 'n verwerp word dus onnodig word. Mene kan gevoelig konkludeer dat aanspreeklikheid op grond van onregmatige vryheidsberoving skuldloos is.' To which he refers (in a wide sense, as in my opinion the succinct dictum in Smits v Meyerston Outfitters (supra) quoted earlier in this judgment embodies a correct statement of our modern law. The application of the principle therein stated furthermore entails practical consequences which seem to me to be both sensible and just. The principles of our law of delict which govern the legal liability of a wrongdoer for the infliction of unlawful bodily restraint, touching as they do the body of the subject, are principles of vital importance. I do not think that this Court should try to reverse the direction along which our law has developed as reflected in the line of judicial precedents examined in this judgment. To upset an established and satisfactory principle because it is not in accordance with the Roman or Roman-Dutch law would be to deny development to our law. Law is not a static thing. It is forever changing and being adapted to novel conditions.' In *Peter V Peter And Others* 1958 (4) SA 361 (N) Casey J observed that 'The word "injury" or "injuries" can be used in a wide sense, as meaning any infraction of right or wrongful act. But the ordinary meaning is injury to property or to person (R v Huchersons and Another, 1912 T.P.D. 705 at p. 716), although it seems that, in relation to property, the more appropriate term is "damage to property", whilst "injury" is employed in relation to persons, whether as to bodily or physical injury (embraced in the Aquilian action) or injury to absolute rights of personality", as to dignity or reputation. For this the *actio injuriarum* is given. De Villiers on Injuries, pp. 21, 22; Wille's Principles, p. 465 (3rd ed.)... In our country, also, damages or compensation for "personal injuries" has an established meaning, that is to say relief in consequence of bodily hurt obtainable primarily under the sequelian action, though there may also be an element of *contumelia*.' It is submitted that in the health services context this line of legal precedent is consistent with and supportive of the idea that damages for unauthorised medical treatment can and should be awarded in appropriate circumstances not only in respect of physical or bodily injury in the strict sense, but also in respect of injury. The nature of medical treatment is such that it affects the patient's 'personhood'. It affects...
overriding social interest, or an interests such as that of a minor child who is dependent upon the person concerned, the mentally competent individual's right to control his own destiny in accordance with his own value system must be rated higher than even his health and life. He says that if there is a conflict between the desire of a person to go his own way, forego medical treatment and to expire in his own manner, on the one hand, and the desire of the doctor to cure him of his disease or to secure his health on the other, the former should be accorded preference. There is neither a general right nor a general duty on the part of a person to protect another against himself31.

7.2.1.3 Liability for Omissions

Generally speaking liability for omissions is more restricted than liability for commissions due to the fact that the courts are reluctant to make individuals within society responsible for the welfare of others to whom they have no relationship.36 One is generally speaking entitled in law to mind one's own business.37 In the context of health care the Constitution has to some extent much more than just his life or physical wellbeing. Strauss (fn 34 supra) comments that if the treatment saves the patient's life then the award of damages is likely to be minimal but this should not be the case in all circumstances. If a patient who is suffering from an incurable disease is forcibly treated against his will in order to save his life and this objective is achieved but in the process his suffering is prolonged and his rights to human dignity and to bodily and psychological integrity have been violated it is submitted that there may well be arguments on the basis of public policy that clearly favour the wrongfulness of such an act and that would support a significant award of damages. Life is not everything. It is rather the lowest common denominator in being human as the matrix of other rights in the constitutional Bill of Rights indicates.

31 Strauss fn 28 supra at p31
36 Neethling, Potgieter and Visser (fn 18 supra)
37 In Sea Harvest Corporation (Pty) Ltd and Another v Duncan Dock Cold Storage (Pty) Ltd and Another 2000 (1) SA 827 (SCA), Scott JA observed that “In the course of the past 20 years or more this Court has repeatedly emphasised that wrongfulness is a requirement of the modern Aquillian action which is distinct from the requirement of fault and that the inquiry into the existence of the one is discrete from the inquiry into the existence of the other. Nonetheless, in many if not most delicts the issue of wrongfulness is contentious as the action is founded upon conduct which, if held to be culpable, would be prima facie wrongful. (Compare Lilicrap, Wassenaar and Partners v Pickington Brothers (SA) (Pty) Ltd 1985 (1) SA 475 (A) at 497B - C.) It is essentially in relation to liability for omissions and pure economic loss that the element of wrongfulness gains importance. Liability for omissions has been a source of judicial uncertainty since Roman times. The underlying difficulty arises from the notion that, while one must not cause harm to another, one is generally speaking entitled in law to mind one's own business. Since the decision in Minister van Polisie ewels 1975 (3) SA 590 (A) the Courts have employed the element of wrongfulness as a means of regulating liability in the case of omissions. If the omission which causes the damage or harm is without fault, that is the end of the matter. If there is fault, whether in the form of dolus or culpa, the question that has to be answered is whether in all the circumstances the omission can be said to have been wrongful or, as it is sometimes stated, whether there existed a legal duty to act. (The expression “duty of care” derived from English law can be ambiguous and is less appropriate in this context. See Knop v Johannesburg City Council 1995 (2) SA 1 (A) at 2713 - E.) To find the answer the Court is obliged to make what in effect is a value judgment based, inter alia on its perceptions of the legal convictions of the community and on considerations of policy. The nature of the enquiry has been
introduced an exception to this rule in the form of the right in section 27(3) not to be refused emergency medical treatment. This right has been discussed elsewhere in this thesis in greater detail. The point to note is that it, like the other constitutional rights is not absolute, but it nonetheless comes closer so far than any other legal principle in compelling certain persons to act in certain circumstances. A health professional or health establishment that refuses to provide emergency medical treatment, whether in the private or public sectors, without solid grounds for doing so is likely to be faced with a claim for violation of this constitutional right. The claim will in all likelihood be based in delict since the harm caused by the refusal to give emergency medical treatment is likely to be construed as a civil wrongdoing involving dolus rather than culpa. Obviously the claim would have to be considered in the light of the relevant circumstances. It is noteworthy that although the language of the Constitution seems to be couched in terms of a positive act, i.e. a refusal to provide medical treatment, rather than an omission, the wrongful ‘act’ in question is likely to be an omission — the failure to provide medical treatment — rather than a positive act.

7.2.2 Causation

In Muller v Mutual And Federal Insurance Co Ltd And Another38 the court observed that “...the problem of causation in delict involves two distinct enquiries. The first is whether the defendant's wrongful act was a cause of the plaintiff's loss (‘factual causation’); the second is whether the wrongful act is

---

38 formulated in various ways. See, for instance, Minister van Polisie v Ewels (supra at 597A - B); Minister of Law and Order v Kadir 1995 (1) SA 303 (A) at 318 E - H and the recent formulation, albeit in a different context, in National Media Ltd and Others v Bogoshi 1998 (4) SA 1196 (A) at 1204D. It is clear that the same facts may give rise to a claim for damages both ex delicto and ex contractu so that the plaintiff may choose which to pursue. But a breach of a contractual duty is not per se wrongful for the purposes of Aquilian liability. (See the Lilliecrap case supra at 496D - I and 499D - G.) Whether the requirement of wrongfulness has been fulfilled or not will be determined in each case by the proper application of the test referred to above.” This passage was quoted with approval by Comrie J in Pinshaw v Nexus Securities (Pty) Ltd And Another 2002 (2) SA 510 (C) Muller 1994 (2) SA 425 (C)

763
linked sufficiently closely to the loss for legal liability to ensue (‘legal causation’ or remoteness).”

In *Minister of Police v Skosana*[^39][^40], the court observed that causation in the law of delict gives rise to two distinct problems. The first is a factual one and relates to the question as to whether the negligent act or omission in question caused or materially contributed to see the harm giving rise to the claim[^41]. If it did not, then no legal liability can arise and *caedit quaestio*. If it did, then the second problem becomes relevant, viz whether the negligent act or omission is linked to the harm sufficiently closely or directly for legal liability to ensue or whether, as it is said, the harm is too remote. This is basically a juridical problem in which considerations of legal policy may play a part[^42]. Therefore the test for factual causation is, except in the most unusual of circumstances, the *causa (conditio) sine qua non*. The plaintiff must show that the harm would not have arisen but for the actions or omissions of the defendant. The courts decide the question of legal causation on the basis of a number of factors that relate essentially to public policy. The importance of public policy in the constitutional legal order that prevails in South Africa has already been discussed in some detail elsewhere. Public policy is informed by the values and principles of the Constitution. Thus decisions as to legal causation must also be informed by constitutional values and principles.

[^42]: Farlam AJ in this case quoted *Prosser Law of Torts* 4th ed at p 237, where it is stated: “A cause is a necessary antecedent: in a very real and practical sense, the term embraces all things which have so far contributed to the result that without them it would not have occurred. It covers not only positive acts and active physical forces, but also pre-existing passive conditions which have played a material part in bringing about the event. In particular it covers the defendant’s omissions as well as his acts.” And then observed that: “The test is thus whether but for the negligent act or omission of the defendant the event giving rise to the harm in question would have occurred. This test is otherwise known as that of the *causa (conditio) sine qua non* and I agree with my Brother Viljoen that generally speaking there may be exceptions- (see *Portwood v Swanmnr 1970 (4) SA 8 (RA) at 14) no act, condition or omission can be regarded as a cause in fact unless it passes this test (see *Da Silva and Another v Coutinho 1971 (3) SA 123 (A) at 147)."
Questions of legal causation involve the limits of legal liability.\textsuperscript{43} The appropriate test for legal causation has been a matter for some debate both in foreign jurisdictions and in South African law\textsuperscript{44}. In \textit{Smit v Abrahams}\textsuperscript{45} the court identified two tests from the literature: the direct consequences test and the reasonable foresight test. The former has been explained as follows:

"The presence or absence of reasonable anticipation of damage determines the legal quality of the act as negligent or innocent. If it be thus determined to be negligent, then the question whether particular damages are recoverable depends only on the answer to the question whether they are the direct consequence of the act."\textsuperscript{46}

The second test is derived from the judgment of Lord Simonds in \textit{Overseas Tankship (UK) Ltd v Morts Dock & Engineering Co Ltd}\textsuperscript{47} where he stated:

"... (I) t does not seem consonant with current ideas of justice or morality that for an act of negligence, however slight or venial, which results in some trivial foreseeable damage, the actor should be liable for all consequences however unforeseeable and however grave, so long as they can be said to be "direct". It is a principle of civil liability, subject only to qualifications which have no present relevance, that a man must be considered to be responsible for the probable consequences of his act. To demand more of him is too harsh a rule, to demand less is to ignore that civilised order requires the observance of a minimum standard of behaviour."

In, Farlam AJ points out that the principle upheld in \textit{Overseas Tankship} is subject to at least two qualifications: (a) as long as the ‘kind of damage’ is foreseeable the extent need not be and (b) the precise manner of occurrence need not be foreseeable.

Farlam AJ states in \textit{Smit} that it is his view that the direct consequence test is not really a rival which ousts the test of reasonable foresight observing that where it applied it operated as an extension to the reasonable foresight test so that, in

\textsuperscript{43} "The use of the expression ‘legal causation’ to describe the concept underlying the second enquiry, namely the enquiry as to the remoteness of damage, may be a convenient label, but it must not be allowed to distract one’s attention from the important consideration that the second enquiry does not really raise a question of causation but relates to the fixing of the outward limit of legal liability."

\textsuperscript{44} See the discussion in \textit{Smit v Abrahams} (fn 45 infra) at p162-174

\textsuperscript{45} \textit{Smit} 1992 (3) SA 158 (C)

\textsuperscript{46} \textit{In re Polemis and Furness, Withy & Co} [1921] 3 KB 560 (CA)

\textsuperscript{47} \textit{Overseas Tankship} [1961] AC 388 (PC) ([1961] 1 All ER 404)
effect, the two were combined with the result that a defendant will be held liable for (i) the reasonably foreseeable consequences of his culpable conduct, plus (ii) any direct consequences thereof, even if they were not foreseeable.

This view was subsequently accepted in *Gibson v Berkowitz* along with the dicta in *S v Mokgethi an Andere*.

In *Silver v Premier, Gauteng Provincial Government*, the court quoted from the minority judgment of Corbett JA (as he then was) in *Siman & Co (Pty) Ltd v Barclays National Bank Ltd* and especially at 915E where he said:

“In many instances, however, the enquiry requires the substitution of a hypothetical course of lawful conduct for the unlawful conduct of the defendant and the posing of the question as to whether in such case the event causing harm to the plaintiff would have occurred or not; a positive answer to this question establishing that the defendant's unlawful conduct was not a factual cause and a negative one that it was a factual cause. This is so in particular where the unlawful conduct of the defendant takes the form of a negligent omission. In *The Law of South Africa* (ibid para 48) it is suggested that the elimination process must be applied in the case of a positive act and the substitution process in the case of an omission. This should not be regarded as an inflexible rule. It is not always easy to draw the line between a positive act and an omission, but in any event there are cases involving a positive act where the application of the but-for rule requires the hypothetical substitution of a lawful course of conduct (cf Prof A M Honoré in *International Encyclopaedia of Comparative Law* c 7 at 74–6). A straightforward example of this would be where the driver of a vehicle is alleged to have negligently driven at an excessive speed and thereby caused a collision. In order to determine whether there was factually a causal connection between the driving of the vehicle at an excessive speed and the collision it would be necessary to ask the question whether the collision would have been avoided if the driver had been driving at a speed which was reasonable in the circumstances. In other words, in order to apply the but-for test one would have to substitute a hypothetical positive course of conduct for the actual positive course of conduct.”

---

48 *Gibson v Berkowitz And Another* 1996 (4) SA 1029 (W). The court noted as follows: “In South Africa the matter has become settled in that the Appellate Division has now laid down a ‘flexible norm’ (‘soepele maatstaf’) whereby considerations of policy, reasonableness, equity and justice are applied to the facts of the case. Van Heerden JA in *S v Mokgethi en Andere* 1990 (1) SA 32 (A) at 401–41B described the test for legal causation thus: ‘Wat die onderskeie kriteria betref, kom dit my ook nie voor dat hulle veel meer skaak is as ‘n maatstaf (die soepele maatstaf) waarvolgens aan die hand van beleidsoorwegings beoordeel word of ‘n genoegsame noue verband tussen handeling en gevolg bestaan nie. Daarmee gee ek ek nie te kenne nie dat een of selfs meer van die kriteria nie by die toepassing van die soepele maatstaf op ‘n bepaalde soort feitkompleks subsidier nuttig aangewend kan word nie, maar slegs dat geen van die kriteria by alle soorte feitkomplekse, en vir die doeleinde van die koppeling van enige vorm van regeansvrylikheid, as ‘n meer konkrete afsregningsmaatstaf gebruik kan word nie.’

51 *Siman fn 39 supra* at p 914C–918A

766
The potential for convergence of the principles of the law of contract and of delict is evident from the judgement in *Silver* where the court refused to distinguish between the test for causation in considering the contractual as opposed to the delictual claim of the patient. It is submitted that this is particularly relevant in the context of claims involving health care services since the facts upon which the claim is based, whether in contract or in delict, are likely to be the same in many instances. In other contexts where contractual claims are based rather more on the anticipated outcome or results of performance than on a failure to perform to some reasonably required minimum standard, there may be argument for a different test of causation to that contemplated in the law of delict. The latter attempts to put the plaintiff in the position in which he would have been but for the wrong that was done him whereas the law of contract attempts to put the plaintiff into the position in which he would have been had the obligations of the defendant under the contract been fulfilled. In the context of the law relating to health services delivery in particular, it has already been pointed out that it is very seldom that results of treatment are contractually guaranteed by those rendering it and the courts are unlikely to infer any kind of assurance of an outcome in a health services contract due to the unpredictability in many instances of health outcomes following treatment. The conflation of delictual and contractual

---

52 *Silver v Premier, Gauteng Provincial Government* fn 50 supra. On the subject of the *sine qua non* test the court observed at p 574-575 of the judgement that: "I am aware that the plaintiff's claim is founded in contract and, in the alternative, in delict. But I see no reason why the *sine qua non* test should not apply equally to the contractual claim in casu. The loss sustained by the plaintiff is said to have been caused by the breach of an implied term of an agreement that the hospital through its staff and employees would exercise due care, skill and diligence in providing nursing care. Precisely the same facts are relied upon as constituting a breach of the implied term as are relied upon as constituting a breach of the duty of care owed to the plaintiff. It would be anomalous if the same result did not follow irrespective of the cause of action. Furthermore, although the question of remoteness of damage for breach of contract is approached (in the absence of a contractual stipulation as to the basis on which compensation is to be made) by determining whether the damage flowed naturally and directly from the defendant's breach or is such a loss as the parties contemplated might occur as a result of such breach (*Victoria Falls & Transvaal Power Co Ltd v Consolidated Langlaagte Mines Ltd* 1915 AD 1 at 22 and 54), it must, in my view, follow as a matter of logic that as a general rule, the test for factual causation would first have to be satisfied. There will, of course, be exceptions, such as that cited by Visser and Potgieter in *Law of Damages* (1993) para 6.3.2 at 80-1: "(W)here a building contractor X is not able to build because Y, who has to deliver cement, and Z, who has to supply bricks, both fail to honour their contractual obligations on the same day and thus cause damage to X (eg he loses profit). According to the *conditio sine qua non* test, neither Y nor Z has caused damage since, if the breach of contract of each is notionally eliminated, the damage does not fall away!" The learned authors express the view that common sense must be employed in such cases - an approach emphasised by Corbett JA in Siman's case at p 917 in fine—918A and employed by Lord Wright in *Yorkshire Dale Steamship Co Ltd v Minister of War Transport* [1942] AC 691 (HL) at 706 ([1942] 2 All ER 6) and by Beadle CJ in *Portwood v Swann* 1970 (4) SA 8 (RA) at 15F—G."
principles in this context is thus logical and justifiable because it is the harm that is done to the patient in the 'delictual' sense, that grounds the claim in contract on the basis of a breach of an implied or express term to take reasonable care. Put another way, the law of contract tends to presuppose that the basis for the contract is an intended positive change in the circumstances of the contracting parties – an arrangement for their mutual benefit that contemplates an improvement in both their situations. To the extent that contracts for health care services do not tend towards such legally recognised presuppositions, the obligations of the parties to the contract are not squarely within the contractual paradigm but lean to some extent towards the delictual paradigm.

The spirit of contractual arrangements from the patient's perspective in the health services context could generally be summed up as: "If you won't say that you can cure me, at least promise to take due care not to harm me in the process of trying". This is a 'contractualisation' of the principles of the law of delict which is why it is entirely apposite to treat the two kinds of claims similarly. There is technically speaking no need to incorporate such a term in the contract except, possibly, for the purpose of mitigating the burden of proof for the patient which he or she would carry in terms of the law of delict. However, the balance of power between patient and provider is such that there is unlikely to be an express term in the contract between them which renders the provider strictly liable for any harm the patient may suffer as a result of the former's ministrations. Consequently the parties are most likely to contemplate an element of fault in their contract as being the reasonable 'trigger' for the liability of the provider. As far as implied terms are concerned, a court is unlikely to accept argument that an implied term of such a contract disposed of the requirement of fault on the part of the provider as a trigger for a claim by the patient. This is likely to be contrary to the norms of society in the majority of cases. Fault is a prominent feature of the law of delict which is why there is in
some respects no practical difference between the contractual and delictual claims in such a situation.

Lines of cause and effect are a preoccupation of the *sine qua non* test for causation53. It is important to distinguish, however, between factual causation and legal causation. Even if the *conditio sine qua non* test is satisfied on the basis of the facts there is still the question of whether, legally speaking, the causal link should be recognised54. The question of causation, viewed holistically, is therefore as much one of policy as it is one of fact55. In *S v

---

53 The court quoted from an unreported case in discussing the applicability of the 'but for' test for causation as follows: "In conclusion, on the applicability of the 'but for' test for causation, I would refer to the following passage in the unreported judgment (which I feel obliged to say I gave but in which Labuschagne J concurred) in *Aalwyn J Besuidenhout and Another v Willie J Jacobus Rossouw v/s Riviera Eiendommme* (WLD, case No A301097, delivered on 15 May 1997): 'Gewoonlik waar daar bepaal moet word of 'n sekere gevolg deur die optrede van versuim van een van die partye regtens veroorsaak is, moet daar gekyk word na 'n verskeidenheid van faktore wat 'n waardebepaling deur die Hof verg. Die vraag of die eerste bekendstelling van die eiendom die eintlike verkooptransaksie veroorsaak het, is geen uitsondering nie. In *Aida Real Estate Ltd v Lipschitz* 1971 (3) SA 871 (W) te 873H-874D het Marais R die volgende gedeel gesê: ‘The law with regard to a matter of this kind is usually stated in the following form: The duty of the estate agent, if he is to earn remuneration by way of commission for selling property, is to introduce to his principal (the seller) a purchaser who is willing and financially able to buy the property, and he earns the commission if a sale is concluded with that purchaser at the stipulated price or a price ultimately proved to have been acceptable to the seller. A proviso has been added to the effect that the introduction of the able and willing buyer must have been the effective cause or cause causans of the sale. If a new factor intervenes causing or contributing to the conclusion of the sale and the new factor is not of the making of the agent, the final decision depends on the result of a further enquiry - viz, did the new factor outweigh the effect of the introduction by being more than or equally conducive to the bringing about of the sale as the introduction was, or was the introduction still overridingly operative? Only in the latter instance is commission said to have been earned. This enquiry is not a metaphysical speculation in the result of cause and effect. It requires, as is said in *Webranchek v L K Jacobs and Co Ltd* 1948 (4) SA 671 (A), a commonsense approach to the question of what really caused the sale to be concluded, or, to put it differently, as it is said in a restatement of the law in America, whether it is 'just' that the agent should receive credit and compensation for the work he has done for the seller. In regard to this latter version, it may be said in passing that this question has nothing to do with the amount of work the agent put into it. The mere furnishing to the prospective buyer of the principal's address or the location of the property offered may be sufficient to entitle him to claim commission from the seller, provided a line of cause and effect can reasonably be traced from the introduction to the conclusion of the sale." Die woorde wat ek gekursiveer het, is belangrik. Dit moet nooit uit die oog verloor word nie dat voordat die gewone vraag (soos in *Aida Real Estate v Lipschitz* (supra) uiteengesit) ontstaan, daar hier - soos in enige ander situasie waar oorsaklikheid bepaal moet word - eers aan die *sine qua non* (ofte wel "but for") toets voldoen moet word. Met ander woorde, as daar nie gesê kan word dat, was dit nie vir die agent se optrede nie, die gevolg (verkoop van die eiendom) nie sou ingetree het nie, kan die optrede van die agent nooit as oorsaak van die verkooptransaksie bestempel word nie. Andereom gestel, as die verkooptransaksie sou plaasgevind het afgesien van enigiets wat die agent gedoen het, is die agent nie (ingeval die gewone kontrak tussen 'n agent en die eienaar) op kommissie geregtig nie.'

54 Thus in *Standard Chartered Bank of Canada v Nedperm Bank Ltd* 1994 (4) SA 747 (A) the court stated: "My conclusion is that the untrue report issued by Nedbank was a factual cause of Stanchar's loss. In other words, it was a *conditio sine qua non* of such loss. That, however, does not conclude the enquiry. It is still necessary to determine legal causation, i.e. whether the furnishing of the untrue report was linked sufficiently closely or directly to the loss for legal liability to ensue, or whether the loss is too remote. The principles applied in such an inquiry have recently been expounded by this Court in the cases of *S v Mokgathi en Andere* 1990 (1) SA 32 (A) at 39D-41B; *International Shipping Co (Pty) Ltd v Bentley (supra) at 700E-701G*, and *Smit v Abrahamse, as yet unreported, dated 16 May 1994, at pp 22-5, 32-3, 36-7, 39-40 of the typescript. As appears from these judgments, the test to be applied is a flexible one in which factors such as reasonable foreseeability, directness, the absence or presence of a novus actus interveniens, legal policy, reasonability, fairness and justice all play their part."

55 In *Smit v Abrahamse* 1994 (4) SA 1 (A) the court held that there can be no doubt that in South African law the *ratio of Owners of Dredger Liebesch v Owners of Steamship Edison; The Edison* [1933] AC 449 (HL) ([1933]
the court was faced with a situation in which a person was wounded so seriously that the injuries, in the absence of prompt medical intervention, would very soon lead to death. The victim of the crime was kept alive artificially by means of a respirator. She was subsequently taken off the respirator once it had been established that her brainstem was no longer functioning. Her heart and lungs ceased functioning some ten minutes after the ventilator was disconnected. The appellant was sentenced to death for her murder. He appealed on the grounds that the real cause of the victim's death was the disconnection of the respirator. In other words a *novus actus interveniens* had occurred to cause her death. The court held that it was not necessary to decide the case on the basis of whether the medical definition of death as being brainstem death must be accepted in law since it was possible to deal with the matter on the more traditional view of the community that death occurred when there was no longer a heartbeat or respiration. It held that the appellant's allegation of a *novus actus interveniens* was unreasonable and unacceptable in that he had given the deceased a wound which, had she not received medical assistance, would have lead rapidly to her death. Medical practitioners had done their best to save her. In the process her life was artificially maintained. When the ventilator was finally disconnected this action

---

66 *Williams* 1986 (4) SA 1188 (A)
was not the cause of her death but rather the termination of a fruitless attempt to save her life.\footnote{The court in \textit{Williams} (fn 56 supra) referred to the observations of the English court in the case of \textit{R v Malcherek; R v Soil} [1981] 2 All ER 422 in which Lord Lane stated as follows: “There is no evidence in the present case here that at the time of conventional death, after the life support machinery was disconnected, the original wound or injury was other than a continuing, operating and indeed substantial cause of the death of the victim, although it need hardly be added that it need not be substantial to render the assailant guilty.” and “Where a medical practitioner adopting methods which are generally accepted comes \textit{bona fide} and conscientiously to the conclusion that the patient is for practical purposes dead, and that such vital functions as exist (for example, circulation) are being maintained solely by mechanical means, and therefore discontinues treatment, that does not prevent the person who inflicted the initial injury from being responsible for the victim's death. Putting it in another way, the discontinuance of treatment in those circumstances does not break the chain of causation between the initial injury and the death.”}

Medical treatment does not necessarily have the effect of breaking the line of causation between the original injury and the death of a person. Even from the point of view of factual causation the withdrawal of medical treatment from a person who has suffered mortal injury cannot be said to constitute a new intervening cause of the ultimate result. From the point of view of legal causation the argument of a novus actus interveniens in these circumstances is clearly wrong since it would be contrary to the legal convictions of the community and the values of the Constitution to allow a wrongdoer to escape the consequences of such a heinous crime on the basis that medical practitioners tried to save the victim’s life but failed. The argument of a \textit{novus actus interveniens} in the context of medical treatment could only succeed if there was convincing evidence that the medical treatment itself precipitated the person’s death and that the initial injury would not have had the same result.

With specific regard to the health care context, it has been observed that the general causation requirement in toxic torts encourages both corporate self-deception and disregard for the public interest. It encourages industry not to investigate harm resulting from its product. By predicing liability on the plaintiff’s proof of causation, the tort system builds in disincentives for corporations to know and disclose information about harm. Legal scholar Margaret Berger argues that it is time to create a new toxic tort that would condition culpability on the ‘failure to develop and disseminate significant
data. She says that agent orange, asbestos, the Dalkon Shield, thalidomide and tobacco are all instances where companies failed to test their products initially, failed to report problems as they emerged and failed to do research to investigate those problems. A system that encourages a 'don't ask, don't tell' policy decouples liability from moral responsibility and thus threatens the basic underpinning of corrective justice. It has been observed that some might argue that current regulations which require premarket testing for drugs and chemicals deemed to be potential hazards are sufficient. However, the regulations have loopholes that the tort system, in placing the burden of proof on the plaintiff, fails to close.

7.2.3 Wrongfulness (Unlawfulness)

Wrongfulness is a question of public policy as informed by the values and principles of the Constitution. It is remarkable that both the Cape High Court and the Supreme Court of Appeal had to be reminded of this fact by the Constitutional Court in a judgment handed down in 2001 despite the fact that in other judgments, in some cases in the same division of the High Court, the courts were taking express cognizance of this central legal principle.

59 In Van Duivenboden v Minister of Safety and Security [2001] 4 B All SA 127 (C), Davis J stated at 132d: “(I)It would appear that the requirement of wrongfulness demands of the court that it determine whether society requires that the law classify the type of conduct concerned as impermissible, that is conduct of which a society disapproves. See Van Aswegen at 192 and Neebining, Potgieter and Visser The Law of Delict (1999) at 39 - 41. In turn the determination of "impermissibility" shaped by a society's vision of itself is contained within its legal system. In terms of the ultimate law in this country, the Constitution, South African society is predicated upon foundational values of human dignity, liberty and equality. The newly established constitutional community is to be built upon those “common values and norms” and the added principle that public authority must be transparent and accountable to the public it serves.”
60 Carmichele v Minister of Safety and Security and Another (Centre for Applied Legal Studies Intervening) fn 15 supra.
61 See Faircape Property Developers (Pty) Ltd v Premier, Western Cape 2000 (2) SA 54 (C) where Davis J stated: "In my view, the determination of the legal convictions of the community on which the test for wrongfulness is based must take account of the spirit, purport and object of the Constitution. As Prof Murenik wrote, the new Constitution ‘must lead to a culture of justification’ - a culture in which every exercise of power is expected to be justified” ((1994) 10 SAJHR 31 at 32). This principle of justification includes the concept of accountability, namely that a public authority is accountable to the public it serves when it acts negligently and without due care. Accountability includes the recognition of legal responsibility for the consequences of such action.”
The case of *Carmichele v Minister Of Safety And Security And Another*62 is a classic example of the importance of the role of the Constitution in the decisions of the courts and of the need to take into account the values and principles contained in the Constitution when considering matters that were previously solely the domain of the common law. In an earlier judgment granting absolution, the Cape High Court held that the pleaded omissions, on which the plaintiff relied, were not wrongful in that the defendants did not owe the plaintiff a legal duty to take positive steps to prevent the harm occasioned to the plaintiff. The court's finding was based on the application of the common-law position as expounded in the decisions of the then Appellate Division in *Minister van Polisie v Ewels*63; *Minister of Law and Order v Kadir*64; *Knop v Johannesburg City Council*65. The matter then went to the Supreme Court of Appeal and from there to the Constitutional Court.

On appeal, the Constitutional Court (*Carmichele v Minister of Safety and Security and Another (Centre for Applied Legal Studies Intervening)*66 referred to the aforementioned common-law test, and, with particular reference to the dictum of Hefer JA (in *Minister of Law and Order v Kadir*), concluded that in the exercise of determining whether a legal duty exists, the weighing and striking of a balance between the interests of the parties and the conflicting interests of the community amount to “a proportionality exercise with liability dependant upon the interplay of various factors”. It held further that “proportionality is consistent with the Bill of Rights, but that exercise must now be carried out in accordance with the “spirit, purport and objects of the Bill of Rights” and the relevant factors must be weighed in the context of a constitutional state founded on dignity, equality and freedom and in which government has positive duties to promote and uphold such values”.

---

62 *Carmichele* fn 49 supra  
63 *Ewels* 1975 (3) SA 590 (A)  
64 *Kadir* 1995 (1) SA 303 (A)  
65 *Knop* 1995 (2) SA 1 (A)  
66 *Carmichele* fn 15 supra
In upholding the appeal, the Constitutional Court refrained from itself deciding whether the law of delict should be developed on the basis contended for on behalf of the plaintiff. What it did hold was that where the common law deviates from the spirit, purport and objects of the Bill of Rights, the courts have an obligation to develop it by removing that deviation. It furthermore held that under the Constitution, courts are obliged to develop the common law under section 39(2) of the Constitution and that both the Cape High Court and the Supreme Court of Appeal assumed that the pre-constitutional test for determining the wrongfulness of omissions in delictual actions of this kind should be applied and in so doing “overlooked the demands of s 39(2)” of the Constitution. The Cape High Court in its reconsideration of the matter admitted that in handing down its initial judgment it did not have regard to the provisions of section 39(2). It noted that counsel for the applicant submitted that in the light of this constitutional duty imposed on the state, and in particular the duty on the State to protect women against violent crime in general, it is necessary to revisit the conventional test for wrongfulness to determine whether the state owed the plaintiff a legal duty to protect her against attacks of the sort perpetrated against her by the rapist: Reasonableness, on which the legal convictions of the community are based, is now to be found in the Constitution and not in some vague notion of public sentiment or opinion. In agreeing with him, Chetty J referred to the words of Davis J in *van Duivenboden* to the effect that the requirement of wrongfulness demands of the court that it determine whether society requires that the law classify the type of conduct concerned as impermissible, that is conduct of which a society disapproves and that in terms of the ultimate law in South Africa, the Constitution, South African society is predicated upon foundational values of human dignity, liberty and equality. Leinius and Midgely note that the criterion for assessing wrongfulness or unlawfulness is said to be one of objective reasonableness, requiring careful

67 *Van Duivenboden* fn 59 *supra*
68 Leinius and Midgley fn 16 *supra*
balancing, amongst others, of the parties’ interests and the circumstances of the particular case. Public policy plays an important role: courts are required to render value judgments as to what society’s notions of justice demand and such judgments should reflect the community’s perception of justice, equity, good faith and reasonableness. They note further that the constitutional court suggested in Carmichele that in applying section 39(2), concepts such as ‘policy decisions and value judgments’ might have to be replaced, supplemented or enriched by constitutional norms (paragraph 56). Noting that they agree with this view, they observe that the Constitution sets out criteria for determining society’s notions of justice and equity and articulates values and norms which must underpin society’s rules and their application. They state that if the common law does not reflect these notions and values, some development will be necessary to ensure that it does so from now on. Leinius and Midgley caution, however, that the view of the constitutional court that development should take place within the common law’s paradigm should be heeded so that whilst the Bill of Rights is now an important factor in assessing wrongfulness, it is not the exclusive embodiment of public policy in delictual matters. They point out that the boni mores, the legal convictions of the community, reflect wider concerns and encompass additional policy considerations – particular factors relevant to omissions, or pure economic loss (for example indeterminate liability), being some of them. It is submitted that whilst Leinius and Midgely

---

70 Carmichele fn 15 supra

71 Leinius and Midgley, fn 16 supra, note that according to the constitutional court, it remains unclear as to how constitutional obligations on the state translate into private-law duties towards individuals. On the one hand it might be easier, they say, to accentuate the objective nature of unlawfulness and ‘to cast the net of unlawfulness wider because constitutional obligations are now placed on the state to respect protect promote and fulfil the rights in the Bill of Rights and, in particular, the right of women to have their safety and security protected.’ On the other hand the elements of fault and remoteness (legal causation) might play a greater role. They do acknowledge that in some instances constitutional values might point to more restricted liability. In their view, while there are instances where constitutional imperatives must be taken into account in assessing fault or legal causation, the wrongfulness criterion is the correct locus for enquiring whether constitutional obligations have delictual equivalents. They note that an infringement of a fundamental right or breach of a constitutional duty will not necessarily entitle one to sue in delict. To do so, fundamental rights and obligations which flow therefrom must establish a subjective right or a corresponding legal duty, or at least fit into one of the established categories. The duty upon the state to ensure that one can freely exercise the right to vote, they say, is an example of a constitutional duty which does not have a delictual equivalent, whereas the right to dignity clearly has. They state that at another level, the more common one, the Constitution will have an ‘indirect radiating effect’ on existing concepts, as suggested in Du Plessis v De Klerk 1996 (3) SA 850 (CC) at paragraph
may be correct in saying that constitutional values and principles are a subset of those to be found at common law, where the latter are inconsistent with the former, section 2 of the Constitution is relevant and applicable and the latter must be discarded. In this sense therefore, only to the extent that common law policy considerations can be regarded as logically and legally consistent extensions of the constitutional values and principles, can they legitimately be applied in deciding claims in the law of delict. It is further submitted that lawyers should guard against being overly legalistic, in the sense of looking at the letter of the Constitution, rather than its spirit, when engaging in legal analysis of public policy principles since policy in itself is not a legal concept that fits easily into moulds of black and white or this and that. Policy is polycentric. Values are relative. The focus in policy consideration is not so much upon the words which express it as the spirit behind it. For this reason, legal thinking from a previous era which tends to focus more or less exclusively on an analytical, almost scientific, approach to legal interpretation and argument is likely to sit uncomfortably in policy debates, constitutional or otherwise.

In *Dersley v Minister Van Veiligheid En Sekuriteit* the court held that the test for wrongfulness required that a judicial value judgment had to be pronounced upon whether or not the infringement of the particular interest of the plaintiff was, in the circumstances, in accordance with the *boni mores* (i.e. the legal...
convictions of the community). If so, there was a legal duty upon a defendant to protect the rights of the plaintiff, which he could not neglect. If not, there was no such legal duty upon a defendant. It stated that the *boni mores* standard consisted of the legal convictions of the community and was not necessarily an ethical, social or contemporary moral standard. Rather it was directed at weighing, in the light of the particular circumstances, the reasonableness or otherwise of the defendant’s conduct against the infringement of the plaintiff’s interests. If reasonableness lay on the side of the defendant, he was not burdened by any legal duty. If, on the other hand, reasonableness lay on the side of the plaintiff, the defendant was indeed subject to a legal duty\(^73\).

\(^73\) At 10541/J - 10551/EF. Scott J in *Deliktuële Aanspreeklikheid Vir Veroorsaking Van Suiver Ekonomiese Verlies: Die Deur Word Wyer Oopgemaak* 2001 Tydskrif vir Hedendaagse Romeinse-Hollandse Reg 64 p681-689 critically examines the judgment in *Dersley*. He says that van Dyk J did not once in this case expressly refer to the fact that he was dealing with the question of delictual liability for pure economic loss. Van Dyk J, he says, found the core of the problem that stared him in the face in the process of the application of the relevant legal principles to the facts before him in the legal rules of delict applicable to omissions as a manifestation of human behaviour. Accordingly he devoted his attention exclusively to capturing the modern South African dispensation concerning the test for unlawfulness in the case of an omission. He observes with regard to the aspect of unlawfulness as dealt with in this case that Van Dyk J attached great value to the contribution of J C van der Walt who points to the basis of unlawfulness as being located in either a violation of the claimant’s subjective right or the non-compliance with a legal duty owed to the claimant. He notes that these sentiments have been shared since the sixties through the writings of academic heavyweights such as WA Joubert and NJ van der Merwe and further notes that the acceptance of van der Walt’s opinion regarding the more sophisticated present day nature of the *boni mores* test does not exactly indicate something which would be regarded in academic circles as revolutionary. In fact, says Scott, it should rather be disturbing for academics working in the field of delict that concepts such as those expressed by Van der Walt are accepted as noteworthy by the bench. Van Dyk J came to the conclusion that: “Dit het my getref dat die basiese toets verander het en dat dit vandag daarin gelet is dat ’n juistdisie waardeorde uitgeplek word. Woord of die eiser se betrokke saamgetaste belang in die omstandighede en tipe situasie wat voor die hof op die feite sou dien, ooreenkomsdig die boni mores (dit wil sê, die reëls van die gemeenskap) beskermingswaardig is al dan nie; en indien wel, is daar inderdaad ’n regsplig op sodanige persoon wat hy nie mag nalat nie. Andersins is daar geen regsplig op ’n verweerder om die regte van die eiser te beskerm nie.” Scott states that the court’s conclusion unfortunately paints a skewed picture of the *boni mores* test. Firstly, he says, it is clear that van Dyk J was setting out the application of the test for unlawfulness in the adjudication of an omission as the cause of pure economic loss while he gave the impression that he was defining the test for unlawfulness in general. Unlawfulness as the violation of a legal duty, the existence and scope of which is determined by the *boni mores*, is the model of choice for the adjudication of omissions. Secondly, says Scott, it should be noted that it is simplistic to hint that the *boni mores* are only relevant in the determination of the worthiness of protection, or not, of an interest. It is obvious that a legally protected interest may in other circumstances be violated, such as in the case of justification. Scott says that van Dyk J’s formulation does not allow the function of the *boni mores* to be fulfilled in the process of the demarcation of the scope of the legally protected interest. He observes that there is a great difference between a case such as that of *Dersley* and that of *Ewels* which revolved around the fact that policemen had failed to intervene in the plaintiff’s cause. In *Dersley* the employee of the defendant had gone out of his way to be helpful to the plaintiff. He engaged in positive action which led to harm to the plaintiff. The mere fact that this conduct was a failure to fulfil his role as a police official in conflict with specific and general legislation ought not to magically transform his act into an omission says Scott. He refers to Van der Walt and Midgley *Delict: Principles and Cases* who issue a warning with regard to this type of situation in the following words: “The failure (omission) to stop at a stop street indicates negligent or deficient positive conduct – *culpa in faciendo*. The mere fact that linguistic alternatives enable us to describe the positive occurrence in a negative way (for example, ‘the driver failed or omitted to stop at the stop street’) is legally irrelevant in the determination of the nature of the conduct.”
In *Aucamp And Others v University Of Stellenbosch*\(^7\(^4\)\) it was held that in considering whether or not the conduct in question is wrongful, the Court is required to make a value judgment. In doing so it must weigh up the interests of the parties and of the community at large against the background of the relevant facts and circumstances. In addition, it must strive, impartially and objectively, to apply the values of justice, fairness and reasonableness, while taking into account considerations of good faith (*bona fides*) and good morals (*boni mores*), otherwise known as public policy reflecting the legal convictions of the community\(^7\(^5\)\). The court in this case set out the factors that should be taken into account in considerations of wrongfulness, i.e. whether the defendant was able to avoid reasonably foreseeable harm by taking reasonable steps to do so, as follows:

(a) whether the defendant had known or had subjectively foreseen that his or her negligent conduct would cause harm to the plaintiff;

(b) whether the defendant could have taken reasonably practical steps to prevent such harm;

(c) whether the defendant possessed or had professed to possess special skill, competence or knowledge;

(d) whether special protection against economic loss had been required;

(e) whether a finding in favour of the plaintiff would lead to a multiplicity of actions or indeterminate liability which would have severe social consequences;

(f) whether a statutory provision required the prevention of economic loss;

(g) whether the plaintiff had been able to protect him- or herself against potential economic loss; and

(h) whether the defendant had been able to protect him- or herself against such loss, for example by arranging adequate insurance cover\(^7\(^6\)\).

---

\(^7\(^4\)\) *Aucamp* 2002 (4) SA 544 (C)

\(^7\(^5\)\) *Aucamp* fn 74 supra paragraph [68] at 5671 - 568B/C.

\(^7\(^6\)\) *Aucamp* fn 75 supra paragraph [69] at 568F - UJ.
The court stressed, however, that there was no *numerus clausus* of such factors. It stated that in the case of negligent misrepresentation, wrongfulness is determined by establishing whether or not the defendant had breached a legal duty to furnish correct information to the person entitled to such information. Similar principles to those applicable with regard to wrongfulness in a general delictual context apply, as do similar guidelines as to whether or not the defendant had a legal duty in a particular case. It listed the factors to be taken into consideration in considering a claim for negligent misrepresentation as follows:

(a) whether the parties had a contractual or fiduciary relationship requiring that correct information concerning any matter arising from such relationship be supplied

(b) whether the defendant had certain exclusive information which was not readily accessible to the plaintiff or other parties;

(c) whether the defendant had furnished information by virtue of his or her professional knowledge and competence;

(d) whether the defendant had been aware, or ought by the exercise of reasonable care to have been aware, of the existence and identity of persons who would rely on his or her negligent misrepresentation; and

(e) whether the defendant had been aware, or ought by the exercise of reasonable care to have been aware, of the existence and identity of persons who would suffer damage should the misrepresentation not be corrected, and would benefit should it be corrected.

In *Geldenhuys v Minister Of Safety And Security And Another* Davis J referred to an article by Francois du Bois which sets out four themes that are illustrative of the key considerations taken into account by courts in investigating wrongfulness. Davis J notes that briefly stated, these themes can be set out thus:

---

77 Aucamp *fn 74 supra* at paragraph [70] at 568J - 569E
78 *Geldenhuys* 2002 (4) SA 719 (C)
79 Du Bois F "Getting wrongfulness right: A Ciceronian attempt" *Acta Juridica* 1 at p 33ff
1. Courts are reluctant to impose delictual liability in cases where the enforcement of a duty in delict may disrupt a contractual allocation of rights and duties.

2. A finding of wrongfulness may be excluded where the law of delict lacks jurisdiction because the event complained of is of such a nature that the legal determination of the defendant's duty to the plaintiff, being the application of the element of fault, cannot be expected to reflect that person's obligations correctly. Of particular relevance to this issue is the recognition by the law of a sphere of decision-making autonomy, which makes the context of the dispute unsuitable for a judicial determination.

3. The extension of wrongfulness will not be easily undertaken where the rights and duties that are at issue have economic and the market provides a mechanism for distributing these in circumstances that could function as an alternative to adjudication.

4. The consideration that an extension of wrongfulness would open the “floodgates” of litigation; a point made by Toon van den Heever as follows: “If every individual were liable for failure to protect others against loss, each would be compelled in order to avoid liability, to run around and busy himself with the affairs of his neighbours, to the neglect of his own, which would lead to chaos.” (Aquilian Damages in South African Law (1944) at 37.)

Questions of wrongfulness in the context of health care can become particularly complicated. Reference has already been made to the thalidomide disaster in the 1960s and the fact that the drug was withdrawn from the market. In 1987 the Hansen’s Disease Centre contracted with the manufacturer of the drug to manufacture clinical grade thalidomide for the treatment of erythema nodosum leprosum. Over 50 kilograms of 99.5%-plus pure drug was delivered and used. Thalidomide clinical trial planning commenced in 1989 with the submission of the drug master file, inspection by FDA and planned orphan drug designation.
submissions. The first pilot clinical trial against Crohn's disease was begun in 1991. In 1992, working with the Division of AIDS of the National Institute of Allergy and Infectious Diseases and an AIDS Clinical Trials Group principal investigator, planning began for a trial against recurrent aphthous ulcers in HIV-positive patients, a previously untreated and incurable condition that severely degraded the quality of life. Study interim analysis in October of 1995 showed that 61 percent of treated patients had complete healing of all their ulcers versus the 5 percent of placebo patients and 91 percent of treated patients had partial or complete healing of all of their ulcers as compared to 18% of placebo patients. From 1993 to 1997 pilot trials were started against three AIDS-related conditions – Kaposi's sarcoma, prurigo nodularis, a severe dermatological condition and immuno deficiency in AIDS patients. The drug clearly has benefits in the treatment of otherwise untreatable conditions. The problem is how to maximise the availability of thalidomide to patients for whom nothing else works while inhibiting its routine availability so as to ensure a pregnant woman can protect her foetus. Thalidomide must therefore be safe and effective not only in the regulatory sense, but safe and effective for everyday use. It was noted in 1997 that the political pendulum in the US was swinging from a paradigm of government as protector and as agent of its citizens to one of less regulation and more consumer and independent citizen decision making. The point was made that if there are fewer government resources to provide comprehensive knowledge and regulatory balancing of risk and reward as they pertain to thalidomide, the patient's ability to make a fully informed and objective use decision can only be adversely affected. When cost-effectiveness constraints and time constraint pressures on providers are added, risk to the patient can only increase further. The result of all this increases the chance of accidents and therefore the threat of litigation. Such a series of events would be nothing short of catastrophic, not only to the victim, but to all others then benefiting from thalidomide and all who might benefit from it. Investment and development initiatives would be chilled or halted, probably irrevocably. 

80 Andrulis Corporation "Thalidomide: Potential Benefits and Risks" transcript Open Public Scientific Workshop
Wrongfulness in the health care context can be a question of balancing the interests of various groupings in society. It can be a question of calculated risks. The question is who takes these decisions and on what basis? These are important questions because if the risk is demonstrably worth it, and the courts sanction those who take it on the basis of a single case that goes wrong, what are the consequences for the many who benefit from the risk? The courts do not necessarily have the means to make policy decisions at these levels. The logical tools at their disposal do not necessarily allow for consideration of all of the public interest issues. Cases that are argued before them are most likely to be about the interests of individuals and not the interests of society as a whole.

The South African Law Commission has observed that professionals traditionally operate in spheres in which success is not always feasible and that even where important factors are within the professional's control, he cannot always guarantee success. The Commission notes that the courts face a particular difficulty in establishing a rational approach to professional liability. On the one hand provision has to be made for adequate protection of the consumer, client or patient and on the other hand human fallibility has to be taken into account. The Commission noted that South African medical practitioners have traditionally received "soft treatment" from the courts and that there have been several cases in which medical practitioners have been held liable for malpractices but in the majority of cases they have been absolved of blame. It also noted that an interesting phenomenon in the USA is that the greatest increase in litigation is experienced in those fields of medicine where the most progress has been made with the development of methods of treatment. The development of sophisticated technology has apparently created higher expectations among patients.

---
7.2.4 Fault

Negligence (*culpa*) is the most commonly encountered form of fault in the context of health service delivery. Although intention (*dolus*) is another recognized form of fault, it tends to play a more significant role in the criminal law than in the law of delict. For this reason, the discussion that follows will focus on fault in the form of negligence. The test for negligence in the South African law of delict has for a long time been accepted as the one enunciated by Holmes JA in *Kruger v Coetzee*: “For the purposes of liability *culpa* arises if-

(a) a *diligens paterfamilias* in the position of the defendant -
   (i) would foresee the reasonable possibility of his conduct injuring another in his person or property and causing him patrimonial loss; and
   (ii) would take reasonable steps to guard against such occurrence; and

(b) the defendant failed to take such steps.”

In *Mukheiber v Raath and Another* the Supreme Court of Appeal apparently seems to have favoured the relative theory of negligence posed by Boberg and stated as follows:

“For the purposes of liability *culpa* arises if-

(a) a reasonable person in the position of the defendant -

---

82 *Kruger* 1966 (2) SA 428 (A) at p 430E - F.
83 Holmes J states in *Kruger*, fn 82 *supra*, that: “This has been constantly stated for the last 50 years. Requirement (a)(i) is sometimes overlooked. Whether a *diligens paterfamilias* in the position of the person concerned would take any guarding steps at all and, if so, what steps would be reasonable, must always depend on the particular circumstances of each case. No hard and fast rules can be laid down. Neethling J and Potgieter JM in ‘Die Toets vir Nalatigheid Onder Die Soeklig: Sea Harvest Corporation (Pty) Ltd v Duncan Dock Cold Storage (Pty) Ltd 2000 (1) SA 827 (SCA), Mzathwa v Minister of Defence 2000 (1) SA 1004 (SCA)’ note that in Mukheiber v Raath 1999 (3) SA 1065 (SCA) 1077 Olivier JA chose to follow Boberg’s reformulation of the test. They criticise this departure from precedent as being without explanation and as supportive of the legal impossibility that even a completely lawful act could be construed as negligent. They say that these decisions create a climate of uncertainty and are thus regrettable. See further the discussion under *Mukheiber v Raath* in chapter nine of this thesis.
84 Mukheiber fn 83 *supra*

783
(i) would have foreseen harm of the general kind that actually occurred;
(ii) would have foreseen the general kind of causal sequence by which that harm occurred;
(iii) would have taken steps to guard against it, and
(b) the defendant failed to take those steps.”

Scott JA comments in his judgement in *Sea Harvest Corporation (Pty) Ltd And Another v Duncan Dock Cold Storage (Pty) Ltd And Another* that, broadly speaking, the former involves a narrower test for foreseeability, relating it to the consequences which the conduct in question produces, and serves in effect to conflate the test for negligence and what has been called “legal causation” (cf *Siman & Co (Pty) Ltd v Barclays National Bank Ltd*) so as, it is contended, to eliminate the problems associated with remoteness.

Scott JA does not read the judgment in *Mukheiber* to have unequivocally embraced the relative theory of negligence. He points out that elsewhere in the judgment and when dealing with the issue of causation the court appears to have applied the test of “legal causation” which the strict application of the relative theory would have rendered unnecessary. He then goes on to state that, having said this, it should not be overlooked that in the ultimate analysis the true criterion for determining negligence is whether in the particular circumstances the conduct complained of falls short of the standard of the reasonable person.

In *Mkhatswa v Minister of Defence* the court emphasised that what is required to satisfy any test for negligence is foresight of the reasonable possibility of harm. Foresight of a mere possibility of harm will not suffice. The Supreme Court of Appeal in this case refused to follow the judgement in *Mukheiber* on

87 *Siman* fn 39 supra at p 914F - H
88 *Sea Harvest Corporation (Pty) Ltd And Another v Duncan Dock Cold Storage (Pty) Ltd And Another* fn 86 supra at p 839
89 *Mkhatswa v Minister of Defence 2000 (1) SA 1104 (SCA)*
the ground that it "might give rise to some uncertainty as to what was sought to be conveyed."90

In Van Duivenboden91 the court observed that negligence is not inherently unlawful. It is unlawful, and thus actionable, only if it occurs in circumstances that the law recognises as making it unlawful. Unlike the case of a positive act causing physical harm, which is presumed to be unlawful, a negligent omission is unlawful only if it occurs in circumstances that the law regards as sufficient to give rise to a legal duty to avoid negligently causing harm. The value of synthesis as opposed to analysis is clear from this statement. Although it is useful to identify the various elements of a delict in order to contemplate them in greater detail, there is a danger in considering them in isolation since they must be considered in a systemic context in terms of which each has a bearing on or relationship to the other. In the same vein, where a legal duty is recognised by the law, an omission will attract liability only if the omission was also culpable according to the test of whether a reasonable person in the position of the defendant would not only have foreseen the harm but would also have then acted to avert it92. The academic debate that was provoked by Mukheiber v Raath is canvassed in more detail in the discussion of that case below.

7.2.5 Loss

As stated previously, loss in the law of delict is calculated differently to loss in the law of contract. Under the law of contract the loss is calculated with regard to the position in which the plaintiff would have been but for the breach of contract. Generally speaking this position is a positive improvement on the position of the plaintiff prior to the contract. In terms of the law of delict, loss is calculated with regard to the position that the wronged party would have been in

90 Mukheiber fn 83 supra at p1111
91 Van Duivenboden fn 59 supra
92 Van Duivenboden 2002 (6) SA 431 (SCA) paragraph [12] at p 441E - 442A.
but for the wrongdoing. It therefore attempts to restore the plaintiff as far as possible to the position he was in before the wrong occurred. In delict, both non-pecuniary and pecuniary loss is recognised whereas in the law of contract, only pecuniary loss is recognised\textsuperscript{93}. With regard to non-pecuniary loss, however, South African courts have apparently decided that it must be viewed subjectively\textsuperscript{94} as opposed to objectively in that, the victim of the delict must be in a position to be able to appreciate and experience the wrong that has been done in order for it to be compensable. In \textit{Collins v Administrator, Cape}\textsuperscript{95}, the facts of which are given in more detail below, the court held that where a defendant’s negligence has resulted in the plaintiff becoming permanently unconscious for the remainder of her life, there is no basis in South African law for awarding her non-pecuniary damages in respect of pain and suffering, shock, discomfort, loss of amenities or shortened expectation of life because the delictual action for damages is compensatory, not punitive. In other words where the non-pecuniary loss is so great that the plaintiff is unable to comprehend it, no damages will be awarded. Where the degree of non-pecuniary loss is not such that the loss itself has robbed the plaintiff of the capacity to experience the loss, however, non-pecuniary damages will be awarded. The court in \textit{Collins} said that where the plaintiff is unconscious and all her physical needs have been taken care of, it is not possible to compensate her

\textsuperscript{93} \textit{Administrator Natal v Edouard} 1990 (3) SA 581 (A)

\textsuperscript{94} Although in \textit{Collins v Administrator, Cape} fn 1 supra the Cape court held that there is no basis for accepting in South African law the distinction drawn in English law between a subjective and an objective element in the loss of amenities of life, a distinction which owes its existence to the Law Reform (Miscellaneous Provisions) Act of 1934 which made a claim for loss of expectation of life transmissible to a deceased's estate. As such a claim is not transmissible in South Africa the occasion for such distinction does not arise and, without such need, there is no logical basis for the drawing of such a distinction, it is submitted that in essence this is what the "functional" approach of the court amounts to:

\textit{Neethling, Potgieter and Visser} (fn 18 supra) at p 249 that in \textit{Gerke v Parity Insurance Co Ltd} 1966 3 SA 484 (W) the court researched the English law and came to the conclusion that in that system a predominantly abstract (objective) approach is followed but that subjective considerations do play a role in determining the quantum of damages. They quote the observations of Ludorf J to the effect that the test is (a) objective in that something falls to be awarded for what has been called loss of happiness even in a case where the victim has been reduced to a state in which he has never realised and will never realise that he has suffered this loss; (b) is, however, subjective, in the sense that the court in fixing quantum, will have regard to any relevant data about the individual characteristics and circumstances of the plaintiff which tend to show the extent and degree of the deprivation; (c) is subjective, also, in the sense that any realisation which the plaintiff has, or did have or will have, of what he has lost, is most material and important. The authors observe that although the case has been strongly criticised and correctly so in some instances, it has generally been followed in other cases such as \textit{Reynes v Mutual and Federal Insurance Co Ltd} 1991 3 SA 412 (W) and in \textit{Southern Insurance Association Ltd v Bailey} 1984 (1) SA 98 (A). They point out that the Appellate Division did not condemn the approach in the \textit{Gerke} case in Bailey:

\textit{Collins} fn 1 supra
for her loss. It would be like paying a dead person money in order to compensate him for the loss of his life. In Collins, the court held that the so-called 'functional' approach is consistent with the principles of South African law and involves the award of non-pecuniary damages only to the extent that such damages can fulfil a useful function in making up for what has been lost in the sense of providing for physical arrangements which can make the victim's life more endurable. It cited Southern Insurance Association Ltd v Bailey NO\footnote{Bailey fn 94 supra} in support of the principle that the function to be served by an award of damages is a relevant consideration in determining what damages should be awarded. The effect of the judgment is that where an award of non-pecuniary damages to the unconscious plaintiff will not serve any purpose for the plaintiff at all, there is no basis for making any award.

The decision in Collins has been criticised as a failure on the part of the court to take into account the high value accorded to human life and dignity by the Bill of Rights\footnote{Visser PJ 'Geen Vergoeding vire Bewustelose Eisers' 1996 THRHR p 179}. Neethling \textit{et al}\footnote{Neethling \textit{et al} fn 18 supra} argue that in analysing the problem under discussion it is important to note that the existence of injury to personality should not be confused with its compensability. They state that there is clear agreement that injury to the personality of a person whose consciousness has been reduced to such a level that he has little or no insight into his own condition cannot be compensated by an award of damages and point out that the solution under German law in such a case is to make an award of objective satisfaction which signifies a symbolic redress of the harm by effecting retribution for the wrong done to the plaintiff\footnote{Neethling \textit{et al} (fn 18 supra) note that Boberg \textit{Delict} p 570 also seems to favour the German approach. Boberg states that "It is believed that our courts will and should continue to award a nucleus of damages for loss of amenities of life to the unconscious plaintiff a la Gerke, though any actual evidence of awareness should greatly increase the award. Compromise this solution may be, but it offers the necessary flexibility to deal justly with individual circumstances, and enables the law to express society's sympathy with the victim and its sense of outrage at this grievous loss". See the criticism by Neethling \textit{et al} fn 338 on p 250 of the views of van der Merwe and Olivier (\textit{Die Onregmatige Daad in die Suid-Afrikaanse Reg}) p 192 fn 51 on this subject and also their exploration of the opinions of Luntz H 'Damages In Cases of Brain Injury' 1965 SALJ p 10 and Erasmus HJ 'Genoegdoening vir Verlies aan Lewensgenietinge' 1976 TSAR p 238. The court in Reyneke (fn 94 supra) stated as follows with regard to the criticism of Luntz H in an article entitled 'Damages in cases of brain injury-}. Neethling \textit{et al} observe that...
injury to personality in cases of interests which are directly related to consciousness consists only of an injury to feelings. The operation of the conscious mind is thus a prerequisite, they say, for the existence of harm such as pain and physical suffering. They note that other forms of personal loss are only

Some developments’ SALJ 1967 at 6 (Luntz disagreed with the conclusion reached by Ludorf J in the Gerke case. He seemed to favour the functional approach, i.e. the subjective approach and relied heavily on the Australian case of Skelton v Collins (1966) 39 ALJR p 480 wherein the High Court of Australia dissented from the views expressed in the Wise v Kaye and West v Shepherd cases.): “His criticism seems to have lost much force in view of the House of Lords decision in the Lim Poh Choo case [Lim Poh Choo v Camden and Islington Health Authority [1979] 2 All ER 910 (HL)]... It seems to me that the criticism of Luntz is also rendered ineffective by the judgment of Nicholas JA in the Bailey case [Southern Insurance Association Ltd v Bailey NO 1984 (1) SA 98 (A)]... when the learned Judge referred to Lord Scarman’s judgment aforesaid with apparent approval and then continued at 119F as follows: ‘As I read the judgment in the Katz case, however, it did not lay down that the “functional” approach was the one to be followed: all that was said was that on the facts of the Katz case, an approach of that kind would not call for an interference with the damages awarded by the trial Court.’ Classen J said: ‘I respectfully read the judgment of Nicholas JA as expressly refraining from laying down a principle of law that the Court is obliged to apply the functional approach where the patient is unconscious of any loss suffered or where the award would most probably not be employed to alleviate his lot. As I understood his judgment the Courts, when making an assessment for general damages, may take into account as one of the factors influencing the amount of the award the fact that such an award cannot be utilised by the patient to alleviate any loss of amenities of life. He did not prohibit the award of general damages for loss of amenities of life or reduced expectation of life to a patient in a ‘cabbage’ case.” With regard to the criticism of Gerke by Erasmus, (“Genoegdoening vir verlies van lewensgenietinge” (1976) 2 TSAR 238) the court in Reyneke observed that: “The learned author argues that damages for pain and suffering and loss of amenities of life are in the nature of a solatium analogous to that awarded under the actio injuriarum. He cites Government of The Republic of South Africa v Ngubane 1972 (2) SA 601 (A) at 607B - C where Holmes JA held as follows: ‘Third, claims for bodily injury involving pain and suffering and the like have this in common with claims under the actio injuriarum - namely that both relate to non-pecuniary loss and the amount awarded is regarded in the nature of a solatium. As Van Wissen J observed in Hoffa’s case supra at 955A: “(The damages awarded therefore bear a direct relationship to the personal suffering of the injured party and are intended for his personal benefit. The damages awarded to him are in a certain sense analogous to the solatium which is awarded under the actio injuriarum to someone as a salve for his wounded feelings.”’”

Professor Erasmus then proceeds to conclude that the Gerke decision [Gerke NO v Parity Insurance Co Ltd fn 94 supra] is wrong and in conflict with the Ngubane decision: “Die huidige posisie is dus dat de die emigte geelente waarop die vraag pertinente ter sprake gekom het, vergoeding vir verlies van lewensgenietinge toegestaan is aan ‘n persoon wat sodanig breinbeskadigd was dat hy nie bewus was van sy eie toestand nie. Intussen het die Appellhof, in navolging van verskeie Provinsiale Afdelings, ‘n uitleg gegee van die aard van die aksie wat onversoenbaar is met enige toekennin onder hierdie hoof aan die breinbeskadigde slagoffer. Daar word derhalwe met eerbied aan die hand gedoen dat in die lig van die besluiting van die Appellhof van die Ngubane -saak, daar nou sonder twyfel aanvaar moet word dat die Gerke -saak gevolg het van die genoegdoening vir die leed wat die slagoffer persoonlik ervaar. As die benadeelde persoon as gevolg van die aard van sy beserings geen leed ervaar nie, is hy van eie reëks nie gereg teen genoegdoening vir dit wat hy nie ervaar nie.”

Classen J then states: “With respect to the learned author, I cannot agree with his conclusions. The Ngubane case decided that a claim for damages for pain and suffering and loss of amenities of life is incapable of cession prior to litis contestatio. The Court did not decide, nor was it called upon to decide, whether a patient in a vegetative state, and thus still alive, is entitled to general damages for pain and suffering and loss of amenities of life. As indicated in the Sandler v Wholesale Coal Suppliers Limited case supra, completely different considerations apply as to whether damages are claimable of not. These were described as ‘the broadest general considerations’ and ‘what is fair in all the circumstances’. These considerations do not apply when considering the question whether or not a claim for pain and suffering and loss of amenities of life is cedable or not. It goes without saying that a solatium is not capable of cession. However that is not the enquiry I am concerned with. I have to decide whether a solatium is payable to a person in a vegetative state. The question which is relevant here is whether an objective or subjective standard is to be applied in assessing such damages. The merits or demerits of these tests were never considered nor relevant in either the Ngubane case or the case of Hoffa NO v SA Mutual Fire & General Insurance Co Ltd 1965 (2) SA 944 (C). As such the criticism of Prof Erasmus seems unjustified. Furthermore, in awarding damages for loss of amenities of life to a person in a vegetative state, one is not awarding such damages to anyone else but the patient. It is not an award to the heirs. The fact that it may eventually redound to the benefit of the heirs because the patient cannot utilize it for his own benefit, does not make the award any less an award of damages to the patient. In any event it seems to me that the criticism of Prof Erasmus falls by the wayside in view of the stamp of approval given by the House of Lords and the South African Appellate Division in the Lim Poh Choo and Bailey cases respectively.”
indirectly related to consciousness. Thus where there is an impairment of reputation or a loss of the amenities of life, the loss is not only to be found in the feelings or consciousness of the plaintiff. In cases of defamation and loss of amenities, it is possible to ascertain objectively without reference to the feelings of the plaintiff whether his esteem in society has been lowered or to what extent his capacity to enjoy a normal life has been negatively influenced. They state that the connection with consciousness is only created through affective (sentimental) loss, that is the reaction of the injured person to his loss, or in other words, his personal unhappiness. In such case an injury to personality has both a subjective and an objective element. According to Neethling et al unconsciousness excludes only the subjective element. They observe that an unconscious person with brain injuries does not have a normal life and does not take part in normal activities and ask how it can then be correct to say that there is no loss? They take the view that the fact that the loss cannot be compensated does not mean that it is non-existent or that the law should ignore it and point out that in such cases the objective function of satisfaction becomes relevant in German, Australian and South African law. They state that the common mistake which is made in the evaluation of personal loss where the plaintiff is unconscious is to equate the existence of loss with its compensability.

In Reyncke v Mutual and Federal Insurance Co Ltd100 the court stated that in making an award the courts adopt an objective approach in determining the

---

100 Reyncke fn 94 supra. The facts of the case were that the plaintiff, the father of a minor daughter, Suzette Aneline Reyneke, who was born on 8 July 1970 sued the defendant company both in his personal capacity and in his capacity as father and natural guardian of Suzette. The claim arose out of a collision which occurred on 9 October 1986. Suzette was on roller skates in Lombard Street, Klerksdorp when the vehicle, which was insured by the defendant company, collided with her. Since the injury, Suzette lay in the surgical ward No 6 at the Klerksdorp hospital. She sustained various minor injuries, viz a fractured jaw, a fracture of the metacarpal of her hand, multiple rib fractures and fractures of both knees. For all practical purposes these minor injuries were not relevant to the dispute. However, as a result of a major head injury, Suzette was in a permanent vegetative state, i.e. she fell into the class of cases known as 'cabbage' cases. She was unaware of all bodily functions, blind, mute, deaf and there was no prognosis of recovery of any of these faculties. The brain injury caused prolonged loss of consciousness and haemorrhage in the deep seated ganglial areas of the brain. As a result of this head injury she was 100% disabled. She was fed by a naso-gastric tube and her urine was drained by an indwelling catheter. She responded to pain only by decerebration posturing. There was a well-marked cough reflex on tracheal pressure. Her pupils were large and did not respond to light. She was blind. Her primary reflexes were still present but she had no spontaneous movement. She could not speak but breathed spontaneously. Her bowels were evacuated either spontaneously or with digital help two or three times a week in bed. There had been episodic chest and bladder infections but these usually clear up within two to three days and in a few instances after approximately nine days. Suzette was emaciated and had lost approximately 16
amount of damages, that is, it awards damages for loss whether the victim is aware of such loss or not. In awarding damages for loss in this category, the court may, but is not obliged to, take into as one of the factors influencing the award, the so-called ‘functional approach’ whereby the amount of damages may be increased or decreased depending on (a) the extent to which the money so

kilograms in weight since the date of the collision. At that time she weighed approximately 55 kilograms, whereas her weight had reduced to 39 kilograms. At the time of the collision she was 16 years of age and she was 20 years when case was heard. She would be bedridden for the rest of her life. In medical terms her condition is described as being a Persistent Vegetative State or PVS after a definition by Jennett and Plum made in 1972. A brain scan showed extensive loss of cortex and diffuse atrophy. She had been in a coma since the collision. The Persistent Vegetative State described patients with irreversible brain damage who, on recovery from a deep coma, pass into a state of seeming wakefulness and reflex responses but never return to a cognitive sapient state. It is the result of destruction of the cerebral cortex of the brain but with sufficient preservation of the brainstem to sustain the vegetative functions - respiration, circulation, gag-reflex etc. The PVS is distinguishable from brainstem death where the patient is kept alive by mechanical respiratory support which, if withdrawn, will result in death. The claim was for (1) Suzette's remaining life expectation; (2) general damages; (3) past and future loss of earnings. With regard to the claim for general damages, Classen J stated at p419 onwards as follows: I now turn to the difficult task of making an award under the heading of 'general damages'. Normally this head of claim will include items such as pain and suffering, loss of expectation of life, loss of amenities of life, disfigurement etc. I may just in passing mention that 'loss of amenities of life' has been defined as "a diminution in the full pleasure of living'. See H West & Son Ltd and Another v Shepherd [1963] 2 All ER 625 (HL) at 636G - H. The amenities of life flow from the blessings of an unclouded mind, a healthy body, sound limbs and the ability to conduct unaided the basic functions of life such as running, eating, dressing, and controlling one's bladder and bowels. Per Hoexter JA in Administrator-General, South West Africa and Others v Kriel [1988] (3) SA 275 (A) at 283E - G. It is common cause that Suzette has lost all these amenities of life. The problem with which I am faced is the difficult question of whether Suzette is aware of the fact that she has suffered any loss of this nature. Suzette's case is to be distinguished from other cases known as the 'twilight' cases where some communication with the patient is sometimes possible. Examples of the so-called 'twilight cases' are Roberts NO v Northern Assurance Co Ltd 1964 (4) SA 531 (D); Lim Poh Choo v Camden and Islington Health Authority [1979] 2 All ER 910 (HL); Marine & Trade Insurance Co Ltd v F Kate NO 1979 (4) SA 961 (A) at 983A; and Southern Insurance Association Ltd v Bailey NO 1984 (1) SA 98 (A) at 120A. The 'cabbage' cases which are on all fours to the present instance are Wise v Kaye and Another [1962] I All ER 257 (CA) and Gerke NO v Purdy Insurance Co Ltd 1966 (3) SA 484 (W). e problem which arises in the 'cabbage' cases is whether a Court should award any general damages in circumstances where the patient is not aware of any suffered loss and where any awarded amount will only redound to the benefit of the patient's heirs, i.e. the patient will not be able to make use of the money to alleviate his/her condition. In dealing with this vexed question the Courts in England and in South Africa have developed a twofold approach, namely a subjective and an objective approach: (i) A subjective approach is adopted in the sense of recognising that certain losses can only be compensated if they are consciously experienced by the patient. Conjoined to this substratum is the idea that when the patient is not aware of deprivation - a substantial loss, whether the patient is aware of it or not. The effect of this divided approach is that the head of claim 'loss of amenities' is divided into two categories of loss, viz

(1) pain and suffering, shock, mental anguish, anxiety, distress or fear etc; and

(2) loss of amenities of life, loss of expectation of life, disfigurement etc.

It is then said that category 1 requires a subjective approach, i.e. if the patient does not consciously experience pain, distress, fear etc, there can be no compensation. As for category 2, it is said that these amenities are objectively lost whether the patient is aware of such loss or not."
awarded can be utilised to benefit the victim in alleviating his/her lot in life; and/or (b) the extent to which such money will exclusively benefit the victim's heirs. The court in Reyneke followed the decision in Gerke while the court in Collins refused to follow these two decisions and the precedent on which they were based. Since the Reyneke and Gerke decisions are those of Witwatersrand Provincial Division of the then Supreme Court and the decision in Collins is that of the Cape Provincial Division of the then Supreme Court, one is in effect faced with a bifurcated approach to a single question of law by South African courts who on a par in terms of the authoritative levels of their respective judgments. (See Neethling et al)

One of the arguments used by the court in Collins to justify its decision is that the object of an award of damages under the law of delict is compensatory and not punitive. Potentially there is another basis for damages which lies between these two polarities and which falls within the realm of constitutional law rather than common law. This possibility is, however, dependent upon the view that the Constitution creates rights that are over and above those recognised by the common law of delict. If one takes for example the Constitutional right to bodily and psychological integrity as expressed in section 12 (2) of the Constitution, one must ask, in order to justify an award of constitutional damages for violation of this right, whether the parameters of this right are wider than those traditionally recognised by the law of delict in respect of bodily and mental injury. Even if the answer is in the affirmative, one is then faced with the question of the extent to which the common law right and the constitutional right overlap. It is only to the extent that the common law right is a subset of the constitutional right, i.e. that the constitutional right is broader than the common law right, that there is scope for the recognition of purely 'constitutional damages' i.e. those falling outside of the scope of the law of delict. Where the two rights overlap, there is no logic in awarding what effectively could amount to double damages as this would place the plaintiff in a better position than that in which he found himself prior to the wrong done to
him. Furthermore, one must bear in mind the constitutional injunction to the courts to develop the common law. According to section 8(3) of the Constitution\textsuperscript{101}, when applying a provision of the Bill of Rights to a natural or juristic person in terms of subsection (2), a court-

(a) in order to give effect to a right in the Bill, must apply, or if necessary develop, the common law to the extent that legislation does not give effect to that right; and

(b) may develop rules of the common law to limit the right, provided that the limitation is in accordance with section 36 (1)\textsuperscript{102}.

Traditionally, damages are awarded in terms of the common law of delict to compensate the plaintiff. The court in \textit{Collins} did not refer to the Constitution. Would the Constitution require one to take a different view to the judgments in \textit{Reyneke} or \textit{Collins} or is it supportive of the judgments in either of these cases? Due to the fact that the court in \textit{Collins} saw fit to depart from the decision in \textit{Reyneke}, one is now faced with a choice as to how similar matters should in

\textsuperscript{101} Act No 108 of 1996

\textsuperscript{102} The constitutional court in \textit{Carmichele v Minister Of Safety And Security And Another (Centre For Applied Legal Studies Intervening)(fn 15 supra) was critical of both the High Court and the Supreme Court in their failure to take into consideration the provisions of section 39(2) of the Constitution holding that where, as in the present case, it was clear that the common law had to be developed beyond existing precedent, there were two stages to the enquiry the Court was obliged to undertake: it had to consider, first, whether the existing common law required development in accordance with the objectives of s 39(2) and, if so, how this development was to take place in order to meet the objectives of s 39(2). It said that in the present case neither the High Court nor the SCA had embarked on either stage of this enquiry, with the result that the CC did not have the benefit of any assistance from either Court on either stage of the above enquiry. Ackermann and Goldstone JJ commented at p 961-962 that: "The influence of the fundamental constitutional values on the common law is mandated by s 39(2) of the Constitution. It is within the matrix of this objective normative value system that the common law must be developed. This requires not only a proper appreciation of the Constitution and its objective, normative value system, but also a proper understanding of the common law. We have previously cautioned against overzealous judicial reform. The proper development of the common law under s 39(2) requires close and sensitive interaction between, on the one hand, the High Courts and the Supreme Court of Appeal which have particular expertise and experience in this area of the law and, on the other hand, this Court. Not only must the common law be developed in a way which meets the s 39(2) objectives, but it must be done in a way most appropriate for the development of the common law within its own paradigm. There are notionally different ways to develop the common law under s 39(2) of the Constitution, all of which might be consistent with its provisions. Not all would necessarily be equally beneficial for the common law. Before the advent of the IC, the refashioning of the common law in this area entailed ‘policy decisions and value judgments’ which had to ‘reflect the wishes, often unspoken, and the perceptions, often but dimly discerned, of the people’. A balance had to be struck between the interests of the parties and the conflicting interests of the community according to what ‘the (c)ourt conceives to be society’s notions of what justice demands’. Under s 39(2) of the Constitution concepts such as ‘policy decisions and value judgments’ reflecting ‘the wishes . . . and the perceptions . . . of the people’ and ‘society’s notions of what justice demands’ might well have to be replaced, or supplemented and enriched by the appropriate norms of the objective value system embodied in the Constitution."
future be decided. There is furthermore the public policy concern that in situations such as those in *Reyneke* and *Collins*, how does one give recognition to the weight of the harm that has been done in the light of constitutional rights to human dignity, the right to life and the right to bodily and psychological integrity? Assuming that wrongfulness has been clearly established in terms of the law of delict and in view of the extreme nature of the plaintiff's loss, how does one recognize or admit such a gross violation of these constitutional rights? Is the compensation that is and was traditionally available under the common law of delict sufficient for this purpose or is something more required? While compensation is the main object of the law of delict it is not necessarily the main object of the Bill of Rights. The objects of the latter embrace the possibly broader concerns of the protection of human dignity and freedom, the enforcement of respect for the human condition and for human life and the recognition of the individual worth of every member of society as a human being. The Constitution is expressly concerned with fundamental values. The question is, if society has recognised the innate worth of an individual human being, then surely it has as much of an interest in the observation of the constitutional rights of individuals as do the individuals themselves?103 This is one sense in which the Constitution may be said to be broader in scope than the law of delict which, falling as it does within the scope of private law, is more concerned with the rights and interests of individuals rather than the collective. The vital interests of society in the observation of the provisions of the Constitution generally and the Bill of Rights in particular could be said to be more prominently recognised in constitutional law than in the law of delict. However, a powerful counterargument to this is that the Bill of Rights in the particular context of the right to bodily and psychological integrity is merely a

103 This is clearly expressed in the minority judgment of Didcott J in *Fose v Minister of Safety and Security* (1996 (2) BCLR 232 (W)) where he stated: "Deterrence speaks for itself as an object. But the idea of vindication, used in the sense that it conveys at present, calls for some elaboration. One of the ordinary meanings which 'to vindicate' bears, the aptest now so it seems to me, is 'to defend against encroachment or interference'. Society has an interest in the defence that is required here. Violations of constitutionally protected rights harm not only their particular victims, but it as a whole too. That is so because, unless they are adequately remedied, they will impair public confidence and diminish public faith in the efficacy of the protection, and for a good reason too since one invasion discounted may well lead to another. The importance of the two goals is obvious and does not need to be laboured. How they are best attained is the question."
codification of the common law right and the fact that the law of delict recognises the importance of public policy in the concept of wrongfulness is comparable to, and in fact no different from, the constitutional expression of the interests of society in the observation of the right in question. The Constitution merely spells out the values of society in a more definite way so that there is now no doubt as to the nature of the public policy that must be taken into consideration in questions of wrongfulness for the purposes of the law of delict.

It has been argued that the objectives of the law of delict differ fundamentally from those of constitutional law. The primary purpose of the former is to regulate relationships between private parties whereas the latter, to a large extent, aims at protecting the chapter 3 rights of individuals from state intrusion. Similarly, the purpose of a delictual remedy differs fundamentally from that of a constitutional remedy. The former seeks to provide compensation for harm caused to one private party by the wrongful action of another private party whereas the latter has as its objective (a) the vindication of the fundamental right itself so as to promote the values of an open and democratic society based on freedom and equality and respect for human rights; (b) the deterrence and prevention of future infringements of fundamental rights by the legislative and executive organs of state at all levels of government; (c) the punishment of those organs of state whose officials have infringed fundamental rights in a particularly egregious fashion; and (d) compensation for harm caused to the plaintiff in consequence of the infringement of one or more of the plaintiff's rights entrenched in chapter 3 of the Constitution. The common-law remedies are not directed to the achievement of the first three of these objectives and the common law should not be distorted by requiring it to perform these functions and fulfil the purposes of constitutional law. Hence the necessity for a specific and separate public-law constitutional damages remedy.\textsuperscript{104}

\textsuperscript{104} These were the arguments of counsel for the plaintiff in \textit{Fose v Minister Of Safety And Security}, fn 34 supra, as summarised by Ackermann J at p 798.
The court in *Collins* was of the opinion that the concepts of loss and damages are two distinct elements which should not be confused. They are separate concepts. This sharp distinction, although logical when considered with regard to the idea of compensation for personal injury as subjectively experienced, is somewhat counter-intuitive and paradoxical from an holistic and more value based approach. It creates a certain unease, possibly because the message seems to be that if one is going to injure someone, it may be cheaper to do it to such a degree that he is unable to appreciate certain elements of his loss. In fact, as the courts have pointed out, it could be argued that it is cheaper to kill a person than to maim him. Although the degree of loss in the *Collins* case was possibly the greatest that could be sustained by a human being, damages could not be awarded because the loss was so great that nothing would compensate for it.

There is also the argument that the criminal law exists to express society’s displeasure at wrongful actions causing such loss at that such displeasure should not be expressed through the law of delict in the private sphere. It is argued that the defendant must be entitled to the full protection of the higher standard of proof that is placed upon the state in a criminal case in which he runs the risk of punishment. It could be argued that this sense of unease arises only from the point of view of the compensation payable in terms of the law of delict and because it does not take into account the possible criminal penalties that may also be involved. A counter to this is that not all delicts are crimes but this does not diminish the wrongfulness of the delictual action in the public mind. The courts have indeed observed with regard to the concept of wrongfulness in criminal law that it is the same as the concept of wrongfulness in terms of the law of delict.

---

105 Van der Walt, *Delict: Principles and Cases* states: "The historical anomaly of awarding additional sentimental damages as a penalty for outrageous conduct on the part of the defendant is not justifiable in a modern system of law. The basic purpose of a civil action in delict is to compensate the victim for the actual harm done. In the case of impairment of personality by wrongful conduct it may be difficult to determine the amount of the solatium which will confer personal satisfaction or compensation for the injury, but in principle all factors and circumstances tending to introduce penal features should be rigorously excluded from such an assessment. The aim of discouraging evil and high-handed conduct is foreign to the basic purposes of the law of delict. It is for criminal law to punish and thereby discourage such conduct. The policy of awarding punitive damages unduly enriches the plaintiff who is entitled only to compensation for loss suffered. This policy has the added disadvantage of putting a wrongdoer in jeopardy of being punished twice - in the civil proceedings and in the criminal proceedings which could conceivably follow or which have preceded the civil action."
law of delict. There seems to be a view that the only distinguishing factor between a delict and a crime is that the one is compensatory and the other, punitive and that consequently this distinction should not be blurred because it would be prejudicial to defendants in delictual claims and would obviate the compensatory principle of the law of delict by rewarding the plaintiff for claiming. It is submitted that this view requires considerable legal

106 In Clarke v Hurst No And Others 1992 (4) SA 630 (D) at p 652, Thirion J said: "Wrongfulness is tested according to society's legal, as opposed to its moral, convictions but at the same time morality plays a role in shaping society's legal convictions. If it is accepted, as I think it should, that law is but a translation of society's fundamental values into policies and prescriptions for regulating its members' conduct, then the Court, when it determines the limits of such a basic legal concept as wrongfulness, has to have regard to the prevailing values of society. I can see no reason why the concept of wrongfulness in criminal law should have a content different from what it has in delict. For the purposes of this case I accept the following formulation of wrongfulness in criminal law by Snyman Strafrecht 2nd ed at 100: "Om vas te stel of 'n handeling wederregtelik is, moet dus gelyk word of dit in stryd is met die goeie sedes of die regsoortuiging van die gemeenskap. Die regverdigingsgronde moet gesien word as praktieke hulpmiddels om die wederregtelikheid vas te stel. Hulle verteenwoordig maar net die situasies wat meestal in die praktyk voorkom en wat daarom al uitgekrystalliseer het as maklik herkenbare gronde vir die uitsluiting van wederregtelikheid. Hulle dek egter nie die hele terrein van die onderwerp waaraan dit hier gaan nie, te wete die afbakening van wederregtelike en regmatige gedrag.' However, see the statement of the constitutional court in Khumalo And Others v Holomisa 2002 (5) SA 401 (CC) that: "It should be emphasised that the Court's perception of the legal convictions of the community as a test for determining wrongfulness in delict might well have to be reconsidered in the context of our new constitutional order. See Carmichele v Minister of Safety and Security and Another (Centre for Applied Legal Studies Intervening) 2001 (4) SA 839 CC". It is submitted that this observation of the court in Khumalo concerning the dicta of the court in Carmichele should not be seen as an expression of the need to do away with the test of the legal convictions of the community as much as it is the need to see the values expressed in the Constitution as the basis for the legal convictions of the community. This is borne out by the emphasis of the court in Carmichele of the need for sensitivity to the common law at p 961 to 962 of the judgment and its statement that: "Under s 39(2) of the Constitution concepts such as "policy decisions and value judgments 'reflecting the wishes ... and the perceptions ... of the people' and 'society's notions of what justice demands' might well have to be replaced, or supplemented and enriched by the appropriate norms of the objective value system embodied in the Constitution." [writer's italics]

107 The court in Fose (fn 34 supra) stated that: "Serious judicial doubts have been expressed concerning, and considerable academic criticism levelled against, the award of punitive damages in delictual claims...Professor Van der Walt, whose views are broadly representative of academic criticism generally, expresses his misgivings succinctly as follows: "The historical anomaly of awarding additional sentimental damages as a penalty for outrageous conduct on the part of the defendant is not justifiable in a modern system of law. The basic purpose of a civil action in delict is to compensate the victim for the actual harm done. In the case of impairment of personality by wrongful conduct it may be difficult to determine the amount of the solatium which will confer personal satisfaction or compensation for the injury, but in principle all factors and circumstances tending to introduce penal features should be rigorously excluded from such an assessment. The aim of discouraging evil and high-handed conduct is foreign to the basic purposes of the law of delict. It is for criminal law to punish and thereby discourage such conduct. The policy of awarding punitive damages unduly enriches the plaintiff who is entitled only to compensation for loss suffered. This policy has the added disadvantage of putting a wrongdoer in jeopardy of being punished twice - in the civil proceedings and in the criminal proceedings which could conceivably follow or which have preceded the civil action." [Footnotes omitted] Ackermann J did state however that: "The question whether, in addition to compensatory damages, 'penal' or 'punitive' or 'exemplary' damages (expressions often used interchangeably and confusingly) are (or ought to be) awarded in delictual claims is a matter of some debate in South Africa. It appears to be accepted that in the Aquilian action and in the action for pain and suffering an award of punitive damages has no place. The Appellate Division has, however, recognised that in the case of defamation punitive damages may in appropriate cases be awarded. In the case of damages for adultery it has been accepted that a penal component is still appropriate. It must of course be borne in mind that it is not always easy to draw the line between an award of aggravated but still basically compensatory damages, where the particular circumstances of or surrounding the infliction of the injury have justified a substantial award, and the award of punitive damages in the strict and narrow sense of the word. There appears to be scant authority for the award of punitive damages in the case of assault, over and above the damages awarded for patrimonial loss, pain and suffering and for the contumelie suffered, which can itself be aggravated by the circumstances of and surrounding the assault." See Dippenaar v Shield Insurance Co Ltd 1979 (2) SA 904 (A) at p 908 where the court stated: When damage for personal injuries has to be assessed, a person's patrimony includes, inter alia, the capacity to earn money.
philosophical debate and discussion which is beyond the scope of this thesis. It is however, worth noting that in his minority judgment in *Fose* Kriegler J makes the following cautionary comments on the judgments of the majority of the court and the minority judgment of Didcott J in that case:

"On one point, I respectfully suggest, Ackermann J is uncharacteristically ambivalent. As I understand the reasoning in paras [69]–[73] of his judgment, my learned Colleague in principle condemns punitive damages as a potential remedy for infringements of constitutional rights but at the same time seeks to found the current rejection on the particular facts of this case. For reasons that I hope to make plain shortly, I agree that we should unequivocally reject punitive damages as a remedy in this case. I do believe, however, that we should refrain from any broad rejection of any particular remedies in other circumstances. On that same point my Colleague Didcott J holds that punitive or exemplary damages are not claimable from the State, the defendant in the present case, for breaches of constitutional rights. He, however, leaves open the case of other infringers of such rights. Notwithstanding the circumscribed ambit of the rejection of punitive/exemplary damages, I believe that we need not and should not go as far as Didcott J in rejecting for all time the possibility that a case may arise where punitive or exemplary damages are 'appropriate' redress for infringement of constitutionally protected rights.[writer's italics]

It is important to note that in the context of the law relating to the delivery of health care services, violations of the constitutional rights to bodily and psychological integrity and other aspects of the right to freedom and security of the person will almost inevitably underlie claims in delict. Whether the converse is true is arguable."

---

108 through his work and skill, i.e. his mental and physical efforts. The loss or impairment of this capacity is therefore also and element of Aquilian damages, if it has in fact led to a diminution of the plaintiff's patrimony. Reinecke (op cit at 29, 34); Byleveldt's case *supra* at 150C. In dealing with this particular head of damage, it is therefore more correct to talk of loss or impairment of earning capacity than of loss of income (whether of past income or future income). Equally, there is in principle no distinction between "loss of past income" and "loss of future income"; the lapse of time between the injury and the trial is purely incidental. In theory the loss was caused immediately when the personal injury was sustained and in theory (perhaps also in practice) the claim for damages could be heard on the day after the accident. In theory there is only one, indivisible cause of action for Aquilian damages and the passage of time only helps to bring greater clarity about the facts regarding the sequelae of the injury. Byleveldt's case at 1740. There has been discussion in the common law whether the correct concept in "loss of earnings" or "loss of earning capacity", the underlying notion being that in the latter event there should be an award of damages for this item of loss even if it has not in fact led to any actual patrimonial loss at all (i.e. the test is then what could the plaintiff have earned, not what would he have earned); Luntz *Assessment of Damages for Personal Injury and Death* (1974) at 131 - 6; *Wigfield & Jolowicz on Tort* 10th ed (1975) at 572 note 55. Fleming (op cit at 218). Whilst such an approach would be quite wrong for our law, it appears to have found some adherents in the Australian Courts; however, it appears from the *dictum* in the leading Australian case of *Graham v Baker* (quoted by Luntz (op cit at 134)) that the correct approach has now also been adopted there."

109 See for instance the judgment of Cameron JA in *Ojitski Property Holdings v State Tender Board And Another* 2001 (3) SA 1247 (SCA) in which he observes that: " It is well established that in general terms the question whether there is a legal duty to prevent loss depends on a value judgment by the court as to whether the
plaintiff's invaded interest is worthy of protection against interference by culpable conduct of the kind perpetrated by the defendant. The imposition of delictual liability (as Prof Honore has pointed out) thus requires the court to assess not broad or even abstract questions of responsibility, but the kind of culpable conduct 'described in categories fixed by the law.' This process involves the court applying a general criterion of reasonableness, based on considerations of morality and policy, and taking into account its assessment of the legal convictions of the community and now also taking into account the norms, values and principles contained in the Constitution. Overall, the existence of the legal duty to prevent loss 'is a conclusion of law depending on a consideration of all the circumstances of the case'.

Where the legal duty to the plaintiff invokes derives from breach of a statutory provision, the jurisprudence of this Court has developed a supple test. The focal question remains one of statutory interpretation, since the statute may on a proper construction by implication itself confer a right of action, or alternatively provide the basis for inferring that a legal duty exists at common law. The process in either case requires a consideration of the statute as a whole, its objects and provisions, the circumstances in which it was enacted, and the kind of mischief it was designed to prevent. But where a common-law duty is at issue, the answer now depends less on the application of formulaic approaches to statutory construction than on a broad assessment by the court whether it is 'just and reasonable' that a civil claim for damages should be accorded. 'The conduct is wrongful, not because of the breach of the statutory duty per se, but because it is reasonable in the circumstances to compensate the plaintiff for the infringement of his legal right.' The determination of reasonableness here in turn depends on whether affording the plaintiff a remedy is congruent with the court's appreciation of the sense of justice of the community. This appreciation must unavoidably include the application of broad considerations of public policy determined also in the light of the Constitution and the impact upon them that the grant or refusal of the remedy the plaintiff seeks will entail.

Though this Court's broad-based approach to determining whether in such circumstances a legal duty exists has attracted criticism, it seems generally to accord with trends in other jurisdictions grappling with related issues. More importantly, it seems to me to be especially apposite to constitutional interpretation, which involves the application of just such standards of public principle and policy. Section 187 does not appear in an ordinary statute. It is part of a Constitution, and within the limits of linguistic meaning 16 constitutional principles must infuse our understanding of its effect. The enactment of the interim Constitution marked the transition from the old order to a new society - one avowedly open and democratic and based on freedom and equality, in which courts were not only enjoined in interpreting fundamental rights provisions to promote the values underlying such a society (s 35(1)), but in interpreting 'any law' to have due regard to the spirit, purport and objects of the fundamental rights chapter (s 35(3)). Though the provisions of the interim Constitution do indeed deal with many mundane questions of governmental structure and organisation not requiring the application of lofty principles, 'any law' in s 35(3) in my view includes where appropriate the other provisions of the interim Constitution itself. 18 Specifically, therefore, in interpreting such provisions s 35(3) applies, and '... when a court is confronted with a problem of unenumerated rights it should seek to answer the question as to whether the development [call: recognition] of a right which is unenumerated in the Constitution would foster or promote those values which underlie an open and democratic society based on freedom and equality.'

To these considerations may be added that in determining whether a delictual claim arises from breach of a statute the fact that the provision is embodied in the Constitution may (depending on the nature of the provision) attract a duty more readily than if it had been in an ordinary statute."

In this case the plaintiff pleaded its claim on two alternative bases. Claim A alleged that its entitlement to damages arose from the defendants' breach of the plaintiff's right to a fair, public and competitive system of tendering for office accommodation in the interim Constitution. Claim B alleged in the alternative that the plaintiff's legitimate expectation to relocate from Pretoria to Johannesburg was not accepted. Thereafter it instituted a claim for damages against the first and second respondents, respectively the State Tender Board which awarded the tender, and the Province of Gauteng which the plaintiff alleged had misconducted itself during the tender process in specified ways with which the Tender Board has associated itself. The damages the plaintiff claimed allegedly arose from the defendants' unlawful conduct in managing the tender process and in awarding the tender. They consisted in the profit the plaintiff asserted it would have made from rentals if it had been awarded the tender. The claim failed. Cameron J observed that: "The plaintiff, which seeks to evoke a delictual remedy from the interstices of the interim Constitution, aspires to recover through it a loss measured not in delictual but in contractual terms. That is a far-reaching assertion. While it is not impossible that a statutory provision, constitutional or otherwise, could be held to accord such recompense for its breach, it seems to me quite inappropriate for this to occur by judicial interpretation of a provision whose primary injunction is for legislative action to occur in that very area. Certainly the contention that it is just and reasonable, or in accord with the community's sense of justice, or assertive of the interim Constitution's fundamental values, to award an unsuccessful tenderer who can prove misfeasance in the actual award its lost profit does not strike me in this context as persuasive..." I agree with the observations of Davis J in Faircape Property Developers (Pty) Ltd v Premier, Western Cape that in deciding whether a statutory provision grounds a claim in damages the determination of the legal convictions of the community must take account of the spirit, purport and objects of the Constitution, and that the constitutional principle of justification embraces the concept of accountability. This in turn must of course weigh in the balance when determining legal responsibility for the consequences of public malfeasance." [Footnotes omitted]
The conflation of the concept of constitutional damages with that of punitive damages may not necessarily be theoretically correct. Punishment in the criminal law is expressed as much in terms of imprisonment as it is expressed in money. Indeed, in the case of more serious criminal actions, punishment sounding in money is not an option. The idea in delict that money is adequate compensation for the violation of the rights of personality is illusory\textsuperscript{110}. This is nowhere more clearly demonstrated than in the law of defamation. A reputation, once lost, can seldom if ever be recovered\textsuperscript{111} in the same way that the capacity to enjoy life, or to be happy, can in certain circumstances never be recovered irrespective of the amount of damages awarded. Damages sounding in money are, nonetheless awarded in the case of the former\textsuperscript{112}.

\textsuperscript{110} In Chetcuti v Van Der Wilt 1993 (4) SA 397 (TK) the court observed that: “Assessment of such damages is always a difficult matter, involving as it does the placing of a money value upon abstractions" (Amersinghe ‘Defamation and Aspects of Actio Injuriarum in Roman Dutch Law' at 178) and the damages cannot be gauged with precision or nicety. In dealing with the difficulty of assessing such damages Lord Atkin in Ley v Hamilton [1935] TLR 384 stated at 386: ‘They are not arrived at as the Lord Justice seems to assume by determining the “real” damage and adding to that a sum by way of vindictive or punitive damages. It is precisely because the “real” damage cannot be ascertained and established that the damages are at large. It is impossible to track the scandal, to know what quarters the poison may reach; it is impossible to weigh at all closely the compensation which will recompense a man or a woman for the insult offered or the pain of a false accusation . . . . The “punitive” element is not something which is or can be added to some unknown factor which is non-punitive.’

\textsuperscript{111} In Moller v South African Associated Newspapers Ltd and Others 1972 (2) SA 589 (C) Watermeyer J stated as follows at 595A: “In estimating the amount of damages to be awarded the Court must have regard to all the circumstances of the case. It must, inter alia, have regard to the character and the status of the plaintiff, the nature of the words used, the effect that they are calculated to have upon him, the extent of the publication, the subsequent conduct of the defendant and, in particular, his attempts, and the effectiveness thereof, to rectify the harm done.”

\textsuperscript{112} In Buthelezi v Poorer and Others 1975 (4) SA 608 (W) at 613H-I Williamson AJ added the rider that the Court “is also entitled to take into account the conduct of the defamer from the time the libel was published until judgment to the extent that such conduct is directly connected with the wrong sued on”. See also Khan v Khan 1971 (2) SA 499 (RAD) at 500C where Lewis AJP stated that: “In English law and in South African law, it is well recognised that the Court is justified in awarding exemplary damages in an appropriate case. The circumstances which have been held to justify such an award of exemplary damages are the wantonness of the allegation and the conduct of the defendant in regard to the allegations right up to the time of judgment . . . .”

In Afrika v Metler And Another 1997 (4) SA 531 (NM) the Namibian court put it graphically thus: “It is, in my view, humanly speaking virtually impossible for one to restore another's good name and reputation to its former glory by a mere, at times invariably predestinated, retraction and/or apology. Similarly no one who empties an eiderdown quilt in the wind is able again to gather the eiderdown and restuff the quilt to its previous format with same.” The court stated that: “With the new democratic dispensation heralded by the Namibian Constitution entrenching fundamental human rights and fundamental freedoms and the premium to be attached to one's good name and reputation in instances of flagrant violation thereof, the time has come to have a liberal approach in the determination of the quantum and award much higher damages, especially instances where aggravating circumstances are present as in the present case. Only then will persons, especially newspaper editors/reporters, publishers/printers and/or owners, be more on their qui vive and be mindful of the strict/absolute liability applicable to members of the press and hopefully act in accordance with the special duty of care that rests upon their shoulders and subject to law pursuant to the reasonable restrictions on the exercise of the fundamental freedoms imposed by art 21(2) of the Namibian Constitution, if they know that substantive exemplary/punitive damages could be visited upon them if they defame another animus injuriandi.”

In SA Associated Newspapers Ltd en ‘n Ander v Samuels 1980 (1) SA 24 (A) the Appellate Division observed that: “The elements to be taken into account in estimating the amount to be awarded are thus the contumelias suffered, the loss of reputation and the penalty. See Gelb v Hawkins 1960 (3) SA at 693H; Salamann v Holmes 1914 AD at 480.” See also with regard to punitive damages Pont v Geyer en ‘n Ander 1968 (2) SA 545; Sa
It is conceivable, especially in circumstances where the defendant health care provider is guilty of persistent and repeated violations of such constitutional rights, that exemplary damages, or at least vindicatory damages in the form of a heavier award of damages than would normally be the case, would be justified in terms of the law of delict on constitutional grounds.

In *Fose v Minister Of Safety And Security*\(^{113}\) the court canvassed the subject of constitutional damages in other jurisdictions in some detail. It summarised the position in foreign jurisdictions as follows:

“The foregoing survey of the remedies granted in other jurisdictions for the breach of a constitutional right indicates that in most cases they are ‘public law’ remedies (to employ for the moment the nomenclature used in certain of the foreign jurisdictions). My understanding of the United States jurisprudence is that both the s 1983 relief as well as the award of constitutional damages based directly on the Constitution should be seen as legislative and judicial responses to the perceived inadequacy of the common-law tort remedies. This inadequacy arises from the limitations placed on relief in tort by various manifestations of the principle of sovereign immunity and vicarious liability and by the vagaries and inconsistencies of tort law, which falls within the jurisdiction of state courts. The responses differ, however. The s 1983 response is basically a statutory extension of a remedy which still is fundamentally a common-law tort remedy. On the other hand the remedy developed in the *Bivens* and similar cases discussed above appears to have a marked ‘public law’ character. The plaintiff is not limited to a remedy under ordinary tort law. The remedy is a completely independent remedy. It differs from that granted between two private citizens and it is one particularly intended to ‘vindicate the interests of the individual in the face of the popular will as expressed in legislative majorities’. The ‘public law’ nature of the remedy under the Canadian Charter is clearly, albeit perhaps implicitly, recognised and express recognition of the ‘public law’ nature of similar remedies has been given under the New Zealand Bill of Rights and the Constitutions of Trinidad and Tobago, India and Sri Lanka.”

The court in *Fose* was asked to award constitutional damages in order to vindicate the constitutional rights of the plaintiff and was asked for punitive damages for violation of the plaintiff’s constitutional rights in order to deter similar future violations of such rights. The interim Constitution was in force at

\(^{113}\) *Associated Newspapers Ltd and Anodher v Yusar* 1969 (2) SA 442, *Buthelesi v Poorter and Others* 1975 (4) SA 608.

*Fose fn 34 supra*
the time of this case. The only requirement of the interim Constitution was that the relief given by a competent court in any particular case should be ‘appropriate relief’ (in terms of section 7(4)(a)). It was left to the courts to decide what would be appropriate relief in any particular case. There was much discussion on the subject of a ‘public law’ remedy as opposed to the ‘private law’ remedy that was available to the plaintiff in terms of the law of delict. Significantly, Ackermann J refused to deal with the issue on the basis of the divisions between public and private law recognising that the validity of such artificial distinctions is becoming increasingly questionable and that it could be dangerous to infer solutions in terms of such an analytical framework.114

7.3 Necessity

This defence115 is often raised in controversial contexts such as the need to smoke cannabis for medical reasons, euthanasia, abortion, sterilisation of mentally disabled persons and surgical removal of organs from donors.116

114 In this regard Ackerman J observed at p818-819 that: “While the foreign jurisprudence referred to emphasises that the proper protection of entrenched fundamental rights requires a ‘public law’ remedy, it is preferable, for the present, to refer to the ‘appropriate relief’ envisaged by s 7(4) merely as a ‘constitutional remedy’. It is both undesirable and unnecessary, for purposes of this case, to attempt to do that which has seemingly eluded scholars in the past and given rise to wide differences of opinion among them, namely the drawing of a clear and permanent line between the domains of private law and public law and the utility of any such efforts. Much of this interesting debate is concerned with an analysis of power relations in society; the shift which has taken place in the demarcations between ‘private law’ and ‘public law’; how functions traditionally associated with the state are increasingly exercised by institutions with tenuous or no links with the state; how remedies such as judicial review are being applied in an ever widening field and how legal principles previously only associated with private legal relations are being applied to State institutions. Suffice it to say that it could be dangerous to attach consequences to or infer solutions from concepts such as ‘public law’ and ‘private law’ when the validity of such concepts and the distinctions which they imply are being seriously questioned.”

115 Necessity is in fact one of a number of grounds of justification. See for instance the discussion of grounds of justification in Neethling et al fn 18 supra at p73-111. Burchell, fn 18 supra, comments at p 70 that if a medical practitioner performs an operation upon or treatment of a patient without informed consent being given by the patient (or legally approved representative) the medical procedure will be unlawful (i.e. an assault). However in an emergency situation (where for instance the patient is unconscious, cannot give the required consent and there is no time to contact relatives) then the doctor may be justified by necessity in performing an operation to save the patient’s life.

116 In an English case in September 2000 the Court of Appeal gave judgment in the case of Re: A (Children) 2000 (www.courtservice.gov.uk) on the question of whether the proposed surgical separation of ischiopagus twins (joined at the pelvis), which would result in the death of one of them, would constitute murder. At the heart of the legal debate in this case was the question of whether decisions about the relative worth of the life of individuals could be legally made when those decisions result in the loss of the life considered less worthy. The twins, Jodie and Mary were born to parents who were devout Catholics. Mary was the weaker of the two and had she been born alone, would not have survived. She was kept alive by virtue of Jodie’s circulatory system. Although Jodie was considered capable of surviving a separation procedure, Mary was not. If no separation took place, both would die in a matter of months due to the added strain on Jodie’s circulatory system. The medical team looking after the twins wished to separate them but the parents would not sanction the operation. The latter could not sanction the shortening of Mary’s life in order to extend Jodie’s. They felt that if it was God’s will that both should die then so be it. The medical team at St Mary’s Hospital, Manchester sought a
ruling from the High Court that surgery to separate the twins, knowing that such a procedure would kill Mary, would not be unlawful. Johnson J ruled that the operation would not be unlawful because in his view the proposed operation represented a withdrawal of blood - a situation analogous to the withdrawal of feeding and hydration in Airedale NHS Trust v Bland (1993). The parents appealed on the grounds that Johnson J was wrong in finding that the proposed operation was in either Mary’s or Jodie’s best interests and that it should have been held that the operation was not legal. Ward LJ, Brook LJ and Walker LJ of the Court of Appeal considered submissions from all interested parties and came to the same conclusion – that Johnson J was correct and that the operation to separate the twins was not unlawful. However, they came this decision via differing routes. The Court of Appeal held that:

1. The clinical judgment is that Jodie and Mary are both alive and therefore separate human beings for the purposes of civil and criminal law;
2. It is fundamental that every person’s body is inviolate and that every person’s life is of equal inherent value and the judge in the court a quo had therefore been wrong to conclude that Mary’s life would be worth nothing to her. It said that life was of value in itself whatever the diminution in one’s capacity to enjoy it. Furthermore, apart from the fact that the distinction between an act and an omission was of doubtful ethical or legal importance in the context of a doctor’s duty to preserve life, it was utterly fanciful to characterise the contemplated operation as an omission rather than an act. The operation would involve a substantial invasion of Mary’s bodily integrity and would, in the absence of justification, involve an unlawful assault upon her. The correct question is whether it was in Mary’s best interests that an operation which would cause Mary to die, should be carried out. It followed that, looking at Mary’s position in isolation and ignoring the equally clear benefit to Jodie, the court would not be able to sanction the operation.
3. The question was whether the court could balance Jodie’s and Mary’s conflicting interests where the right to life is at stake. Ordinarily in family law the interests of the child are paramount but this must be qualified where the interests of two children, each with an entitlement to have their interest treated as ‘paramount’ were in conflict. It would be an abdication of the court’s duty to refuse to undertake such balancing act and the least detrimental alternative must be found.
4. The parents have the right to make a decision on the future of the twins and their wishes command the greatest respect such rights are subservient to the paramount duty of the court to consider the welfare of the child. Where its view of the child’s welfare was inconsistent with the view of the parents, it must give effect to its own judgment. The matter should be decided afresh, albeit with due weight attached to the wishes of the parents rather than reviewing the reasonableness of the parental decision.
5. The interests of the two children must be balanced, weighing the advantages and disadvantages to each of the proposed course of action rather than comparing the worth of one life against another. As such it was legitimate to consider the actual quality of life that each may experience. The prospect of a full life for Jodie was counterbalanced by the acceleration of certain death for Mary but the fact that Mary’s capacity to live was in any event fatally compromised meant that the balance of interest was heavily in Jodie’s favour. Furthermore, it was relevant that Mary was only alive at all because she was supported by her stronger sibling and that she was constitutionally incapable of being self-supporting. It followed that, subject to the question of the lawfulness of the proposed operation in terms of the criminal law, permission should be granted.
6. The proposed operation would unquestionably and foreseeably cause Mary’s death so that the doctors have the required murderous intent. The lawfulness of the operation therefore turns on the availability of a defence to murder. Two important principles could be discerned. The doctors have a duty to Mary not to operate because it would kill her and a duty to Jodie to operate because it would save her life. The doctors cannot be denied a right of choice where they were under a duty to choose. In the face of such a conflict of duty, the law must allow an escape route by allowing the doctors to choose the lesser of two evils and they should be placed in exactly the same position as that in which the court found itself and allowed to make the decision along the same lines as the court has done.
7. The proposed operation does not offend against the sanctity of life principles. The reality of the situation was that Mary was killing Jodie by draining her lifeblood, albeit such an action on her part could not be described as unlawful. The doctors would therefore be justified in coming to Jodie’s aid in legitimate defence of her life. The plea of quasi self-defence is applicable in the unique circumstances of this case;
8. The three requirements for the application of the defence of necessity, that the act was needed to avoid the inevitable and irreparable evil, that no more should be done than was reasonably necessary for the purpose to be achieved and that the evil inflicted was not disproportionate to the evil avoided, were satisfied in this case.
9. The Human Rights Act, 1998, incorporating the European Convention on Human Rights into domestic law, is due to come into force before any operation could be carried out and is therefore applicable. Article 2 of the Convention provides that no one should be deprived of their life intentionally save in circumstances not relevant to this appeal. However, the ECHR does not import any prohibition on the proposed operation not already found in pre-existing domestic law.

The case sparked quite a bit of controversy and as one writer put it "brought into focus so many difficult and far-reaching issues in family and criminal law that the debate is likely to go on for years". (Fitzpatrick J ‘Jodie and Mary: whose choice was it anyway?' Spiked Liberties 19 June 2001).
Fitzpatrick, a director at the Kent Law Clinic and co-author of \textit{Criminal Justice and the Human Rights Act 1998, 2nd edition 2001}, observes that the law protects human life in different ways at different stages. The law protects the embryo from experimentation once the primitive streak has appeared or 14 days have passed, but not before. The law protects the foetus from a termination but not during the first 24 weeks of pregnancy if medical opinion considers there to be a health risk (very broadly defined) to the mother or any of her children. Furthermore, he says, the law allows a mother to have a termination at any time before birth if medical opinion confirms a substantial risk of a seriously handicapped child being born. A mother suffering from post-natal depression who kills her child in its first year will face an infanticide rather than a murder charge and be treated as if she had committed manslaughter. Beyond that, the laws of assault, homicide etc. protect all legal persons, adult and child alike. Fitzpatrick points out that one situation that raises similar principles to the conjoined twins case is that of the pregnant woman who can seek a termination right up to term in cases where serious handicap is expected. The interests of the woman, as future parent with the extra burdens of caring for a seriously handicapped child, are simply given priority over those of the foetus - either because the foetus (handicapped or not) is not recognised as a person who can be wronged by a termination, or because a greater value is placed upon the self-determination of an adult than on the life of a seriously handicapped unborn baby. In either case, he says, it is not clear what the difference is between a seriously handicapped foetus a few days before birth and a seriously handicapped neonate a few days after birth. Nor is it clear how the physical event of birth transforms a foetus into a person or confers a value on the handicapped neonate equal to that of a healthy adult human being. He points out that the law, however, confers personhood at birth, drawing a crucial line at this point for understandable reasons, not least the fact of separation and entry into the world. He notes that it is necessary to draw a line as to when life begins at some point and it may be necessary to apply it rigidly for the purpose of upholding its integrity and says that once the law recognised Jodie and Mary as legal persons who were children, there was only one decision to which the courts could come. Under British law if the jurisdiction of the court is invoked to protect a legal person who is a child, then the court must give 'first and paramount consideration' to the interests of that child. There is little flexibility, the interests of the parents must come second. Fitzpatrick states that there is a limited analogy between the position of these parents and that of the pregnant woman seeking a very late termination of the pregnancy on account of the risk of a seriously handicapped child. In both cases the parents are prepared to sanction the death of their severely handicapped babies, one by termination, the other by refusing to consent to an operation that could save one of the twins. Furthermore, he says, the respect and mercy shown by the law to the parents of a child about to be born is shown to the twins' parents because their children have actually been born. He says that whilst human beings must have the protection of the law, the question as to whether that protection has to be both full and immediate is less clear as the law on infanticide indirectly indicates. Fitzpatrick refers to a case in 1997 in which the Court of Appeal had reversed a High Court order that the transplant operation take place on a child a few weeks old against that of the parents. He says that it was clear that the child was to die within a short time of birth and the parents had no choice about making this decision. Fitzpatrick notes that the law, however, confers personhood at birth, drawing a crucial line at this point for understandable reasons, not least the fact of separation and entry into the world. He notes that it is necessary to draw a line as to when life begins at some point and it may be necessary to apply it rigidly for the purpose of upholding its integrity and says that once the law recognised Jodie and Mary as legal persons who were children, there was only one decision to which the courts could come. Under British law if the jurisdiction of the court is invoked to protect a legal person who is a child, then the court must give 'first and paramount consideration' to the interests of that child. There is little flexibility, the interests of the parents must come second. Fitzpatrick states that there is a limited analogy between the position of these parents and that of the pregnant woman seeking a very late termination of the pregnancy on account of the risk of a seriously handicapped child. In both cases the parents are prepared to sanction the death of their severely handicapped babies, one by termination, the other by refusing to consent to an operation that could save one of the twins. Fitzpatrick reflects that this is an interesting position: it would have been lawful for the doctors to have accepted the parents' decision. Had St Mary's done so, there could not have been the slightest criticism of the hospital for letting nature take its course in accordance with the parents' wishes. Later in his judgment he said, however, that if the court were to give permission for the operation to take place, then a legal duty would be imposed on the doctors to treat their patient in her best interests, i.e. to operate upon her. Fitzpatrick reflects that this is an interesting position: it would have been lawful for the doctors to have accepted the parents' decision and let the twins die; the doctors were entitled, but not bound, to seek a court ruling; having done so they were bound in law to accept the court's decision – which was contrary to that of the parents. He notes that the judge seemed to be saying that not everything has to be referred to the courts, even those matters of life and death that the court would be constrained to decide differently. Fitzpatrick states that something of the judge's own diffidence on this topic is contained in his opening comment: 'There has been some public concern as to why the court is involved at all. We do not ask for work but we have a duty to decide what parties with a proper interest ask us to decide.'
Necessity is a defence against unlawfulness or wrongfulness. In *S v Adams*\(^{117}\) the court considered the doctrine of necessity in the context of the criminal law and noted that for an act to be justified on the grounds of necessity:

(a) a legal interest of the accused must have been endangered;
(b) by a threat which had commenced and was imminent;
(c) which was not caused by the accused's fault and
(d) in addition it must have been necessary for the accused to avert the danger; and
(e) the means used for this purpose must have been reasonable in the circumstances.

In *Adams*\(^{118}\) King J referred to *R v Bourne*\(^{119}\) where a surgeon carried out an operative procedure on a girl of 15 in order to procure an abortion. She had conceived in consequence of a rape. It was held that the defence of necessity had succeeded – apparently because it was held that the operation was necessary to preserve the life of the girl which the accused genuinely believed to be in danger. There was considerable argument in *Bourne* as to the distinction between danger to life and danger to health. The statements by McNaghten J are contained in his direction to the jury and, said King J, it appeared therefrom that if the danger had been to health alone the accused would have been convicted.\(^{120}\)

King J stated that there was no reason why threats to the interests of a third party, particularly one under the protection of an accused, should not justify an act in necessity to the same extent as threats in respect of an accused himself.

The principle *nemo tenetur ad impossibilia* can only be applied to a prohibitory provision by holding that an accused could not help doing the act prohibited by law, in the sense of impossibility of performance. King J said he did not intend,

\(^{119}\) *R v Bourne* (1938) 3 All ER 615 (CCC)

\(^{119}\) In *R v Bourne* (fn 119 supra) at p 617 and 618, in dealing with the distinction between danger to life and danger to health, McNaghten J said: "... As I say, you have heard a great deal of discussion as to the difference between danger to life and danger to health... but is there a perfectly clear line of distinction between danger to life and danger to health? I should have thought not. I should have thought that impairment of health might reach a stage where it was a danger to life... it may be that you will accept the view that Mr Oliver put forward when he invited you to give to the words 'for the purpose of preserving the life of the mother' a wide and liberal view of their meaning. I would prefer the word 'reasonable' to the words 'wide and liberal'... He is not only entitled, but it is his duty to perform the operation with a view to saving her life..."
in saying this, to confuse the defence of necessity with the defence of impossibility, the two being distinguishable legal concepts.

He said he agreed with the statement by Glanville Williams\textsuperscript{121} that a criminal statute need make no mention of the doctrine of necessity as a statute can be regarded as being impliedly subject to the doctrine, just as a statute is impliedly subject to the defence of infancy, insanity or self-defence. This, in turn, would, of course, be subject to an express provision in the statute excluding the doctrine of necessity or an implied exclusion because of some express language in the statute. In regard to the legal interest, there is no clear statement of law as to what can be embraced by a legal interest to justify a defence of necessity. An interest connotes objective concern in something. The difficulty arises in endeavouring to define a legal objective concerning something. It was submitted on behalf of the appellant that the legal interest need only be a legitimate one, which the ordinary man has in our society, to protect the life or good health of himself and the persons to whom he stands in a protective relationship. King J held that a legal interest must involve a fear of injury to person or damage to property saying he found it unnecessary to decide whether the legal interest must be one which is capable of protection in law or need only be legitimate, but not necessarily one capable of protection in law\textsuperscript{122}.

Rumpff J held in \textit{S v Adams; S v Werner}\textsuperscript{123} that “\textit{Wanneer ‘n toestand regteos as noodtoestand beskou moet word, sal afhang van die feite van elke geval. Of die optrede van ‘n persoon wat in noodtoestand handel as redelik beskou kan word of nie, hang ook van die feite van elke geval af.”}\textsuperscript{124} South African law

\textsuperscript{121} Glanville Williams 1965 \textit{Current Law Problems} at p 224
\textsuperscript{122} King J in \textit{Adams} fn 117 supra also referred to the American Penal Code, Tentative Draft No 853, which stated: “Conduct which an actor believes to be necessary to avoid an evil to himself or to another is justifiable, provided that: (a) The evil sought to be avoided by such conduct is greater than that sought to be prevented by the law defining the offence charged....”
\textsuperscript{123} \textit{S v Adams; S v Werner} 1981 (1) SA 187 (A)
\textsuperscript{124} Du Toit, one of the Counsel for the state set out the principles and precedents as follows: “In die Suid-Afrikaanse reg is die volgende vereistes vir die verwerp van noodtoestand aangestip: (1) daar moet, objektief gesien, ‘n reeds begonne toestand van nood wees, of, ook objektief gesien, ‘n onmiddellik dreigende noodtoestand; (2) die persoon in beweerde nood moet nie regtens verplig gewees het om die nood te verduur
recognizes a general defence of necessity. In Roman law there was no systematic discussion of the defence of necessity but there are isolated instances in which such a defence was recognized\textsuperscript{125}. Several Roman-Dutch writers considered necessity as a general defence\textsuperscript{126}. Necessity has been recognized as a general defence in modern South African law\textsuperscript{127}. The legally protected interest may be threatened by force of surrounding circumstances\textsuperscript{128}.

Strauss\textsuperscript{129} submits that there are only three possible grounds of justification for a medical intervention namely--

- The patient’s consent (or the consent of someone legally capable of consenting on his behalf);
- \textit{Negotiorum gestio} which entitles a doctor to administer emergency medical treatment in those cases where on account of the patient’s condition he is unable to consent;
- Necessity, i.e. where the interests of society are at stake (which would entitled a doctor to treat the patient even against his will) for example where medical intervention is necessary to prevent the spreading of a contagious disease\textsuperscript{130}.

\textsuperscript{130} 806
He points out that in *Stoffberg v Elliot* it was held that in the eyes of the law every person has certain absolute rights which the law protects. They are not dependent on statute or upon contract but they are rights to be respected and one of the rights is absolute security to the person. Any bodily interference with or restraint of a man's person which is not justified, or excused or consented to is wrong. A man by entering a hospital does not submit himself to such surgical treatment as the doctors in attendance upon him may think necessary. He remains a human being and retains his rights of control and disposal of his own body. He still has the right to say what operation he will submit to and any operation performed upon him without his consent is an unlawful interference with his right of security and control of his own body and is a wrong entitling him to damages if he suffers any. More recently, in *Minister of Safety and Security and Another v Xaba*¹³², Southwood J in the Durban and Coast Local Division of the High Court refused to follow a decision of the Cape High Court in *Minister of Safety and Security and Another v Gaqa*¹³³ in which an order was granted to allow police officials to use necessary violence to obtain the surgical removal of a bullet from an accused in circumstances where it was required as evidence in the criminal prosecution of the accused. In *Xaba* the applicants applied for the confirmation of a rule *nisi* which would declare the second social relationships and is of supreme moral value. It reflects the sanctity of life doctrine which is essentially a religious concept. He points out, however, that Ward LJ noted that the principle does not represent an absolute rule — life must be protected from unjust attack, and the deliberate taking of life is prohibited except in self-defence or in the legitimate defence of others. All of the judges considered the possibility of the proposed operation on Jodie and Mary as falling within the realm of the doctrine of necessity although it was Brook LJ who provided a detailed examination of the application of this 'obscure aspect of the common law' as Jones puts it. He notes that in essence the defence of the doctrine of necessity is of a similar species to that of duress and has been termed "duress of circumstances" and that it embodies the concept of utilitarianism. He quotes Sir James Stephens who stated in the Digest of Criminal Law (1887) that the doctrine of necessity could be described as follows: "An act which would otherwise be a crime may in some cases be excused if the person accused can show that it was done only in order to avoid consequences which could not otherwise be avoided, and which, if they had followed, would have inflicted upon him or others whom he was bound to protect inevitable and irreparable evil, that no more was done that was reasonably necessary for that purpose and that the evil inflicted by it was not disproportionate to the evil avoided."

Jones notes the defence of duress itself has been disapproved where the charge is murder (*Abbott v R* (1976)) and historically, the case of *R v Dudley & Stephens* (1884) suggested that necessity was not a defence that would be successful either. It was reaffirmed in the more recent cases of *R v Howe* (1987) and *R v Pommell* (1995) but Brook LJ considered the facts of these cases to be very different to the case of Jodie and Mary. Brook LJ found that the component parts of necessity had been fulfilled in *Re: A (Children)*. Ward LJ agreed and stated that the doctors were in an impossible position.

¹³¹ Stoffberg fn 28 supra
¹³² Xaba 2003 (2) SA 703
¹³³ Gaqa 2002 (1) SACR 654 (C)
applicant, a police officer, to be entitled to 'use reasonable force, including any necessary surgical procedure performed by . . . medical doctors' to remove a bullet lodged in the respondent's thigh, and directing the respondent to subject himself to the procedure, failing which the Sheriff was to furnish the necessary consent on his behalf. The respondent was a suspect in a motor-vehicle hijacking case and the police believed the bullet would connect him with the crime. Not surprisingly, the respondent refused to undergo the procedure. The applicants relied on section 27 of the Criminal Procedure Act\textsuperscript{134} which deals with legitimate use of force by police in the event of resistance against search or seizure, and section 37, which deals with police powers in respect of prints and bodily features of the accused. Section 27 of the Criminal Procedure Act authorises a 'police official' to 'use such force as may be reasonably necessary to overcome any resistance' against a lawful search of any person or premises. Section 37(1)(c) authorises a 'police official' to 'take such steps as he may deem necessary in order to ascertain whether the body of a person . . . has any mark, characteristic or distinguishing feature or shows any condition or appearance; provided that no police official shall take any blood sample'. Section 37(2)(a) allows 'any medical officer of any prison or any district surgeon or, if requested thereto by any police official, any registered medical practitioner or registered nurse to 'take such steps, including the taking of a blood sample, as may be deemed necessary to ascertain whether the body of any person . . . has any mark, characteristic, or distinguishing feature or shows any condition or appearance'. The applicable section of the Constitution, section 12, guarantees the right to freedom and security of the person, including the right 'to be free from all forms of violence from either public or private sources', and the right to bodily and psychological integrity, including the right to 'security and control [one's] body'. Section 36 of the Constitution provides that fundamental rights such as those in section 12 may be limited by a law of general application in certain circumstances.

\textsuperscript{134} Criminal Procedure Act No 51 of 1977
In the cases of *Xaba* and *Gaqa* the court had to balance the rights of the suspects to bodily and psychological integrity against the rights of society as a whole to safety and security. It is interesting that in the one the court came down in favour of the individual and in the other in favour of the collective. Generally speaking the courts seem to favour the rights of the individual over those of the collective. The obvious question in these two cases is why, if the suspects were innocent, they would object to having the bullets removed since this would have proved their innocence if it in fact existed. In the context of the doctrine of necessity it is possible that the decision of the court in Xaba was correct provided that the court could draw an adverse inference from the suspect’s unwillingness to have the bullet removed. In other words there may be less drastic ways of proving the suspect’s guilt than the forced removal of the bullet. However, it could be argued that in South Africa the rights of society to safety and security are under siege and that the interests of the collective should weigh more heavily in these circumstances than those of the individual since the harm to the individual, should he be guilty or innocent, of minor surgery is not nearly as significant as the potential harm to society, should he be guilty, of releasing him to continue his hijacking activities which cost people their lives.

**7.4 Vicarious Liability**

The liability of public providers of health care services is likely to be vicarious in most if not all instances. As noted previously the State Liability Act specifically recognizes the possibility of such liability. According to Neethling *et al*, vicarious liability may in general terms be described as the strict liability of one person for the delict of another. In other words it the delict of the tortfeasor is imputed to another person who has a particular relationship of authority over the tortfeasor in the absence of fault on the part of that other person. The important relationships in this regard are employer and employee and principal and agent. Neethling *et al* observe that the rationale for the vicarious liability of an employer for the delicts of an employee is controversial. They state that the best-known explanation is that the employer's liability is
founded on his own fault (*culpa in eligendo*). However, fault in the choice of employee has been referred to in *Feldman (Pty) Ltd v Mall*\(^{135}\) as a “hoary explanation” and Neethling *et al* agree. They point out that this explanation is based on a fiction since according to this theory there is an irrebuttable presumption that the master has been negligent if he servant commits a delict. It is not open to him to prove the opposite. Other theories put forward are the interest or profit theory, the identification theory, the solvency theory and the risk or danger theory\(^{136}\) Neethling *et al* observe that Scott\(^{137}\) argues convincingly that the risk or danger theory furnishes the true rationale for the employer’s liability. The theory assumes that the work entrusted to the employee creates a certain risk of harm for which the employer should be held liable on the grounds of fairness and justice as against injured third parties\(^{138}\). Scott\(^{139}\) maintains that the employer should only be held liable if the conduct of the employee was reasonably foreseeable\(^{140}\).

In *Masuku and Another v Mdlatlose and Others*\(^{141}\) the Supreme Court of Appeal observed that despite various nuances in expression, the common-law test of vicarious liability, i.e. whether the employee in question was acting in the course and scope of his employment or, put differently, whether he was engaged in the affairs or business of the employer, had been applied consistently since 1958 to the liability of the state for the wrongful acts of police officers.\(^{142}\) It stated that

136 See Neethling *et al* fn 18 supra at p 373 for a more detail as to the substance of these theories.
137 Scott WE, *Middellike Aanspreklikheid in die Suid-Afrikaanse Reg* p 30
138 In *Minister Of Law And Order v Ngobo* 1992 (4) SA 822 (A) the court held, however, that in the circumstances of that case, there could be no doubt that, on the basis of the standard test, the appellant ought not to have been held vicariously liable for the employee’s wrongful act because the constables had not been on duty; they had at no stage purported to be carrying out any police function, they had unnecessarily resorted to the use of firearms in the course of an equally unnecessary altercation with strangers; and they had in no sense been engaged in the affairs of the appellant (despite the fact that they had used the revolvers they had been authorised to retain, which factor, though relevant, was not in itself enough to satisfy the standard test).
139 Scott fn 137 supra
140 This conclusion was not supported by the minority judgment of Viljoen JA in *Minister of Police v Mdlini* 1983 (3) SA 705 (A)
141 *Masuku* 1998 (1) SA 1 (SCA)
142 See *African Guarantee & Indemnity Co Ltd v Minister of Justice* 1959 (2) SA 437 (A) at p 445; *Mhlongo and Another NO v Minister of Police* 1978 (2) SA 551 (A) especially at 567 para (3); *Macala v Maokeng Town Council* 1993 (1) SA 434 (A); *Minister of Law and Order v Ngobo* 1992 (4) SA 822 (A) at 826F–828A;
the previous cases, on analysis, all confirmed that, in order to establish the vicarious liability of the state, the plaintiff must prove that the person who did the wrong was (a) an employee of the state acting in that capacity, and (b) that he or she performed the wrongful act in the course or scope of his or her employment. It said that the tests for state liability for the wrongful acts of police officers and the test for an employer's vicarious liability were stated explicitly to be the same in *Mhlongo and Another NO v Minister of Police*.

The terms ‘within the scope of his authority’ and ‘within the scope of employment’, said the court, were treated as being synonymous. Reference was made to the notional difference between the two last-mentioned concepts that were mentioned, but not explained or used, in *Feldman (Pty) Ltd v Mall* but doubt was expressed as to the tenability of this difference when Corbett JA stated at 567D:

“Nevertheless, it has never been suggested that the state escapes liability for a wrongful act committed by a servant in his capacity as such simply because the act fell outside the ‘scope of his authority’, when it was clearly within the ‘scope of his employment’.”

In *Minister of Safety and Security v Jordaan T/A Andre Jordaan Transport* it was noted that the standard test for vicarious liability is whether the delict in question was committed by an employee while acting in the course and scope of his employment. The inquiry is frequently said to be whether at the time the employee was about the affairs or business, or doing the work, of the employer. The court said that while this was no doubt true, it should not be overlooked that the affairs or business or work of the employer in question must relate to what the employee was generally or specifically instructed to do. It held that provided the employee was engaged in activity reasonably necessary to achieve either objective, the employer would be liable. The court observed that the difficulty is that, while the general approach to be adopted may be easy enough to formulate,
its lack of exactitude is such that problems inevitably arise in its application. This is particularly so in the so-called deviation cases. Not every act of an employee committed during the time of his employment which is in the advancement of his personal interests or for the achievement of his own goals, necessarily falls outside the course and scope of his employment. In each case, whether the employer is held to be liable or not must depend on the nature and extent of the deviation. Once the deviation is such that it cannot reasonably be held that the employee is still exercising the functions to which he was appointed, or still carrying out some instruction of his employer, the latter will cease to be liable. The court found that whether that stage has been reached is essentially a question of degree and said that answer to each case will depend upon a close consideration of the facts. The same is true of the inquiry as to whether the deviation has ceased and the employee has resumed the business of his employer.

In *Minister van Veiligheid vn Sekuriteit v Phoebus Apollo Aviation Bk*¹⁴⁵ it was held that the actions of three dishonest policemen who were involved in a robbery had not, considered objectively or subjectively, fallen within the course and scope of their duties and that they had embarked on an unauthorised jaunt for their own benefit with the intention of stealing from their own employer. It was held, further, that the three policemen had, by their theft and fraudulent conduct, not caused vicarious liability to devolve upon their employer.

In *Minister van Veiligheid en Sekuriteit v Japmoco Bk H/A Status Motors*¹⁴⁶ the respondent claimed that members of the vehicle theft unit of the South African Police Service, in the service of the State, had intentionally and for private gain, co-operated with a syndicate of car thieves and made it possible for the latter to sell cars stolen by its members. The relevant policemen prepared and issued motor vehicle clearance certificates, without which the vehicles could not be B

¹⁴⁶ *Japmoco* 2002 (5) SA 649 (SCA)
registered and resold. Eight of the vehicles for which false documentation was provided were sold to a second-hand motor vehicle dealer, Pro-fit, which in turn sold the vehicles to the respondent. The respondent sold seven of the vehicles at a profit to various members of the public. All eight vehicles were later seized by the police. Six of the seven purchasers held the respondent liable in terms of his common-law implied warranty against eviction and the respondent was forced to compensate each of them by repaying the purchase price or value of the motor vehicle. The respondent lost the eighth vehicle. The respondent based his claim in delict. It was argued that the relevant policemen, acting within the course and scope of their employment as employees of the state, had made it possible for the thieves to trick unsuspecting purchasers with false documentation. Without the relevant documents, the respondent alleged that he would never have purchased the relevant vehicles and would therefore have suffered no damages. During the trial it was admitted that the relevant clearance certificates were issued while the relevant policemen were aware of the fact that the clearance certificates were being issued in respect of stolen vehicles. The Court had to answer three questions: (1) Had the respondent proved a causal link between the actions of the relevant policemen and the purchase of the eight vehicles by the respondent; (2) had the policemen been acting within the course and scope of their duties; and (3) had the respondent proved the fact that he had suffered damages as well as the quantum thereof. Nienaber JA held that an employer was legally liable for the damage caused to third parties by the unlawful actions of his employee within the course of his duty. He said that whether the unlawful action occurred within the course of the employee's duty was a factual enquiry and that sometimes it was a question of degree whether the relevant action fell just within or without the scope of the employment. It could fall within the scope of employment even where it conflicted with an emphatic ban from the employer and even where the employee acted intentionally and not negligently. The employee's purpose had to be examined and in this respect, the test was subjective. Where there was, however, a close connection between the employee's action for his own interests and purposes
and the business of the employer, the employer might still be liable. Nienaber JA held that this was an objective test. He held further that the unlawful conduct of the relevant policemen consisted of the intentional issue of false clearance certificates, knowing that innocent third parties could be misled to their detriment thereby. Such actions were in conflict with the prescriptions of their employer, the appellant. Subjectively speaking, their prime objective was not to serve the interests of their employer but to favour their own pockets. On the other hand, each of them was, objectively speaking, performing the exact task assigned to them. This was accordingly not a matter where the employees, in the manner in which they performed the task, had totally distanced themselves from their assigned duties. The court said that that, while the clearance certificates were false, they were not forged. There was therefore a close connection between the employees’ actions for their own interests and purposes and the business of the employer. The appellant was accordingly, in principle, responsible for the actions of his officers. It said that such action contained an element of fraud was not in itself conclusive. The fraud was not so much aimed at the employer as at third parties and did not necessarily reside in the action but the purpose with which the action was executed. However, the respondent failed in his claim because he had not proved the quantum of his damages.

In *Minister of Safety and Security v Van Duivenboden*\(^\text{147}\) the court had to consider the question of liability for an omission as well as vicarious liability of the state for the omissions of its employees. In this case it held that there was no effective way of holding the state accountable other than by way of an action for damages. The court stated that in the absence of any norm or consideration of public policy outweighing it, the constitutional norm of accountability required that a legal duty be recognised. The negligent conduct of police officers in those circumstances was accordingly actionable and the state was vicariously liable for the consequences of any such negligence\(^\text{148}\).

\(^{147}\) *Van Duivenboden* fn 92 supra

\(^{148}\) Paragraph [22] at 448C/D - E.
Strauss\textsuperscript{149} points out that the general principle is that there must be a relationship of employment whereby one person stands in a position of authority in relation to another in terms of which the former is legally capable of exercising control over the latter’s actions\textsuperscript{150}.

The question in the health care context is whether employees who are registered health professionals can incur liability on the part of their employers by their negligent actions in the course and scope of their duties. After all they can be punished by their own professional boards for such acts and the employer does not necessarily itself have the expertise to know when for instance an employee surgeon is being negligent in the operating theatre. The earlier cases did at first subscribe to the view that an employer cannot be held vicariously liable for the ‘professional’ negligence of employees. Thus it was held in the case of Lower Umfolos District War Memorial Hospital v Lowe\textsuperscript{151} that the placing by a nurse of a hot water bottle in the bed of a patient who had been under the effects of an anaesthetic, causing the patient to be badly burnt, was a professional act of negligence and that the hospital could thus not be held liable.\textsuperscript{152} In St

\textsuperscript{149} Strauss fn 34 supra

\textsuperscript{150} In Stein v Rising Tide Productions CC 2002 (5) SA 199 (C) it was held that the Courts had drawn a clear distinction, for the purposes of vicarious liability, between an ‘independent contractor’ and an employee (or ‘servant’). As a general rule, an employer was vicariously liable for the delicts of his employee acting in the course and scope of his employment, while he was not vicariously liable for the negligence of an independent contractor employed by him - the exception being where the employer himself had in some way been personally at fault (usually negligent) in regard to the conduct of the independent contractor that had caused harm to a third party. The main distinction between the two was that the employee (servant) undertook to render personal services to the employer, while the independent contractor undertook to perform a certain specified piece of work or to produce a certain specified result for the employer. Unlike an employee, an independent contractor was generally not subject to the control or the instructions of the employer as to how he performed the work or produced the result. In the past the Courts had generally relied on the so-called ‘control test’ to determine whether the employment relationship was one of ‘master and servant’ or one of employer/independent contractor. The court further held that problems experienced with the control test had led the Courts to rely, particularly in marginal cases, on the ‘dominant impression’ test, viz whether or not the dominant impression was that of a contract of employment. This required a typological approach in which the right of control was not an indispensable requirement of the contract of service, but only one of a number of indicia, the combination of which might be decisive. Other indicia were: the nature of the work; the existence of a right of supervision; the manner of payment (fixed rate or commission); the relative independence of the employee; the employer’s power of dismissal; whether the employee was precluded from working for another; whether the employee was required to devote a particular amount of time to his work; whether the employee was required to perform his duties personally, the ownership of the working facilities and whether the employee provided his own tools and equipment; the intention of the parties; the period of employment, etc. (From headnote)

\textsuperscript{151} Lower Umfolos 1937 TPD 31

\textsuperscript{152} Other South African cases that followed the same logic are Hartl v Pretoria Hospital Board 1915 TPD 336 and Byrne v East London Hospital Board 1926 EDL 128
Augustine's Hospital (Pty) Ltd v Le Breton\textsuperscript{153} a 92-year-old patient fractured her leg when, in the middle of the night, she fell out of a hospital cot due to the negligence of the nursing staff in failing to erect the sides of the cot at night. The single judge was constrained to hold that in the absence of any special term in the contract between the hospital and that patient, the ordinary contract between patient and hospital does not cast upon the hospital an obligation to do more than take reasonable steps to assure itself of the professional competence of the nurses it employs to attend to the patient. The patient could thus not hold the hospital liable for the negligence of its nursing staff. The court in this case made the point that it was obliged by the principle of \textit{stare decisis} and the fact that the decision of the Natal court in the \textit{Lower Umfolosi Memorial Hospital} case had been one of a Full Bench to make the judgment that it had but that it would have preferred to come to a different finding had it been free to do so. In \textit{Mtetwa v Minister Of Health}\textsuperscript{154} the plaintiff was a patient at the King George V Hospital. She was being treated for suspected tuberculosis. The physician treating her was a certain Dr Pala, an employee of the defendant. The plaintiff alleged that Dr Pala acted carelessly in prescribing and administering a particular medication for her, in consequence of which she suffered a series of unpleasant and harmful after- and side-effects. She accordingly claimed R7 000 for pain, suffering, discomfort and inconvenience and R3 000 for loss of amenities. The respondent excepted to the plaintiff's claim on the basis of the decision of the court in \textit{Lower Umfolosi District War Memorial Hospital v Lowe}. The court in Mtetwa observed that in the Transvaal the cases of \textit{Esterhuizen v Administrator Transvaal}\textsuperscript{155}, \textit{Dube v Administrator Transvaal}\textsuperscript{156} and \textit{Buls and Another v Tsatsarolakis}\textsuperscript{157} do not mention nor support the distinction, which is pivotal to the decision in the \textit{Lower Umfolosi} case, between professional work over which the hospital is said to have no control and for

\textsuperscript{154} Mtetwa 1989 (3) SA 600 (D)
\textsuperscript{155} Esterhuizen fn 29 supra
\textsuperscript{156} Dube 1963 (4) SA 260 (T)
\textsuperscript{157} Buls 1976 (2) SA 891 (T)
which it is accordingly not liable, and managerial or administrative duties performed by an employee, for which it is responsible. In the Transvaal cases the issue was simply whether the particular member of staff was negligent in the exercise of his duties, regardless of whether he was part of a professional team or not. However, said the court, as long as the decision in the Lower Umfolosi case stands, that is not the prevailing view in Natal. Because of the divergence of judicial views, and because the plaintiff was anxious to avoid the predicament which compelled Fannin J in the St Augustine's Hospital (Pty) Ltd case to follow the one view while preferring the other, the plaintiff, as the respondent to the exception, initiated an application in terms of s 13(1)(b) of the Supreme Court Act to have the hearing of the exception referred to the Full Court of the Natal Provincial Division. That application, which was not opposed, was duly granted. The court observed that the point on which the decision in the Lower Umfolosi case hinged was that a member of the professional staff of a hospital was not a servant proper for whose misdeeds the hospital was accordingly responsible. At the time that was perceived to be a principle of law. Nowadays, the question is purely one of fact. The degree of supervision and control which is exercised by the person in authority over him is no longer regarded as the sole criterion to determine whether someone is a servant or something else. The deciding factor is the intention of the parties to the contract, which is to be gathered from a variety of facts and factors. Control is merely one of the indicia to determine whether or not a person is a servant or an independent worker. Nienaber J stated that just as the Minister of Law and Order can be held accountable for the peccadilloes of a policeman even when the latter exercised a discretion of his own and indeed, even when he was not on duty, so too, it might be argued by analogy, the Minister of Health is at risk if a member of the staff of a hospital under his command is negligent in the exercise of any of his duties, be they professional and not subject to dictation.

158 Supreme Court Act No 59 of 1959
159 Minister van Politie en 'n Ander v Gamble en 'n Ander 1979 (4) SA 759 (A)
160 Minister of Police v Rabie 1986 (1) SA 117 (A)
from others. The court held that to the extent that the judgment in the *Lower Umfolosi* case purported to enunciate a universal principle of law, namely that a hospital assumes no responsibility for the negligence of any member of its staff engaged in professional work, it has been overtaken by more recent authority, not only by the South African cases referred to but by English ones as well.\textsuperscript{161}

7.5 Medicines

Medicines are of particular interest in the delictual sphere because they are the product or goods aspect of health services delivery. Consequently issues such as product liability and the liability of the manufacturer as opposed to that of the health services provider who supplies the medicine are of relevance. Whilst issues of the administration of medicines by health care providers are also important, the context in which medicines are marketed, developed and supplied by manufacturers adds a new dimension to the discussion. The efficacy of a medicine is a quality that can only be generally, as opposed to specifically, established in the sense that different individuals react and respond differently to the same medicine\textsuperscript{162}. They may experience different side-effects, they may

---

\textsuperscript{161} See, for instance: *Gold v Essex County Council* [1942] 2 KB 293; *Collins v Hertfordshire County Council* [1947] KB 598; *Cassidy v Ministry of Health* [1951] 2 KB 343 (CA); *Roe v Minister of Health* [1954] 2 QB 66

\textsuperscript{162} The Nuffield Council on ‘Bioethics Pharmacogenetics: Ethical Issues’ has stated that: “People vary in their response to the same medicine. Few medicines are effective for everyone; all may cause adverse reactions or occasionally death. Some of the variation between individuals in response to medicines is due to differences in their genetic make-up. There are many different reasons why medicines may be dangerous or ineffective, such as inaccurate prescribing, poor compliance by the patient and interaction between a particular medicine and other substances, including other medication. However, advances in genetic knowledge may enable us to take better account of differences between individuals. Pharmacogenetics is the study of genetic variation that affects response to medicines. It has the potential to play an important role in improving safety and efficacy. Adverse reactions to medicines have significant costs, in both human and monetary terms. In addition, considerable resources are wasted on prescribing medicines that have little or no effect in particular patients.”

http://www.nuffieldbioethics.org/filelibrary/pdf/pharmacogenetics_report.pdf. They proceed to point out that the most common reason for medicines to be withdrawn from the market once they have been licensed is the subsequent occurrence in patients of serious adverse reactions which were either unsuspected at the time of marketing authorisation or occur more frequently than was expected at the time of the grant of marketing authorisation. They also make the point that both public and private providers of healthcare operate on limited budgets. In addition to the traditional requirements of quality, efficacy and safety for the regulatory approval of new medicines, public policy in many countries is developing the requirement to assess medicines for their cost-effectiveness.

Abraham J, Sheppard J and Reed T “Rethinking Transparency and Accountability in Medicines Regulation in the United Kingdom” *British Medical Journal* Jan 2 1999 observe that: “The marketing of a number of drugs that would have been withdrawn because their risks outweighed their benefit would probably have been challenged earlier if there had been greater transparency and public accountability... In the case of Opren, the lack of experimental testing for photosensitivity before approval in the United Kingdom and the omission of clear estimates of risks of photosensitivity from the United Kingdom product data sheet might well have been questioned. Hundreds of patients who had taken Opren subsequently complained of persistent photosensitivity. Similarly, Zomax was approved in the United Kingdom for the chronic treatment of arthritis without any
experience widely varying levels of efficacy, in some cases they may even experience an allegoric reaction to the medicine. Furthermore, the efficacy of a medicine from the point of view of the patient is dependent upon a number of external factors such as the accuracy of the diagnosis, the manner and the environment in which it is administered or taken, the overall state of health of the patient, whether the patient has an allergy to the medicine, whether it is taken in combination with other drugs or an appropriate dietary regimen etc.

Laypersons are sometimes of the view, in relation to medicines, that even if the medicine is not effective surely there can be no harm in taking it. This can be a dangerous misperception. Many medicines are toxic substances, some more so than others. They can themselves induce illness if used incorrectly. There can

warning on the product data sheet, despite positive carcinogenicity findings in animal tests before marketing. After the drug had been withdrawn, the Medicines Commission described the findings on carcinogenicity as a cause for concern when justifying its recommendation that Zomax should be returned to the market. Had those findings been public before the drug had been approved fewer patients would probably have been prescribed Zomax. More recently, Halcion was finally banned in the United Kingdom in 1993. It had been approved in 1978 but suspended since 1991. On banning Halcion the British regulatory authorities said that if they had known in 1978 what they knew in 1991, they would never have approved the drug in the first place."

Brazell C, Freeman A and Mosteller, M "Maximizing the value of medicines by including pharmacogenetic research in drug development and surveillance" British Journal of Clinical Pharmacology March 2002 state that "Genetics provides significant opportunities to maximize the safety and efficacy of medicines...The ability to develop drugs with a predictable response will allow clinicians to provide targeted treatment for patients with greater confidence of safety and efficacy. Patients will therefore receive more efficacious, timely and well-tolerated medicines."

Penicillin for example is an effective antibiotic in many instances but some individuals are allergic to it and therefore cannot use it.

Anti-retroviral drugs are highly toxic substances that can in some cases result in death. By way of example the drug profile of Abacavir (ABC): Ziaqen (GlaxoSmithKline); related: Trizivir (TZV) CLASS: reads as follows — NRTI INDICATIONS: Most potent NRTI. FORMS AND PRICE: Tabs: 300 mg at $6.41. As TZV: AZT 300 mg/3TC 150 mg/ ABC 300 mg at $16.75 PATIENT ASSISTANCE: 800–722–9294 REGIMEN: 300 mg bid. Renal failure: Standard. PATIENT INSTRUCTIONS: No food restrictions. Warn about hypersensitivity reactions expressed as fever (usually 39° to 40°C), rash (maculopapular, often subtle), fatigue, nausea, vomiting, diarrhea, abdominal pain, muscle/joint pain, paresthesias, cough and/or dyspnoea. The highest risk is in the first 6 weeks but can occur at any time. A common concern is that every cold or side effect from a drug taken concurrently is interpreted as a side effect of ABC. Fever is nearly always present with ABC hypersensitivity. Patients should be advised to contact provider with questions prior to d/c. Warn of lipodystrophy and fat redistribution. WARNINGS: HSR, may be severe, resulting in hypotension and possible death. Warning card is available from pharmacists. Next dose will illicit same or worse Sx; may wish to administer next dose under observation. Remember that once this drug is stopped for suspected hypersensitivity it is often lost forever. SIDE EFFECTS: HSR with above Sx; complications include anaphylaxis, renal failure, hepatic failure, hypotension and death. Rechallenge has resulted in 3 deaths. GI intolerance. Class ADR: Lactic acidosis and hepatic steatosis.... DRUG INTERACTIONS: ETOH increases ABC AUC 41% (clinical significance unknown). ABC may ± methadone C; ± methadone dose may be required. PREGNANCY: Category C. Efavirenz, EFV: Sustiva (Bristol-Myers Squibb) CLASS: NNRTI INDICATIONS: Potent anti-HIV agent; one of few triple agent regimens with comparable antiviral activity with baseline VL above or below 100,000 c/mL in treatment naive patients. FORMS AND PRICE: Caps: 50 mg, 100 mg, 200 mg at $4.39 REGIMENS: 600 mg (three 100 mg tabs) hs. Renal failure or hepatic failure: Standard PATIENT INSTRUCTIONS: Take without regard to meals except that high fat meals should be avoided because they increase absorption. If switching from PI to EFV, some experts suggest an overlap of 1 week to achieve
also be significant consequences for general public health if they are used inappropriately. Multi-drug resistant tuberculosis (MDR-TB) is a real example of the dangers for patients of widespread resistance to antibiotics. MDR-TB can only be treated with a limited number of extremely expensive antibiotics. If resistance to these antibiotics develops, there is no other effective treatment for the disease. Malaria is another example of a disease that has beaten what was once its standard treatment. The World Health Organisation has warned that many infectious diseases which can be controlled now may be untreatable within 10 years. The same principles are applicable to...
antiretroviral drugs (ARVs). The dangers of resistance are real. Apart from mutation of the virus within individuals which can lead to individual resistance to ARVs, there is the danger of global resistance to ARVs as the ARV resistant strains spread and become dominant. The HI virus mutates periodically to a point at which the prevailing recommended drug regimens have to be changed or new drugs, where possible, introduced. Given that there is only a limited number (approximately 20) different ARVs available worldwide and most of them are currently used in 3 or 4 drug combinations, mass resistance to ARVs

168 According to the Rutger Hauer Starfish Foundation, a global surveillance system for tracking HIV drug resistance has been launched by the World Health Organization and the International AIDS Society. They believe that the programme will be crucial to prevent important HIV drugs, called antiretrovirals, from being "wasted" as they start to be used in the developing world. Their use has been made possible as a result of price cuts by drug companies, cheaper generic versions of the drugs and foreign aid funding. The surveillance network will also help western countries use antiretrovirals more intelligently. (www.rutgerhauer.org/rutgerhauerstarfishinfo/infonewstories) See also WHO Global Strategy for Containment of Antimicrobial Resistance (WHO/CDS/CSR/DRS/2001.2) in which it is stated that deaths from acute respiratory infections, diarrhoeal diseases, measles, AIDS, malaria and tuberculosis account for more than 85% of the mortality from infection worldwide. Resistance to first-line drugs in most of the pathogens causing these diseases ranges from zero to almost 100%. In some instances resistance to second- and third-line agents is seriously compromising treatment outcome. Added to this is the significant global burden of resistance hospital-acquired infections, the emerging problems of antiviral resistance and the increasing problems of drug resistance in the neglected parasitic diseases of poor and marginalized populations. According to the WHO, resistance has recently been described as a threat to global stability and national security. In 1998 the World Health Assembly urged member states to develop measures to encourage appropriate and cost-effective use of antimicrobials, to prohibit the dispensing of antimicrobials without the prescription of a qualified health professional, to improve practices to prevent the spread of infection and thereby the spread of resistant pathogens, to strengthen legislation to prevent the manufacture, sale and distribution of counterfeit antimicrobials and the sale of antimicrobials on the informal market and to reduce the use of antimicrobials in food-animal production.

http://www.who.int/csr/resources/publications/drugresist/ECGlobal_Strat.pdf. In another publication in 2000, entitled "Overcoming Antimicrobial Resistance" the World Health Organisation stated that recent studies it had undertaken indicated that for every 100 respiratory infections, only 20% required antibiotic treatment. This meant that 80% of patients are treated with unnecessary medications thereby leading drugs directly into the sight lines of resistance. It commented that while bacterial infections can kill, treating viral illness with antibiotics is not only ineffective but contributes to the development of resistance. (http://www.who.int/infectious-disease-report/2000/eh4.htm).

169 Gillim L, Guevara GL, Vargas J Jr, Marras D, Klotman ME and Cara A 'Development of a Novel Screen for Protease Deficient Mutants of Human Immunodeficiency Virus I (HIV-1)'. In Clinical and Diagnostic Laboratory Immunology, note that "Since the onset of the AIDS epidemic, a number of antiretroviral drugs have been developed for the treatment of human immunodeficiency virus type 1 (HIV-1) infection. While the initial target for therapy was reverse viral transcriptase, inhibitors targeting the viral protease (PR) enzyme have become a mainstay of antiretroviral therapy. Although use of these compounds in multidrug regimens has dramatically reduced viral load as well as morbidity and mortality, their long term benefit in HIV-1 infected patients has dramatically reduced viral load as well as morbidity and mortality, their long-term benefit in HIV-1 infected patients has been limited by the emergence of drug-resistant viral strains. The high rate of mutation of HIV-1 coupled with incomplete viral suppression and widespread use of this class of drugs will continue to contribute to this problem. For this reason it is essential that new drugs targeting PR, as well as new viral targets be developed."

170 See "Quadruple Therapy With A Protease Inhibitor and NNRTI Achieves Highest Rate of Viral Suppression in Nucleoside Analogue Experienced Patients" (Montaner/Mellors, NEJM 8/9) HIVdent Drug & Medications News Update. It has now been observed, for example, that quadruple therapy consisting of two nucleoside reverse transcriptase inhibitors (one of which is new), a protease inhibitor and a non-nucleoside reverse transcriptase inhibitor achieves a higher rate of viral suppression in patients who have already been treated with NRTIs (antiretroviral drugs) than treatment regimens consisting of NRTIs and either a NNRTI or a protease inhibitor, according to a study published in the August 9 (2001) edition of the New England Journal of Medicine. The study was conducted by Dr Mary Albrecht and colleagues of the AIDS Clinical Trials Group. The findings indicated that quadruple therapy offers "significantly more durable suppression" than either
can rapidly become a serious and global public health problem. Negligent or irresponsible prescription and use of certain drugs can therefore in itself be harmful not only to individual patients but to society as a whole. What has all this to do with the law of delict, one might ask. It is submitted that there is potential for claims in delict, based on the circumstances discussed above, at a number of different levels within the health system. Take for example the case of a family doctor who negligently, unnecessarily and repeatedly prescribes a drug for a particular patient. The drug is a lifesaver for a particular condition (e.g. myocardial infarct) when taken appropriately but if used too frequently results in a rapid build up of resistance within the patient which nullifies its efficacy for the life threatening condition. In certain circumstances the doctor could be held liable for a claim in delict if the patient’s capacity to benefit from the drug was nullified by the doctor’s unnecessary prescription of it and it was reasonably foreseeable that the patient could suffer from the life threatening condition at some stage. Obviously much would depend on the facts of the particular case but delictual liability within these circumstances is not impossible. Within the public sector, overuse or misuse of certain medicines on the prescription of doctors who are employees of the state and who create a public health risk because of an increase in drug resistance due to the overuse or misuse of the medicine, could conceivably lead to claims in delict in certain circumstances. At a constitutional level the irresponsible and irrational prescription of a drug within the public health sector could result in reduced access to health care services for large numbers of patients – especially if any alternative therapies were considerably more expensive and therefore unaffordable for the majority of patients that previously had access to the now defunct drug. Class actions could conceivably arise against drug manufacturers in consequence of marketing practices which actively encourage health professionals to ‘push’
their products when treating patients in terms of prescriptions and medical advice if it can be shown that such marketing is irresponsible and does not warn doctors and other prescribers of the dangers of resistance with the result that the drug becomes useless to those who need it. There has of late been a major shift in advertising with more and more funds being spent on direct to consumer promotion of drugs.

One of the major problems with responsible use of pharmaceutical products in order to avoid mass resistance and one that does not seem to be linked very often in the literature to problems of resistance are the commercial practices surrounding the sale and marketing of medicines. Pharmaceutical manufacturers and others in the medicines supply chain incentivise healthcare professionals to prescribe and administer their particular products and also specific volumes of those products. The primary motivation is commercial – to 'move' as much product as possible. The results of unethical marketing of medicines are inter alia unethical, unnecessary and irresponsible prescription of medicines. Furthermore, at the extreme end of the spectrum, it could even be said that drug resistance is a beneficial aspect of the system from the point of view of the manufacturer since as long as it can continue, by means of research and development to stay ahead of the resistance game it is guaranteed of a market for new drugs as the older ones become obsolete. Drug companies are likely to argue that drug resistance is not beneficial for them because they would like to continue to sell both old and new products. However the maximum duration of a patent is usually twenty years in principle and less in practice. Once the drug goes off patent, the fact is that its price drops dramatically as generic manufacturers climb onto the bandwagon. The theory of planned

---

Fresle DA and Wolfheim C ‘Public Education in Rational Drug Use: A Global Survey’ WHO Geneva March 1997 Pharmaceutical marketing to prescribers, dispensers and consumers may contribute to irrational use. Unethical marketing of drugs is widespread in developing countries and although standards have improved in developed countries, recent studies have found continuing problems, such as false and misleading claims, switch campaigns and commercial promotion disguised as scientific trials.

obsolescence describes a way of maintaining control of a particular market in other industries. Manufacturers who make drugs for the communicable diseases market do not have to worry about planned obsolescence—nature has built it into the system for them in the form of drug resistance. However, this does not mean to say that they cannot profit significantly from drug resistance and that there is no inherent perverse incentive sufficiently present within the system for them to focus on and actively promote widespread, high-volume use of a drug without being overly concerned about the appropriacy of that use. Furthermore, all drugs have expiry dates beyond which they may not lawfully be sold. It is clear that just around medicines alone, which are only one aspect of health services delivery, there are a number of complex issues upon which the law of delict has relevance.

The question of the liability of a medicines regulatory authority to cancel or suspend the registration of a medicine on receipt of information subsequent to its registration that its efficacy is dubious is also of interest in the context of delicts committed by the state. Section 16 of the Medicines and Related Substances Control Act states that:

1) If the council-

---

172 The New Dictionary of Cultural Literacy, Third Edition 2002, defines 'planned obsolescence' as "Incorporating into a product features that will almost certainly go out of favour in a short time, thereby inducing the consumer to purchase a new model of the product. Placing sweeping tail fins on an automobile was an example of planned obsolescence." [http://www.bartleby.com/59/18/plannedobsol.html]

173 Bulow J 'An Economic Theory Of Planned Obsolescence' states that "Except under unusual conditions, a monopolist will produce goods with inefficiently short useful lives. The result is closely linked to the observation that a durable goods monopolist will prefer to rent, rather than sell, its output. An oligopolist, or equivalently a monopolist facing certain entry in a subsequent period, also has a countervailing incentive to extend durability. As a corollary, such firms have an incentive to steer customers to purchase rather than rental contracts. This same result also holds if future competition is to be over a related but not identical substitute product. Therefore, while monopolists will opt for inefficiently short useful lives, oligopolists may choose either uneconomically short or long lives, depending on their technologies and market conditions. There is also an incentive to increase durability to deter entry." [https://faculty-gsb.stanford.edu/bulow/articles/Art%20Economic%20Theory%20of%20Planned%20Obsolescence.pdf]

174 In terms of section (3) (a) of the Medicines and Related Substances Act No 101 of 1965: If after consideration of any such application and after any investigation or enquiry which it may consider necessary the council is satisfied that the medicine in question is suitable for the purpose for which it is intended and complies with the prescribed requirements and that registration of that medicine is in the public interest, it shall approve of the registration thereof. In terms of section (3) (c) of the Act: In determining whether or not the registration or availability of a medicine is in the public interest, regard shall be had only to the safety, quality and therapeutic efficacy thereof in relation to its effect on the health of man or any animal, as the case may be.

Medicines Act fn 12 supra
(a) is of the opinion that any person has failed to comply with any condition subject to which any medicine has been registered; or
(b) is of the opinion that any medicine does not comply with any prescribed requirement; or
(c) is of the opinion that it is not in the public interest that any medicine shall be available to the public,

the council shall cause notice in writing to be given accordingly by the registrar to the holder of the certificate of registration issued in respect of that medicine.

(2) Any such notice shall specify the grounds on which the council's opinion is based, and shall indicate that the person to whom it is directed may within one month after receipt thereof submit to the registrar any comments he may wish to put forward in connection with the matter.

(3) If no such comments are so submitted, or if after consideration of any comments so submitted the council is of the opinion that the registration of the medicine in question should be cancelled, the council may direct the registrar to cancel the registration thereof.

The Act does not state what happens if the council fails to comply with section 16. Furthermore subsection (3) states that the council may direct the registrar to cancel the registration of the medicine if it is of the opinion that the registration of the medicine in question should be cancelled. Since for the purposes of the Act, registration of a medicine is based upon its quality, efficacy and safety, it is difficult to envisage a situation in which the Council would be justified in failing to cancel the registration of a medicine where it is of the opinion that such registration should be cancelled.

7.6 Constitutional Delicts?

To some extent this topic has already been touched upon in the earlier discussion under the section on loss. However, it is important to explore this
issue specifically from the constitutional perspective of the State’s obligation to achieve the progressive realisation of the right of access to health care services. If the State, or some organ of state, fails in some obvious respect to do so, does this constitute a delict against the affected persons? A pertinent example of this is the present state of affairs concerning municipal health services. Section 84 of the Local Government: Municipal Structures Act assigns certain functions to district municipalities including municipal health services. There are two problems associated with this. The first is that health services being rendered by municipalities are for the most part funded and rendered by metropolitan municipalities and local municipalities. These latter levy rates and taxes within their areas of jurisdiction and fund such services from these rates and taxes. District municipalities do not have the power to raise money in this way. Essentially, therefore, the Municipal Structures: Local Government Act has created an unfunded mandate for district municipalities. This in itself is not problematic in view of the fact that the Minister of Provincial and Local Government can authorise a local municipality to render municipal health services in its area. The Minister did issue such authorisations to most, if not all, local municipalities by way of a series of notices issued in November 2000. Subsequently, in 2003, the Minister decided to revoke the authorisation to the extent that it covered municipal health services with effect from 01 July 2004 and did so by way of a series of notices published in the Gazette. Since the funding issues for district municipalities will not have been resolved at that time, since estimates are that the current value of municipal health services rendered by local municipalities is close to one billion rands and since the provincial governments do not have this kind of funding available to enable them to step into the breach, the Minister’s actions in revoking the authorisations are highly problematic and quite possibly unconstitutional.

176 Municipal Structures Act No 117 of 1998
177 Fn 176 supra Section 84(1)(i)
178 Fn 176 supra Section 84(3)(a)
It is conceivable that a situation could arise in which a person seeking health care services, especially emergency medical treatment, suffers loss due to the fact that the required health care services were not available or were not available within a specific time. Reference has already been made to the case of Olitzki and the concurrence of the Supreme Court of Appeal in that case with the observations of Davis J in *Faircape Property Developers (Pty) Ltd v Premier, Western Cape* that in deciding whether a statutory provision grounds a claim in damages the determination of the legal convictions of the community must take account of the spirit, purport and objects of the Constitution, and that the constitutional principle of justification embraces the concept of accountability. What is the position when the statute in question is the Constitution itself? In *NAPTOSA and Others v Minister of Education, Western Cape, and Others* the court observed that:

"The complexities of remedies for a violation of a fundamental right were, in the context of a claim for 'constitutional damages', discussed in *Fose v Minister of Safety and Security* 1997 (3) SA 786 (CC) (1997 (7) BCLR 851). It is clear from this decision of the Constitutional Court that there may be circumstances where a litigant against the state would be entitled to rely directly on a breach of a fundamental right. Whether this would be permissible would depend, however, on the availability of 'appropriate relief'. The majority judgment written by Ackermann J explains that 'appropriate relief' will in essence be relief that is required to protect and enforce the Constitution. In deciding what is appropriate relief, the interests not only of the complainant but of society as a whole, he holds, ought to be served.

In *Gerber v Voorsitter: Komitee Oor Amnestie van Die Kommissie vir Waarheid en Versoening* it was held that it was of paramount importance that the rights set out in the Bill of Rights had to be protected and accordingly the Court had to be prepared to determine whether the constitutional rights of the applicant had been infringed or threatened and to apply the appropriate legal remedy and that neither the procedure nor the investigation nor the legal remedy should be hamstrung if the Constitution and the Bill of Rights were to be given their fullest meaning. The court held further that in applying section 38 of the

---

179 *Faircape* fn 61 *supra*
180 *NAPTOSA* 2001 (2) SA 112 (C)
181 *Gerber* 1998 (2) SA 559 (T)
Constitution, the nature of the remedy or what it was called was not important. Where the rights set out in the Bill of Rights were infringed by the conduct or decision of a lower court or a tribunal, council or official which exercised judicial, quasi-judicial or administrative functions, the person affected thereby could seek relief in terms of Rule 53 of the Uniform Rules of Court. In the event that the Court found that the applicant's rights in terms of the Constitution had been infringed, it could grant the appropriate relief.

Clearly the courts construe their power to grant appropriate relief as being wide and flexible. In *Bel Porto School Governing Body and Others v Premier, Western Cape, and Another* the constitutional court observed that:

> "There are several provisions in the Constitution which are important to bear in mind when considering constitutional remedies, in particular ss 38, 172(1), 8(3), and 39(2). Section 172 provides that if a court finds law or conduct inconsistent with the Constitution, it must declare that law or conduct to be invalid to the extent of its inconsistency. In addition to the declaration, the court may proceed to provide additional appropriate relief. Sometimes a declaration of invalidity may not be sufficient, or appropriate on its own. The constitutional defect might lie in the incapacity of the common law or legislation to respond to the demands of the Bill of Rights. Section 8(3) then requires that the Court should develop a suitable remedy. No particular remedy, apart from the declaration of invalidity, is dictated for any particular violation of a fundamental right. Because the provision of remedies is open-ended and therefore inherently flexible, Courts may come up with a variety of remedies in addition to a declaration of constitutional invalidity. An 'all-or-nothing' decision is therefore not the only option...The flexibility in the provision of constitutional remedies means that there is no constitutional straightjacket such as suggested in the High Court or in argument in this Court. The appropriateness of the remedy would be determined by the facts of the particular case. In a constitutional state with a comprehensive Bill of Rights protected by a Judiciary with the power and duty to do what is just, equitable and appropriate to enforce its provisions, it is not hard cases that make bad law, but bad cases that make hard law."

It is submitted that probably the most likely situation in which a constitutional delict will be recognised in future is that described by the court in *Sooobramoney v Minister of Health, Kwazulu-Natal* in reviewing the facts of the Indian case of *Paschim Banga Khet Mazdoor Samity and Others v State of West Bengal* and

---

182 *Bel Porto* 2002 (3) SA 265 (CC)
183 *Sooobramoney* 1998 (1) SA 765 (CC)
Another. It was a case in which constitutional damages were claimed. The claimant had suffered serious head injuries and brain haemorrhage as a result of having fallen off a train. He was taken to various hospitals and turned away, either because the hospital did not have the necessary facilities for treatment, or on the grounds that it did not have room to accommodate him. As a result he had been obliged to secure the necessary treatment at a private hospital. It appeared from the judgment that the claimant could in fact have been accommodated in more than one of the hospitals which turned him away and that the persons responsible for that decision had been guilty of misconduct. This is precisely the sort of case which would fall within s 27(3). It is one in which emergency treatment was clearly necessary. The occurrence was sudden, the patient had no opportunity of making arrangements in advance for the treatment that was required, and there was urgency in securing the treatment in order to stabilise his condition. The treatment was available but denied. In the South African context, however, it is most likely to occur in the context of the refusal by a private sector hospital of emergency medical treatment if the patient is unable to pay the exorbitant deposit which such hospitals tend to require in advance of treatment. The public sector is likely to turn away a patient requiring medical treatment only in circumstances where the particular facility is not equipped to give adequate assistance or where it is already at running at full capacity with regard to emergency medical services. In this latter scenario it will be a question of whether the facts sufficiently justify the refusal to provide emergency medical treatment, i.e. whether the resources where being adequately utilised, whether there were attempts to refer the patient to an alternative facility where treatment could be obtained, the availability of such alternatives etc, whereas in the former scenario the refusal is likely to be unconstitutional in the absence of arguments of lack of capacity.

The constitutional obligation to provide emergency medical treatment is a particularly good example because in terms of the common law of delict as it

---

184 Paschim 1996 (AIR) SC 2426.
stands currently, there is no generally recognised obligation to render emergency medical treatment\(^{185}\).

A further question of some importance in the context of health services delivery is whether a provider can contract out of delictual liability, whether this is in accordance with public policy and how this issue is dealt with by the courts. The Appellate Division, in the case of *Afrox Healthcare Bpk v Strydom*\(^{186}\) answered this question in the affirmative for the private sector at least. The facts of this case are canvassed in detail in the section of the thesis that covers contracts within the private sector. The question is whether, in the light of the constitutional obligations of the state to provide access to health care services, the state could also contract out of delictual liability to patients in its care. In the *Afrox* case, the High Court tried, in what is, with respect, an ineptly reasoned judgment, to bring the matter within constitutional values and decided in favour of the plaintiff. The Supreme Court of Appeal, in what is with respect, a highly regressive judgment, chose to reverse the decision of the High Court and – notwithstanding the constitutional rights of the patient to bodily and psychological integrity, and human dignity – followed the well worn argument of the sanctity of contract under just about all circumstances except those that are essentially criminal. It is a great pity that this case never got as far as the constitutional court. The High Court and the Supreme Court of Appeal have been criticised by the Constitutional court on at least one occasion\(^{187}\) for failing

---

\(^{185}\) In the common law of delict the existence of a duty to rescue is a question of fact as much as it is of law since the duty to rescue can be inferred in certain circumstances. See *Minister of Police v Ewels* (fn 43 supra) The relevant passages (in translation) from the interpretation in *Ewels*’ case at p 684 which provide assistance are the following (at p 597E): ‘Just as a duty to rescue can sometimes be a legal duty, so a duty to protect may be a legal duty, and it would depend on all the facts whether such duty is a legal duty or not. Clearly it is impossible to determine in general when such a legal duty would arise.’ [Writer’s italics] The Constitution, it is submitted, imposes that general duty at least upon health care providers, to ‘rescue’ persons in need of emergency medical treatment. See also *Silva’s Fishing Corporation (Pty) Ltd v Mawesa* 1957 (2) SA 256 (A). Strauss. *Doctor, Patient and the Law* p 24 points out that the traditional view that no liability will lie for mere omission came under attack in our law in the middle of this century (the 20\(^{th}\) century). He states that a court may now well hold a doctor liable for harm suffered by an injured or ailing person where the doctor, aware of his condition, unreasonably refused or failed to attend. It is quite possible that even in the absence of the Constitution, the courts would infer on a case by case basis, a duty upon a health care provider to attend to a patient but, it is submitted that the Constitution still goes further in that it actively prohibits a refusal of emergency medical treatment.

\(^{187}\) *Carmichele fn 15 supra*
to take into account the provisions of section 39(2) of the Constitution and it is submitted that Afrox is another case in point. In Afrox, the admission document signed by the respondent during his admission to the hospital contained an exemption clause, providing that the respondent ‘absolved the hospital and/or its employees and/or agents from all liability and indemnified them from any claim instituted by any person (including a dependant of the patient) for damages or loss of whatever nature (including consequential damages or special damages of any nature) flowing directly or indirectly from any injury (including fatal injury) suffered by or damage caused to the patient or any illness (including terminal illness) contracted by the patient whatever the cause/causes are, except only with the exclusion of intentional omission by the hospital, its employees or agents’. The appellant relied on such clause to avoid liability. The clause was extremely wide in its scope, the applicant even apparently foregoing his constitutional right to life and waives a claim based on negligence and even, it would seem, intentional commission since the only exception is intentional omission. The judgment is discussed in detail elsewhere in this thesis. A study of the indemnity clause in Afrox reveals that the constitutional rights that the patient waived were those to life, bodily and psychological integrity and human dignity. As stated previously, it is not only the individual who has an interest in the observation of, and respect for, his constitutional rights but society as a whole. Individuals can find themselves in desperate circumstances, and in the health services context in particular their judgment is likely to be impaired in many instances. Their ability to resist inroads into their fundamental rights is not what it usually is due to physical and mental stress, they may believe that they have no choice but to sign the indemnity clauses if they want to receive treatment. It is submitted that the arguments of the Supreme Court of Appeal in its judgment in this case took none of the bargaining equalities between patient

188 Afrox fn 186 supra. “Ek onthef die hospitaal en/of sy werknemers en/of agente van alle aanspreeklikheid en ek vrywaar hulle hiermee teen enige eis wat ingestel word deur enige persoon (insluitende 'n afhanklike van die pasient) weens skade of verlies van watter aard ookal (insluitende gevolskade of spesiale skade van enige aard) wat direk of indirek spruit uit enige besering (insluitende noodlottige besering) opgedoen deur of skade berokken aan die pasient of enige siekte (insluitende terminale siekte) opgedoen deur die pasient wat ook al die oorsak/oorsake is, net met die uitsluiting van opsetlike verwaai deur die hospitaal, werknemers of agente.”

831
and provider into account in Afrox. It saw a contract for health services as no different to any other contract for goods and services - despite the fact that it has been widely and repeatedly recognised that such contracts are not just like any other. If the values and the rights recognized by the Constitution are a reflection of public policy then it would surely be contrary to public policy to allow a waiver of those rights since such waiver would in effect be an attempt to sanction behaviour that is contrary to public policy. In the delictual context, behaviour that is contrary to public policy is wrongful or unlawful and, as has already been observed in the contractual context, provisions that are contrary to public policy are unlawful and therefore unenforceable. Agreements contrary to statutory provisions or purporting to exclude such provisions from the relationship are unlawful as they are contrary to public policy. It is important to point out in this context that a decision not to exercise a particular constitutional right on the part of the right holder should not be equated with a waiver of that right. It is part of the concept of a right that the holder is free to choose whether or not to exercise it in certain circumstances. Thus in the health care context, a patient who has been the victim of the negligence of a doctor in treating him or her has the power to decide whether or not to claim damages, i.e. to exercise the right to go to court to enforce the right to bodily and psychological integrity. A waiver is a contractual undertaking not to exercise a

189 For the latest expression of this issue see Redefinition of Negligence/Liability A Summary Paper prepared by the Australian Medical Association Queensland 20 August 2002 in which it is stated: "The doctor-patient relationship cannot be seen as a normal commercial interaction even though a fee is paid. The service provided by a doctor has a readily visible and assessable component and a less tangible but nevertheless essential second component. The obvious first component consists of the basic facts of the patient’s disorder conveyed in the consultation and the treatment parameters prescribed including measurable factors such as a discussion of potential adverse effects and compilations of the treatment recommended. Similarly a procedure or surgical operation falls into this first component and likewise is readily assessable and open to outside scrutiny. However, there is a second less measurable component to the doctor patient interaction that is just as important to the therapeutic outcome for the patient. In a consultation this consists of the ability of the medical practitioner to achieve a beneficial outcome for the patient and always involves several less measurable components such as

• persuading the patient to follow a prescribed course of treatment;
• persuading the patient to desist from other self-prescribed remedies which interfere with recovery;
• altering behaviour patterns which, although not immediately obvious to the present specific complaint will nevertheless significantly benefit that person in the longer term (losing weight, lifestyle changes);
• with medical procedures or surgical operations the preparation and post-operative management is often as important to the eventual outcome as the technical exactitude of the surgery itself."

190 See for instance ABSA Bank I/A Bankfin v Louw En Andere 1997 (3) SA 1085 (C)in which it was held that an agreement whereby a party waives beforehand and in its entirety the protection of the Prescription Act 68 of 1969 is contrary to public policy and thus invalid. In Saafin (Pty) Ltd v Brukes 1989 (1) SA 1 (A) the court said that "Agreements which are clearly inimical to the interests of the community, whether they are contrary to law or morality, or run counter to social or economic expediency, will accordingly, on the grounds of public policy, not be enforced."[writer's italics]
right in the event that it is contravened by someone else. In this sense it is almost a license to someone to contravene the right since in the event that he does so, no action will be taken against him. In the Republic, law or conduct inconsistent with it is invalid and the obligations imposed by it must be fulfilled. If ordinary legislation cannot lawfully contradict or restrict the rights in the Constitution, even indirectly, then it is difficult to see why contractual provisions, at least as between the contracting parties, should be able to achieve this. A waiver of a constitutional right in a

191 The cases of Community Development Board v Revision Court, Durban Central, And Another 1971 (1) SA 557 (N); Frames (Cape Town) (Pty) Ltd v 1995 (8) BCLR 981 (C); Maharam v Chairman, Liquor Board 1997 (1) SA 273 (N); ABBM Printing & Publishing (Pty) Ltd v Transnet Ltd 1998 (2) SA 109 (W) are authority for the argument that waivers of constitutional rights are themselves unconstitutional and thus contrary to public policy.

192 Transnet 1998 (4) SA 989 (W) at p 997

193 In terms of section 8 of the Constitution the Bill of Rights applies to all law and binds the legislature, the executive, the judiciary and all organs of state. It also binds a natural or juristic person if and to the extent that it is applicable taking into account the nature of the right and the nature of any duty imposed by the right. In terms of section 36(1) of the Constitution the right in the Bill of Rights may be limited only in terms of law of general application to the extent that the limitation is reasonable and justifiable in an open and democratic society based on human dignity, equality and freedom. Except as provided in subsection (1) or any other constitutional provision no law may limit any right entrenched in the Bill of Rights.

194 See however, Hopkins K Constitutional Rights and Waiver (2001) 16 SAPR 122 who comments that the view of Olivier JA that the correct approach to the question of waiver of fundamental rights is to adhere strictly to the provisions of section 36(1) of the Constitution is an 'oversimplification of what is in reality an extremely complicated issue'. Hopkins says that Olivier JA has seemingly attached equal importance to all of the fundamental rights. He says that he finds this reasoning untenable because it implied that all rights in the Bill of rights are destined to receive the same treatment in issues of waiver. He argues that a more careful analysis reveals that a hierarchy of rights is prevalent within the Bill of Rights and that for this reason each right needs to be assessed on its own before assigning a weight of significance to it. Hopkins says that it makes no sense to attach the same weight of significance to all rights. He notes that Olivier JA states that a waiver is a limitation of a right and that, for this reason, strict adherence to the provisions of section 36(1) is warranted. Surely, says Hopkins, this cannot be correct because a waiver cannot be a limitation in the section 36 sense of the term because it is not a law of general application. A waiver is simply the operation of the law of contract that agreements must be upheld. Having said this it is true that enforcement of a waiver might constitute an infringement of a constitutional right in which case the courts ought not to be entitled to uphold them unless there is good reason to do so. With respect to Hopkins he is oversimplifying both the context in which constitutional rights operate and the law of contract since he does not pursue the logic further to state the essential principle of the law of contract that where a provision is contrary to public policy or the moral values of the community, it will not be enforced. Since the Constitution is the embodiment of these values it follows that a contractual provision that is contrary to the Constitution cannot be enforced. Hopkins also fails to appreciate that one cannot sit in the abstract and assign a hierarchy to the rights in the Bill of Rights since they only have real meaning in the various contexts in which they are played out in society. Their relative weights and significance, it is submitted, are dependent upon the context in which they are exercised and any attempt to state that one right has more weight than another ignores the polycentric structure of the Bill of Rights itself. Hopkins observes that Currie in the 1999 Annual Survey of South African Law p 54-55, commenting on the case of Garden Cities Incorporated Association Not For Gain v Northpine Islamic Society 1999 (2) SA 268 (C) suggests that freedom rights such as the right to freedom of religion can be waived by a contractual undertaking. He explains this by saying: "This is because freedom rights can be positively or negatively exercised. Just as..."
one can exercise the right to freedom of expression by choosing to remain silent, one is free to practise one's religion and equally free to choose not to. A waiver therefore amounts as it were to an undertaking to exercise the right negatively. The undertaking in clause 20(6) of the contract of sale not to make calls to prayer would be similar to a contractual undertaking not to disclose certain information, or not to work in one's chosen profession, or to perform nude on stage or to attend religious instruction in a private school. These are respectively waivers of rights to freedom of expression, to occupational freedom, to privacy and to freedom of religion. "The issue of whether or not such rights are capable of being waived. He says that whenever one speaks of a waiver of fundamental rights, one is in effect referring to two concepts - 'waiver' and 'fundamental rights capable of being waived'. This complex issue is best understood, says Hopkins, in the context of an appreciation for both of these concepts. He goes on to define 'waiver' as 'in essence a unilateral decision made on the basis of fundamental rights, one is in effect referring to a contract not to avail oneself of a right or power or benefit or opportunity'. This definition, he says, seems to be compatible with the Supreme Court of Appeal's consistent tendency to equate waiver with election - in other words when one waives then one is in effect electing not to enforce a remedy, for example, or not to claim a right. But a distinction needs to be maintained between two 'categories' of waiver argues Hopkins. He says that the first is a waiver of contractual rights and the second is a waiver of rights conferred by law. Hopkins notes that it may at first seem that waiver of constitutional rights is concerned with the second category of waiver only. However, he says, this is not necessarily the case. The second category applies to situations where the right is not a contractual right. It cannot be a contractual right if it is able to rescind a contract for misrepresentation not to act or elect not to cancel a contract for breach. In these examples the right being waived is one conferred by law and the waiver is by choice - the consent of the other party is not required in order to waive these rights. But, says Hopkins, where the waiver is of a constitutional right in terms of a contract then there is no longer a choice. There is no possibility of election to resort to a right that is ordinarily conferred by law. There is an agreement with the other contracting party that the constitutional right will not be enforced. For this reason, says Hopkins, it seems that one is concerned with more than simply the second category of waiver identified earlier. However, he says, one is not strictly speaking dealing only with the first category either because the first category involves the waiver of a right conferred by a term in the contract. He gives as an example the landlord who despite the fact that the lease requires payment of the rent on the first day of every month, waives the right to be promptly paid by accepting late payment. He says that it seems as though the waiving of a constitutional right does not fall squarely into this category unless the provisions of the bill of rights are implied into all contracts as terms. The problem with this, notes Hopkins, is that terms can only be implied into contracts where they do not conflict with express terms that already exist. He says that this is problematic because all contracts that seek to waive the constitutional rights of one party do so with an express term. It is the inclusion of this express term that effectively disqualifies one from later trying to include, by implication, the very term expressly excluded. Thus it is difficult to slot constitutional waiver into the first category identified above.

It is submitted that this reasoning of Hopkins is guilty of a number of errors in logic. The first is that he conflates the concept of contractual waiver of a contractual or other right with the concept of waiver of a constitutional or other right. Thus he says waiver of constitutional rights is not concerned with the second category of waiver only - i.e. the waiver of rights conferred by law, because even in the law of contract it is possible to waive the right to rescind a contract for misrepresentation, a right conferred not by the contract, but by law. This is a non sequitur. He is conflating the origin of the right with the 'origin' or basis of the waiver. It is submitted that there are four possible elements in this logical system. These are (a) a non-contractual waiver of a right conferred by law - whether by the common law, a statute or the Constitution (b) a non-contractual waiver of a right conferred by contract eg a unilateral decision, despite provision for breach in the contract itself, not to act upon that contractual provision and invoke the remedies for breach (c) a contractual waiver of a right conferred by contract for example an undertaking in the contract that if a certain event transpires, the party will waive a right conferred by that same contract (d) a contractual waiver of a right conferred by law i.e. the common law, a statute or the Constitution. It is category (d) with which one is most concerned in the question of contractual waivers of constitutional rights since contractual waivers of constitutional rights are binding. The person who waives the right is bound by that waiver, depending on the nature and terms of the contract either indefinitely or for a specific and identifiable period of time eg the term of the contract or a period identified by a term within the contract. It is submitted that even in terms of the two categories imposed by Hopkins upon himself, the waiver of a constitutional right falls clearly into the second category, whether it is contractual or non-contractual. The first and second categories are defined with reference to the source of the right and not with reference to the source or basis of the waiver. A constitutional right, logically speaking, should not be regarded as a contractual right because it is not a right conferred by the contract. Any attempt to include a constitutional right as a contractual right would be largely superfluous. At most, it may give the right holder additional certainty about the platform from which to launch a claim for contractual (as opposed to delictual) damages for violation of a constitutional right. However it may be that, depending upon the nature of the contract in question, a particular constitutional right could be regarded as an implied term of the contract in any event. The second is that he is crossing the first category of a waiver of a constitutional right, with the thread of an act of waiver of a right external to a contract. Then he says in speaking of a waiver only with the first category - i.e. waiver of contractual rights because not every constitutional right is an implied term of the contract. There is in any event a tautology, which Hopkins himself points out, since potential implied terms are ousted by express terms to the contrary. It is submitted that this latter argument is not useful in that it simply
begs the question and ignores the fact that the Constitution is the substratum or grundnorm of all law in South Africa, including the law that upholds contractual arrangements. A contractual term could only out a constitutional right if the law recognises that a contractual arrangement can out or exclude a constitutional right from the relationship. If the law did so it would be conceding that contracts can be structured such that they are not subject to the Constitution which is a legal impossibility since all law (and a contract constitutes law between its parties) is subject to the Constitution and to the extent that it is inconsistent with it – invalid. Hopkins then draws another distinction which, it is submitted, is on firmer ground. There is a distinction between the waiver of a ‘fundamental’ right and a mere decision not to exercise it. Waivers are undertaken given to another person not to exercise a right at a future time. He notes further that if waivers are undertaken then waivers are themselves contracts and that it thus stands to reason that the enforceability of a waiver must be determined in the same way as it would be for any other type of contract. Considerations of public policy, says Hopkins, play a crucial role. He states that there can be no general rule on the validity of a contractual waiver of constitutional rights per se since each must be scrutinised to determine whether or not the waiver is contrary to public policy. He goes on to point out that public policy is not informed by the Constitution generally and the Bill of Rights in particular. This means, says Hopkins that the resourceful body of public policy doctrine will play a crucial role in determining the validity and enforceability of contracts. He observes that prior to the Constitution, the sanctity of contract was regarded as the pillar of public policy. Hopkins then goes on to state that it nevertheless remains to be disputed that the public policy will not extend to agreements that expressly seek to waive the fundamental rights of one of the parties thereto. Hopkins states that this is an interesting question because of the apparent tension between the traditional pre-constitutional idea that sanctity of contract is public policy epitomised on the one hand and the new post-constitutional idea that the Bill of Rights represents a reliable statement of what public policy is on the other.

The writer submits that there is no question as to which is the correct view since the Constitution ushered in a new legal order for South Africa and to the extent that the common law, within which the notion of sanctity of contract is rooted, is in conflict or inconsistent with the Constitution, or constitutional values, it must be modified or adapted to the extent necessary to remedy that conflict or inconsistency. To suggest otherwise is to undermine the rule of law and the concept of the Constitution as the supreme law. The writer further submits that one must decide carefully what is meant by waiver and whether it is a contract by implication incapable of being waived and second, under what circumstances can the other (lesser) rights provided for in the Bill of Rights, not be identified as inalienable, be waived by the right-holder? As an observation in passing, it is submitted that the question of the waiver of constitutional rights is much more complicated an issue than even Hopkins suggests. It impacts upon the fact that the Constitution contains a list of non-derogable rights in section 37 dealing with states of emergency and that the Constitution is at pains to stipulate that no Act of Parliament that authorises the declaration of a state of emergency and no legislation enacted or other action taken in consequence of a declaration may permit or authorise (a) indemnifying the state or any person in respect of any unlawful act, (b) any derogation from section 37 of the Constitution or (c) any derogation from a section mentioned in column 1 of the Table of Non-Derogable Rights to the extent indicated opposite that section in column 3 of the Table. It is worth noting that section 37(4) of the Constitution stipulates that any legislation enacted in consequence of a declaration of a state of emergency may derogate from the Bill of Rights to the extent that – (a) the derogation is strictly required to the extent that it is consistent with the Republic’s obligations under international law applicable to states of emergency. The question of waiver of constitutional rights also impacts upon the interests of South African society in the observation and fulfilment of constitutional rights, upon questions of balancing of rights faced by the constitutional and other courts when dealing with disputes involving constitutional rights, upon questions of equity in contracting and imbalances of power between contracting parties and upon the fact that the Constitution represents a fundamental and irreversible break with the past, which included a system of common law used to enforce and uphold inequality between persons at many different levels and in many different ways and which often did not recognise the rights now enshrined in the Bill of Rights at the fundamental levels of human dignity and equality. Hopkins then goes on to categorise certain rights as inalienable such as life and human dignity and that any waiver which either directly or indirectly impairs the right-holder’s right to life and/or dignity must be invalid and consequently unenforceable. It is submitted that it is unfortunate that these kinds of discussions take place only in the abstract and only in the light of extremes. They are thus fruitlessly simplistic. It is submitted that more often than not, constitutional rights are not wholly alienated or ‘waived’ but more usually, limited to varying degrees by circumstances and by the consent of the right-holder. It is further submitted that such limitation and consent thereto does not constitute waiver at all, whether contractual or otherwise, but is more often a balancing exercise in which an individual weighs up the relative importance to him or herself of the various rights in play in a particular situation. The tragic case of the surgical separation in July 2003 of 29 year old Iranian conjoined twins Laden and Laleh Bijani is one of the more dramatic examples of the polarisation of two ‘inalienable’ rights: the right to life and the right to human dignity requiring a choice between the two. The women said that they wanted to be able to see each other face to face;
and to pursue independent careers, one as a lawyer, the other as a journalist. They had different interests, different hobbies, different personalities. Due to the fact that they were conjoined at the head one of them was always forced to choose between her interests, career aspirations and hobbies and those of the other. For example although Ladan wanted to be a lawyer, Laleh wanted to be a journalist. They could not go to different classes at university and so Laleh chose to study law with her sister. They decided to undergo dangerous surgery, quite literally putting their lives at risk, for the sake of their human dignity and freedom. If they had signed an indemnity clause in the contract in terms of which the surgery was undertaken, acknowledging the risks and the chances of their survival of the operation were poor but saying that they were adamant that the operation should proceed would this have been unconstitutional in the South African context? A different question is whether in undergoing the surgery they waived their right to life. It is submitted that there was no waiver of any rights. There was only an exercise of choice – a balancing of rights and a decision to prefer a particular right over the other. According to news reports this is pretty much what happened. According to the reports the critical component of the surgery was how to deal with the thick vein that drained blood from their brain to their hearts. Several teams of experts had previously declined to operate on the Bijani sisters because they shared this important vein, which meant that the chances of both sisters surviving the separation surgery was “almost nil,” according to Madjid Samii, president of the International Neuroscience Institute in Hanover, Germany. Samii had evaluated possibilities for separating the Bijani sisters in as early as 1988, but had decided against the procedure because it was “virtually impossible.” In 1997, another team of doctors in Germany also decided against surgery because they “thought one of the twins would die and the other would be at risk” since there was only one vein. The team that actually operated on Laleh and Ladan attempted to solve the vein problem by using the vein grafted from Ladan’s inner thigh in her brain, and “reroute” the shared vein inside Laleh’s head. But soon, Ladan’s grafted vein congested, signalling failure for this plan. Associated Press reports...surgeons Monday night considered whether to call off the rest of the operation and leave the twins joined or “continue with final stage of the surgery, which we knew would be very, very risky,” [Dr.] Loo said. “The team wanted to know once again what were the wishes of Ladan and Laleh,” Loo said. “We were told that Ladan and Laleh’s wishes were to be separated under all circumstances.”

http://www.inphx.org/news/000031.html There was some debate concerning the ethics of carrying out the operation. Jonathan Glover, professor of medical law and ethics at Kings College London was quoted as saying that every operation carries risks and unless the odds against success are overwhelming it is right to present patients with the choice. He said: “The risks were high in this case. I would want to know a lot about what they were told, whether they understood it and what their quality of life was like. Were they both in agreement or was one dominant and hustling the other into the operation?... Normally it would not be desirable to operate where the risks were so high. But these were exceptional circumstances. If they both wanted it over a long period of time and were unwavering then I feel it was their life and they had the right to make that decision.” Michael Wilks, chairman of the British Medical Association’s ethics committee said, “You cannot take the view that doctors should not do things because they are risky. Otherwise there would be no heart transplants. On the other hand, it is fair for doctors to say they won’t do something because they do not believe it is in the patient’s best interests. It was a pretty stark choice these sisters faced.” (Laurance J, “Questions raised about risks of operation to separate twins” (http://www.nzherald.co.nz) See also the report in Guardian Unlimited entitled ‘Doctors Reject Claims they Acted Unethically’ (http://www.guardian.co.uk/international/story/) by Aglionby J in which Dr Benjamin Carson, a surgeon from Johns Hopkins University is reported to have said he was struck by the determination of the twins to lead separate lives come what may. He apparently said that “even recognising that the odds were not good, I think it was a worthy humanitarian effort.” He said that it became clear in his early deliberations about the situation that they were going to seek separation and continue to do so until it occurred. He said he felt compelled to become involved because he wanted to make sure they had the best chance. Dr Carson is reported to have raised the chances of success at only 50%.

In his article on waiver of constitutional rights, Hopkins does not take into account decisions taken every day by patients dying of terminal illnesses to take painkilling medication in the certain knowledge that it will shorten their lives. This does not constitute a waiver or the exercise of an inescapable choice between rights. Hopkins states that it is his submission that all the rights in the Bill or Rights are/out to be inalienable and incapable of waiver but, he says, taken in context any right may become inalienable if, by losing the right the right-holder simultaneously loses the right to have his or her dignity respected and protected. See further his discussion of the "essential substance level" and the process of "leveling". He argues in closing that the validity of waivers is determined by the ordinary rules of contract law. He states that to summarise the position of the washer of a constitutional right (other than an inalienable right) is to reiterate his argument that contracts are enforceable unless contrary to public policy. Contracts whose enforcement would entail the violation of a right in the Bill of Rights says Hopkins, are unenforceable because they are contrary to public policy. Bewilderingly, then he goes on to contradict himself by saying immediately thereafter that enforcement of such a waiver would mean in effect the limitation of a contract’s constitutional right – this can only be done if the requirements for the valid limitation of a constitutional right in the limitations analysis are met. This totally ignores the fact that the limitations analysis referred to in section 36 of the Constitution is conducted only with regard to law of general application since it is only in terms of law of general application that the rights in the Bill of Rights may be limited. He argues that only "alienable rights" are capable of being justifiably limited. It is submitted that the categorisation of the rights in the Bill of Rights is not only unconstitutional but inadvisable due to the fact that they are complex, interdependent and interrelated concepts that do not lend themselves, like the Bijani twins, to separation. Indeed, without straining the metaphor unduly, one could safely say that attempts to regard the individual rights in the Bill of Rights as separate and
contract essentially purports to authorise the person in favour of whom the
waiver is made to act in a manner that is contrary to constitutional values and
principles. Can such an action (the waiver on the part of the one party to the
contract) ever have the effect of justifying what is basically an unconstitutional
act on the part of the other party to the contract? Waiver of rights conferred by a
statute or by a court order, as opposed to those conferred by a contract, has been
recognised as legally possible. The problem with waiver is that as soon as a
waiver of a right has been communicated to the opposite party it is irrevocable;
the right has perished. How can a constitutional right be allowed to perish?
How can it be revived once it has perished based as it is on a statute which is the
foundation for all other law in South Africa and in which it is recognised as
fundamental?

7.7 Res Ipsa Loquitur and Strict Product Liability

The res ipsa loquitur rule can be of considerable value in the context of the law
relating to the delivery of health services in the sense that it can contribute to the
evening out to some degree of the imbalance in the provider patient relationship.
The effect of the rule is that the mere fact of a particular occurrence warrants an
inference of negligence where the occurrence is due to a thing or means within
the exclusive control of the defendant. It is described in Hoffmann and
Zeffertt’s The South African Law of Evidence as follows: “If an accident
happens in a manner which is unexplained but which does not ordinarily occur

---

195 See Wright v Wright 1978 (3) SA 47 (E) in which the court stated: “Where there is no prohibition against
waiver the general rule is that any person can enter into a binding contract to waive benefits conferred upon him
by law for his sole benefit: McDonald v Enslin 1960 (2) SA 314 (O) at p 17. This applies also to a benefit or
right conferred by statute: Tompkins v Coet 1978 (1) SA 88 (W) at p 90H. I see no difference in principle
between waiver of a right conferred by statute and waiver of one which is derived from a Court order. To my
mind both waivers are competent and valid. The only complication in the case where the right is conferred by a
Court order is that, as far as the party who must pay maintenance is concerned, the order must
be obeyed until it
is discharged: Hadkinson v Hadkinson (1953) 2 All ER 567. However, that is a matter between the Court and
the party owing the obligation and it is for the latter to liberate himself from the terms of the order by obtaining
its discharge.”

196 Mutual Life Insurance Co of New York v Ingle 1910 TPD 540 at p 550; Glaser v Milward 1950 (4) SA p 587
(W); Moult v Minister of Agriculture and Forestry, Transkei 1992 (1) SA 688 (Tk)

197 Hoffinan and Zeffertt 4th ed at p 551
unless there has been negligence, the court is entitled to infer that it was caused by negligence.” Unfortunately, although South African courts have been applying the rule for more than a century to various other delictual claims, they have not applied it to claims for medical negligence on the basis of the majority judgment in Van Wyk v Lewis in which it was held that the doctrine was not applicable to such claims. It seems, that they have declined to apply the doctrine to medical negligence cases only because in the medical context, the requirement that the occurrence must fall within the scope of the ordinary knowledge and experience of the reasonable man cannot be met. Van den Heever observes that until the 1924 judgment is successfully challenged and overturned, lower courts are bound to follow its approach because of the principle of stare decisis followed by the South African legal system.

198 Van Wyk v Lewis 1924 AD 438
199 Van den Heever P ‘Should res ipsa loquitur “speak for itself” in medical accidents?’ De Rebus November 2002 http://www.derebus.org.za/archives/2002/Nov/articles/medical.htm The article is an extract from van den Heever’s unpublished doctoral thesis: “The Application of the Doctrine of Res Ipsa Loquitur to Medical Negligence Actions: A Comparative Survey” 200 It is submitted that the matter is not quite as simple as this. In Shabalala v Attorney-General, Transvaal, And Another Gumedze And Others v Attorney-General, Transvaal 1995 (1) SA 608 (T) Cloete J noted that: “All counsel appearing before me submitted that where a Court is called upon to interpret the Constitution, that Court can depart from other decisions on the same point in the same Division if it disagrees with such other decisions. I cannot agree with this submission. It is settled law that a Court can only depart from the previous decisions of a Court of equivalent status in the same area of jurisdiction where it is satisfied that the previous decision is ‘clearly wrong’: S v Tarajka Estates (Edms) Bpk en Andere 1993 (4) SA 467 (T) at 470A; and cf R v Jansen 1937 CPD 294 at 297 and Duminy v Prinsloo 1916 CPD 83 at 84 and 15.” Cloete J held that: “I see no reason to depart from this salutary principle simply because the point at issue involves an interpretation of the Constitution. I appreciate that s 4(1) of the Constitution provides that ‘This Constitution shall be the supreme law of the Republic . . .’ and that s 4(2) provides that ‘This Constitution shall bind all . . . judicial organs of State at all levels of government’; but those provisions do not in my view mean that the established principles of stare decisis no longer apply. Such an approach would justify a single Judge departing from a decision of a Full Bench in the same Division because he considered the interpretation given to the Constitution by the Full Bench to be in conflict with the Constitution, with resultant lack of uniformity and certainty until the Constitutional Court, whose decisions in terms of s 98(4) bind, inter alia, ‘all judicial organs of State’, had pronounced upon the question.”

This said, however, he went on to state that: “On the other hand, the interpretation given to s 241(8) in this Division cannot be said to have established a long-standing practice. The general difficulty which I have, with respect, with the decisions in the Transvaal which have hitherto interpreted s 241(8) is that the learned Judges who gave those decisions appear to have applied ordinary principles of statutory interpretation and not to have given sufficient weight to the ‘spirit and tenor of the Constitution’ (Achenu’s case supra loc cit). I also believe that I am justified in departing from those decisions for the following additional reasons.”

In Ex parte Minister of Safety and Security and Others: In re S v Walters and Another 2002 (4) SA 613 (CC) the Constitutional Court held that neither the fact that under the interim Constitution of the Republic of South Africa Act 200 of 1993 the Supreme Court of Appeal had no constitutional jurisdiction nor that under the (final) Constitution of the Republic of South Africa Act 108 of 1996 it did not enjoy ultimate jurisdiction in constitutional matters warranted a finding that its decisions on constitutional matters were not binding on High Courts. It stated that it did not matter that the Constitution enjoined all courts to interpret legislation and to develop the common law in accordance with the spirit, purport and objects of the Bill of Rights. In doing so, courts were bound to accept the authority and the binding force of applicable decisions of higher tribunals. Kriegler J held that High Courts were obliged to follow legal interpretations of the Supreme Court of Appeal, whether they related to constitutional issues or to other issues, and remained so obliged unless and until the Supreme Court of Appeal itself decided otherwise or the Constitutional Court did so in respect of a
den Heever submits that there are reasonable grounds for advancing a persuasive argument that the judgment in *Van Wyk v Lewis* should be overruled. He states that although support for applying the doctrine to medical negligence actions can also be found with reference to constitutional and other considerations, he attacks the judgment in *Van Wyk* on the basis of the following principles.

Van den Heever points out that from the record of the court proceedings, the evidence of Dr Lewis was that he had never been made aware that a swab had been retained and he sought to exculpate himself further by *inter alia* testifying that it was a difficult operation, that time was of the essence and it was in the constitutional issue. However, the question of the binding effect of decisions of higher tribunals given before the constitutional era was a different issue, was not under consideration in the present case. In *McNally v M & G Media (Pty) Ltd And Others* 1997 (4) SA 267 (W) Du Plessis J observed that there is nothing in s 35(3) to suggest that the High Court is not, as it has always been, bound by precedent. On the contrary, both 'application' and 'development' imply that what must be applied and developed must be left intact at the outset. He noted that the decision in *Rivell-Carnac v Wiggins* 1997 (3) SA 80 (C) held that 'the Constitution could never have envisaged such a fundamental rejection of precedent so as to empower an individual Judge to overturn decades of precedent developed by the Appellate Division' but that 'the Constitution mandates each Court to examine the common-law rules afresh and if necessary to ensure that the content thereof accords with the principles thereof', an examination which has to be done 'cautiously after a careful examination of the existing principles which underpin the common-law rules and a comparison thereof with the key principles of Constitution'. With these dicta there can be agreement, but with the addition that authorities ordinarily binding may only be deviated from if it can truly be said that they no longer constitute precedent. In order to determine whether a particular judgment is a precedent, it is necessary carefully to examine the full ratio of that judgment.

In *Bookworb (Pty) Ltd v Greater Johannesburg Transitional Metropolitan Council and Another* 1999 (4) SA 799 (W) Cloete J made the point that while the Constitution required that its provisions and values be given primacy over the rules of the common law, even when those rules had been invested with the highest stature of pre-constitutional judicial authority, where a superior Court had decided what the effect of the Constitution on established law was, whether substantive or procedural, a lower court had to follow that decision, notwithstanding the supremacy of the Constitution. In *Afrox Healthcare Bpk v Strydom* fn 186 supra, the Supreme Court of Appeal held that as far as pre-constitutional decisions of the Supreme Court of Appeal regarding the common law were concerned, a distinction had to be drawn between three situations which could develop in the constitutional context. First, the situation where the High Court was convinced that the relevant rule of the common law was in conflict with a constitutional provision. In that instance the Court was obliged to depart from the common law as the Constitution was the supreme law. Secondly, the situation where the pre-constitutional decision of the Supreme Court of Appeal was based on considerations such as boni mores or public interest. If the High Court was of the opinion that such decision, taking constitutional values into account, no longer reflected the boni mores or public interest, the High Court was obliged to depart from the decision. Such a departure would not be in conflict with the principles of *stare decisis* as it had to be accepted that boni mores and considerations of public policy were not static concepts. Thirdly, the situation where a rule of the common law determined by the Supreme Court of Appeal in a pre-constitutional decision was not in direct conflict with any specific provision of the Constitution; the decision was also not reliant on any changing considerations such as boni mores; but the High Court was nevertheless convinced that the relevant common-law rule, upon the application of s 39(2) of the Constitution, had to be changed to promote the spirit, purport and object of the Constitution. In this situation, the principles of *stare decisis* still applied and the High Court was not empowered by the provisions of s 39(2) of the Constitution to depart from the decisions of the Supreme Court of Appeal, whether such decisions were pre- or post-constitutional.

2 Van den Heever fn 199 supra
3 *Van Wyk* fn 198 supra
patient’s interest to be stitched up and removed from the operating table as soon as possible. He did not conduct his defence on the basis that he had to terminate the operation before finding the missing swab because of the plaintiff’s critical condition. He was not even aware that there was a swab missing and if there was he averred that it was the responsibility of the theatre sister employed by the hospital and for whom he was not vicariously liable. Van den Heever argues that a balanced, objective consideration and evaluation of the evidence should have led the court to conclude that the swab was retained post operatively by the patient established a prima facie case of negligence (correctly acknowledged by minority judgment of Kotze JA). He observes that the defendant was able to escape liability by tendering acceptable exculpatory evidence and that the facts of the case provide a valuable example of circumstances where the plaintiff should have been permitted to rely on the doctrine of proving only that the swab was post-operatively retained. The prima facie inference of negligence based on the retention of the swab would merely have required Dr Lewis to provide an exculpatory explanation of why it had been retained and that it had not been his responsibility to count the swabs and make sure that none were missing. Thus while the outcome of the case may have been no different for Dr Lewis, the court could have avoided setting an undesirable and unfortunate precedent concerning res ipsa loquitur that unduly sways the balance of power even more in favour of the provider in the provider-patient relationship. He notes that the finding that res ipsa loquitur could not find application in Van Wyk on the fact that the court would – in view of the notion that the medical layman knows very little, if anything about complex abdominal surgery – have had also to consider the surrounding circumstances provided by expert medical opinion and submits that the court made two fundamental errors in this regard. The first is that the retention of the swab clearly bespoke negligence, even from the medical layman’s point of view. It cannot be argued with any confidence that the court would have had to consider expert medical evidence to be persuaded that the swab should not have been left behind in the patient’s body. The court considered the surrounding circumstances only at that stage when the defendant
provided his exculpatory evidence. The majority of the court compounded this material misdirection by elevating a speculative defence to accentuate the complexities of abdominal surgery which had the effect of placing the occurrence outside the realm of the ordinary experience and common knowledge of the medical layman. Secondly the court misconstrued the expert medical evidence in disregarding the evidence that a swab cannot be left in a patient even if it is left behind in a life-threatening intra-operative situation. The evidence was that as soon as the patient was up to a further operation the swab would in any event have to be removed. It is submitted that the judgment in Van Wyk v Lewis was possibly partially a consequence of the mystique that surrounded surgeons and other members of the medical profession at that time and that the court incorrectly focused on the complexities of abdominal surgery rather than on the much more simple fact that a swab which could logically not have entered the patient’s body in any other way, except though surgery, coupled with a history of recent surgery, had evidently been retained in the patient’s body consequent upon such surgery. It does not take a medically qualified person to draw the obvious conclusions. Van den Heever submits that the approach of the court conflated a question of law (whether an inference of negligence can be drawn from the occurrence itself) and a question of fact (whether the facts, including the evidence of the defendant, or the absence of such evidence, support the inference of negligence.) He notes that it cannot seriously be contended that the leaving behind of a surgical instrument in the

204 In more modern times medical practitioners are seen rather more as ordinary human beings capable of ordinary human error and rather less as the demigods they were perceived to be in times past. See for instance ‘The Practice of Autonomy: Patients, doctors, and medical decisions’ N Engl J Med Vol 340: 821-822 No 10 March 1999 in which it is stated: “The process of making medical decisions in the United States today is, in theory, a neat and well-defined affair. Authority and responsibility are shared, as mentally and emotionally capable adults choose voluntarily and intelligently from among various options whose relative risks and benefits their personal physicians have fully explained to them. Gone are the days of medical paternalism, when arrogant health care professionals misused their power to force particular treatments on dependent patients who blindly trusted them.” See also Patterson J and Conroy B “New Breed of Informed Patients Put Pressure on Healthcare providers” Cap Gemini Ernst & Young http://www.us.capg.com/news/current_news.asp in which it is noted that research by Cape Gemini Ernst & Young has found that informed patients are increasing pressure on physicians. Almost one third of doctors surveyed had been asked by patients to prescribe drugs about which they themselves had insufficient knowledge. Boudreau D “Patient Power” The Novartis Journal notes that there is a new breed of healthcare consumers who are no longer content to rely solely on their doctor’s word. Van den Heever P, ‘Res Ipsa Loquitur and Medical Accidents: Quo Vadis?’ De Rebus June 1998 makes the point that recognition of the application of res ipsa loquitur in respect of medical accidents would promote equity between parties by accentuating patient interest instead of medical paternalism and serve to combat the so-called conspiracy of silence among doctors. http://www.derebus.org.za/archives/1998/jun/articles/accident.htm
body of a patient after the completion of an operation does not create a *prima facie* inference of negligence.

Van den Heever argues that in terms of section 9 of the Constitution everyone is equal before the law and has the right to equal protection and benefit of the law. In this regard, he says it could be argued that the victim of a medical accident is at a procedural disadvantage because of the fact that patients are usually anaesthetised or under the influence of an anaesthetic agent when the accident occurs as a result of which they are completely in the dark as to what actually happened. He says that to permit the plaintiff to rely on *res ipsa loquitur* in these circumstances would level the playing fields between the plaintiff and the defendant to a certain extent by promoting procedural equality. He points out that section 34 of the Constitution also recognises the right to fairness in civil litigation which provides further constitutional motivation for the application of the doctrine to medical negligence actions\(^{203}\).

Van den Heever states that the approach of South African courts to the doctrine of *res ipsa loquitur* with regard to medical negligence actions is out of touch with modern trends and that the more patient-oriented approach in *Castell v De Greef*\(^{206}\) is in line with developments in other common law countries with regard to health care law in general and creates an environment where further traditional and outdated approaches such the approach adopted in *Van Wyk v Lewis*\(^{207}\) can be challenged successfully.

In the spirit of optimism it is thus appropriate to examine in further detail the manner in which the doctrine has been applied in other contexts by South African courts and to explore the central principles. In *Stacey v Kent*\(^{208}\) the court

---

203 He refers to Carstens P 'Die toepassing van *res ipsa loquitur* in gevalle van mediese nalatigheid' 1999 *De Jure* 19 in this regard.
206 *Castell* 1994 (4) SA 408 (C). Discussed in chapter nine dealing with the private sector.

208 *Stacey* 1995 (3) SA 344 (E) at p 352.
stated the principle as follows: the rule gives rise to an inference, not a presumption, of negligence. The court is not compelled to draw the inference. At the end of the case the enquiry is where, on all the evidence, the balance of probabilities lies. If it is substantially in favour of the party bearing the onus on the pleadings, he succeeds; if not, he fails. Once the plaintiff proves the occurrence giving rise to the inference of negligence on the part of the defendant, the latter must adduce evidence to the contrary; he must tell the remainder of the story, or take the risk of judgment being given against him. How far the defendant’s evidence need go to displace the inference of negligence arising from proof of the occurrence depends upon the facts of the particular case. Mere theories or hypothetical suggestions will not avail the defendant; his explanation must have some substantial foundation in fact and the evidence produced must be sufficient to destroy the probability of negligence inferred to be present prior to the testimony adduced by him. There is, however, no onus on the defendant to establish the correctness of his explanation on a balance of probabilities. The enquiry at the conclusion of the case remains whether the plaintiff has, on a balance of probabilities, discharged the onus of establishing that the collision was caused by negligence attributable to the defendant. In that enquiry the explanation tendered by the defendant will be tested by considerations such as probability and credibility.

In *Macleod v Rens* the court expressed some reservations about the rule\(^2\) and in *Madyosi and Another v SA Eagle Insurance Co Ltd* \(^1\) the Appellate Division

---

\(^2\) *Macleod* 1997 (3) SA 1039 (E) at p 1048 where it stated: As a particular form of inferential reasoning, *res ipso loquitur* requires careful handling. It is not a doctrine, as it is sometimes referred to. It propounds no principle and is therefore strictly speaking not even a maxim. What it does do is pithily state a method of reasoning for the particular circumstance where the only available evidence is that of the accident. It boils down to the notion that in a proper case it can be self-evident that the accident was caused by the negligence of the person in control of the object involved in the accident. As such it is not a magic formula. It does not permit the Court to side-step or gloss over a deficiency in the plaintiff’s evidence; it is no short cut to a finding of negligence: these are real dangers in the application of the expression. It seems to tempt Courts into speculation. Expressions such as ‘in ordinary human experience’, ‘common sense dictates’, and ‘obviously’, which are regularly employed in reasoning along the lines of the maxim, sometimes only serve to disguise conjecture. Moreover, there is a risk of false syllogism inherent in reasoning that, as the accident would ordinarily not have occurred without negligence on the part of the driver of the vehicle, the defendant, having been the driver, was therefore negligent. Finally, reasoning along the lines of *res ipso loquitur* leads to the somewhat unsatisfactory finding that the defendant was negligent in some general or unspecific manner.”

\(^1\) *Madyosi* 1990 (3) SA 442 (A)
stated that: In our law the maxim *res ipsa loquitur* has no bearing on the incidence of proof on the pleadings, and it is invoked where the only known facts, relating to negligence, are those of the occurrence itself. It quoted from *Sardi and Others v Standard and General Insurance Co Ltd*\(^\text{211}\) where the court stated that:

"At the end of the case the court has to decide whether, on all of the evidence and the probabilities and the inferences, the plaintiff has discharged the onus of proof on the pleadings on a preponderance of probabilities, just as the court would do in any other case concerning negligence. In this final analysis, the court does not adopt the piecemeal approach of (a) first drawing the inference of negligence from the occurrence itself, and regarding this as a prima facie case; and then (b) deciding whether this has been rebutted by the defendant's explanation."

The case of *Wagener v Pharmacare Ltd; Cuttings v Pharmacare Ltd*\(^\text{212}\) involved the extent to which a manufacturer can be strictly liable in delict for unintended harm caused by defective manufacture of a product where there is no contractual privity between the manufacturer and the injured person. The appellant in the first appeal underwent shoulder surgery at a private hospital conducted by a trust. The surgical procedure involved administration of a local anaesthetic called Regibloc Injection ('Regibloc) which was manufactured and marketed by the respondent company. As an aftermath of the surgery the appellant was left with necrosis of the tissues and nerves underlying the site of the operation, and paralysis of the right arm. In an action for damages for personal injury which the appellant instituted in the Cape Town High Court, she sued the respondent and the trustees of the trust. She alleged, among other things, that her injury and its sequelae were caused by Regibloc. A virtually identical suit was brought by the appellant in the second appeal, another alleged victim of Regibloc. The two actions were consolidated. One of the causes of action the appellant relied on was that the Regibloc administered to her was defective as a result of negligent manufacture by the respondent. However, that was pleaded only in the alternative. Her main claim was based simply on the allegation that, contrary to the respondent’s duty as manufacturer (obviously

\(^{211}\) *Sardi* 1977 (3) SA 776 (A) at p 780D - E and G – H

\(^{212}\) *Wagener* 2003 (4) SA 285 (SCA)
meaning legal duty in the delictual sense) the Regibloc administered was unsafe for use as a local anaesthetic because it resulted in the necrosis and paralysis. The court said that in deciding the issues raised by the appeal it must be accepted, as regards the facts, that the Regibloc in question was manufactured by the respondent, that it was defective when it left the respondent's control, that it was administered in accordance with the respondent's accompanying instructions, that it was its defective condition which caused the alleged harm and that such harm was reasonably foreseeable. It must also be accepted, as far as the law is concerned, indeed it was not disputed, first, that the respondent, as manufacturer, although under no contractual obligation to the appellant, was under a legal duty in delictual law to avoid reasonably foreseeable harm resulting from defectively manufactured Regibloc being administered to the first appellant and, secondly, that that duty was breached. In the situation pleaded there would therefore clearly have been unlawful conduct on the part of the respondent. The essential enquiry was whether liability attaches even if the breach occurred without fault on the respondent's part.

The court observed that if there were strict liability, it would not be open to a manufacturer to rely on proof that it had taken all reasonable care, but then one must ask what real difference that is likely to make. It stated that once there is prima facie proof, direct or circumstantial, that the product was defective at the various times material to the action, it is virtually inevitable that res ipsa loquitur will apply and require an answer from the manufacturer. It said that whilst the maxim comes into play only if the plaintiff's evidence is such that it can be said that the event (in this case, for example, the necrosis) would not ordinarily occur without there having been negligent manufacture (involving, perhaps, some scientific explanation in addition to the mere fact of the injury) it is perfectly conceivable that the Courts may develop reasons for being readier in some cases of alleged defective manufacture to draw the necessary prima facie inference of negligence where expert evidence is extremely difficult for the plaintiff to acquire, and perhaps even more so where administration of a
substance made to be applied to the human body has apparently had an effect quite contrary to the manufacturer's stated aim. If the law requires development to cater for this particular type of suit, then there would be the need for what is but an incremental shift and not a complete rejection of long-standing principle. The court pointed out that the question of that type and degree of development did not arise in the present case but said that it may arise if, and when, the litigation proceeded on the alternative claim. It stated that the same considerations pertain to the possibility that it might well be thought right in future for reasons of policy, practice and fairness between the parties to place the onus on the manufacturer to disprove negligence but noted that this was something for another day. The court ultimately expressed the view that it was the applicability of *res ipsa loquitur*, perhaps even in an extended way, and the possibility of a reverse onus, which militated against the conclusion that the Aquilian remedy was insufficient to achieve protection of the claimant’s right in this kind of litigation.

The Supreme Court of Appeal refused to allow strict product liability in this case. It was of the view that the subject was more suited to legislation. Some of the objections it raised to the imposition of such liability were-

- It is difficult to understand how the Courts could logically, fairly or in principle confine the imposition in this way, whether one looks at the matter from the standpoint of the claimant or that of the manufacturer. Why should only the victims of defectively made medicines have the remedy or, conversely, why should their producers be the only manufacturers strictly liable?

---

213 *Waegener fn 212 supra at p 298 Howie P stated that: “What I find significant about all the arguments in favour of strict liability is that, virtually without exception, they would hold good were imposition to be by the Legislature. They do not begin to get to grips with the question which forum it should be. One finds in Neethling, Potgieter and Visser the statement that ‘ultimately, products liability ought to be based on liability without fault’. The authors then, in support, quote from the article by J C van der Walt [“Die deliktuele aanspreeklikheid van die vervaardiger vir skade berokken deur middel van sy defekte” 1972 *THHR 224* at p 247 - 8, p 249] who in turn provides reasons why there should be strict liability but does not say why its imposition should be judicially achieved.” [Footnotes omitted]
One of the difficulties which could arise were the Courts to impose strict liability is this. A decision in favour of the appellants would not merely have prospective effect. A finding that strict liability attaches to the respondent would, in effect, declare what the law on this point has always been even if it has never before been so stated. Accordingly, a manufacturer could now, by reason of such declaration, become strictly liable for a product defectively made some years ago in respect of which, absent proof of negligence, it stood in no jeopardy of an adverse judgment. There is no procedural mechanism available by which to avoid that unjust result if the imposition of strict liability were to be by judgment. Were that imposition to be legislative, the relevant statute would not operate retrospectively on a matter of substantive law.

Howie P pointed out that it was not without significance that in other parts of the world, the imposition had been by way of legislation. The court said that it was no doubt recognised in the countries concerned that the subject of product liability is boundless as regards the possible structures and codes that can be put in place, that the investigation and debate which is part and parcel of the democratic process are the best measures by which to canvass the opinions of all interested parties and to produce a comprehensive set of principles, rules and procedures, all in force from one and the same date. By contrast, said the court, the result sought by the appellants would merely pertain to one type of product and only to manufacturers of such products. The fate of manufacturers of other products or of other articles, the fate of manufacturers of ingredients (as opposed to the manufacturers of entire medicines) and of components, would have to depend on the uncertain and unpredictable frequency with which future disputes spawned cases and those cases spawned judgments.
In the context of health service delivery in the public sector the court in *Pringle v Administrator, Transvaal*\(^{214}\) refused to apply the principle of *res ipsa loquitur*, stating that it was clear on the authorities that the onus of proving that the doctor was negligent in one or more of the respects alleged in the particulars of claim rests throughout on the plaintiff. Blum AJ held that the maxim could only be invoked where the negligence alleged depends on absolutes. In the instant case the initial problem was caused by the perforation of the superior vena cava. If the evidence showed that by the mere fact of such perforation, negligence had to be present, then the maxim would have application. He noted that no such evidence had emerged and that since the question of whether negligence was present or not depends upon all the surrounding circumstances, this made the maxim totally inapplicable in cases such as *Pringle*.

In the context of health service delivery in the private sector Marais JA observed in *Broude v McIntosh and Others*\(^{215}\) that the trial Judge concluded that the evidence did not establish on a balance of probabilities that the facial nerve was severed during operation. That conclusion, said Marais JA, rested upon a number of subsidiary findings and considerations which, if correct, amply justified it. It was clear that the facial nerve must have sustained some injury during the operation but severance could not be deduced solely by invoking the *res ipsa loquitur* doctrine because there were other potential causes of damage to the nerve which did not entail severance. In *Blyth v Van Den Heever*\(^{216}\) counsel for the respondent argued that it is trite law that a practitioner may be negligent in making a wrong diagnosis, but a wrong diagnosis is not necessarily a negligent diagnosis. It may be due to a reasonable error of judgment\(^{217}\). He said that triers of fact may tend, albeit unconsciously, to apply the maxim *res ipsa loquitur* to a situation such as the present case where plaintiff has suffered a major vascular catastrophe after being treated by defendant but that such an

---

approach would not be warranted and should be guarded against. The court did not apply the maxim in this case. It also refused to apply the maxim in *Mitchell v Dixon*[218] stating that that the mere fact that the accident occurred was not in itself *prima facie* proof of negligence.

Strauss[219] observes that by a slender majority of two to one the Appeal Court in *Van Wyk v Lewis*[220] held in effect that the rule of *res ipsa loquitur* does not apply to medical situations. He observes that generally speaking in the law of negligence “this rule is a great boon to the plaintiff but that even where a swab is post-operatively sewn up inside a patient, there is no presumption of negligence on the part of the doctor”. Strauss himself appears to have strongly criticised the judgment[221] but observes that it has nevertheless stood ever since and that in *Pringle*[222] the court once again held that there was no room for the application of *res ipsa loquitur* in medical negligence cases. He notes that in the USA the maxim has gained a strong foothold and has become a powerful tool in the hands of lawyers acting for dissatisfied patients. It has developed into a ‘rule of sympathy’ for the patient and been used to combat the ‘conspiracy of silence’ among doctors.

On the subject of strict liability in respect of products, Strauss[223] comments that proof of negligence may be facilitated by the principle of *res ipsa loquitur*. He notes that the principle has been applied in South Africa for negligent services[224] involving an exploding boiler in a power station and where a woman’s hair was scorched during a “perm” and that the liability of the person in control of the defective object was at issue in these two cases rather than the manufacturer.

Strauss points out that other systems of law have moved away from the notion of fault liability for defective products and have introduced the concept of strict liability as regards the manufacturer. He notes that this is a form of consumer protection since the manufacturer in marketing his product assumes the role of insurer of consumers who are harmed by the product. Strauss observes that it may be extremely difficult for a patient who alleges that a prescribed drug was defective to prove that his damage is attributable to the negligence of the manufacturer and that the doctrine of res ipsa loquitur may perhaps to a certain extent alleviate the burden of proof for the patient. He states that the apparently simply issue of proving a causal connection between the use of the drug and the patient’s injury in itself may, however, still present the patient with an insurmountable obstacle.

Neethling et al225 observe that in Bayer South Africa (Pty) Ltd v Viljoen226 the Appellate Division was not in principle opposed to the application or res ipsa loquitur where policy considerations justify it. They state, however, that Milne JA, unlike Anglo-American law, wanted to restrict the doctrine to its “normal” application, that is, that it is only applicable in instances where the facts of the case give rise to an inference of negligence. They suggest that the res ipsa loquitur influence of negligence should at least be made where a consumer process that he was prejudiced by a defective (unreasonably dangerous) product and that the product was in this state when the manufacturer abandoned his control over it. Ultimately, they say, product liability ought to be based on liability without fault227. They refer to the statements of van der Walt228 to the effect that the acceptance of strict liability (non-fault based) in the case of product liability can be justified on the basis of various factors: the public interest in bodily and psychological integrity of a person requires the highest

degree of protection against defective consumer goods; the manufacturer creates through marketing and advertising the belief in the public mind that his product is safe; strict liability serves as an incentive to ensure the utmost degree of care; the manufacturer is from an economic perspective, best able to absorb the risk of damages and to distribute it through price increases and insurance.229

Strauss refers to a point made by de Jager that the mere fact of registration of a medicine under the Medicines and Related Substances Act will probably be regarded by South African courts as a strong indication that the manufacturer has not been negligent in the design of his product. “After all extreme caution was built into the statutory machinery to ensure appropriate warnings and directions regarding their ultimate use”. He notes that de Jager230 has indicated that manufacturers’ liability for injuries to patients caused by defective medicines will probably be limited to the following types of cases:

- Where there has been negligent deviation from the formula submitted for official registration;
- When the manufacturer has failed to warn against adverse side-effects, or to give directions for use as prescribed by the Medicines Control Council;
- When registration of a medicine was cancelled and the manufacturer has failed to withdraw his product from the market within a reasonable time.

It is submitted that de Jager’s suggestions are overly simplistic for a number of reasons. Firstly, product liability need not necessarily arise only from the design of the drug. This would involve largely patented drugs since generic drugs are not ‘designed’ to the same degree as much of the development work has already been done by the erstwhile patent holder. The generic drug market is a highly

229 Loosely translated from Afrikaans by the writer. The original reads as follows: ‘Die aanvaarding van ’n skuldlose aanspreeklikheid in geval van produktieaanspreeklikheid kan deur verskeie faktore geregtwoordig word: die openbare belang in die fisies-psigiese welsyn van die mens vereis die hoogste mate van beskerming teen defektiewe verbruiksgoed; die vervaardiger skep deur sy bemarking en advertensie die vertroue by die publiek dat sy produk veilig is; die streng aanspreeklikheid dien as aansporing om die uiterste mate van sorg aan die dag te lei; die vervaardiger is, vanuit ekonomiese oogpunt gesien, die beste in staat om die skadelas te absorbeer en te versprei deur prysverhoging en versekerings.”

significant sector within the wider pharmaceutical manufacturing environment. There may not be negligent deviation from the formula of the drug so much as negligence in the manufacturing process itself so that certain active ingredients are for instance inadvertently rendered inactive, or that specific storage conditions for the drug, such as refrigeration at a specific temperature, are not followed.

Secondly, no matter how well designed the drug is, manufacturing processes can and do go wrong. Accidents happen on the production line. Contamination of raw materials can occur. The raw materials can be obtained from an inferior source. Insufficient quality guarantees may be obtained by the manufacturer from the supplier of the active pharmaceutical ingredients. It is in recognition of these dangers that the medicines control legislation in South Africa requires manufacturers to comply with what is commonly referred to as GMP or “Good Manufacturing Practice”. This comprises a set of fundamental rules that are essential for the manufacture of safe and effective medicines. The system of licensing of manufacturers of medicines in South Africa requires them to undergo inspections to ensure that they observe GMP. It may happen though that an inspection does not take place at the required time for some reason or that although GMP is generally followed in the manufacturing process there is a lapse on the part of the manufacturer. The GMP inspectors do not maintain a constant watch on the activities of every manufacturer in South Africa. Logistically speaking this is not feasible.

Thirdly there is the question of the indication for which the drug is registered in South Africa. It often happens that drugs are registered for more than one indication in other parts of the world or that new indications for existing drugs are subsequently discovered. The registration process requires approval of registration for specific indications of the drug and not just blanket registration for every possible indication. For example Nevirapine was a registered drug in South Africa for a while before it was registered in respect of the prevention of
mother to child transmission of HIV. It had been registered earlier in respect of other indications but not the prevention of mother to child transmission of HIV because conclusive clinical trial results with regard to this particular indication were still awaited. If a drug is marketed by a manufacturer as being suitable for use for an indication for which it was not registered it will not help the manufacturer to argue that it was registered for another indication and that it is therefore safe for the unregistered indication. Product liability could and, it is submitted, should arise in such a situation.

Fourthly, manufacturers often themselves conduct clinical trials on drugs they have researched and developed. There is clearly potential for a conflict of interests in such circumstances and there may be significant pressures to demonstrate that the drug does what it has been designed to do rather than to conduct objective and scientifically unbiased tests as to what the drug in fact does. There are of course rigorous standards that are set worldwide for clinical trials but it is not impossible for things to go wrong in a clinical trial, negating the results or findings of the trial. Clinical trials are themselves extremely expensive exercises. If an expensive clinical trial fails to meet the strict standards required for clinical trials it is worthless and there is the distinct possibility that some corporate executive’s or senior researcher’s head will roll. It does not take a psychologist intimately acquainted with human nature to appreciate the possibilities in such a situation. Liability on the part of a manufacturer could arise as a result of defective information obtained from a clinical trial that was presented to the medicines control authority when application was made for the drug to be registered. Facts can be concealed from the medicines registration authority and it is not always possible, despite all reasonable attempts, for that authority to detect defects in clinical trials that in most instances have been conducted on the other side of the world. Consequently the mere fact that a drug has been registered as safe and effective by the Medicines Control Council would not and it is submitted, should not necessarily preclude a claim on the basis of product liability against the
manufacturer. The extreme caution that was built into the medicines registration process is no guarantee of the same extreme caution in the manufacturing process occurring subsequent to registration.

It is submitted that the extreme reluctance of South African courts to apply the principle of res ipsa loquitur is based partly on an apparently fairly widespread misunderstanding of its effect in a delictual action and partly on a reluctance to even appear to be moving away from fault based liability. In Wagener v Pharmacare Ltd; Cuttings v Pharmacare Ltd the court seemed to prefer the application and even extension of the res ipsa loquitur principle to the imposition of strict liability on the manufacturer of a product as being the lesser of two evils. With due respect to the learned judge, the real questions in the context of health services delivery appear to be –

(a) the likelihood of there ever being factual circumstances in which the maxim could be applied in the light of the view of the court in Van Wyk v Lewis and more recently in Pringle that the maxim could only be invoked where the negligence alleged depends on absolutes; and

(b) the chances of the courts being able to bring themselves to apply it in this specific context;

let alone the question of the further development of the maxim so as to resolve broader issues of product liability.

Wagener 2003 (4) SA 285 (SCA). Howie P stated at p294: "As regards the problem of proving fault, counsel for the respondent pointed out that even if strict liability were imposed a plaintiff would still have to prove that the product concerned was defective when it left the manufacturer. If that were indeed established, then application of res ipsa loquitur would suffice to place the manufacturer on its defence and, in effect, compel an exculpatory explanation, if one existed. In the circumstances it was submitted that proving fault was really no more difficult than proving defectiveness.

Van Wyk fn 198 supra
Pringle fn 214 supra
Thus far, South African courts seem to be oblivious to the obvious imbalance in the provider-patient relationship and there is not yet even any certainty, when these relatively rare cases do come up for decision as to whether they will apply themselves to the process of judicial reasoning required by the Constitution so as to take into account the possibility of the development of the law in such a way as to lend weight, as van der Walt suggests, to the constitutional rights to bodily and psychological integrity. The predilection of the court in Pringle to apply the doctrine only where the alleged negligence depends on absolutes does not take into account that where the alleged negligence is so dependent upon absolutes it is probably a lot easier for the defendant to produce evidence of negligence in the normal way and the application of the doctrine in such circumstances is likely to be unnecessary in many instances. Part of the reason

---

234 Russell Levy, Joint Head of Leigh Day & Co’s Clinical Negligence Department, addressed a seminar in the House of Commons on the 6th November 2002 on the subject of how proposed reforms to clinical negligence compensation will impact on patients. He expressed the obvious as follows: "Lord Woolf in his final report to the Lord Chancellor on the civil justice system in England and Wales had the following to say in the chapter concerning medical negligence: 'It would be difficult to exaggerate the effect on potential claimants of the problems that they encounter in obtaining information, coupled with the knowledge that defendants have easy access to medical information and opinion.' This reflects the fact that the relationship between a doctor and a patient is not an equal one. It is natural for any patient to feel apprehensive about dealings with healthcare professionals in relation to his or her health. It is also natural that patients will place a great deal of trust in the skill and ability of the healthcare professionals treating him or her. The new Civil Procedure Rules start with the overriding objective of enabling the Court to deal with cases justly. In defining such justice the first principle laid down is ensuring that the parties are on an equal footing. The question of who bears the burden of proof was not considered by Lord Woolf. Presumably this was because the burden of proof has traditionally been borne by a claimant and, without thinking further about it, lawyers regard it as axiomatic that this should be so. This blind acceptance that it is somehow right that a claimant should bear the burden of proof means that the resulting inequality in clinical negligence cases passed unnoticed. A modern society demands a modern approach to dispute resolution. It is high time that we examined critically what we currently take for granted and challenge orthodox assumptions where they entrench inequality. A good place to start would be by considering why it is that although one party has the vast bulk, if not all, of the knowledge and information relating to a clinical negligence case as well as the specialist expertise required to interpret that knowledge and information, the burden of proving the case is on the other party. This is on top of the fact that the party without the information and expertise is by definition an individual patient who has been injured or the family of a dead patient. The other party is by contrast an institution or (for general practitioners and in cases of private medicine) is represented by an experienced defence organisation or insurer." He proposes as an alternative a formula for the shifting of the burden of proof along the following lines "An injury to or unexpected death of a patient that occurs in the context of a duty of care relationship with a healthcare provider gives rise to an entitlement to compensation unless the healthcare provider can prove that the injury or death was not caused by a breach of that duty" It is of interest to note that he states that even the benefit of the long-established legal maxim of res ipsa loquitur is at present effectively denied to patients in clinical negligence cases. He refers to the case of Ratcliffe v Plymouth & Torbay Health Authority & Another (1996) 4 Lloyds Rep Med 162 where the Court of Appeal held that despite the judge finding that a spinal anaesthetic was the cause of a patient’s neurological damage, he was entitled to conclude that he simply did not know what had happened, that res ipsa loquitur was not a principle of law and did not relate to or raise a presumption, and that the courts would be doing the practice of medicine a considerable disservice if, in such a case, because a patient has suffered a grievous and unexpected out-turn from a visit to hospital, a careful doctor was ordered to pay him compensation as it he had been negligent. Levy makes the point that this presumably well intentioned statement highlights the inequity of the position: because the patient was unable to discharge the burden of proof, even though he was asleep at the time the injury occurred, the Court of Appeal felt it right to assume that the doctor was careful rather than to compensate the patient despite the finding of fact that the spinal anaesthetic was the cause of the wholly unexpected adverse outcome.

http://www.leighday.co.uk/upload/public/attachments/reversingtheburdenofproof.doc
for the transfer of the evidentiary burden to the defendant by *res ipsa loquitur* is precisely that the plaintiff does not necessarily know what exactly happened and is not necessarily even in a position to identify such ‘absolutes’. If the object of the maxim is to give the patient the benefit of the doubt then how can one turn around and say that it should only be applied in circumstances where there can be little doubt to begin with? It is submitted that such an extremely narrow approach defeats the object of the maxim to a large degree since one is effectively saying that the circumstances of the case must be such that there is no ‘significant doubt’ that there was negligence due to the presence of the ‘absolutes’ in question.

Given the fact that the maxim only shifts an evidentiary burden, as opposed to the plaintiff’s entire burden of proof, such a narrow approach in circumstances such as the provider-patient relationship in which there is a clear imbalance in favour of the provider is hardly justifiable. It is furthermore of some concern to note that the court in *Wagner* implied that an extended *res ipsa loquitur* application could be a viable substitute for strict liability. *Res ipsa loquitur* does not exclude the element of fault from a delictual claim. It simply translates the evidentiary burden of proving fault from the plaintiff into an evidentiary burden of proving an absence of fault onto the defendant. It creates a rebuttable presumption of negligence, regarding a specific fact or circumstance, on the part of the defendant. Since the defendant, unlike the plaintiff, is in full possession of all of the facts, if he was not negligent this should not be difficult to prove. It

235 Richmond and Quinn a law firm in Alaska, point out in their *Litigation Overview*, that the doctrine of *res ipsa loquitur* is “a bridge dispensing with the requirement that a plaintiff specifically prove breach of duty, once that duty and proximate cause have been established” and applies only when an accident ordinarily does not occur in the absence of negligence. *State Farm Fire Cas. Co v Municipality of Anchorage* 788 P.2d 726, 730 (Alaska 1990); *Widmyer v Southeast Skyways, Inc* 584 P.2d 1, 10 (Alaska 1978); *Falconer v Adams*, 974 P.2d 406, 414 (Alaska 1999). They observe that the doctrine of *res ipsa loquitur* permits but does not compel an inference of negligence from the circumstances of an injury and that the doctrine should be applied when (1) the accident is one which does not ordinarily occur in the absence of someone’s negligence; (2) the agency or instrumentality is within the exclusive control of the defendant; and (3) the injurious condition or occurrence was not due to any voluntary action or contribution on the part of the plaintiff. They state that by shifting the burden of the production of evidence to the defendant without relieving the plaintiff of the burden of proof, the doctrine makes recovery possible where circumstances render proof of the defendant’s specific act of negligence impracticable and the defendant is the party in the superior if not the only position to determine the cause of an accident. *Ferrell v Baxter* 484 P.2d 250, 258 (Alaska 1971). They make the point that uncontradicted proof of specific acts of negligence which completely explain the circumstances and cause of the accident renders the doctrine superfluous and inapplicable. (http://www.richmondquinn.com)
by no means relieves the plaintiff of the ultimate burden of proving his case including the presence of fault on the part of the defendant. Strict liability, on the other hand, does exactly that. It is based on a public policy point of view that favours the consumer for the reasons mentioned by van der Walt\textsuperscript{236}. There is a real danger, given the apparent lack of understanding in judicial circles of the import and application of \textit{res ipsa loquitur}, that the two concepts will be become conflated and ultimately, once they have been pared down to mere shadows of their former selves, excised from the South African legal system with the razor of conservatism that presently seems to be a favourite logical tool of the Supreme Court and some of the divisions of the High Court in South Africa.

The maxim of \textit{res ipsa loquitur} is not even remotely in the same league as strict (no-fault) liability in favouring the plaintiff. The one operates squarely within a fault-based framework whereas the other is completely outside of it. Judgments that suggest that the one, even in an extended form, could become a substitute for the other are problematic and unfortunate. It is submitted that the fixation of South African courts on fault, their too frequent lack of cognisance of constitutional values and principles and their failure to take seriously the constitutional injunction to develop the common law in accordance with the rights in the Bill of Rights is nowhere more clear\textsuperscript{237} than in the reasoning of Howie P in \textit{Wagener}.

The circumstances of the case could not have been simpler. The Supreme Court of Appeal at the outset of its judgment stated that it must be accepted, as regards the facts, that the Regibloc in question was manufactured by the respondent, that it was defective when it left the respondent’s control, that it was administered in accordance with the respondent’s accompanying instructions, that it was its defective condition which caused the alleged harm and that such

\begin{itemize}

\end{itemize}
harm was reasonably foreseeable. It must also be accepted, said the court, as far as the law is concerned, indeed it was not disputed, first, that the respondent, as manufacturer, although under no contractual obligation to the appellant, was under a legal duty in delictual law to avoid reasonably foreseeable harm resulting from defectively manufactured Regibloc being administered to the first appellant and, secondly, that that duty was breached. The court opted for the view that the existence of instances of strict liability in the law of delict was attributable to special policy considerations obtaining in those cases. Their existence did not advance appellants’ case. This conclusion appears to have been reached without any examination of public policy as reflected in the Constitution, specifically with regard to the right to freedom and security of the person including the right to bodily and psychological integrity and the right to human dignity and the provisions of section 39(2) of the Constitution. The court rejected the case of Kroonstad as precedent using the compartmentalization argument and demonstrating once again the objection that this argument.

---

238 This was on the strength of the judgment in Ciba-Geigy (Pty) Lid v Lushof Farms (Pty) Lid en 'n Ander 2002 (2) SA 447 (SCA) which was hailed as opening the way for strict product liability in South African law by Nethling J and Potgieter JM ‘Die Hoogste Hof van Appel laat die deur oop vir strkie vervaardigersanspreeklikheid’ 2002 TSwAR 582. Unfortunately it is a door that the same court in Wagener, effectively shut firmly at the first available opportunity.

239 Kroonstad Westelike Boere Ko-operatiewe Vereniging Bpk v Botha and Another 1964 (3) SA 561 (A)

240 The predilection of the courts for the argument that one cannot allow elements or aspects of one area of law to 'contaminate' another is a purist based approach that takes insufficient cognizance of underlying policy considerations that are common to the legal system as a whole. It is submitted that particularly under South Africa’s constitutional legal dispensation this argument is even less valid than it may have been in earlier times since it elevates form over substance often without offering any rational explanation for doing so. Whilst legal certainty is important and the value of stare decisis is not disputed, the courts themselves have acknowledged that a system which relies totally on precedent has its problems. It is submitted that when there is scant legal precedent upon a particular point the courts are finally forced to return to the wellspring of law in any society – public values and public policy. The building blocks of the law that has gone before or in another related area are taken into consideration and their logic is used to forge solutions to unprecedented cases. This is as it should be if the legal system as a whole is to be a credible and internally consistent framework. However the question in terms of the South African constitutional order is whether the courts should not be more actively considering past precedents in the light of constitutional values and principles in order to ascertain whether or not the former should still hold. After all, law that is inconsistent with the Constitution is invalid. It is not advisable for a court to superficially and without detailed analysis arrive at a conclusion that a right reflected in the Bill of Rights is the same as a similar right that is reflected in the common law – for example the right to bodily and psychological integrity. Whilst it is likely that in most if not all cases there will be some overlap it is not advisable or desirable for the future development of the South African law in a manner that is consistent with the Constitution to assume the extent of that overlap without explicitly exploring the possibility of potential differences. A more thoughtful and enquiring judiciary could greatly benefit and facilitate the constitutional development of the legal system in South Africa at present.

It is of some significance that even prior to the Constitution, in Government of the Republic of South Africa v Ngubane 1972 (2) SA 601 (A) the Appellate Division observed that: “Neither the Roman-Dutch law nor any other binding source of law deals specifically with this point. What approach then must this Court adopt? As to that, I agree with the following passage in The South African Legal System and its Background, by H. R. Hablo and Ellison Kahn, p 304: "If there is no Roman-Dutch rule which appears to the court to be applicable to the case... how is the court, bereft of binding legislation, precedent and modern custom, to give a reasoned
values legal form over substance. Howie P stated that “contract and delict, being quite separate branches of the law, have their own principles, remedies and defences. One cannot, because of the absence of contractual privity between the injured party and the manufacturer, simply graft warranty liability onto a situation patently governed by the law of delict.” The court emphasised the binding force of precedent instead of conducting a detailed and comprehensive analysis of public policy and the relevant constitutional rights and values. It chose rather to accept that the right as embodied in the Constitution was the same as that recognised at common law and that since the common law had always required fault as an essential element of a successful claim, the position could be no different at this stage.

Howie P unconvincingly dismissed the judgement in *Loriza Brahman en 'n Ander v Dippenaar* with the sweeping statement that: “As regards the

judgment? Dealing with this problem, van der Keessel in his Dictata approvingly quotes Grotius’ statement to the effect that ‘wanneer daar in bepaalde sake geen wetteregtelike bepalings, privilegies, keure (offewel stedelijke regarels) of gebruikregsreels aangetref word nie, is die Regters reeds van die vroegste tye af onder eed vermaan om in sodanige saak die beste rede te volg soos deur huile pliggetroutheid en verstand aan die hand gedoen', adding that judgment will have to be given in accordance with natural law and equity – 'secundum ius et sequietatem naturalem'. See van der Keessel, Praelectiones, 1.2.22, (Gonin's translation, vol. 1, p. 29). This does not mean that a Judge is at large to make new law. The learned authors rightly point out at p. 306 that he ‘fashions it as far as possible out of materials at hand... though in the process he may within the fabric of the law fashion a new rule’. The foregoing seems to me consistent with what was said by Schreiner, J.A., in *Crookes, N.O., and Another v Watson and Others*, 1956 (1) SA 277 (AD) at p. 290H, namely –

'It is natural, when one is considering a branch of the law on which there is relatively little direct authority, to seek assistance from other portions of the law that seem to present useful analogies; but analogies are only useful if they provide, not merely some solution of the problem under enquiry, but a solution which is satisfactory... Care must be exercised not to force a legal instrument of great potential efficiency and usefulness into a mould that is not properly shaped for it.'”

It noted at p294 that: “Most of the cases pre-date the Constitution but that of Ciba-Geigy was decided after the Constitution came into operation. The position is, therefore, that the right concerned enjoys the same importance now as it always did and because of the operation of stare decisis its enforcement must, subject to the consideration to which I next come, be governed by the same principles as applied before. The binding force of precedent is as effective now as it always was.”

Howie P stated: “In evaluating the parties’ competing submissions one’s starting point is that the right which the appellants seek to protect and enforce is constitutionally entrenched. This is therefore one of the factors to be borne in mind when having regard to the injunction to shape the common law in accordance with the Constitution’s spirit, purpose and objects. The next consideration is that this same right has also always existed at common law. In that law, its unintended infringement, where (among other consequences) bodily harm results, gives rise to a specific remedy, namely the Aquillian action. To succeed in the action, proof of fault in the form of negligence has always been necessary.”

In *Loriza* 2002 (2) SA 477 (SCA). In that case the facts were that the respondent, while attending a cattle auction, was knocked over and injured by a Brahman heifer-calf named Alicia, the property of the first appellant, a stud farm. The respondent brought an action in a Provincial Division against the first appellant based on the *actio de pauperie* for the damages allegedly sustained by him as a result of Alicia's conduct. The Court a quo made a declaratory order in the respondent's favour. It appeared from the evidence that the respondent had entered the auction pen in which Alicia and about 25 other heifers were being kept pending auction. The respondent, who was busy studying a catalogue, did not see the heifers and was totally unaware of their presence in the pen. None of the other heifers followed Alicia's example. On appeal to the Supreme Court of Appeal it was argued...
appealants’ reliance on other instances of strict liability, it was pointed out that
these have either a long history or a policy-based reason for existence, in both
cases peculiar to themselves, and not free from jurisprudential controversy in
any event. Any analogy based on them would therefore be false.” This is not, it
is submitted, a singularly praetorian approach to the South African common
law. It would seem that the court felt itself incapable of deducing any policy
based approach for the remedy sought in *Wagener* and the fact that the *actio de
pauperie* was a policy based remedy for some reason disqualified it as a valid
precedent in *Wagener*. It is submitted that the complete opposite view should
have prevailed i.e. that where there were significant policy considerations in
favour of a particular remedy, the provisions of section 39(2) of the Constitution

on behalf of the appellant that the *actio de pauperie* was an anachronism that should no longer be recognised in
our law, inter alia because it involved a primitive form of absolute liability; the *contra naturam sui genus*
requirement was confusing and inconsistent; the actio was not logically justified; and it often led to unfair
results. The second defence put up by the appellant was that Alicia had not acted *contra naturam* because her
conduct had to be compared with that of all other heifers, but specifically with that of the average Brahman
heifer, a more highly-strung breed than average. The SCA held that the fact that the *actio*, which was more than 24
centuries old and still formed part of South African law, involved absolute liability was no reason to banish
it: the phenomenon of risk-liability was becoming more prevalent and had a useful role to fulfil in areas such as
the liability of owners for damages caused by domesticated animals. It held further that the Court would not
be astute to abolish a controversial cause of action that was not unconstitutional or contra bonos mores or fallen
desuetude: rather, it was the duty of the Court where necessary to adapt it and, depending on the
circumstances, to either expand or curtail it. The court said that if, instead of the dogmatic view that all
‘delictual liability’ had to be based on fault, a broad view was adopted that encompassed risk-liability in
deserving cases, the only remaining question was whether the *actio* had a useful role to play from a practical
point of view. It pointed out that no practical reason relevant to the facts of the present case for the denial of the
*actio* was raised and that the time for burying the *actio* had thus not yet arrived. Olivier JA quoted from
O’Callaghan NO v Chaplin in which the court stated: “It is satisfactory to find that the action de pauperie still
forms part of our law. . . . I think the conclusion is a sound and just one, for if a man chooses to keep an animal,
and injury or damage is caused by it to an innocent person, he must make adequate compensation. The owner of
the animal and not the person injured must bear the loss. . . . After all, the result arrived at is but the natural
development of a doctrine which, as we learn from eminent jurists, such as Wesenbeck, Vinnius, Matthaeus,
Huber and others, had already been accepted in most places, notwithstanding the reception of the Roman law.
These masters and expounders of the law rightly saw nothing unjust in the view that, as the Roman law
regarded *nozze deditto* as merely an alternative mode of solution at the election of an owner, that is of
discharging his liability for *pauperies*, the fact of its disappearance did not deprive an injured plaintiff of his
right to full compensation to be paid him by the defendant. The doctrine, therefore, which they state
was observed in actual practice in their time, has since been accepted by the more modern and mature
jurisprudence, and still prevails as existing law in several civilised European countries as well as in our own.”

Howie P’s emphasis on legal precedent and the principle of stare decisis is thus somewhat selective and once
again focuses on form over substance. It is submitted that the rationale behind the *actio de pauperie* is not as
peculiar as Howie P would have one believe. It runs like this: If one chooses to have in one’s possession
something which represents a potential danger to others, then one is liable in the event that the danger in
question materializes. The same argument can quite easily be applied in the modern context to the manufacture
of pharmaceuticals. If one chooses to be in the business of the manufacture of pharmaceuticals, many of which
are essentially potentially dangerous substances, then, in the absence of any contributory negligence on the part
of the defendant one should be liable in the event of the materialization of the risk. To put it another way, the
fault, it could be said, lies in the choice of business activity. The word ‘fault’ is not used here in the moral or
emotional sense but in the legal, public policy sense. In the policy context it is difficult to understand why the
unsuspecting patient should sustain the loss caused by a defective drug especially when that patient’s
constitutional right to bodily and psychological integrity takes precedence over any right at common law.
should be invoked to develop the common law in keeping with those policy considerations.

If one studies the arguments of Howie P against an award based on strict liability they amount to the following:

- Even if one accepted that a case for strict liability could be made out, it is not for the courts to impose that liability but the Legislature despite the admission that: “One is sensitive to the criticism expressed by Prosser that to say that only the Legislature should make changes is to echo ‘the cry invariably raised against anything new whatever in the law’. Nevertheless, what needs to be done is to assess what the new development entails and how best to implement it.” It is submitted that this view is totally contrary to sections 8(3) and 39(2) of the Constitution which require the courts, not the legislature, to develop the common law.

- The court could impose strict liability only if it considered that this was what, in developing the common law, s 8(3) of the Constitution compelled. But, if the Court did so hold, the Legislature would be hamstring by such conclusion even if the democratic parliamentary process in due course delivered up the conclusion that only certain manufacturers or certain instances of manufacture should be subject to strict liability. This is illustrative of the sort of problem that could indeed arise if the Courts were to alter the law in the respect proposed by the appellants rather than to leave it to Parliament. It is submitted that this argument demonstrates a lamentable lack of understanding of the role and power of legislation. The common law can never ‘hamstring’ the Legislature since it is free to legislate inter alia in order to alter the common law. Indeed one of the checks and balances within the doctrine of separation of powers is that in a situation where the Legislature does not approve of a court decision it may legislate to the contrary - provided of
course that such legislation is consistent with the provisions of the Constitution.

- The court's observation that it is not without significance that in the other parts of the world of which mention has already been made, the imposition has been by way of legislation, failed to take into account the imposition of strict liability at its own backdoor such as that in the actio de pauperie by courts removed in time rather more than geographical space.\(^{244}\)

However, Neethling et al\(^{245}\) in fact observe that in Continental systems, liability without fault originated primarily from legislation (it is submitted that this is largely due to the preference by Continental systems for codification of law) while in Anglo-American law, case law played the dominant role. They state that in South Africa both the legislature and the courts contributed to the development of liability without fault. It is thus submitted that the court's reference is to mainly Continental systems of law as opposed to Anglo-American ones such as the South African system and that it has therefore drawn a false and thus invalid comparison. Continental systems are codified whereas the Anglo-American legal systems are common law based.

- There was extensive regulation of the manufacture of medicines without the imposition of strict liability by the Legislature. It could not therefore

\(^{244}\) Vicarious liability is another example of the imposition of strict liability for reasons of public policy. In Amalgamated Beverage Industries Natal (Pty) Ltd v Durban City Council 1994 (3) SA 170 (A), Botha JA stated: "It is necessary in this context to revert to the question of vicarious liability. It is seen in the majority judgment as a lesser evil than strict liability. Again, with respect, I am unable to agree. As I have indicated, I regard vicarious liability as but one form of strict liability. Notionally it may be possible to separate strict liability in the form of vicarious liability from the remaining field of strict liability (i.e. where the acts of employees are not involved), but I can perceive no practical profit in doing so. It does not appear from the majority judgment whether vicarious liability is postulated on the premise that there must be mens rea on the part of the servant. If it is, the same difficulties of proving negligence on the part of the servant will certainly be encountered as in the case of the employer. Yet another example is the Praetor's edict de nauis capitis et stabularis which imposes strict liability on innkeepers in respect of goods brought onto their property by guests and which was found to be still part of South African law by the court in Gabriel And Another v Enchanted Bed And Breakfast CC 2002 (6) SA 597 (C). See further the discussion in Neethling et al (fn 18 supra) p362-380 regarding the actio de pastu, actio de feris, actio de effusis vel defectis, actio positiv vel suspensii and the discussions of the law of vicarious liability and agency all of which are common law concepts involving strict liability.

\(^{245}\) Neethling et al fn 18 supra at p363
have intended strict liability to apply. It is submitted that the existence of extensive regulation of the manufacture of medicines without the imposition of strict liability by the Legislature does not prove anything in terms of individual cases. By its nature, legislation is generic rather than specific. The possibility of the imposition of strict liability by a court cannot be said to have been excluded simply due to a failure on the part of the Legislature to include it in legislation.

- The court posed a series of questions in the judgment to demonstrate the complexities of trying to legislate judicially in the area of product liability. With respect, it is submitted that even if the court had decided in favour of strict liability in the present case, this would not necessarily have meant that every other manufacturer of every other product was also subject to strict liability neither would it have meant necessarily that only, manufacturers of medicines were strictly liable.

It is submitted with respect that the court lost sight of the fact that it was only being asked to ‘legislate’ upon one extremely limited set of facts and that whilst the essence of its reasoning could be extracted and applied to other cases\(^{246}\), those other cases would not necessarily be decided in the same way if the facts differed. For example, it could be argued that product liability for medicines in the same category as Regibloc should be strict for the following reasons:

- Such medicines are administered to the patient by a trained health professional as opposed to being self-administered. There is thus small chance of the medicines being administered contrary to the manufacturer’s instructions;

---

\(^{246}\) In *National Director of Public Prosecutions And Another v Mohamed NO and Others* 2003 (4) SA 1 (CC) it was observed that “Whatever the case may be, the Court is obliged at all stages of the inquiry to give proper reasons for its conclusion. Such reasons will not only be binding on the litigants but will constitute an objective precedent, with such binding force on other courts as the principles of stare decisis and the status of the Court delivering the judgment dictate.” It is the reasons for the decision which are binding. Since the reasons are heavily dependent upon the facts of the individual case, the facts of other cases would have to be on all fours before the reasons in the particular precedent could be applied to those other cases.
• The patient had no choice as to the kind of local anaesthetic administered and even if consulted as to her preference, would not have been in any position to give a meaningful response unless by some quirk of fate, she was herself a health professional with extensive knowledge of local anaesthetics. The patient’s role in the situation is therefore one of extreme passivity;

• The patient is not in a position to ascertain the merits of various local anaesthetics or to determine the chemical components of the medicine and whether it is defective or not;

• The patient is not in a position to read the labelling or other information or warnings on the packaging of the medicine. She is highly unlikely to have handled or inspected the medicine prior to its administration;

• The route of administration (by way of injection) represents a potentially greater danger to the patient than by some other less rapid and invasive route eg oral ingestion. If she decided that the medicine tasted ‘bad’; for instance she could have spat it out. Once a medicine has been injected into the bloodstream, however it is impossible for the patient to reverse this process;

• The harm caused was severely disabling and constituted a violation of the patient’s right to bodily and psychological integrity;

• It was established that the medicine was defective when it had left the manufacturer’s premises;

• It was not disputed that the medicine had caused the injury in question;
• The harm caused was reasonably foreseeable.

This set of circumstances is highly specific to (a) medicines (b) medicines administered by injection (c) local anaesthetics (c) medicines that are not self-administered (d) medicines that are clearly defective upon leaving the control of the manufacturer. It is quite justifiably argued that in such circumstances the imposition of strict liability upon the manufacturer is entirely in accordance with public policy whereas with respect to other types of medicine, taken in different circumstances and with different potential for harm this argument may not apply. Thus the arguments of the court about the need to take into account different kinds of manufacturers of different products and the consequences for them if the court had to impose strict liability in the present case are largely, it is respectfully submitted, specious. The impact of the judgment would have been very much contained by the highly specific nature of the circumstances involved.

7.8 Imperitia Culpae Adnumeratur

This maxim means that ignorance or lack of skill is deemed to be negligence. Neethling et al247 observe that the maxim is misleading because South African law does not accept that mere ignorance constitutes negligence248. They note that

---

247 Neethling et al fn 18 supra at p136
248 See also Boberg fn 18 supra p346 where he states that the maxim imperitia culpae adnumeratur is misleading. Lack of skill can never amount to negligence for no one can be skilful at everything. But it may be negligent to undertake work requiring a certain expertise without possession the necessary degree of competence. Van der Walt observes that the maxim imperitia culpae adnumeratur can apply only if the task or the engagement in an activity is itself blameworthy. He says that a layman who renders medical assistance in an emergency is not judged by the standard of a doctor. As long as he exercises the care of an ordinary layman in the same situation he is not negligent. Scott TJ in 'Die Reel Imperitia Culpae Adnumeratur As Grondslag Vir Die Nasiligheidstoets Vir Deskundiges' in Die Delikseweg Petere Fontes: L C Stein Gedenkbandel 124-162 deals with the question of whether the maxim is consistent with the reasonable man test of negligence or whether it introduces a subjective standard of negligence in taking into account the qualifications and skill of the professional person. Scott points out that it is not unreasonable for professionals to undertake tasks for which they are qualified and so the explanation that the negligence consists in the undertaking of a task without the necessary skill as opposed to the lack of skill itself does not apply to professionals. Scott says that the negligence of an expert should be determined by applying the test of the reasonable expert to the actual conduct of the expert. Although this introduces a subjective element to the usually objective reasonable man test for negligence, it will only have the effect of raising the standard – never lowering it. The personal characteristics of the expert remain irrelevant. The ultimate objectivity of the test for negligence is thus not compromised. The question of the layperson who renders emergency medical assistance is an interesting one. From a constitutional
the principle embodied in the maxim applies where a person undertakes an activity for which expert knowledge is required while such person knows or should reasonably know that he lacks the requisite expert knowledge and should therefore not undertake the activity in question. In *Durr v Absa Bank Ltd and Another* the court made reference to the maxim with regard to the expert activities of investment brokers. The court said that the question as to whether the standard must be that of the specific subset of experts to which the defendant belonged or should it be the lower standard of the general set of experts to which the defendant belonged had to be resolved with regard to the standard implied in the defendant's public professions of skill and expertise in relation the nature of the services they were offering. The court said that those who undertake to advise clients on matters including an important legal component do so at their peril if they have not informed themselves sufficiently...
on the law. Schutz JA stated that in real life negligence is not a mere legal abstraction, but must be related to particular facts. However, as a matter of law set in the present factual context, he said he was of the opinion that the relevant standard was not that of the ‘average or typical broker’ as he has been defined. Schutz JA said that to accept that standard would be to allow a definition chosen by a witness for his own purposes to dictate the result, making the enquiry as to what is required of a particular kind of broker pointless. What is actually needed is first to determine what skills the particular kind of broker needs to exhibit, which must depend in large part on what skills he is held out to possess. If this were not so, then the reasoning advanced by the respondents would justify the neurosurgeon being judged by the standards of the general practitioner. That would be contrary to the reference by Innes CJ in Van Wyk v Lewis to ‘the branch of the profession to which the practitioner belongs’. He concluded that the appropriate standard is that of the regional manager of the broking division of a bank professing investment skills and offering expert investment advice.

The court quoted with approval the basic rule stated by Joubert (ed), as follows:

"The reasonable person has no special skills and lack of skill or knowledge is not per se negligence. It is, however, negligent to engage voluntarily in any potentially dangerous activity unless one has the skill and knowledge usually associated with the proper discharge of the duties connected with such an activity."

The court held that given the rule of law concerning the undertaking of activity requiring skill, Stuart (the broker) was in a constant dilemma. Either he had to forewarn the Durrs where his skills ended, so as to enable them to appreciate the dangers of accepting his advice without more ado, or he should not have

---

251 Schutz JA would not accept as a defence the fact that the broker (Stuart) was entitled to rely on regulatory authorities and officials to ensure that all of the risks had been eliminated. He stated at p467 of the judgment: "I would say something about reliance on the various regulatory bodies and officials. They do perform valuable functions in protecting the public against fraud. But for an investment advisor to assume that they have shot out all the predators is ingenuous. New ones always creep in under the wire. Those responsible for lending other people's money must be ever alert to this and, sometimes helped by the regulatory powers, make their own investigations to the extent reasonably necessary. These powers are not there, after all, to give individual and daily attention to particular lenders, and the grindings of their mills are sometimes slow. Individual attention falls to be given by individual advisors. And then there are also other aids to the investor and his advisor which the State has made available. To what extent did Stuart avail himself of them?"

252 The Law of South Africa First Reissue vol 8.1 para 94

867
recommended the investment. What he was not entitled to do was to venture into a field in which he professed skills which he did not have and to give them assurances about the soundness of the investments which he was not properly qualified to give. Before he recommended the investment in question he should first have sought help which was readily available to him. The court found in favour of the appellant (the plaintiff).

In the public health sector in particular the maxim of *imperitia culpae adnumeratur* is of importance given the constant shortages of health care professionals experienced by this sector. The state is under great pressure, especially in deep rural areas in which it is sometimes almost impossible to recruit health professionals, to provide services with the barest minimum of human resources, and in the worst cases, in the complete absence of suitably qualified and adequately trained personnel. A number of questions arise in this regard which need to be explored in more detail. Health professionals are generally registered with regard to particular scopes of practice. A health professional who exceeds that scope of practice would almost certainly as a general rule fall foul of the law on the basis of the maxim as well as any other professional rules that may be involved.253 Are there any circumstances,

---

253 In terms of section 27 of the Nursing Act No 50 of 1978 -
(1) A person who is not registered or enrolled in a particular capacity-
(a) who makes use of a title which only a person who is registered or enrolled in that capacity may use, whether he makes use of such title alone or in combination with any word or letter;
(b) who holds himself out or permits himself to be held out, directly or indirectly, as being registered or enrolled in that capacity; or
(c) who wears a uniform, badge or other distinguishing device, or any misleading imitation thereof, prescribed in respect of a person registered or enrolled in that capacity, shall be guilty of an offence.
(2) Subject to the provisions of subsection (4) and the Medical, Dental and Supplementary Health Service Professions Act, 1974 (Act 56 of 1974), a person-
(a) who is not registered as a nurse or enrolled as a nurse or a nursing auxiliary and who for gain performs any act pertaining to the profession of nursing;
(b) who is not registered or enrolled as a midwife and who for gain performs any act pertaining to the profession of midwifery;
(c) who is not registered or enrolled as a midwife and who makes any internal examination of the genitals of a woman while attending to the woman in relation to a condition arising out of or in connection with pregnancy, shall be guilty of an offence.
(3) A person who, knowing that another person is not registered or enrolled in a particular capacity-
(a) describes such person as the holder of a title which only a person who is registered or enrolled in that capacity may use, whether he describes such other person by making use of such title alone or in combination with any word or letter; or
(b) holds such other person out, directly or indirectly, as being registered or enrolled in that capacity, shall be guilty of an offence.
however, in which there could be lawful defences to such prima facie illegal acts? With regard to nurses in particular, there is also the matter of section 38A of the Nursing Act which is quoted in full in the footnote for the sake of convenience. A further question is whether the right to emergency medical treatment contemplated in section 27(3) of the Constitution limited by the qualifications of the health professional at the scene or would the health professional who in an emergency medical situation exceeds the bounds of his or her scope of service in coming to the rescue of a patient be able to use section 27(3) as grounds for justification of what would otherwise be an unlawful act?

Necessity or compulsion has been recognised as a defence in criminal law for some time. It has not apparently arisen in the context of a health professional

---

254 Nursing Act No 50 of 1978

255 Notwithstanding the other provisions of this Act and the provisions of the Medicines and Related Substances Act in 12 supra of the Pharmacy Act, 1974 (Act 53 of 1974), and of the Medical, Dental and Supplementary Health Services Act, 1974 (Act 56 of 1974), any registered nurse who is in the service of the Department of Health, Welfare and Pensions, a provincial administration, a local authority or an organization performing any health service and designated by the Director-General: Health, Welfare and Pensions after consultation with the South African Pharmacy Board referred to in section 2 of the Pharmacy Act, 1974, and who has been authorized thereto by the said Director-General, the Director of Hospital Services of such provincial administration, the medical officer of health of such local authority or the medical practitioner in charge of such organization, as the case may be, may, in the course of such service perform with reference to-

(a) the physical examination of any person;
(b) the diagnosing of any physical defect, illness or deficiency in any person;
(c) the keeping of prescribed medicines and the supply, administering or prescribing thereof on the prescribed conditions;
(d) the promotion of family planning, any act which the said Director-General, Director of Hospital Services, medical officer of health or medical practitioner, as the case may be, may, after consultation with the council determine in general or in a particular case or in cases of a particular nature: Provided that such nurse may perform such act only whenever the services of a medical practitioner or pharmacist, as the circumstances may require, are not available.

256 In S v Adams v Werner 1981 (1) SA 187 (A), Counsel CJM Dugard and J M Burchell acting for the appellant, Werner, observed the following with regard to necessity: "In Roman law there was no systematic discussion of the defence of necessity but there are isolated instances in which such a defence was recognized. See D 47.9.3.7; D 9.2.49.1; D 43.24.7.4; D 9.2.29.3; D 19.5.14 pr. Several Roman-Dutch writers considered necessity as a general defence. See Grotius De Jure Belli ac Pacis 2.2.6 - 9; Puffendorf De Jure Natuorae et Gentium 2.6.4 and 5; Van der Keersaal Praelectiones 47.2.8. Necessity has been recognized as a general defence in modern South African law. See S v Mshomed and Another 1938 AD at 34 - 35; S v Rabodilla 1974 (3) SA 324; S v Pretorius 1975 (2) SA 85; Chetty v Minister of Police 1976 (2) SA 452 - 3; Minister of Police v Chetty 1977 (2) SA 885; S v Adams 1979 (4) SA at 796A - C; Burchell and Hunt South African Criminal Law and Procedure vol 1 General Principles at 283 et seq; De Wet and Swanepoel Strafreg 3rd ed at 87 - 88; J V van der Westhuizen Noodtoesland as Regverdingsgrond in die Strafreg (1979) LLD dissertation (Pretoria) 730. Compulsion or duress is a form of necessity and is recognized as a general defence. See S v Golash 1973 (3) SA 1; S v Mlemele 1977 (3) SA 628; S v Kubwika 1978 (4) SA 173; S v Alfeus 1979 (3) SA 145; S v Petersen 1980 (1) SA 938. Necessity is prima facie available as a defence to common law crimes and statutory offences. It is, therefore, available to a contravention of the Group Areas Act 36 of 1966 unless the Legislature expressly or impliedly provides otherwise. See S v Adams (supra at 798F - H); Burchell and Hunt (op cit at 284); Glanville Williams Text Book of Criminal Law (1978) at 555. There is no express exclusion of the defence of necessity and the provision for permits (s 26 (1) of the Group Areas Act 36 of 1966) does not implicitly exclude the defence. See Steyn Uitleg van Weite 4th ed at 102 - 106 (and cases cited by the learned author). As to the requirements of the defence of necessity, see Burchell and Hunt (op cit at 283), approved in S v Pretorius (supra at 89); S v Alfeus (supra at 152H); S v Adams 1979 (4) SA at 796A - C. The appellant does not rely on economic
rendering health care services in an emergency situation or otherwise. In a society which still tends to be non-litigious, whether due to the prohibitive costs of legal action or for other reasons, it is unlikely that a health professional who assists someone in a medical emergency in a way that goes beyond his or her scope of practice will be sued on this basis unless the harm caused by the intervention is serious relative to that initially anticipated as a consequence of the emergency itself. Strauss discusses necessity with regard to a situation in which the treatment is against the will of the patient but where the interests of society are at stake for example where medical intervention is necessary to prevent the spreading of a contagious disease. He does not raise the defence in the context of a violation of the provisions of the Health Professions Act or the Nursing Act with regard to scope of practice in circumstances where there was patient consent and for instance the patient’s life was at stake. It is submitted that this is the context in which the applicability of the defence of necessity is more likely to arise in practice, especially in the public sector in which there is a severe shortage of suitably qualified personnel in some areas. There is a constitutional right to life which, it could be argued, a health professional was seeking to uphold in acting outside of his or her scope of practice in an emergency situation. Even, however, where the risk was not to life but to limb there is the constitutional right to bodily and psychological integrity. The question is how far these rights would go as justification for the actions of a health care provider in exceeding his scope of practice when assisting a patient. Even if the patient is begging for assistance, there is no-one else to help and the

necessity which "is not a form of necessity that the law recognizes". See R v Conestria 1951 (2) SA at 324. The list of legally protected interests is not closed. See Jv van der Westhuizen Noodtoestand as Regverdingsgrond in de Strafreg at 553; Burrough and Hunt (op cit at 285 - 8); Glanville Williams Criminal Law - The General Part 2nd ed at 755 - 7. Health is a legally protected interest. See S v Pretorius (supra at 89 - 90); R v Bourne (1939) 1 KB at 692; S v Johnson 53 A 1021 (1902) dealt with in Jerome Hall General Principles of Criminal Law 2nd ed 426. Family life is a legally protected interest. See Levy NO and Another v Schwartz NO and Others 1948 (4) SA at 933; art 6 of the Constitution of the Federal Republic of Germany. The constitutional right to life which, it could be argued, a health professional was seeking to uphold in acting outside of his or her scope of practice in an emergency situation. Even, however, where the risk was not to life but to limb there is the constitutional right to bodily and psychological integrity. The question is how far these rights would go as justification for the actions of a health care provider in exceeding his scope of practice when assisting a patient. Even if the patient is begging for assistance, there is no-one else to help and the
health professional knows what must be done to assist the patient, must he refuse treatment on the grounds that he is not qualified to administer it? What constitutes necessity in such a situation? In this regard there is also the difficult distinction between situations of emergency and urgency. A balancing exercise is required with the constitutional rights of the patient being weighed against the transgression by a health professional of the law or at the least, the rules of his or her professional body for which he or she can be disciplined. In the context of the public sector this is most likely to arise where there is no doctor available and the nurses are the only health professionals around who can help the patient.

Would the situation be any different if the patient was unable to consent because he or she was unconscious? If so would it be worse or better, for the health professional concerned, than a situation in which there is patient consent in the clear knowledge that the nurse is not qualified to perform a particular procedure but there are no alternatives? Generally speaking the law sanctions actions and omissions in an emergency situation which it would not otherwise. An example is the doctrine of negotiorum gestio which allows the interference of one person in the affairs of another (the dominus) in the interests of the latter. What is the position then of a health professional who exceeds his or her scope of practice in such a situation. It is submitted that, if the circumstances were such that there was no alternative, that the patient consented to the risks of the treatment and that the health professional in question exercised the same degree of care and skill in administering the treatment as would have been exercised by a reasonable person in the circumstances, a subsequent delictual action against the health professional is not only unlikely but also should not succeed if his or her actions were in accordance with public policy and constitutional values. The maxim imperitia culpae adnumeratur should be defeated by the maxim volenti non fit injuria. In similar circumstances, where the patient is unable to give consent for some reason, a subsequent action in delict against the health professional could obviously not be defeated by the maxim volenti non fit injuria and the health professional runs a greater risk of having the claim against him or her succeed on the basis of the maxim imperitia culpae adnumeratur.
However, it remains to be seen how the court will interpret the right not to be refused emergency medical treatment in practice.

Strauss\(^{257}\) observes that medical treatment against the will of the patient is legally permissible within very narrow limitations only. The legal ground of justification upon which the doctor or other person may rely in these cases is necessity. He states that a feature of the typical situation to which the doctrine of necessity generally applies is that the interest of a person (the so-called innocent third person) is sacrificed to protect or rescue the lawful interest of another who is endangered either by a natural force ("inevitable evil") or by human agency. Therefore, says Strauss, where a doctor – in order to protect the social interest – administers medical treatment to a person against the latter's will, he (the doctor) may raise the defence of necessity against a charge of assault. Thus a doctor may treat a patient suffering from a dangerous infectious disease against the patient's will, to prevent the disease from spreading. So too, a doctor may vaccinate healthy persons to prevent the outbreak of a dangerous disease in the community. Strauss notes that although the defence of necessity may be relied upon even where the act intended to ward off the danger is directed not against the interest of an innocent third person but against other interests of the person threatened with the danger, such action, if undertaken against the will of the latter, can in his opinion only in exceptional circumstances be justified on the basis of the doctrine of necessity.\(^{258}\)

In the case of *nego*torium *gestio* the courts have observed that the gestor is only entitled to reimbursement of expenses and not to remuneration, the underlying principle being that *nego*torium *gestio* arises from an act of generosity and friendship and is not aimed at allowing the gestor to make a profit out of his

\(^{257}\) Strauss fn 34 supra

\(^{258}\) Strauss (fn 34 supra) refers to Van der Westhuizen JV Noodtoestand as Regverdigingsgrond In die Strafreg (LLD thesis, University of Pretoria 1979) p 585, p 609 in this regard
administration. The gestor must have a clear intention to serve the dominus. The actions of the gestor were usually understood to be in situations of urgency in which there was no time or opportunity to contact the dominus. The negotiorum gestor has a right to be compensated for necessary and useful expenses. This principle is clearly support for the proposition that where a person renders emergency medical treatment in term of section 27(3) of the Constitution, such person is subsequently entitled at least to compensation for necessary and useful expenses. Indeed it is submitted that the concept of negotiorum gestio takes on a certain constitutional significance in the light of section 27(3) of the Constitution. Negotiorum gestio is informed by the morals or values of society. Thus Hahlo observes that in negotiorum gestio, it is generally a good defence to the gestor's claim that the principal had forbidden him to act, but this defence will not avail if the action was morally demanded. The values of South African society are reflected in the Constitution. The right

259 Mt Argun: Sheriff Of Cape Town And Another v Mt Argun, Her Owners And All Persons Interested In Her And Another 2000 (4) SA 857 (C) Williams's Estate v Molenschoot and Schep (Pty) Ltd 1939 CPD 360 at 370 - 2; Blommaert 1981 Tydskrif vir Suido-Afrikaanse Reg 123 at 134

260 In Standard Bank Financial Services v Taday 1979 (2) SA 383 (C) at 387 in Van Zijl JP set out the law in regard to negotiorum gestorum as follows: "Our law in regard to negotiorum gestorum is based firmly, with but minor divergencies, upon the Roman law. In Roman law the payment of the debt of another without a mandate to do so gives rise to the actio negotiorum gestorum contraria and the gestor could recover the amount of such payment together with the interest thereon unless the debtor had some interest in the payment not being made. (See Digest 3.5.43 and 22.1.37.) This quasi-contractual relationship was brought about where the gestor, acting without a mandate, rendered a service to the dominus - in this instance the debtor - and in doing so acted reasonably and in the interest of the dominus with the intention not only of administering the affairs of the dominus but also of being compensated for such administration. This action fell away if the gestor did not intend to serve the dominus, i.e. the gestor mistakenly thought he was administering his own affairs or made payment of a debt sui lucri causa. There is a basic difference between the gestores in these two instances. In the first the gestor acted bona fide, but in the mistaken belief that he was serving the dominus. In the latter instance he acted mala fide in his own interest. These two classes of gestor can be described respectively as the bona fide gestor and the mala fide gestor. Neither of them could sue as negotiorum gestor as neither had the intention to serve the dominus. If, however, the dominus had been enriched at their expense they were each given the right to recover from the dominus on the grounds of unjust enrichment."

261 In Maritime Motors (Pty) Ltd v Von Steiger And Another 2001 (2) SA 584 (SE) the court observed at p 599 that: "He [the counsel for the plaintiff] referred to the following passage in Silke De Villiers and Macintosh The Law of Agency in South Africa 3rd ed at 274: 'Not only can a person (gestor) recover expenses on the ground of unjust enrichment when he has paid another's debt (that of his dominus) for his own benefit (sui lucri causa), but also when he has done so against the express wishes of the debtor (dominus). The circumstances in which the payment was made contrary to the wishes of the dominus are always an important factor in determining whether the payment was or was not justly done.' It appears from the same work that the term negotiorum gestor was originally used to describe the person who acts on behalf of another and solely for the latter's benefit in circumstances of urgency, knowing that he had no such authority to act. There was and could be no question of any relationship arising between the parties by consent. It was further emphasised by the learned authors that the negotiorum gestor plays a constantly shrinking role in the world of ever-improving communications because it is quite clear that an unauthorised person should not interfere in another's affairs if it is possible to get in touch with that other.

to life, the right to human dignity and the right not to be refused emergency medical treatment are all suggestive of a greater duty to rescue than previously existed at common law. Whilst it is not suggested that the values in the Constitution require members of society to go about poking their noses into other people's business, they may well expect positive intervening action in circumstances where public mores require it264.

**Negotiorum gestio** is often associated with actions for unjust enrichment265. It was referred to in the context of health care services in **Behr v Minister of Health**266.

---

264 They would in other words, inform situations such as that in *Minister van Polate v Ewela (fn 63 supra)* in which Rumpff JA observed that: “Dit wil voorkom van die vraagstuk van ‘n late, as deliktuwe onregmatige gedrag, tot ‘n mate van klaarheid ontwikkel het, vgl. Silva’s Fishing Corporation (Pty.) Ltd. v Maweza, 1957 (2) SA 256 (AA); Regal v African Superslate (Pty.) Ltd., 1963 (1) SA 102 (AA); Minister of Forestry v Queenlamba (Pty.) Ltd., 1973 (3) SA 69 (A). As uitgangspunt word aanvaar dat daar in die algemene geen regspig op ‘n persoon rus om te verhinder dat iemand anders skade by nie, al sou so ‘n persoon maklik kon verhinder dat die skade gely word en al sou van so ‘n persoon verwag kon word, op suiwere morele gronde, dat hy daadwerkelik optree om die skade te verhinder. Ook word egter aanvaar dat in seker omstandighede daar ‘n regspig op ‘n persoon rus om te verhinder dat iemand anders skade by. Ver-suim hy om daardie plig uit te voer, ontstaan daar ‘n onregmatig late wat aanleiding kan gee tot ‘n eis om skadevergoeding. Hierdie gevalle is nie beperk tot ‘n eienaar van grond wat deur sy late veroorsaak dat iemand anders deur iets wat in verband staan met sy grond skade by nie of, in die algemeen, tot gevalle waar daar ‘n seker voorafgaande gedrag (“prior conduct”) was nie. ‘n Sekere voorafgaande gedrag van die beheer oor eiendom mag ‘n faktor wees in die totaal van omstandighede van ‘n bepaalde geval waarvan onregmatigheid afgelei word, maar is nie ‘n noodwendige onregmatigheidsvereiste nie. Dit skey of dié stadium van ontwikkeling bereik is waarin ‘n late as onregmatige gedrag beskou word ook wanneer die omstandighede van die geval van so ‘n eard is dat die late nie alleen morele onverantwoordiging ontlok nie maar ook dat die regsoortegting van die gemeenskappy verlang dat die late as onregmatig beskou behoort te word en dat die gelede skade vergoed behoort te word deur die persoon wat nage laat het om daadwerkelik op te tree. Om te bepaal of daar onregmatigheid is, gaan dit, in ‘n gegee geval van late, dus nie oor die gebruiklike “naligheid” van die bonus paterfamilias nie, maar oor die vraag of, na aanleiding van al die feite, daar ‘n regspig was om redelik op te tree.

Rubin L., *Unauthorised Administration in South Africa*, pp. 72 - 73, emphasises the distinction between the true action based on negotiorum gestio and an action based on enrichment: “There can be little doubt that in most cases a negotiorum gestio results in actual enrichment of the dominus. The destruction of the beneficial service rendered by the gestor before the dominus could enjoy it may safely be regarded as a rare occurrence. It is clear, also, that in some cases the result would be the same result would be achieved whether the person rendering the service claimed as a gestor or relied on the principle of unjust enrichment; furthermore, that in such cases, the latter course must be recommended because the intention of the plaintiff would be irrelevant, and to that extent the proceedings would be simplified. It must be borne in mind, however, that in the one case the claim is for all the useful and necessary expenses incurred; in the other, it is based upon an entirely different criterion, namely, the extent to which the dominus has been enriched. In the first case the question is whether they are expenses which the dominus would, himself, have incurred, whether the amount thereof represents his actual enrichment or not; in the second case all considerations other than the actual enrichment of the dominus fall away. It follows, therefore, that there are circumstances in which a plaintiff who, able to base his claim on negotiorum gestio, nevertheless chose to rely on the principle of unjust enrichment, would, thereby, deprive himself of the right to recover part of the amount which he had expended in the course of the gestio. In fact, such a plaintiff would be ill advised to base his claim on the principle of unjust enrichment, unless he had first satisfied himself that he would be entitled to recover no less on that basis than on the basis of negotiorum gestio.”

265 *Behr* 1961 (1) SA 629 (SR). The court said with regard to a husband’s duty to pay for his wife’s medical treatment: “If she had such cause, the husband’s legal duty to support his wife and provide her with necessities continues despite the cessation of the joint household, and the tradesman who supplies her with necessities such as food or clothing, the landlord who lets her a lodging, the professional man who renders her necessary service, are entitled to recover from the husband. As it is put by Dr. Rubin in his handbook on *Unauthorised Administration (negotiorum gestio)* at p. 62, the tradesman or landlord or professional man is discharging a
7.9 Class Actions

In *Permanent Secretary, Department of Welfare, Eastern Cape, and Another v Ngxuza and Others*\(^{267}\) the applicants decided to proceed with a class action under section 38(c) of the Constitution. This case is currently the leading case on class actions in South Africa. In previous cases, to which Cameron J refers in his judgment in *Ngxuza*, the courts had been reticent or reluctant to recognise the possibility of a class action despite the provisions of section 38(c) of the Constitution. *Ngxuza* is interesting because it is a case which demonstrates the risks run by the public sector in terms of class actions for logistical systems failure and for ill advised policy decisions. The court did not consider the merits of the case since the application was for leave to institute representative, class action and public interest proceedings against the provincial authorities, with the assistance of the Legal Resources Centre in terms of s 38(b), (c) and (d) of the Constitution on behalf of everyone else in the province who had also had their grants unfairly and unlawfully terminated. The respondents were among tens of thousands of recipients of social disability grants whose grants had unilaterally and without notice been terminated by the Eastern Cape provincial authorities.

The order the applicants in *Ngxuza* applied for had three essential features. First, it permitted the applicants, assisted by the Legal Resources Centre, to litigate as representatives on behalf of anyone in the whole of the Eastern Province whose disability grants were between specified dates cancelled or suspended by or on behalf of the Eastern Cape government ('the class definition'). Associated with this was an order requiring the Eastern Cape government to provide the Legal Resources Centre with the details of the members of the class kept on computer or physical file in governmental records ('the disclosure order'). The order

---

\(^{267}\) legal duty resting upon the husband; he is a gestor who has administered the affairs of the dominus, i.e., the husband, and is therefore entitled to compensation from him. This is the basis upon which the judgment of Benjamin J., in *Gammon v McClure*, 1925 CPD 137 at p 139, is based, and the husband's liability to pay compensation to the gestor was enforced in *Coetze v Higgins*, 5 E.D.C. 352, a case which has subsequently been referred to with approval (see e.g., *Excell v Douglas*, 1924 CPD 472 at p 481).”

*Ngxuza* 2001 (4) SA 1184 (SCA)
lastly required the applicants to disseminate through various print and radio media in the Eastern Cape and (with the assistance of the provincial government) by notices at pension pay points information about the class action ("the publication order"). The object of publication was to give members of the class the opportunity, if they wished, to opt out of the proceedings envisaged on their behalf.

Cameron JA observed that in the type of class action at issue in this case, one or more claimants litigate against a defendant not only on their own behalf but on behalf of all other similar claimants. He said that the most important feature of the class action is that other members of the class, although not formally and individually joined, benefit from, and are bound by, the outcome of the litigation unless they invoke prescribed procedures to opt out of it. Cameron JA pointed out that although the Constitutional Court had not dealt with the class action specifically, it had pronounced pertinently on the ambit to be accorded all the standing provisions of the interim Constitution, which in material respects are identical to those of the Constitution. He noted that in *Ferreira v Levin NO and Others; Vryenhoek and Others v Powell NO and*  

---

268 Cameron JA observed at p 1192 in *Ngxuza* (fn 267 supra) that: "The class action was until 1994 unknown to our law, 6 where the individual litigant's personal and direct interest in litigation defined the boundaries of the court's powers in it. If a claimant wished to participate in existing court proceedings, he or she had to become formally associated with them by compliance with the formalities of joinder. The difficulties the traditional approach to participation in legal process create are well described in an analysis that appeared after the class action was nationally regularised in the United States through a Federal Rule of Court 8 more than 60 years ago: "The cardinal difficulty with joinder . . . is that it presupposes the prospective plaintiffs' advancing en masse on the courts. In most situations such spontaneity cannot arise either because the various parties who have the common interest are isolated, scattered and utter strangers to each other. Thus while the necessity for group action through joinder clearly exists, the conditions for it do not. It may not be enough for society simply to set up courts and wait for litigants to bring their complaints - they may never come. What is needed, then, is something over and above the possibility of joinder. There must be some affirmative technique for bringing everyone into the case and for making recovery available to all. It is not so much a matter of permitting joinder as of ensuring it."

The class action cuts through these complexities. The issue between the members of the class and the defendant is tried once. The judgment binds all and the benefits of its ruling accrue to all. The procedure has particular utility where a large group of plaintiffs each has a small claim that may be difficult or impossible to pursue individually. The mechanism is employed not only in its country of origin, the United States of America, where detailed rules governing its use have developed, but in other countries as well. The reason the procedure is invoked so frequently lies in the complexity of modern social structures and the attendant cost of legal proceedings:

"Modern society seems increasingly to expose men to such group injuries for which individually they are in a poor position to seek legal redress, either because they do not know enough or because such redress is disproportionately expensive. If each is left to assert his rights alone if and when he can, there will at best be a random and fragmentary enforcement, if there is any at all." [Footnotes omitted]
Others, the majority of the court held that these provisions must be interpreted generously and expansively, consistently with the mandate given to the courts to uphold the Constitution, thus ensuring that the rights in the Constitution enjoy the full measure of protection to which they are entitled. Cameron JA stated that the circumstances of this particular case - unlawful conduct by a party against a disparate body of claimants lacking access to individualised legal services, with small claims unsuitable for if not incapable of enforcement in isolation - should have led to the conclusion, in short order, that the applicants’ assertion of authority to institute class-action proceedings was unassailable. He said that the applicants’ averments about the predicament of other members of the class to some extent rest on hearsay evidence was obvious but that few class actions could be maintained without some element of hearsay. Indeed, he said, if first-hand evidence could be obtained from all those sought to be included, they could as readily be joined, and the need for class proceedings would fall away. He observed that hearsay evidence in any event varies in its import and quality. That produced in this case - from district surgeons, advice offices, civic and political organisations and public authorities - left little doubt that the province’s methods were causing widespread misery and injustice. He pointed out that it is precisely because so many people in South Africa are in a ‘poor position to seek legal redress’ and because the technicalities of legal procedure, including joinder, may unduly complicate the attainment of justice that both the interim Constitution and the Constitution created the express entitlement that ‘anyone’ asserting a right in the Bill of Rights could litigate ‘as a member of, or in the interest of, a group or class of persons’. Cameron JA held that insofar as the judgments in Lifestyle Amusement Centre (Pty) Ltd and Others v Minister of Justice and Others270 and Maluleke v MEC, Health and Welfare, Northern Province271 questioned the availability of the class action in South African law, or suggested different criteria for constituting and defining a class for the

269 Ferreira 1996 (1) SA 984 (CC)
270 Lifestyle 1995 (1) BCLR 104 (C)
271 Maluleke 1999 (4) SA 367 (T)
purposes of a class action, he was unable to agree with them, and to the extent that they are inconsistent with his judgment in *Nguxa*\(^{272}\) they must be regarded as overruled. He observed that there could be no doubt that the Constitution requires that, once an applicant has established a jurisdictional basis for his or her own suit, the fact that extra-jurisdictional applicants are sought to be included in the class cannot impede the progress of the action. He noted that this is the position also in the United States of America, to the laws of which, together with other foreign countries, the Constitution permits the courts to look when interpreting the Bill of Rights and pointed out that in the USA a plaintiff class action (which is materially different from a defendant class action), the presence of a large preponderance of out-of-state plaintiffs does not impede the proceedings once the original litigants have established jurisdiction in the forum court. It was held that it was clear that the order of the Court *a quo* encompassed only those whose social benefits had unlawfully been discontinued in the same manner as those of the respondents. Cameron JA also held that the appellants' objections had no substance. He said the matter in issue was no ordinary litigation- it was a class action expressly mandated by the Constitution and that the Courts were enjoined by section 39(1)(a) of the Constitution to interpret the Bill of Rights, including those provisions relating to standing, so as to 'promote the values that underlie an open and democratic society based on human dignity, equality and freedom'. He stated that the Courts were also enjoined by section 39(2) to develop the common law, which included the common law of jurisdiction, so as to 'promote the spirit, purport and objects of the Bill of Rights'.

From this case it is clear therefore that class actions are permissible and must be recognised in South Africa and also that the problem of provincial boundaries and the jurisdiction of the different divisions of the High Court could be addressed and need not be an obstacle to class actions.

8.1 Introduction

The principles of the law of delict do not differ between the public and the private sectors. However because the private sector and the public sector tend to have certain operational differences with regard to the manner in which they render health care services, in practice there will be different emphases placed on different aspects of the law of delict discussed above within the different sectors. Vicarious liability, for example, is of much greater interest to the public sector than the private sector in terms of the risks it poses simply because the public sector employs more kinds of health professionals than does the private sector. The public sector is concerned with the public demand for health care services in a quite different way to the private sector and legal issues involving the rationing of health care services, for instance, are much more likely to be an issue in the public sector than in the private sector. In the public sector, by contrast, competitive issues are not nearly as significant as they are in the private sector although the sharp divide that once existed between these two sectors in terms of their respective ‘turf’ is becoming less distinct in that changes to medical schemes legislation allow for the designation by medical schemes of public health facilities as preferred providers and some public hospitals are actively targeting as patients medical scheme members who in the
not too distance past would have been the preserve of the private provider sector until they ran out of medical scheme benefits.

These features and other operational differences between the public and private health sectors will become evident from closer examination of the case law involving the two different sectors. This chapter focuses on the case law involving the public sector whilst chapter nine focuses on the case law involving the private sector. For a general discussion of fundamental principles of the law of delict as they relate to health service delivery, see chapter seven of this thesis. An examination of the relevant case law is important because it gives a sense of the manner in which the fundamental principles of the law of delict, discussed in chapter seven, are applied in practice. Since the law does not operate in a vacuum, a comprehensive consideration of the case law is essential to an understanding of the law of delict as it relates to health service delivery. Such a consideration also serves to highlight the extent of the progress that has been made by the courts in ‘constitutionalising’ the law of delict in this field.

8.2 Case Law

8.2.1 Rex v Van Schoor

Facts

The accused was charged on two counts of culpable homicide, in that on the 9th February, 1948, he wrongfully, unlawfully and negligently administered a lethal dose of a certain arsenical preparation known as Neo-Halarsine to each of two patients, Simon Mtoa and Trollie Mandunda. They died from the effects of the preparation. The defence set up on his behalf was that in the circumstances under which the lethal doses were administered there was not that degree of

---

1 Van Schoor 1948 (4) SA 349 (C)
negligence requisite to justify a finding that he had committed the crime of culpable homicide.

In the present case a young doctor was required to administer a dangerous poisonous drug to syphilitic patients. He had no experience in connection with the drug, so that he had to act with caution. He had arrived at Upington on the 2nd February to be Dr. Reitz’s assistant, and on the 9th February, having had no experience in the administration of Neo-Halarsine, he treated a number of syphilitic patients, including the two deceased. When he was at the surgery where Dr. Eksteen, another assistant of Dr. Reitz, was dealing with other patients a number of syphilitic patients arrived and were awaiting attention at the clinic, thirty yards away. The time came for their treatment and Dr. Eksteen, who had intended to deal with them, was still busy. He therefore delegated the duty to the accused. The accused admitted that he had never in the past administered Neo-Halarsine, and though he stated that he had read a certain amount about the drug, it was clear from his evidence that his knowledge was scanty. When called upon by Dr. Eksteen to proceed with the treatment of the patients he apparently asked him how he should set about it. Dr. Eksteen, not realising the limited knowledge of the accused about the use of this drug, simply pointed to a shelf where this drug and other compounds were kept and said:

“Take an ampoule and mix it with 9 c.c. of water, and that would be the maximum dose”.

Neo-Halarsine was kept in ampoules in carton boxes each box containing on the outside in a number of places a description of the compound and the dosage in the ampoule. Inside there were instructions as to how the compound had to be administered. The accused took from the shelf a number of cartons and proceeded to the clinic to administer the doses as contained in each ampoule to each of the patients, the administration being by way of intravenous injections. When Dr. Eksteen gave the instructions in the manner that he did, he was under
the impression that these ampoules contained .09 grams, but without his knowledge other cartons had been placed on that shelf containing ten times the quantity in each ampoule. When the accused took the cartons of compound out he could have seen, just by an ordinary glance, that they were multi-doses. He did not take the precaution to look and see that they were multi-dose. He also failed to read the instructions inside and he admitted that all these drugs were always accompanied by instructions as to the manner of use. In this manner the patients received doses ten times stronger than they should have received. The doses were administered with two fatal results. He apparently noticed that the ampoules contained 0.9 grammes of the compound, and when he was asked by the Court why he accepted that 0.9 gramme doses were the proper doses he merely stated that all the other preparations he had used in the treatment of syphilitic patients were of 0.9 dosage and he assumed that in the administration of Neo-Halarsine it would be the same. In the opinion of the court the accused was not justified in such assumption. The court said that he should not have relied on the very scanty knowledge that he possessed of such a dangerous drug without satisfying himself that he could safely administer a dosage of 0.9 gramme strength. It noted that if he had read the instructions he would have seen what was required of him. If, furthermore, he had been in doubt, he could have taken the ampoule, walked to Dr. Eksteen and consulted him further as the latter was only thirty yards away. The accused failed to do this. Under the circumstances, held the court, the accused did not exercise that degree of care in administering a poisonous drug as was required of a reasonable man, and in the circumstances found the accused guilty of the crime with which he had been charged.

**Judgment**

Both counsel for the Crown and counsel for the defence submitted that the test of what conduct constitutes negligence is the same in a criminal as it is in a civil case. With this the court agreed, but added that in a criminal case the Crown
must discharge the onus of proving the averred negligence beyond a reasonable
doubt, whereas in a civil case a plaintiff discharges such onus if he succeeds on
the balance of probabilities as to the facts of the case. The court added that it
must not be forgotten that as to liability there are no degrees of negligence,
whether the case is criminal or civil.

It stated that a person is either negligent or he is not, and that negligence is the
failure to exercise the requisite care required of a reasonable man in all
circumstances of each particular case. In the case of a person required to do the
work on an expert, for example, a doctor dealing with the life or death of his
patient, the court said that he too must conform to the acts of a reasonable man,
but the reasonable man as viewed in the light of an expert.

The court made the point that even an expert doctor, in the treatment of his
patients, would be required to exercise in certain circumstances a greater degree
of care and caution than in other circumstances. For instance, in the treatment of
patients, where he is dealing with a dangerous drug or medicine, as in the
present case, administering a compound containing arsenic, he would be
required to exercise far greater care than in the administration of a drug not
containing such a poisonous or dangerous ingredient, and not only the
administration of the drug but also the manner in which that administration is
made may necessitate a different degree of care. Thus, if a poisonous compound
is administered through the mouth to go straight into the stomach, its expulsion
from the patient’s stomach if discovered to be harmful would be relatively
simple as compared with the difficulty attendant upon cleansing or purifying the
patient’s system if the harmful compound had been injected into the patient's
veins. In the latter case, therefore, greater care must be exercised against the
administration of an overdose. The court observed that it is thus very difficult to
further particularise a standard of care. Each case depends on its own particular
circumstances.
The court commented that the question of sentence was a difficult matter as the accused was a young man on the threshold of his career. It said that in imposing a punishment it was taking into consideration all the mitigating factors which the counsel for the accused placed before the Court. The court was impressed by the candid manner in which the accused gave his evidence and also by the argument that in this particular case the accused was to some extent the victim of circumstances. It noted that as soon as he discovered his mistake he did what he could for the patients and he withheld nothing from his principals. If it had not been that on this particular day Dr. Eksteen had been so busy; accused would not have been required to deal with these patients. The court also took into consideration the mental anxieties which the accused endured and the prejudice that he would suffer in his profession. It noted that the conviction might count against him in obtaining particular posts where the conviction by itself would be very damaging. It observed that there was also a possibility that the Medical Council may take steps against him and expressed the hope that the conviction and the sentence which it intended to impose would be regarded by the Medical Council as sufficient punishment. The lightest sentence the court felt it could impose was a fine of £10 on each count, or an alternative of fourteen days' imprisonment with hard labour on each count.

Discussion

This case although not expressly so is an illustration of the rationale behind the maxim *imperitia culpae adnumeratur*. The court refused to take into account the fact that the defendant doctor was newly qualified and not acquainted with the drug. He should at least have been able to comprehend the risks posed by his lack of knowledge of which he was clearly conscious at the time when he administered the drug since he had made enquiries from the more experienced doctor working nearby. Furthermore he made no attempt to read the labelling on the medicine which was there for the very purpose of informing users of the correct dosage and other important information. If one professes a skill then one
is judged by the standard of the reasonable person who also professes that skill. The standard is an objective and not subjective. It does not take into account the lack of knowledge and experience of the particular practitioner concerned but looks rather at the knowledge and standard of care that one could reasonably expect from a person in the practitioner’s position. This case also supports that point made earlier about the different levels of risk associated with the different ways in which medicine is administered for example, orally as opposed to intravenously. The more poisonous the medicine the more care one must exercise since the degree of risk to the patient is increased. In this case the young doctor, no doubt stressed by his new environment and the lack of supervision to which he had become accustomed as part of his training simply failed to think. The information he needed to avoid the risk was apparently on the labelling of the containers of the medicine. All he had to do was read. The difference between being a qualified and registered medical practitioner and a student doctor is that there is no longer anyone else to take responsibility for what goes wrong. This case also demonstrates that if one chooses to engage in an occupation that represents a greater risk to peoples’ life and health than many others, the minimum degree of care and skill that is required is concomitantly higher. The lack of adequate instructions from the more experienced doctor in this case could not save the defendant. Although a failure to give adequate instructions to employees dealing with a dangerous substance has been held to amount to negligence on the part of the employer, the court held in this case

---

2 See Oosthuizen v Homegas (Pty) Ltd 1992 (3) SA 463 (O). The plaintiff had instituted action in a Provincial Division for damages arising out of injuries which he had sustained in an explosion on the defendant’s premises in Bloemfontein. It was alleged that the explosion had been caused by the defendant’s negligence. The plaintiff had, at the relevant time, been the manager of the defendant’s Bloemfontein branch. The defendant’s business had been the selling of liquid petroleum gas in cylinders which it had purchased from a supplier and resold to the public. Members of the public also brought smaller gas cylinders to defendant’s premises for filling with gas and defendant would decant gas into their cylinders. It appeared that, in so doing, the defendant acted illegally as it was in conflict with the licence granted to the defendant by the Bloemfontein Municipality. The plaintiff continued to decant gas illegally on the premises in order to meet his sales targets set by the defendant. It has been made clear to the plaintiff and others by the defendant that it would become necessary to close the Bloemfontein branch should the turnover required by the defendant’s head office not be achieved. At the time of the explosion, the process of decanting gas into small cylinders was carried out in a strong-room on the defendant’s premises by means of a machine which had been sent to the defendant’s Bloemfontein branch by its head office. There were no windows or other means of proper ventilation in the strong-room, such proper ventilation being necessary to enable free-flowing air to clear the strong-room of gas and thus prevent the accumulation of gas therein. The evidence revealed that the persons whose responsibility it was to decant the gas had a very rudimentary knowledge of the dangers involved in their work and that none of them, including the plaintiff, had received any training in working with gas. On the day of the explosion, the plaintiff had gone

---
that the defendant had failed to exercise the minimum level of care and skill that was expected of him.

8.2.2 R v van der Merwe

Facts

The accused was a medical practitioner charged with culpable homicide arising from his treatment of the deceased with dicumarol. Evidence showed that the deceased had died of dicumarol poisoning as the result of an overdose.

Judgment

Roper J after defining negligence told the jury that this is a definition which applies to all forms of negligence and that the definition has a special application in the case of a member of a skilled profession such as a doctor because such a person holds himself out as possessing the necessary skill and he undertakes to perform the services required of him with reasonable skill and ability. He is thus expected to possess a degree of skill which corresponds to the ordinary level of skill in the profession to which he belongs. In deciding whether such a person is negligent or not the question is whether, applying the definition of negligence, he has exercised the degree of care and skill which a reasonable man, who is also skilled in the profession, would employ. He pointed out that although a medical practitioner is not required to bring to bear the highest possible degree of professional skill, he is bound to employ reasonable skill and care – not the highest, not the specialist’s skill, but reasonable skill and

3

Van der Merwe 1953 (2) PH H 124 (W)
care. He said that in deciding what is reasonable, regard must be had to the
general level of skill and diligence possessed and exercised by members of the
branch of the profession to which the practitioner belongs. The standard is the
reasonable care and skill which is ordinarily exercised in the profession
generally. Roper J said that this means that a practitioner cannot hide behind the
defence that he did not know enough or was not sufficiently skilled. He said that
before a medical practitioner uses a dangerous drug with which he is unfamiliar
he must satisfy himself as to the properties of the drug and he cannot defend
himself if he is called to account afterwards, by saying that he did not know
because it is his duty to know. The court observed that in South African law the
test for negligence is exactly the same in civil as in criminal cases and that it
makes no difference whether a medical practitioner is sued in the civil courts for
damages or is prosecuted in the criminal courts by the state. He also stated that
in South African law a man is liable criminally for negligence whether his
negligence is gross or slight. The jury returned a verdict of guilty.

Discussion

The point to note about this case is that, as in van Schoor\(^4\), the court stated that
the test for negligence is exactly the same in civil law as it is in the criminal law
— it makes no difference whether a medical practitioner is sued civilly for
damages or by a patient who alleges that he has been negligently treated or is
prosecuted by the state. The burden of proof in criminal cases though, is heavier
than in civil cases since in the latter the plaintiff must only prove his case on a
balance of probability, whereas in the latter negligence must be proven beyond
reasonable doubt. The other point to note is that the same standard of care is not
required of a general practitioner as of a specialist. A specialist is required to
employ a higher degree of care and skill concerning matters within the field of
his speciality that a general practitioner. In fact one of the current problems
within the system of registration of medical practitioners in South Africa is that

\(^4\) Van Schoor fn 1 supra
whilst specialists have defined scopes of practice and may not operate outside of those, a general practitioner’s scope of practice is not defined. There is no regulation that prohibits a general practitioner from performing the work of a specialist. In effect this means that a general practitioner can do anything that a specialist may do if he so chooses and not be taken to task for it by the Health Professions Council whilst a specialist may only operate within a relatively narrowly defined scope of practice. Legal principles such as *imperitia culpae adnumeratur* thus come into their own in situations where a general practitioner attempts to do something that should only be undertaken by a medical specialist although for the poor patient this may be cold comfort indeed. Claassen and Verschoor⁵ state that if a practitioner presents himself as a specialist in the sense that he handles a case from a specialist’s point or view, or he insists on specialist tariffs or he professes to treat a patient with a special degree of knowledge, care, skill and experience, the law will hold him to this pretext. His performance will then have to comply with the standard of conduct of a reasonable specialist belonging to the same speciality the practitioner professes to be a member of. They point out that Potgieter⁶ submits that the opposite is also true, namely that when a professional person indicates that he possesses a lower degree of skill than the required minimum standard, and the client knowingly still accepts his services then the professional person need only comply with the expressed lower standard of conduct. The current writer submits that a medical specialist registered as such with the Medical and Dental Board of the Health Professions Council of South Africa will in practice have a very hard time convincing a court or anyone else that the patient accepted a lower degree of skill in treatment falling within the scope of the specialty for which he is registered since a person can only in terms of the Health Professions Act⁷ be registered as a specialist once he has satisfied the regulatory body that

⁶ Potgieter JM 1985 *Professionele Aansprakelijkheid* Research Report, Department of Private Law, University of Pretoria
⁷ Health Professions Act No 56 of 1974. Section 35(3) states that: “No registered person shall take, use or publish in any way whatsoever any name, title, description or symbol indicating or calculated to lead persons to infer that he holds any professional qualification which is not shown in the register in connection with his name,
he has the necessary skill and experience. The Health Professions Act defines a ‘speciality’, in relation to a medical practitioner, dentist or psychologist, as including any particular subdivision of a speciality in which such medical practitioner, dentist or psychologist specializes or intends to specialize. Section 18 of the Act requires the registrar to keep registers in respect of medical practitioners, dentists, interns, student interns, medical students, dental students, psychologists, intern-psychologists and psychology students or any other health professionals as determined by the council and persons doing community service in terms of section 24A and, on the instructions of the professional board, to enter in the appropriate register the name, physical address, qualifications, date of initial registration and such other particulars (including, in the case of medical practitioners, dentists and psychologists, the name of their speciality or category, if any) as the professional board may determine, of every person whose application for registration in terms of section 17 (2) has been granted. In June 2001 the Minister of Health made regulations in terms of section 35 of the Health Professions Act read together with section 61(1) (f) of that Act concerning specialities and subspecialities in Medicine and Dentistry. In those regulations a general practitioner is defined as “a medical practitioner or a dentist not registered as a specialist”, a “medical specialist” is defined as a “medical practitioner who has been registered as a specialist in a speciality or related specialities and a subspeciality (if any) in medicine in terms of these regulations and a “specialist” is defined as a “medical practitioner or a dentist who has been registered as a specialist in a speciality or relation specialities and subspeciality (if any) recognised in terms of these regulations and who confines his or her practice to such speciality or related specialities and subspeciality (if any)” (writer’s italics). In these regulations the requirements for registration of a

---

8 Regulations Relating to the Specialities and Subspecialities in Medicine and Dentistry Gazette No 22420 Notice No 590 Regulation Gazette No 7098 of 29 June 2001
medical practitioner in the category independent practice (specialist) are set out and include *inter alia* proof of specialist qualifications, the prescribed period of internship training, and further 12 months experience in any one of more of the disciplines of medicine, including research. In terms of section 14 of the regulations, a medical practitioner or a dentist who holds a registration as a specialist in terms of the Act is required in the case of a speciality to confine his or her practice to the speciality or related subspecialities in which he or she is registered and in the case of a subspeciality confine his or her practice mainly to the subspeciality in which he or she is registered and the retention of his or her registration as a specialist in the relevant speciality, related subspecialities or subspeciality is contingent on whether he or she so confines his or her practice.

These regulations further provide that a specialist may charge fees for examinations or procedures which usually pertain to some other speciality only if such examination or procedures are also recognised in his or her speciality, related subspecialities or subspeciality as generally accepted practice and provided that such fees are not higher than those charged by general practitioners for the same examinations or procedures and that such examinations or procedures are carried out only for his or her *bona fide* patients.

In terms of regulation 16(2) a specialist may treat any person who comes to him or her direct for consultation but may not in terms of regulation 15 take over a patient from any other practitioner, whether he or she is a specialist or a general practitioner, except with the consent of the practitioner concerned, which consent may not be unreasonably withheld.

Regulation 18 requires a specialist who is consulted by a patient or who treats a patient to take all reasonable steps to ensure collaboration with the patient's general practitioner.
From the foregoing the differences between general practitioners and specialists are very clear. This said, in South Africa it is not unusual to find a doctor retaining his registration as a general practitioner whilst practising some speciality which interests her and in which she has received further academic and practical training largely because of the requirement that to be registered as a specialist, one must confine one’s practice to the speciality. This is because general practice is just that – general. One can do anything as a general practitioner – even specialised work.

There may well be those who feel that this situation is far from ideal, while others may argue that there is sufficient control in not allowing such a general practitioner to charge the fees that a specialist would in respect of his specialist work. In response to the latter it is noted that there is no legal restriction on what a practitioner can charge in terms of fees provided that he is reasonable, that many patients do not belong to medical schemes and would not necessarily know whether the rate was that of a specialist or a general practitioner and that where a patient’s medical scheme refuses to pay the doctor the higher, specialist, rate, he or she is legally entitled to claim the balance from the patient or to require the patient to pay cash up front and then submit the claim to the medical scheme. It certainly seems that in a legal environment in which a general practitioner may do pretty much as he pleases in terms of work requiring specialised skill and experience, there is much to be said for a more rigorous system of ongoing monitoring and evaluation of general practitioners than presently exists in South Africa. Alternately, there should be attempts to define the scope of practice of a general practitioner to areas and levels within those areas with reference to the scopes of practice of specialists. The problem with this latter solution is that it will not necessarily promote quality of health

9 In fact the Competition Commissioner recently ruled that the practice of publishing tariffs by both the South African Medical Association and the Board of Healthcare Funders which related inter alia to fees that general practitioners and specialists may charge amounts to restrictive horizontal practices in terms of the Competition Act are therefore illegal.

10 The charging of fees that are excessive or unreasonable could constitute unprofessional conduct which is subject to disciplinary action by the relevant Board.
care services amongst general practitioners as would the first suggestion and also, from the point of view of the currently significantly under serviced need of the South African population to be able to access health care services and the severe shortage of medical specialists in the country, it is likely to reduce rather than promote general access to health care services, particularly specialised ones.

It is to be noted that in addition to the legal penalties and sanction that may be imposed upon a health professional for acting negligently, it is also likely that the professional body that has registered him or her will be able to take disciplinary measures in respect of unprofessional conduct. In terms of the Health Professions Act "unprofessional conduct" means improper or disgraceful or dishonourable or unworthy conduct or conduct which, when regard is had to the profession of a person who is registered in terms of this Act, is improper or disgraceful or dishonourable or unworthy. There is a similar definition in the Pharmacy Act\(^\text{11}\) and the Allied Health Professions Act\(^\text{12}\) (AHPA). Although the term is not defined in the Nursing Act\(^\text{13}\), section 28(1) states that the South African Nursing Council may institute an inquiry into any complaint, charge or allegation of improper or disgraceful conduct against any person registered or enrolled under the Act and, on finding such person guilty of such conduct, may impose any of the penalties referred to in section 29(1): Provided that in the case of a complaint, charge or allegation which forms or is likely to form the subject of a criminal case in a court of law, the council may postpone the holding of an inquiry until such case has been disposed of. The question as to the level of care required to be exercised by a general practitioner who practices a certain speciality without being registered as a specialist in that field must, it is submitted, logically be that of a reasonable general practitioner who is also

---

11 Pharmacy Act No 53 of 1974. In terms of this Act: 'unprofessional conduct' means improper, disgraceful or dishonourable or unworthy conduct or conduct which, when regard is had to the profession of a person who is registered in terms of this Act, is improper or disgraceful or dishonourable or unworthy;

12 Allied Health Professions Act No 63 of 1982. In terms of the AHPA: 'unprofessional conduct' means improper, disgraceful, dishonourable or unworthy conduct or conduct which, when regard is had to the profession of a person who is registered in terms of this Act, is improper or disgraceful or dishonourable or unworthy;

13 Nursing Act No 50 of 1978
practising that speciality. It cannot be that of the reasonable specialist in that speciality and who is registered as such and who practices exclusively in that field. If, however, the general practitioner holds himself out to be a specialist then he is publicly professing a certain degree of skill and, as Claassen and Verschoor\textsuperscript{14} then rightly state, he should be judged by the same standard as a specialist would be judged. In the context of the Cuban doctors that are sent by Cuba to work in South Africa in the public sector in terms of a government-to-government agreement with Cuba, these doctors are registered in a special category by the Health Professions Council of South Africa as general practitioners in the public sector but usually in connection only with a particular field of practice such as obstetrics and gynaecology for example. Such practitioners thus have a special registration as general practitioners which allows them to practice only in the field designated on their registration certificate. This does not mean that they are medical specialists in the sense referred to in the Health Professions Act and regulations. They have not done the extra periods of practical training and engaged in the further studies required of specialists. They are general practitioners confined to a particular practice area and should therefore also be judged by the standard of the reasonable general practitioner rather than that of the reasonable specialist.

Claassen and Verschoor\textsuperscript{15} point out that where a practitioner treats a patient without prior consent, and in the absence of a legally recognized ground of justification, he commits assault. However, where the practitioner negligently injures the patient the wrongdoing will not be classified as assault because assault requires fault in the form of intention. They state that even where consent is obtained by a physician, he may still be guilty of contravening a statutory prescription or assault if his conduct is in conflict with the law. It is submitted that informed consent only protects the health professional or health institution where the act or omission complained of falls within the ambit of the

\textsuperscript{14} Claassen and Verschoor fn 5 supra

\textsuperscript{15} See Claassen and Verschoor (fn 5 supra) p 127 and the footnotes
consent\textsuperscript{16}. Those acts and omissions falling outside of the ambit of the consent are obviously not covered by it and since medical interventions in South Africa are \textit{prima facie} unlawful, the absence of consent or a legally recognised justification will mean that they are unlawful. Thus when a patient submits herself to treatment by a doctor it cannot be said that an implied or tacit term of the contract or an element of the relationship is the understanding that the doctor can act carelessly or negligently in writing out a prescription or administering an overdose of a drug.

Strauss\textsuperscript{17} observes that there have been several cases in South Africa in which a doctor was held legally liable for drug damage but these cases invariably involved over-prescribing or over-administration, on account of ignorance or carelessness on the part of the doctor, of drugs that are quite safe when used in accordance with the manufacturer’s directions. He states that in a case of a drug which was properly designed, developed, tested, registered and distributed and which was prescribed in conformity with the statutory standards, and which is now alleged to be potentially hazardous to patients, proof of negligence on the part of a doctor may be well-nigh impossible. If there is a strong indication that there was no negligence on the part of the manufacturer, this factor, he submits will weigh even more heavily in the favour of the doctor. Strauss does say that it is not inconceivable that in exceptional circumstances a doctor may be held liable for a defective drug. He notes that there is the possibility that a drug despite all the precautions taken to ensure its safety turns out to be unsafe. The thalidomide disaster immediately springs to mind, he says, but other examples in recent pharmaceutical history may also be cited. Without a doubt there is a duty upon the doctor to keep himself adequately informed on developments in the pharmaceutical field in so far as his profession is affected. Strauss points out that, for example, a doctor were to prescribe or administer a drug despite the

\textsuperscript{16} See Strauss SA and Strydom MJ \textit{Die Suid-Afrikaanse Geneeskundige Reg} p 9 and p 330 who point out that a patient who consents to an operation must also consent to the accompanying procedures, eg the administration of anaesthesia

\textsuperscript{17} Strauss SA \textit{Doctor, Patient and the Law: A Selection of Practical Issues}
fact that its newly discovered risks have been fully described in a medical journal circulating in his area of practice, an inference of negligence can clearly be drawn. This will also be the case when a manufacturer has withdrawn a drug, the safety of which has become suspect and has given wide notice of its decision. Strauss also gives the example in the case of doctors who do their own dispensing or a doctor who gratuitously hands over pharmaceutical samples to a patient, that where the particular medicine has become unsafe or ineffective due to contamination or a chemical reaction, the doctor could be held liable in delict for any harm suffered by the patient as a result18. The present writer respectfully concurs with these views.

8.2.3  

Esterhuizen v Administrator of Transvaal19

Facts

In 1945, when plaintiff, was ten years old, a small nodule showed itself immediately below the ankle of her right leg which she then injured. As a result she experienced some discomfort and her father took her to a medical practitioner. He treated the injury, but also excised the nodule which he submitted for analysis to the South African Institute for Medical Research. It was identified by Dr. Murray, a witness for plaintiff, as a manifestation of a disease known as Kaposi’s haemangiosarcoma. This is a malignant tumour occurring mainly on the extremities from there spreading centrally towards the trunk and other parts of the body. It originates in more than one centre at the same time. As the nodules of the disease grow, they eventually coalesce to form larger tumours which are destructive to the neighbouring tissues and lead to ulceration of the skin, destruction of the underlying tissues, infection and ultimately, if not checked in its progress, to death of the patient either by infection, some other incidental disease, haemorrhage or spreading of the disease to vital organs. It is a disease which is very intimately related to the

18 Strauss (fn 17 supra) at p 294
19 Esterhuizen 1957 (3) SA 710 (T)
blood vessels and the cells of which it is composed. It is a slowly but relentlessly progressive disease and the general consensus of opinion at that time was that the average life expectancy of a patient is five to ten years. However cases of death occurring in a shorter period than a year had been recorded and others were on record in which the patient survived for as long as forty years.

The plaintiff’s mother was at the time advised that it was necessary for the plaintiff to proceed to the Johannesburg General Hospital for treatment. She was informed that the site where the nodule had been excised would receive X-ray treatment. The plaintiff was taken by her father to the Johannesburg General Hospital and there received superficial X-ray treatment over the site of the excision. She was then sent home. The X-ray machine used for that purpose was referred to as the Chaoul Unit. Plaintiff experienced no pain or discomfort; a week or two later the skin peeled off over the site which had been treated and the wound healed completely. Some three months later, however, further nodules appeared on her right leg, foot and toes, under the left foot, and on the dorsum of the right hand. Once more, accompanied by her father, she was taken to the same institution and there received superficial therapy treatment from the 8th to the 13th October, again by means of the Chaoul Unit, whereafter she was sent home without any ill effects. She was given instructions, however, to report back from time to time, but in any event to do so immediately on new or fresh nodules making their appearance.

During the period 1945 to 1949 she reported back on about ten occasions - but received no treatment. By October 1949, however, fresh nodules once more appeared on all of the plaintiff’s extremities. Her father and natural guardian had died previously. Her mother was then living with a second husband in Swaziland, whilst plaintiff resided with her grandfather at Volksrust in order to enable her to attend school there. When the plaintiff’s mother was advised of the reappearance of these nodules, she instructed the grandfather to take
plaintiff to the Johannesburg General Hospital for treatment - and in so far as plaintiff’s mother was concerned once more to receive such treatment as might be deemed best by the institution’s medical authorities. The mother expected that the treatment on this occasion would be the same as on the two previous occasions, and never thought or entertained any idea that it might carry any risk or danger to plaintiff. In October 1949, the plaintiff was admitted as a patient in the Johannesburg General Hospital. Shortly thereafter one of the nodules was surgically excised after an aunt of plaintiff had duly signed and completed a document consenting to operative treatment being carried out on the plaintiff.

At the hospital Dr. Cohen took charge of the plaintiff for purposes of administering X-ray treatment to her. At the time he had held a Diploma in Medical Radiotherapy (London University) for some six months, having qualified in April of that year. He had graduated as a doctor at the University of the Witwatersrand in 1942, and after doing further medical and surgical practice in various hospitals in South Africa, proceeded to America in 1946, where he gained some therapy experience - without graduating or obtaining any degree - at the Bellevue Hospital. He then attended the London University, where he studied for the Diploma, which he obtained after some sixteen months.

He stated in evidence that, having examined the plaintiff, he concluded that she required ‘radical’ treatment. Although aware of the fact that she had received superficial therapy treatment from a certain Dr. Krige on two previous occasions, he decided - as, in his opinion, the disease was rapidly progressing, leaving the plaintiff with an estimated expectation of life of one year - that she required not only deep therapy treatment, but of a dosage measured in ‘r’ (roentgen) units which, could only be described as ‘radical.’ Dr Cohen admitted that the dosage and manner of treatment which he worked out and decided to apply to plaintiff was of such a nature or order that he knew beforehand that plaintiff would:

i. Suffer severe irradiation of the tissues in the treated areas and could possibly sustain ulceration of these tissues.
ii. Become disfigured or deformed in the sense that permanent harm would be
done to her epiphyses (growing bone ends) in the treated areas, causing a
shortening of the limbs and furthermore that cosmetic changes would set in -
a feature described by Dr. Cohen as ‘permanent visible damage to the skin -
a change in pigmentation - causing the skin to become lighter or darker or
blotchy with light and dark patches; the skin might become drier and
thinner, stopping sweating in the affected area.’

iii. Run a risk and be subjected to a possibility of having to suffer amputation of
the treated limbs. These consequences and risks arising from the treatment
and dosage worked out by Dr. Cohen were known only to himself and no-
one else. The plaintiff’s mother had no knowledge of any danger and
anticipated none. The plaintiff, who had been admitted to a ward under the
charge of a certain Dr. Adno, enquired from him - before treatment was
administered - what was going to happen to her, and was told not to worry
about it. As a child of fourteen years, she had no reason to anticipate any
danger. The danger, if any, accompanying superficial therapy treatment such
as the plaintiff received on the two earlier occasions by means of the Chaoul
Unit was infinitely less than that attendant on the proposed or contemplated
treatment and dosage for which purpose the Maximar Unit was to be used.

There was ample time and opportunity on hand to have procured the consent of
plaintiff’s guardian to the proposed treatment. Dr. Cohen, the only person with
knowledge of the danger and consequences which might or would ensue, was
asked in cross-examination whether he did not think that he should have
afforded the parents an opportunity to consider the situation and he replied:

‘It was my function to cure the disease if it was possible . . . I was fully aware that there
would be cosmetic changes... after radiotherapy. I did not consider it necessary to
discuss these details with the patient and I had never met the patient’s parents . . . . It is
not the usual procedure in the radiotherapy department to ask the parents to come.’

During the period of the 1st up to and including the 5th November, 1949, the
plaintiff received deep therapy treatment under the Maximar Unit, in accordance
with the technique and the dosage evolved by Dr. Cohen. Her two feet and legs were treated up to approximately the knees whilst both hands were treated up to the wrists. Ten days after the end of the treatment plaintiff noticed blisters forming on the treated areas and experienced a burning sensation. Her condition became worse and according to her mother, who had in the meantime been summoned by plaintiff's aunt, a foul stench hung about the plaintiff's bed. On the 31st December, 1949, the plaintiff, at the request of her mother was transferred to the Volksrust Hospital and later to the Piet Retief Hospital. She was finally readmitted to the Johannesburg General Hospital, where on the 17th May 1950, her right leg was amputated just below the knee. This was followed by a similar amputation of the left leg, necessitated by post-radiation malignant ulcers, and an additional amputation of portion of the stump of the right leg. In 1954 two fingers of her left hand were amputated for the same reason, and the evidence was clear that it would be necessary to amputate the whole of the left hand. In August, 1955, the right hand was amputated at the wrist, resulting in plaintiff now being minus legs, a right hand and faced with the certain prospect of having to lose her left hand - which in any event had been rendered useless by the treatment.

The court observed that even with the treatment the plaintiff was not 'cured' in the ordinary sense of the word. The evidence showed that as the disease was multi-centric in origin and that it could re-occur at any moment in the plaintiff, notwithstanding the fact that she had lost her limbs. A medical expert, Dr. Murray, stated that whilst there was a reasonable prospect that the disease would not re-occur, he could not say, nor was he prepared to say, that the plaintiff has been permanently cured of the disease. The court accepted his opinion. The plaintiff claimed damages against defendant in his capacity as the Administrator of the Transvaal Province, representing the Provincial Administration, under whose jurisdiction public hospitals in the Province were vested by the provisions of Ordinance No 19 of 1946, of which the Johannesburg General Hospital happened to be one.
Judgment

The court, referring to Stoffberg v Elliot, noted that:

‘In the eyes of the law every person has certain absolute rights which the law protects. They are not dependent on statute or upon contract, but they are rights to be respected, and one of the rights is absolute security to the person. . . . Any bodily interference with or restraint of a man's person which is not justified in law, or excused in law or consented to, is a wrong and for that wrong the person whose body has been interfered with has a right to claim such damages as he can prove he has suffered owing to that interference.’

It also observed that in Ex parte Dixie, Millin J held with reference to a surgical operation, that, as a matter of law,

“such an operation cannot lawfully be performed without the consent of the patient, or, if he is not competent to give it, that of some person in authority over his person. The fact that he is a patient in this hospital does not entitle those in charge of it to perform any surgical operation upon him which they may consider beneficial. They would only be justified in performing a major operation without consent where the operation is urgently necessary and cannot with due regard to the patient's interests be delayed.”

The court observed that the sole question to be answered was whether it had been shown that the treatment to which the plaintiff was subjected in November, 1949, took place without lawful consent - a matter which gave rise in itself to yet a further question, viz., what constitutes consent. It was contended for the defendant that Dr Gouws of Volksrust informed the parents that ‘X-ray treatment’ at the Johannesburg General Hospital was essential. It was proved that the mother at the time thought that unless the plaintiff received such treatment, death would ensue within a short length of time; and it was reasonable to accept that the father of the plaintiff must have shared in that state of mind. The mother, originally and also in 1949 at a time when she was the plaintiff’s legal guardian, was content to leave the choice and manner of treatment to the medical authorities at the hospital - and although there was no

20 Stoffberg v Elliot 1923 CPD 148
21 Dixie 1950 (4) SA 748 (W) at p 751
express consent to the treatment, these circumstances coupled with the fact that the father originally, and the grandfather in October, 1949, at the request of the mother, brought the plaintiff to the institution for the very purpose of receiving X-ray treatment, constituted proof of lawful consent to the treatment which the plaintiff in fact received in November, 1949. It was conceded that neither the guardian nor the patient was aware of any possible danger or risk attaching to the treatment - a feature so the argument proceeded, entirely irrelevant and of no consequence to the determination of the defendant’s liability. It was contended, that the facts showed that the plaintiff’s guardian, if not originally, then certainly in 1949, in effect stated to the defendants servants: ‘Do what you think best - preserve life regardless of consequences,’ which was consent wide enough to cover the treatment meted out to the plaintiff and which negatived any idea of an unlawful assault on her.

The court was not prepared to uphold this contention. Quoting Lampert v Hefer, N.O., it said that generally speaking, all the numerous authorities without exception, indicate that, to establish the defence of volenti non fit injuria the plaintiff must be shown not only to have perceived the danger, for this alone would not be sufficient, but also that he fully appreciated it and consented to incur it. Bekker J referred to Rompel v Botha in which Neser J, held:

“There is no doubt that a surgeon who intends operating on a patient must obtain the consent of the patient. In such cases where it is frequently a matter of life and death I do not intend to express any opinion as to whether it is the surgeon’s duty to point out to the patient all the possible injuries which might result from the operation, but in a case of this nature which may have serious results to which I have referred, in order to effect a possible cure for a neurotic condition, I have no doubt that a patient should be informed of the serious risks he does run. If such dangers are not pointed out to him then, in my opinion, the consent to the treatment is not in reality consent - it is consent without knowledge of the possible injuries. On the evidence defendant did not notify plaintiff of the possible dangers, and even if plaintiff did consent to shock treatment he consented without knowledge of injuries which might be caused to him. I find accordingly that plaintiff did not consent to the shock treatment.”

22 Lampert 1955 (2) SA 507 (AD) at p 508 where Schreiner JA stated: “it is usual to include in the defence volenti non fit injuria, or, as I call it for convenience, consent, cases of voluntary acceptance of risk as well as cases of permission to inflict intentional assaults upon oneself, as in the case of surgical operations.”

23 Rompel T.P.D., 15th April, 1953, unreported. Also referred to in Strauss fn 17 supra at p 10
Bekker J held that a therapist, not called upon to act in an emergency involving a matter of life or death, who decides to administer a dosage of such an order and to employ a particular technique for that purpose, which he knows beforehand will cause disfigurement, cosmetic changes and result in severe irradiation of the tissues to an extent that the possibility of necrosis and a risk of amputation of the limbs cannot be excluded, must explain the situation and resultant dangers to the patient - no matter how laudable his motives might be - and should he act without having done so and without having secured the patient’s consent, he does so at his own peril. When it was suggested that the plaintiff only had one year to live, according to Dr Cohen and that consequently the treatment was a matter of life and death, the court stated that it was common cause that there was sufficient time to have obtained the consent of plaintiff’s guardian if that had been thought desirable or necessary. The court said that the test to be applied in the determination of the question whether a doctor acted negligently or unskilfully in any given case emerged clearly from the decision of Wessels, J.A., in *van Wyk v Lewis* 24 who held that:

“the surgeon (must perform) the operation with such technical skill as the average medical practitioner in South Africa possesses and (must) apply that skill with reasonable care and judgment . . . (he) is not expected to bring to bear on a case entrusted to him the highest possible professional skill but is bound to employ reasonable skill and care and is liable for the consequences if he does not.”

Counsel for the defendant referred the court to the remarks of Van Den Heever, J.A., in *Herschel v Mrupe* 25 who stated:

“The concept of the *bonus paterfamilias* is not that of a timorous faintheart always in trepidation lest he or others suffer some injury; on the contrary, he ventures out into the world, engages in affairs and takes reasonable chances.”

Counsel contended on behalf of defendant that the facts show, not only that Dr. Cohen was not negligent, but at most, that he took ‘a reasonable chance’ which

---

24 *Van Wyk v Lewis* 1924 AD 438 at p 456
25 *Herschel* 1954 (3) SA 464 (AD) at p 490

902
he was obliged to have done in the circumstances of this case, and that if any error was committed, it was an error of judgment is a matter of opinion.

The court nonetheless found as a fact that the dosage and technique employed in the plaintiff's case resulted in the administration to her of X-rays of too high an order, and which exceeded the limits of skin or tissue tolerance, so in the end causing the necrosis and leading to the amputation of these limbs and that he acted without ordinary or reasonable care in a number of respects, which as a matter of probability, either individually or conjunctively, contributed towards the dosage which exceeded the limits of skin or tissue tolerance. It came to the conclusion that the plaintiff's misfortune was not occasioned by chance, or by an error of judgment in a matter of opinion, but by actions on the part of the therapist which fell short of ordinary care and diligence and that the defendant was liable to the plaintiff on both the main and the alternative cause of action. The court awarded damages in respect of artificial limbs, future medical expenses, procuring the services of an assistant and in respect of loss of amenities, disfigurement, pain and suffering.

Discussion

The argument in Esterhuizen\footnote{Esterhuizen fn 18 supra} revolved around whether or not the specific consent of the patient or her guardian was necessary and what constituted such consent. The court emphasised the fact that the consent had to be specific and that it was necessary on the basis of the common law right of absolute security of the person. Blanket consent to the general nature or circumstances of the treatment is not sufficient to save the health care provider from a claim in delict\footnote{See National Media Ltd And Another v Jooste 1996 (3) SA 262 (A) in which the court held that: "Consent is only a valid defence for an action for invasion of privacy provided that the invasion takes the form consented to... This principle finds expression in, for example, O'Keeffe v Argus Printing & Publishing Co Ltd 1954 (3) SA 244 (C), where the plaintiff had consented to her photograph being used to illustrate a news item, but not as an advertisement. Similarly in Kidson v SA Associated Newspapers Ltd 1957 (3) SA 461 (W) the plaintiffs consented to their photographs being used to illustrate a nursing journal, but not in a nationwide appeal for funds in a popular Sunday newspaper. Accordingly, where the consent is based on an express agreement}. This is due to the manner in which the courts apply the doctrine of...
volenti non fit injuria. The doctrine includes both consent to injury and consent to the risk of injury. Neethling et al point out that the expression ‘voluntary
At common law money paid under economic compulsion could be recovered in an action for money had and received. The compulsion had to be such that it was deprived of "his freedom of exercising his will". It is doubtful, however, whether at common law any duress other than duress to the person sufficed to render a contract voidable. American law now recognises that a contract may be avoided on the ground of economic duress. The commercial pressure alleged to constitute such duress must, however, be such that the victim must have entered the contract against his will, must have had no alternative course open to him, and must have been confronted with coercive acts by the party exerting the pressure. Recently two English Judges have recognised that commercial pressure may constitute duress the presence of which can render a contract voidable. Both stressed that the pressure must be such that the victim's consent to the contract was not a voluntary act on his part. In their Lordship's view, there is nothing contrary to principle in recognising economic duress as a factor which may render a contract voidable, provided that the basis of such recognition is that it must amount to a coercion of will, which vitiates consent. It must be shown that the payment made or the contract entered into was not a voluntary act.

In Malilang and Others v My Hooda Pearl 1986 (2) SA 714 (A), Corbett JA commented as follows at p 730: "I turn now to the defence of duress. The form of duress here under consideration is what has been termed 'economic duress'. A number of recent decisions in England appear to have established that in English law commercial pressure exerted on one party to a contract in order to induce him to enter into the contract may amount to economic duress entitling that party to avoid the contract, provided that the pressure amounts to a coercion of the will which vitiates consent. (See Occidental Worldwide Investment Corporation v Skibs AS Avanti (The Siloens and the Siloare) [1976] 1 Lloyd's Rep 293 at 335; North Ocean Shipping Co Ltd v Hyundai Construction Co Ltd and Another (The Atlantic Baron) (supra) at 1182; Pao On and Others v Lau Yiu Long and Others (supra) at 635–6; Universe Tankships Inc of Monrovia v International Transport Workers' Federation (The Universe Sentinel) [1980] 2 Lloyd's Rep 523 (CA) at 530–1, 541; [1982] 2 All ER 67 (HL) at 75–6, 88–9; Alec Lobb (Garages) Ltd and Others v Total Oil GB Ltd [1983] 1 All ER 944 (Ch) at 960.)" The court in Malilang accepted the concept of economic duress as being applicable within the context of the South African law of contract.

The court in Van Den Berg & Kie Rekkenkundige Beamptes v Boomprops supra distinguished Malilang's case, however, on the basis that it was designed in terms of English marine law under the Colonial Courts of Admiralty Act 1890 (32 and 34 Vict Ch 27) and that the Appellate Division had been obliged to apply it in the circumstances. It said that: "Soos reeds gemeld is die uitspraak van Corbett AR in Malilang se saak geen gesag as soos dit in die Engelse reg erken word en basis daarop dat dit vrywillig wisselwerk behels." The court in Van Den Berg & Kie Rekkenkundige Beamptes went on to hold that the concept of economic duress does not form part of South African law. It observed that "Dat daar interessante ontwikkelinge op hierdie gebied tans in die Engelse reg plaasvind en wie oj, 'n baie bree front is waar. Sien onder andere dat ons eie regsbeginsels oor 'duress' oorgeneem het en dat dit weer oortuig dat die beginse van 'economic duress' in die Engelse reg deel is van ons reg nie. Ek is na geen sogenaamde 'economic duress' in die Engelse reg erken nie. Die concept is meer dan dat. Freedom can primarily be exercised by the absence of coercion or constraint. If a person is compelled by the state or the will of another to a cause of action or inaction which he would not otherwise have chosen, he is not acting of his own volition and he cannot be said to be truly free. One of the major purposes of the Charter is to protect, within reason, from compulsion or restraint. Coercion includes not only such blatant forms of compulsion as direct commands to act or refrain from acting on pain of sanction, but also any activity which is imposed on the individual without his free and voluntary consent. This includes actions and abstentions which are dictated by external pressure. It is this type of pressure, which can amount to economic duress, that is relevant here.

In a different context the court in Kothe v Kothe 2003 (3) SA 628 (T) observed that: "Dickson CJ in the Supreme Court of Canada (R v Big M Drug Mart Ltd [1985] 15 CR(4) 644 (SCC)); [1985] 1 SCR 265; 18 CCC (3d) 359, 1886) LRC (Constr) 322): 'A truly free society is one which can accommodate a wide variety of beliefs, diversity of tastes and pursuits, customs and codes of conduct. A free society is one which aims at equality with respect to the enjoyment of fundamental freedoms and I say this without any reliance upon s 15 of the Charter. Freedom must surely be founded in respect of the inherent dignity and the inviolable rights of the human person. The essence of the concept of freedom of religion is a right to entertain such religious beliefs as a person chooses, the right to declare religious beliefs openly and without fear and hindrance or reprisal, and the right to manifest religious belief by worship or by teaching and assimilation. But the concept means more than that. Freedom can primarily be exercised by the absence of coercion or constraint. If a person is compelled by the state or the will of another to a cause of action or inaction which he would not otherwise have chosen, he is not acting of his own volition and he cannot be said to be truly free. One of the major purposes of the Charter is to protect, within reason, from compulsion or restraint. Coercion includes not only such blatant forms of compulsion as direct commands to act or refrain from acting on pain of sanction, but also any activity which is imposed on the individual without his free and voluntary consent. This includes actions and abstentions which are dictated by external pressure. It is this type of pressure, which can amount to economic duress, that is relevant here."
assumption of risk’ by contrast, is sometimes used to imply consent to the risk of injury, a ground of justification, and sometimes to refer to contributory intent (a ground for excluding fault or culpability). The recommendation that one should ascertain precisely what happened in a particular situation — whether the wrongfulness was excluded because of the consent of the injured, or whether the negligence of a defendant was cancelled by the plaintiff’s intention (contributory intent) or whether, although the plaintiff neither consented not had contributory intent, he was in fact contributorily negligent in respect of his damage because he acted in a manner different from that of the reasonable man.

It is submitted that from a certain perspective the application of the principle of volenti non fit injuria in the law of delict may be seen as the recognition of a contract between the relevant parties to the effect that the one agrees to the contemplated harm and will not ‘hold it against’ the other who is inflicting the harm. However, it is not necessarily the case that the maxim represents a contract in every instance. It can be applied in circumstances where no contract exists. A contract only arises where there is an intention between the parties to

coercion includes indirect forms of control which determine or limit alternative courses of conduct available to others. Freedom in a broad sense embraces both the absence of coercion and constraint, and the right to manifest beliefs and practices. What may appear good and true to a majoritarian religious group, or to the state acting at their behest, may not, for religious reasons, be imposed upon citizens who take a contrary view.”

In Ex Parte Coetsee et Uxor 1984 (2) SA 363 (W) the applicants had married out of community of property on 5 March 1982. An antenuptial contract was executed on the same day and registered on 17 March 1982. In an application for cancellation of the contract, the applicants contended that they had concluded the contract reluctantly and purely as a consequence of the pressure exerted by a parent, who had threatened to exclude them from access to his home should they marry in community of property. The parties were young and inexperienced, and the parental pressure, coupled with the advice of a minister to preserve the family peace, had led to a decision which subsequently, because of dissatisfaction and self-reproach, threatened the happiness of their marriage. It was held that, while the pressure exerted by the father did not constitute undue influence, coercion or menace, the parties had, on the facts, shown good cause for cancellation. The contract accordingly cancelled as from the date of the order to that effect. See also BOE Bank Bpk v Van Zyl 1999 (3) SA 813 (C). In BOE Bank Bpk v Van Zyl 2002 (5) SA 165 (C) it was held that an overarching ground of avoidance based on the absence of bona fides or the improper procurement of consent was not recognised in South African law. The court said that was no authority for it in the decisions of the Supreme Court of Appeal, and it was not for the Court to depart from settled rules without proper direction from that source. There was also no authority for the statement that the distinctions between duress, misrepresentation and undue influence as well as the recognised requirements for these concepts had to be dispensed with. The court emphasised that for avoidance of a contract on the ground of duress, the threat must be one of imminent or inevitable harm. It said that the threat that a family member would be prosecuted if the suretyship agreement was not signed did not satisfy this requirement and that the feared harm, viz incarceration of family member, had to be considered in the light of the relevant facts and legalities. The decision in BOE Bank Bpk v Van Zyl 1999 (3) SA 813 (C) to the effect that a suretyship agreement had been entered into under duress was consequently reversed.

See Neethling et al in 28 supra p 97 and footnote 346.
create one. Consent in the sense of the maxim\(^{30}\) can be a precursor to a contract but it is not proof in itself that a contract came into existence between the parties\(^{31}\). Contracts can be verbal or written, tacit, implied or express. The law of delict may be seen as saying in the context of health service delivery that bodily injury is harmful but if a patient consents (or agrees) to such injury and its consequences then this justifies the harm in that it does away with the element of wrongfulness required for a successful delictual claim. In the context of private health services delivery at least, consent is likely to be as much a contractual concept as it is delictual due to the fact that the patient is usually in terms of the same transaction contracting for health services and undertaking to pay therefor. However, the consent could also be precontractual and may be one of the conditions that induced the contract rather than a term of the contract itself.

In light of the foregoing discussion, an interesting question arises in the context of the contractual or non-statutory limitation of constitutional rights as to whether the application of the principle in delict of *volenti non fit injuria* in the

\(^{30}\) The maxim requires more than just 'mere' consent. It was stated by the court in *Van Wyk v Thrills Incorporated (Pty) Ltd* 1978 (2) SA 614 (A) that: "To sustain this defence [of volenti non fit injuria] respondent must show not merely that the deceased had knowledge of the danger, but also that with the full appreciation of its nature and extent he voluntarily elected to encounter it, or, as it is usually put, consented to take the risk upon himself. See *Waring & Gillow Ltd v Sherborne* 1904 TS 340. Although *Santam Insurance Co Ltd v Vorster* 1973 (4) SA 764 may be distinguished from the instant case on the basis that the latter deals with the assumption of a known risk, the following dictum at 777B is highly relevant: "... it is I think fair to say that the general tenor of the judgments is to decide against the applicant on the volenti ground." Again in *Waring & Gillow Ltd v Sherborne* (supra at 344) Innes CJ said that this type of defence must be applied 'cautiously and with circumspection'. No warning specifically referred to the date or dealt in any way with the additional danger to be encountered there. The warnings themselves were silent as regards possible acts of negligence on the part of the respondent."[writer's italics]

With regard specifically to warnings that would obviate liability and effectively activate the acceptance of the risk by the customer, the court stated that: "An exemption of liability as set out in the above mentioned warnings must be held to exclude liability for negligence. *South African Railways & Harbours v Lyle Shipping Co* 1958 (3) SA 416; *Essa v Divaris* 1947 (1) SA at 767. As respondent did not endeavour to exclude negligence in its warnings or exemption clauses on its tickets, the warnings themselves were insufficient to exempt respondent from liability."

\(^{31}\) *Volenti non fit injuria* is usually raised in the form of a defence rather than the term of an agreement. Thus Harms JA observed in *National Media Ltd And Another v Jooste* cit 27 supra that: "This does not mean that the delictual nature of the claim is thereby compromised. The breach of the agreement is relevant to the claim in the sense that it may be a determinant of the scope of the complainant’s ‘privaathoudingswil’. Also, the general sense of justice of the community requires, in my judgment, due compliance with the terms of such an agreement. If, as here, it is breached intentionally, the breach may be a relevant fact to consider in assessing the wrongfulness (in a delictual context) of the publisher’s action. On the other hand, had publication taken place according to the terms of the agreement, the publication of the erstwhile private facts could not have been wrongful for several reasons, such as lack of ‘privaathoudingswil’, consent and *volenti non fit injuria*. (Where the one defence begins or the other ends is, from a practical point of view, difficult to discern and probably often of no consequence.)"
context of health services delivery constitutes a waiver of the patient’s constitutional rights to bodily and psychological integrity especially in the context of an indemnity clause in hospital admission form. Is consent to medical treatment a form of waiver, i.e. contract, or is it something else? If constitutional rights cannot be limited except in terms of the provisions of section 36 of the Constitution and the consent or *volenti non fit injuria* principle constitutes waiver then this puts providers of health care services in a legally untenable position. It has been observed previously that there is a considerable weight of authority to the effect that constitutional rights cannot be contractually waived. Christie makes the point that when the parties to an existing contract come together in an agreeing frame of mind and formally or informally agree to vary or discharge their contract, there is no difficulty about describing what has happened as a variation or discharge by agreement, or a cancellation by agreement. But when one of the parties by his words or actions or inaction has evinced an intention not to enforce one or more or all of his rights conferred by the contract, whichever word seems most appropriate is selected from a list which includes abandonment, acquiescence, release, renunciation, surrender, election, relinquishing of a right and waiver. Christie observes that of these words by far the most commonly used is ‘waiver’ which is regarded in many of the cases as interchangeable with any of the other words. He notes that waiver of a right conferred by the terms of a contract being itself a contract, it can be established without the necessity to establish the requirements of estoppel. A party relying on waiver need only show that he has accepted, usually tacitly, the other party’s express or tacit offer to release him from his obligations, but a party relying on estoppel must go further and show that he has acted to his detriment in reliance on the other party’s words or conduct. Christie notes that it follows from the contractual nature of waiver of a right conferred by the terms

Christie RH The Law of Contract p 507
of a contract that the intention to waive must be communicated to the other party. Until then the party who has decided to waive may change his mind as pointed out by Innes CJ in *Mutual Life Insurance Company of New York v Ingle*\(^{34}\). Christie observes further that a further result of the contractual nature of a waiver is that as soon as the contract to waive a right conferred by the terms of a contract is concluded, that right is irrevocably destroyed. It may be replaced by a new right by agreement between the parties but a waived right cannot be resuscitated by a purported withdrawal of the waiver. Christie points out that *dicta* in the Appellate Division have equated waiver with election and says that the equation may be accepted up to a point but it must not be allowed to blur the distinction between waiver of a right conferred by the terms of a contract and waiver of a right conferred by law. He notes that waiver of a right conferred by the terms of a contract is itself a contract but waiver of a right conferred by law, even in a contractual context, is not\(^{35}\).

Despite this observation on the part of Christie, for which he cites no authority, the requirements of proof of waiver are remarkably similar to the requirements

\(^{34}\) *Ingle* 1910 TPD 540 at p550

\(^{35}\) In *Girdwood v Girdwood* 1995 (4) SA 698 (C) the respondent, relying on *Schutte v Schutte* supra 1986 (1) SA 872 (A), argued that it was not incompetent, unlawful or contra bonos mores for parties to contract out of the statutory right to apply for the variation of a maintenance order in terms of s 8(1) of the Divorce Act 70 of 1979, and that clause 10 of the agreement constituted an unequivocal waiver by the parties of their right to claim further relief pertaining to matters such as maintenance payable by the one to the other. It was held although it had to be accepted that a waiver by a spouse of his or her statutory right to apply for a variation of a maintenance provision was not in conflict with public policy, there had to be a clear and unequivocal indication in the agreement that such statutory right had been waived. It was further held that the Court, as upper guardian of all dependent and minor children, had an inalienable right and authority to establish what was in the best interests of the children, and to make corresponding orders to ensure that such interests were effectively served and safeguarded, and that no agreement between the parties could encroach on this authority. The court said that clause 10, the umbrella clause excluding further claims between the parties, could not be regarded as a waiver of rights relating to aspects such as custody of, access to, and maintenance for minor children, which matters had been provided for in the agreement in the present case because such waiver would inevitably be contra bonos mores. It held that before the appellant could be deprived of her statutory right to apply for variation of the maintenance provision, there would have had to be some clear indication in the agreement that she had been fully aware of such statutory right at the relevant time and had expressly, or by conduct, waived or abandoned it, and that no such indication appeared from the cited clauses or from any other part of the agreement. In *Claussens v Claussens* 1981 (1) SA 360 (N), Didcott J held (at 373B) that the waiver of a right to claim an increase in maintenance does not infringe public policy. In *Schutte v Schutte* supra, van Heerden JA took cognisance of English law, which does regard a waiver of this nature as contra bonos mores. The court held, however, (at 884A), that other considerations apply in England from those applicable in South Africa, including the fact that, in England, a divorcée has a statutory right to claim maintenance even if she was not granted maintenance at the time of dissolution of the marriage.
for proof of an implied term of a contract\textsuperscript{36}. It is submitted that in the context of health care services the situation is complicated by the fact that there is often a contractual overlay in the situation that gave rise to the delict. Christie observes that a waiver of a right derived from a contract is itself contractual in nature but this is not necessarily true of the waiver of a statutory right. In the context of health care services, however, the patient usually agrees to 'waive' his or her constitutional rights on the basis of a contract which he enters into with the health care provider. In the private sector in particular, the patient's consent to the contemplated treatment is obtained on a hospital admission form in the case of inpatient treatment. In the case of non-institutional providers such as general practitioners and dentists, written consent is often not obtained at all or only at the beginning of the relationship when the patient fills in a patient registration form in which case, as a 'blanket' consent, it is not worth the paper it is written on most of the time\textsuperscript{37}. In the case of the public sector, the argument for the existence of a contractual relationship between patient and provider is possibly a

\textsuperscript{36} In \textit{Road Accident Fund v Moshupi} 2000 (4) SA 38 (SCA) the Supreme Court held that: ‘Waiver is first and foremost a matter of intention. Whether it was the waiver of a right or a remedy, a privilege or power, an interest or benefit, and whether in unilateral or bilateral form, the starting point invariably was the will of the party said to have waived it. The test to determine intention to waive has been said to be objective. \textit{Palmer v Poulter} 1983 (4) SA 11 (T) at 20C - 21A; \textit{Multilateral Motor Vehicle Accidents Fund v Meyerowitz} 1995 (1) SA 23 (C) at 26H - 27G; \textit{Bekassou Properties (Pty) Ltd v Pam Golding Properties (Pty) Ltd} 1996 (2) SA 537 (C) at 543A - 544D). That said the court, meant, firstly, that the intention to waive, like intention generally, was adjudged by its outward manifestations (\textit{Traub v Barclays National Bank Ltd}; \textit{Kalk v Barclays National Bank Ltd} 1983 (3) SA 619 (A) at 634H - 635D; \textit{Boha (now Griessel) and Another v Finanscredit (Pty) Ltd} 1989 (3) SA 772 (A) at 792B - E); secondly, that mental reservations, not communicated, were of no legal consequence (\textit{Mutual Life Insurance Co of New York v Ingel} fn 30 supra at 550); and, thirdly, that the outward manifestations of intention were adjudged from the perspective of the other party concerned, i.e. from the perspective of the latter's notional alter ego, the reasonable person standing in his shoes. The outward manifestations of intention could consist of words (i.e. express waiver) or of some other form of conduct from which the intention to waive was inferred, or even of inaction or silence where a duty to act or speak existed (i.e. tacit or inferred waiver). Because no one was presumed to waive his rights, the onus was on the party alleging it and clear proof was required of an intention to do so. The conduct from which waiver was inferred had to be unequivocal, that is to say, consistent with no other hypothesis. (\textit{Ellis and Others v Laubscher} 1956 (4) SA 692 (A) at 702E - F); (\textit{Hepper v Rooidepoort-Maresburg Town Council} 1962 (4) SA 772 (A) at 778D - 779A; \textit{Borstlap v Spangenberg en Andere} 1974 (3) SA 695 (A) at 704F - H). The conduct from which waiver is inferred, so it has frequently been stated, must be unequivocal, that is to say, consistent with no other hypothesis. The court observed that 'It is a well-established principle of our law that a statutory provision enacted for the special benefit of any individual or body may be waived by that individual or body, provided that no public interests are involved. It makes no difference that the provision is couched in peremptory terms (\textit{SA Eagle Insurance Co Ltd v Barnuma} 1985 (3) SA 42 (A) at 49G - H). In \textit{Transnet Ltd v Goodman Brothers (Pty) Ltd} 2001 (1) SA 853 (SCA) the court held that: "A waiver of a right is a limitation thereof. One must be careful not to allow all forms of waiver, estoppel, acquiescence, etc to undermine the fundamental rights guaranteed in the Bill of Rights. In my view, a strict interpretation of s 36(1) is indicated." The dictum in \textit{SA Eagle} is clearly not consistent with the view that constitutional rights cannot be waived if one regards the Constitution as a simply another statute. Obviously this case was decided before the Constitution and so the court was not obliged to consider the matter in this context.

\textsuperscript{37} Consent to treatment, and a waiver of a right must be specific and in the full knowledge of the particular risks and potential consequences involved. 'Blanket consents' such as those under discussion cannot possibly be argued as sufficient to address these requirements.
bit weaker than in the case of the private sector but there are certain instances in which one could definitely show contractual relationship between public sector providers and their patients. One could argue that waiver or consent to medical treatment can be by conduct as well as expressly and in writing. However there are fairly strict requirements for tacit or implied waiver of a right. It is submitted that even if the possibility of waiver of a constitutional right is recognised, the courts should be extremely reluctant to recognise an implied or tacit waiver of such a right because of the dangers of undermining these rights that were so hard won in the process of drafting the Bill of Rights in the Constitution and because of the very real imbalances of power that still exist between consumers and suppliers of goods and services in many contexts in South Africa, not least of which is health care context. In comparison with the

38 In Modise and Others v Steve's Spar, Blackheath 2001 (2) SA 406 (LAC) the court observed that: "In Laws v Rutherford 1924 AD 261 at 263 Innes CJ said in effect that, where conduct is relied upon to found a waiver of a right, such conduct must be 'plainly inconsistent with an intention to enforce such right'. (See also Hepner v Rooidepoor-Mahasberg Town Council 1962 (4) SA 772 (A) at 778F - G)." In Xenopoulos and Another v Standard Bank of SA Ltd and Another 2001 (3) SA 498 (W) at 511D - F, the court held that what has to be established is an unequivocal act indicating a waiver of a right or remedy. In this regard the onus lies on the party alleging that a decision or act of the other party precludes the latter from exercising the remedy which the latter party seeks to enforce. (At 511D - F.) In Bikishita v Eastern Cape Development Board and Another 1988 (3) SA 522 (E) the court stated: "There can be no waiver of a right without an intention to do so. As stated in Pretorius v Greyling 1947 (1) SA 171 (W) at 177: 'Waiver is not to be presumed, it must be proved; and not only must the acts which constitute waiver be shown to have occurred, but it must appear from these acts or otherwise that there was an intention to waive.' In Harksen v Attorney-General, Cape, and Others 1999 (1) SA 718 (C) Friedman JP and Brandt J noted that: "The requirements for an implied waiver of legal professional privilege are, firstly, that the privilege holder must have full knowledge of his rights and, secondly, that he must have so conducted himself that, objectively speaking, it can be inferred that he intended to abandon those rights. (See, for example, Laws v Rutherford 1924 AD 261 at 263; Borstlap v Spangenberg en Andere 1974 (3) SA 695 (A) at 704F-H.) There is also authority to the effect that legal professional privilege may be imputedly waived where the privilege holder so conducts himself that, whatever his subjective intention might be, the inference must in fairness be drawn that he no longer relies on his privilege. (See, for example, Attorney General, Northern Territory v Maurice and Others (1986) 161 CLR 475 (HCA) at 481 ((1987) 61 ALJR 92); Goldberg and Another v Ng [1996] 185 CLR 83 (HCA); Peacock v SA Eagle Insurance Co Ltd 1991 (1) SA 589 (C) 591-2.) Wigmore On Evidence 3rd ed vol 8 in the oft-quoted passage in para 2327 does not appear to draw a distinction between an implied waiver and an imputed waiver: Having posed the question: 'What constitutes a waiver by implication?', the author supplies the following answer: 'Judicial decision gives no clear answer to this question. In deciding it, regard must be had to the double elements that are predicated in every waiver, i.e., not only the element of implied intention, but also the element of fairness and consistency. A privileged person would seldom be found to waive, if his intention not to abandon could alone control the situation. There is always also the objective consideration that when his conduct touches a certain point of disclosure, fairness requires that his immunity shall cease, whether he intended that result or not. He cannot be allowed, after disclosing as much as he pleases, to withhold the remainder. He may elect to withhold or to disclose, but after a certain point his election must remain final.' The court in Peacock v SA Eagle Insurance Co Ltd 1991 (1) SA 589 (C) refused to recognise an argument of implied waiver whether there was no clear intention to waive the right or privilege, stating that: 'It would seem preferable, therefore, to speak rather of imputed waiver, where, as here, an actual intention to waive cannot be inferred on the facts.' It went on to state that it is necessary to consider whether in the circumstances of the present case it is fair that the privilege in respect of the statement be lost.
rest of the world South Africa is still fairly backward in terms of laws for the protection of consumers against unreasonable or unfair contractual terms. This issue of waiver of constitutional rights has been discussed in more detail previously and will not be further considered here. The question is whether this purported waiver of the constitutional right to bodily and psychological integrity is valid, whether it is valid in terms of the law of contract or upon some other legal basis and whether it is in fact a waiver at all.

As stated previously, waiver does not necessarily equate with the exercise of a choice not to exercise a right. A person’s decision not to vote does not mean

---

39 The South African Law Commission noted in its Report in 1998 on Project 47: Unreasonable Stipulations In Contracts And The Rectification Of Contracts that: “It happens daily that individuals voluntarily enter into contracts with one another, or with banks, building societies, financial institutions, wholesalers or retailers, in the expectation that the contracts will satisfy their needs and aspirations, only to find subsequently that, in practical application, the contracts as a whole or some of their terms are unjust or unconscionable.” It noted with regard to the judgment in Bank of Lisbon and South Africa (Ltd) v De Ornelas and Another that: “For those hoping that our courts would develop a doctrine of relief in cases of unconscionability, the judgment was a great disappointment. Only legislative intervention can now correct its implications. The research team that worked on the project found that: Courts in Germany, England, the USA, Sweden, Israel, the Netherlands and Denmark may take judicial action against unfair terms, in addition to which preventative control may also be used against unfair terms.

40 De Waal J, Currie I, and Erasmus G, The Bill of Rights Handbook (Fourth edition) state at p 42 that “Although the distinction may be difficult to make in some cases, the waiver of fundamental rights should be distinguished from a decision to exercise a fundamental right. Where a person chooses not to take part in an assembly or not to join an association they cannot later complain about a violation of their freedoms of assembly or association. The same applies when an arrested person makes an informed choice to co-operate with the police by making a statement or a confession, or when a person allows the police to search their home. Such a person may not object at their trial that the introduction of the evidence violates their right to remain silent or their right to privacy of their home. In principle, the accused may nevertheless object to the use of the evidence if it would render the trial unfair. But in the absence of other circumstances (such as that the accused was improperly persuaded to co-operate) it is difficult to see why the use of the evidence would result in an unfair trial. Waiver is quite different. One is dealing with waiver when someone undertakes not to exercise a fundamental right in future. For example, a contractual restraint of trade is an undertaking to waive the right to occupational freedom for a certain period of time. Or a person may undertake not to disclose sensitive information, or to vote for a certain political party on election day, or to perform nude on stage or to attend religious instruction in a private school. These are, respectively, attempts to waive the rights to freedom of expression, to vote, to privacy and to freedom of religion. The question is then whether someone may be obliged to honour such an undertaking even if they subsequently change their minds. A few general observations must be made at the outset. A waiver cannot make otherwise unconstitutional laws or conduct constitutional and valid. Section 2 of the Constitution provides that laws or conduct inconsistent with the Constitution is invalid.” It is submitted that this statement has to be qualified to allow for situations in which the Constitution itself envisages that consent can render an otherwise unconstitutional action constitutional. An example is to be found in section 12(2) in which a person may not be subjected to medical or scientific experiments without their informed consent. It is also submitted that consent as a legitimating factor is implicit in the section 12(2) right to make decisions concerning reproduction so that a person can decide to be sterilised and that with the informed consent of the patient such sterilisation will be constitutional whereas without it, the operation would clearly be a violation of the patient’s constitutional rights. They continue to state that: “The actions of the beneficiary of the right can have no influence on the invalidity of unconstitutional law or conduct. That is why a person cannot undertake to behave unconstitutionally. Such an undertaking will have no force and effect. Similarly a person cannot waive the indirect application of the Bill of Rights. Two persons cannot undertake for example, that the law of defamation must be applied in future disputes between them without any reference to the Bill of Rights... What individuals may do is waive the right
that he or she waives his or her right to vote, for instance, just as a person’s
decision not to pursue a delictual claim does not amount to a waiver of his or
her right to bodily integrity. The court in Cape Town Municipality and Another
v Belletuin (Pty) Ltd\textsuperscript{41} observed that a waiver amounts to a voluntary
relinquishment or abandonment of a right. Is it correct to regard the principle of
\textit{volenti non fit injuria} as a form of waiver especially in the case of the
constitutional rights to bodily and psychological integrity? Another manner in
which this concept is sometimes expressed is ‘voluntary assumption of risk’. De
Waal \textit{et al} in their discussion on the question of waiver of constitutional rights\textsuperscript{42}
making a promising start but then seem to get hopelessly tangled up in the
question of freedom rights as opposed to other kinds of rights, the question of
whether in fact constitutional rights can be waived or whether the ‘right to
exercise a fundamental right’ may be waived and the problem of the
compartmentalisation of constitutional rights. It is the view of the author that
there is very little if any practical distinction between a waiver of a
constitutional right itself and the waiver of the right to exercise a fundamental
right. The thinness of this ‘distinction’ it is submitted is likely to precipitate the
very danger envisaged by Olivier J in the \textit{Transnet} case\textsuperscript{43} that a waiver of a right
is a limitation thereof and that all forms of waiver, estoppel, acquiescence, etc
could undermine the fundamental rights guaranteed in the Bill of Rights. He

\textsuperscript{41} Belletuin 1979 (2) SA 861 (A)
\textsuperscript{42} De Waal \textit{et al} see fn 34 supra
\textsuperscript{43} Transnet Lid v Goodman Brothers (Pty) Lid fn 36 supra
points out that section 36(1) of the Constitution stipulates that ‘the rights in the Bill of Rights may be limited only in terms of law of general application. . . ‘. It is submitted that compartmentalisation of constitutional rights into freedom rights and other kinds of rights is also a dangerous argument since it does not take into account the fact that the Bill of Rights is a synchronous and internally consistent whole. One cannot separate out the right of freedom from the right to human dignity. One cannot separate the right to freedom and security of the person from the right to human dignity or the right to equality. The rights are a matrix of interrelated and interdependent concepts and to use methods of analysis which avoid this truth will ultimately lead to the reduction of the Bill of Rights to the sum of its parts rather than something more. This reduction will inevitably reduce the scope and significance of the underlying values of the Bill of Rights and ultimately those upon which the Constitution itself rests. It is too mechanistic. Furthermore there is no need to rely on the dissection of the rights out of the Bill of Rights to this extent. The problem should be regarded rather in the light of a balancing exercise that is inevitably required not only of the judiciary in considering the rights of one party versus another or the executive in making policy decisions which may favour some rights over others but also of the individual in exercising his or her own rights in the infinite number of possible circumstances in which individuals in society find themselves. It is a matter of fundamental choices. This is nowhere more clearly illustrated than in the context of health services delivery. A patient who is in agony on his deathbed can exercise his right of access to health care services and to human dignity by requesting powerful painkillers that will inevitably shorten the duration of what life he has left to him. He is preferring his right to human dignity and access to health care services to his right to life. He would rather die

Section 7(1) of the Constitution states that the Bill of Rights enshrines the rights of all people in our country and affirms the democratic values of human dignity, equality and freedom. Section 1 of the Constitution states that the Republic of South Africa is founded on the following values:

(a) Human dignity, the achievement of equality and the advancement of human rights and freedoms;
(b) Non-racism and non-sexism
(c) Supremacy of the Constitution and the rule of law;
(d) Universal adult suffrage, a national common voters roll, regular elections and a multi-party system of democratic government, to ensure accountability, responsiveness and openness.
knowing and feeling that state of being human than to have a few more days of life as something less than human. He cannot have both under the circumstances. When a person gives consent to a surgical operation that he knows will violate his right to bodily and psychological integrity, he is choosing the right of access to health care services and possibly even the right to life and human dignity, depending on the reasons for the surgery, over the right to bodily and psychological integrity since under the circumstances, he cannot exercise these rights simultaneously. Even in dealing with the same right there are choices to be made. When a person asks to be sterilised he or she is exercising the section 12(2) right to make decisions concerning reproduction as much as when such person decides to have a child. This does not constitute a waiver of the constitutional right to make decisions concerning reproduction, it is an exercise of that right. When a person gives informed consent to be subjected to medical or scientific experiments he or she is exercising his or her right to bodily and psychological integrity, not waiving it. A person who chooses not to access health care services when they are freely available may be preferring his or her right to privacy and bodily and psychological integrity over the right of access to health care services. He is not waiving the latter. He may at any time change his mind. If for some reason he signs an agreement not to access external health services, because for instance he is participating in a clinical trial for which he is being paid and to which he has given informed consent, he has not necessarily waived his constitutional right of access to health care services. Indeed, the research organisation in question may in certain circumstances find that such a contractual provision means that it is completely responsible for the provision of all his health service requirements for the duration of the clinical trial. He may run the risk of being sued for contractual damages in seeking assistance for an urgent health care problem in breach of the contract but it is doubtful whether a court would uphold such a contractual term in most circumstances in which case the purported ‘waiver’ is likely to be nothing of the sort.
Outside of the health services context, it is submitted that even in the case of the more absolute rights in which the existence of choice is not *prima facie* evident, the element of choice is implicit in the enforcement of the right. Thus section 13 of the Constitution states that no one may be subjected to slavery, servitude or forced labour. If a person allows himself to be subjected to such and then takes the matter up in the Constitutional court, he or she is exercising his or her constitutional right in terms of section 13. It is extremely difficult to envisage any court allowing an argument that the person ‘waived’ his section 13 right by being subjected to slavery because the right reinforces the fundamental constitutional value of freedom. Even if the defendant successfully presents the argument that the plaintiff agreed to waive the right to exercise this constitutional right it is submitted that it is likely to meet with an unfavourable reception in a court of law. To allow such waiver would be to undermine a fundamental constitutional right and the underlying constitutional value of freedom. However, if a person subjects himself to slavery and does nothing about it, what external agency is going to take action on his behalf and in the absence of a request from him for assistance? Assuming that he is fully aware of his rights under section 13 and assuming that his decision to subject himself to what might be considered slavery is fully informed, he is in effect making a choice not to exercise his section 13 rights. In real life such a practical example is likely to be encountered in the context of certain forms of extreme religious beliefs which lead people undertake for instance join some form or religious order which requires them to devote their lives to working without pay or any other form of compensation. In such circumstances they would be preferring their right to religious freedom in terms of sections 15 and 31 of the Constitution over their section 13 rights. The criminal law is the vehicle through which society expresses its disapproval of certain actions and sanctions them but even at this level, someone has to take some positive action such as laying a charge or reporting the matter. Obviously the subject of religious cults is one of the more sensitive and controversial examples of the extent to which people
may exercise their constitutional rights but it serves as a useful illustration of the paradox of freedom.

An employee who is able to choose from a number of different posts but who decides on one in terms of which the employer requires a restraint of trade agreement because the employer feels the need to protect his own rights in the circumstances because it is much better paid than the others is exercising his right to freely choose his trade, occupation or profession, not waiving it. Such employee is also recognising his employer’s right to protect his trade secrets i.e. his right to privacy. It is submitted that contracts involving constitutional rights and provisions which suggest that such rights are being waived are on the whole to be more soundly and sensibly construed as being attempts between private parties to regulate their relationship in terms of the same balancing exercise that the courts are often called upon to perform when disputes as to the validity of such contracts arise. Whether or not the balance such private parties eventually achieve is constitutionally acceptable remains for the courts to decide when the contractual relationship breaks down or when one of the parties changes her mind about the fairness of that balance.

The Bill of Rights is an indivisible web of concepts that cannot be construed or understood in isolation from each other. It is submitted that, the recognition of the need for consent in our law speaks to the constitutional value and right of freedom. Freedom in its turn is based upon the greater and more pervasive right to human dignity. The nature of the right to freedom is not confined to physical freedom. Section 12(1)(a) of the Constitution refers to the right to

45 Thus in S v Makwanyane and Another 1995 (3) SA 391 (CC) the constitutional court stated that “Implicit in the provisions and tone of the Constitution are values of a more mature society, which relies on moral persuasion rather than force; on example rather than coercion. In this new context, then, the role of the State becomes clear. For good or for worse, the State is a role model for our society. A culture of respect for human life and dignity, based on the values reflected in the Constitution, has to be engendered, and the State must take the lead. See also words of Mureinik E [‘A Bridge to Where? Introducing the Interim Bill of Rights’] (1994) 10 SAJHR 31 at p 32: “If the new Constitution is a bridge away from a culture of authority it is clear what it must be a bridge to. It must lead to a culture of justification - a culture in which every exercise of power is expected to be justified; in which the leadership given by government rests on the cogency of the case offered in defence of its decisions, not the fear inspired by the force at its command. The new order must be a community built on persuasion, not coercion.”
freedom and security of the person. This could be read in one of two ways. Firstly it could be read as meaning freedom of the person and security of the person. Secondly it could be read as meaning freedom generally and security of the person. The list that follows suggests that the former reading should be followed. However freedom is not only a right in the Constitution. It is a value as well. Consequently a broad interpretation of the concept of freedom must be followed when considering it in the context of the Constitution. Freedom cannot be seen in isolation from the other rights since the Bill of Rights is not merely a list of separate and independent rights but a complex web of interrelated and interdependent rights and freedoms in which the whole is more than the sum of its parts. The constitutional court has said with regard to the apartheid regime and the multiple denials of freedom that occurred thereunder that:

"A feature common to all or many of these denials of freedom was a denial of the freedom to choose or develop one’s own identity, a denial of the freedom to be fully human. One of the main objects of the Constitution is to eradicate such denial or restriction of freedom, not in a casuistic way but as a profound constitutional commitment."

Significantly, the court emphasised the importance of not conflating freedom and the conditions of its exercise since in the process one could grant all the

---

46 Thus in Ferreira v Levin No and Others; Vryenshoek and Others v Powell No and Others 1996 (1) SA 984 (CC) Ackermann J held that: “An individual’s human dignity cannot be fully respected or valued unless the individual is permitted to develop his or her unique talents optimally. Human dignity has little value without freedom; for without freedom personal development and fulfilment are not possible. Without freedom, human dignity is little more than an abstraction. Freedom and dignity are inseparably linked. To deny people their freedom is to deny them their dignity. Although freedom is indispensable for the protection of dignity, it has an intrinsic constitutional value of its own. It is likewise the foundation of many of the other rights that are specifically entrenched. Viewed from this perspective, the starting point must be that an individual’s right to freedom must be defined as widely as possible, consonant with a similar breadth of freedom for others. There are other and more specific indications in the Constitution that the right to freedom is to be extensively interpreted. Section 35(1) embodies an injunction that, generally, in interpreting the chap 3 provisions, a Court of law must promote the values which underlie an ‘open’ and democratic society ‘based on freedom and equality’. An ‘open society’ most certainly enhances the argument that individual freedom must be generously defined. It is a society in which persons are free to develop their personalities and skills, to seek out their own ultimate fulfilment, to fulfill their own humaneness and to question all received wisdom without limitations placed on them by the State. The ‘open society’ suggests that individuals are free, individually and in association with others, to pursue broadly their own personal development and fulfilment and their own conception of the ‘good life’. [Footnotes omitted] A teleological approach also requires that the right to freedom be construed generously and extensively.” In footnote 34 of the judgment the court referred to the words of Isaiah Berlin’s Introduction in ‘Four Essays on Liberty’: “Those who have ever valued liberty for its own sake believed that to be free to choose, and not to be chosen for, is an inalienable ingredient in what makes human beings human.” Thus in constitutional terms the right of the patient in Esterhuizen (fn 19 supra) to freedom in the wide and general sense had been violated as much as had her rights to freedom and security of the person and to bodily and psychological integrity.

47 Ferreira fn 46 supra
freedoms in the world in the certain knowledge that the capacity or power to exercise them does not exist and that they are therefore meaningless.  

For the purist, the doctrine of informed consent on the basis of Esterhuizen may have a slightly different, or possibly less differentiated, basis than at constitutional law where, it is submitted, it would be based more appropriately on the right to bodily and psychological integrity in subsection (2) of section 12 as opposed the right to freedom and security of the person as contemplated in subsection (1) of that subsection. It is of interest that consent to the commission of a wrong is a unilateral juristic act which may be withdrawn by the consenting party at any time.

It has already been observed that in section 12 of the Constitution, the rights to freedom and security of the person are linked with those of bodily and psychological integrity. It is submitted that one of the reasons for this is that the personality must be construed as a whole. A violation of the right to freedom or security of the person will very often involve the violation of the rights to bodily or psychological integrity as well. This is supported by the fact that consent, in order to legitimate an action that would otherwise be wrongful in terms of the

---

48 In the words of Ackermann J in Ferreira fn 46 supra: "It is essential to distinguish between freedom (liberty) and the conditions of its exercise. It could be dangerous to conflate the two concepts. [and then quoting from Berlin 'Introduction' Four Essays on Liberty - 'If a man is too poor or too ignorant or too feeble to make use of his legal rights, the liberty that these rights confer upon him is nothing to him, but it is not thereby annihilated. The obligation to promote education, health, justice, to raise standards of living, to provide opportunity for the growth of the arts and the sciences, to prevent reactionary political or social or legal policies or arbitrary inequalities, is not made less stringent because it is not necessarily directed to the promotion of liberty itself, but to conditions in which alone its possession is of value, or to values which may be independent of it. And still, liberty is one thing, and the conditions for it another... Useless freedoms should be made usable, but they are not identical with the conditions indispensable for their utility. This is not a merely pedantic distinction, for if it is ignored, the meaning and value of freedom of choice is apt to be downgraded. In their zeal to create social and economic conditions in which alone freedom is of genuine value, men tend to forget freedom itself, and if it is remembered, it is liable to be pushed aside to make room for these other values with which the reformers or revolutionaries have become preoccupied.... To provide for material needs, for education, for such equality and security as, say, children have at school or laymen in a theocracy, is not to expand liberty. We live in a world characterized by régimes (both right- and left-wing) which have done, or are seeking to do, precisely this; and when they call it freedom, this can be as great a fraud as the freedom of the pauper who has a legal right to purchase luxuries. Indeed, one of the things that Dostoevsky's celebrated fable of the Grand Inquisitor in The Brothers Karamazov is designed to show is precisely that paternalism can provide the conditions of freedom, yet withhold freedom itself.'"  

49 Esterhuizen fn 19 supra  

50 See National Media Ltd And Another v Jooste fn 27 supra in which the court referred to Strauss SA 'Toestemming tot Benadeling as Verweer in die Strafreg en die Deliktereg' (LLD thesis (1961)) at 199 and following and Neethling, Potgieter and Visser Law of Delict at p 90-1.
law of delict, must be freely and voluntarily given. Otherwise it does not qualify as consent for this purpose. Freedom implies an absence of coercion or constraint\textsuperscript{51}. Despite some court decisions to the contrary,\textsuperscript{32} until relatively recently there was some debate around awards of damages purely for mental suffering\textsuperscript{53}. The court in \textit{Clinton-Parker v Administrator, Transvaal Dawkins v Administrator, Transvaal}\textsuperscript{54} noted that with reference to Bester’s case, Burchell\textsuperscript{55} correctly concluded that the previous approach had been regarded as too restrictive pointing out that Bester’s case held that the brain and the nervous system is just as much part of the physical body as an arm or a leg. He stated:

‘The Appellate Division in this case looked at certain limiting factors. The nervous shock in order to give rise to a claim for damages under the Aquilian action must be substantial and not of short duration and such shock must be reasonably foreseeable before the defendant can be held liable for causing such injury.’

The court commented\textsuperscript{56} that as can be seen from Bester’s case and subsequent developments, the erstwhile distinction between a psychological and physical injury has been rejected. In this sense mental injury has come to be regarded as much of a physical injury as more obvious bodily injuries.

The close link between the rights to dignity, freedom and security of the person and bodily and psychological integrity are demonstrated by the dictum of

\item[51] S v Lawrence; S v Negal; S v Solberg 1997 (4) SA 1176 (CC)
\item[52] Waring & Gillow Ltd v Sherborne fn 20 supra and Hauman v Malmesbury Divisional Council 1916 CPO 216
\item[53] Burchell J in Principles of Delict at p 59 (as quoted by the court in Bester (see below) points out that the Courts ‘here and in other countries have been cautious about extending liability for negligently caused nervous shock’. He points out that in the early cases in South Africa liability for negligently inflicted nervous shock was restricted by two factors, viz the nervous shock had to result in physical injury and the plaintiff must have feared for his or her own safety. Burchell states: ‘The first of these restrictions was based on the outdated distinction between mind and matter and based on the view that injury to the physical body was the subject of Aquilian liability and that damage to the individual’s nervous system on its own was not sufficient for such liability. The second factor was a way of limiting the scope of potential liability to someone who in fact ran the risk of being physically injured.’
\item[54] In Bester v Commercial Union Verzekeringmaatskappy van SA Bpk 1973 (1) SA 769 (A), the court stated that the reasonable foreseeability test was the test for liability for negligence and that this has repeatedly been set out in numerous authorities. He also pointed out that damages were regularly awarded for shock, pain and suffering, incapacity, loss of amenities of life and shortened life expectation, ‘ten minste waar dit met ‘n suiver fisiese besering gepaard gaan’. He concluded that to deny a victim compensation purely on the basis that the shock and consequential harm were not allied to a physical injury cannot be defended logically.

\end{itemize}
\end{footnotesize}
Bosshof AJ in *Brenner v Botha*\(^{57}\) where he stated that: “The specific interests that are detrimentally affected by the acts of aggression that are comprised under the name of injuries are those which every man has, as a matter of natural right, in the possession of an unimpaired person, dignity and reputation”. They are all rights of personality under the common law\(^{58}\).

In *Maisel v Van Naeren*\(^{59}\) the court observed that:

“The foundations of the English and Roman-Dutch legal systems as to liability for delictual acts differ substantially. Speaking generally, all liability for delict in our common law derives from the application of the principles of the *actio injuriarum* and the *actio legis Aquiliae*, as they have developed through the centuries: and in terms of these principles blameworthiness on the part of the defendant, in the form of *dolus* or *culpa* as the case might be, is an essential in each case.”

The concept of *dignitas* links the concepts of bodily and psychological integrity, dignity and freedom and security of the person\(^{60}\). There is also a strong link with

---

\(^{57}\) *Brenner* 1956 (3) SA 257 (T)

\(^{58}\) See also Gardiner, J.P., in *Rex v Holliday* 1927 CPD 395 at p. 400: “*Dignitas* is not simply the esteem in which a person is held by others - this is his *fama* - but it includes, it seems to me, his self-respect. Thus we find that writers on Roman Law include under *injuria* something more than violence to a man’s person or his reputation. Moyle in his Institutes (I. p. 535) says: ‘The delict of injury here treated may be defined as a wilful violation of what writers on jurisprudence term the ‘primordial’ rights of a free man - the rights to personal freedom, safety and reputation.’ ... de Villiers on Injuries (pp. 24 - 25) says: ‘The specific interests that are detrimentally affected by the acts of aggression that are comprised under the name of injuries are those which every man has, as a matter of material right, in the possession of an unimpaired person, dignity and reputation. By a person’s reputation is here meant that character for moral or social worth to which he is entitled among his fellow-men; by dignity that valued and serene condition in his social or individual life which is violated when he is, either publicly or privately, subjected to offensive and degrading treatment, or when he is exposed to ill-will, ridicule, disesteem or contempt. The rights here referred to are absolute or primordial rights; they are not created by, nor dependent for their being upon, any contract; every person is bound to respect them; and they are capable of being enforced by external compulsion. Every person has an inborn right to tranquil enjoyment of his peace of mind, secure against aggression upon his person, against the impairment of that character for moral and social worth to which he may rightly lay claim and of that respect and esteem of his fellow-men of which he is deserving, and against degrading and humiliating treatment; and there is a corresponding obligation incumbent on all others to refrain from assaulting that to which he has such right.’ The latter portion of this passage was referred to with approval by Innes, C.J., in *Rex v Umapa*, 1908 T.S. at p. 67. It was because of this right to tranquil enjoyment, this primordial right of every man, that ‘forcible and wrongful intrusion, into the house of another was looked upon as an *injuria*, not because it was a trespass on the property, but because it was a violation of family sanctity’ (per Innes, C.J., loco cit.). It is the violation of a man’s rights of personality, his primordial rights of ‘son etat civile’, which gives rise to an action of injury.”

\(^{59}\) *Maisel* 1960 (4) SA 836 (C)

\(^{60}\) In *Jackson v SA National Institute for Crime Prevention and Rehabilitation Of Offenders* 1976 (3) SA 1 (A) the court noted that: “*Dignitas* embraces concepts of ‘self-respect’, ‘peace of mind’, ‘mental tranquillity’ and ‘privacy’. Hunt, S.A. *Criminal Law and Procedure*, vol. II, p. 496, in considering the ambit of *dignitas* in relation to *crimen injuria* (which in this respect is similar to that in the *actio injuriarum*), specifies certain concepts falling under it, and then continues: ‘The concepts of self-respect, mental tranquillity and privacy are judged both objectively and subjectively. Objectively in that the law accepts that each person is entitled to them. Subjectively in that it depends upon the particular person and the circumstances whether it can be said that his dignitas has in fact been impaired. In a sense the quantum of dignitas varies from one person to another. An act which would not impair the dignitas of an ordinary person may conceivably impair the dignitas of a highly
the right to privacy, which it is submitted is inherent in the right to bodily and psychological integrity despite the fact that it also recognised as a separate right in the Bill of Rights. On the subject of damages for pain and suffering the courts have said in the past that such damages do not fall under the auspices of the actio injuriarum but under the actio legis Aquilia. It is important to note,

61 In Hunt P, South African Criminal Law and Procedure, vol. II, p 495, the author, after referring to attempts at definition and description of the word "dignitas" by the text-writers and the Courts, submits that "it is a somewhat vague and elusive concept which can, however, be broadly described positively in terms of a person's right to 'self-respect, mental tranquillity, and privacy.' These are the elements which have been constantly stressed by the courts. It can be described negatively in terms of his right to freedom from insulting, degrading, offensive or humiliating treatment and to freedom from invasions of his privacy". In S v A and Another 1971 (2) SA 293 (T) the court held: "It seems to me that there can be no doubt that a person's right to privacy is one of, and that I quote from Umfaan's case, "those real rights, those rights in rem, related to personality, which every free man is entitled to enjoy". Accordingly it appears to me that an infringement of a person's privacy prima facie constitutes an impairment of his dignitas. There have been many attempts in the authorities to define "dignitas". In Umfaan's case, on which Mr. Rossenweig has relied, Innes, C.J. quoted the following passage: 'Every person has an inborn right to the tranquil enjoyment of his peace of mind, secure against aggression upon his person, against the impairment of that character for moral and social worth to which he may rightly lay claims, and of that respect and esteem of his fellow-men of which he is deserving, and against degrading and humiliating treatment; and there is a corresponding obligation incumbent on all others to refrain from assailing that to which he has such right.'

Further on he says: 'As affecting dignity, there are many illustrations. Insults to chastity, for instance, such as indecent proposals to a woman, forcible and wrongful intrusion into the house of another was looked upon as an injury, not because it was a trespass on the property but because it was a violation of family sanctity - of that peace and dignity which a free man was entitled to enjoy.'

Various other definitions are to be found collected in South African Criminal Law and Procedure, formerly Gardner and Lansdown, in vol. 2, which is by Hunt, at p 495. I do not think it necessary to refer to the various definitions of this concept as set out in this work. Sufficient it to say that I have no doubt that the right to privacy is included in the concept of dignitas, and that there is no dearth of authority for this proposition."

Thus the court in Hoffa, No v SA Mutual Fire & General Insurance Co Ltd 1965 (2) SA 944 (C) held that it would be wrong, both historically and in principle, to classify a claim for damages for pain and suffering, etc., under the actio injuriarum: (a) The actio injuriarum requires an animus injuriandi, whereas this claim (like any other Aquilian relief) can be based on mere culpa. See Matthews v Young, supra; de Villiers, loc cit. (b) This claim is a personal one, whereas a claim under the actio injuriarum is incapable of cession. De Villiers, loc cit; Sande De. Act. Cess. 5.11 (Anders' translation, p. 58), and see Boes v Harilagh, 1946 W.L.D. 157; Walker v Malieron, 1936 NPD 495. (c) The actio injuriarum always incorporates an element of contumelia. See Stoffberg v Elliott, (fn 18 supra) 148; Matthews v Young, supra, whereas this is not included under 'pain and suffering', see Radebe v Hough, 1949 (1) SA 380. Mental shock is not actionable under the Lex Aquilia. See Hamman v Malmbay D.C. 1916 CPD 215; Layten & Layten v Wilcock & Hixson, 1944 S.R. 48. (d) The actio legis Aquiliae was extended - even in Roman law - to cases of bodily injury. See Matthews v Young, supra; Union Government v Warneke, supra; Voet, 9.2.11, 47.10.18; van den Hoever, op. cit. (e) The actio injuriarum constituted an exception to the rule as to transmissibility. See McKerron on Delict, 6th ed. p 131; Buckland, pp. 313, 586, 685 - 6; de Villiers, p. 235. (f) Claims for pain and suffering, etc., are merely factors in the assessment of the quantum of the damnum. See Contee v S.A.R. & H, supra. See also Sandel v Wholesale Coal Supplies, 1941 AD at pp 194, 199. As to what this damnum can comprise, see the authorities collected in Gordon & Suzman Law of Compulsory Motor Vehicle Insurance, p. 99. In our law the actio legis Aquiliae is no longer penal, but repersecutory, whereas the actio injuriarum is purely penal. McKerron, op. cit, pp. 7 - 9. (g) The actio injuriarum is not associated with bodily injury, but with injured feelings where no physical hurt has been done. See Pan v African Guarantee, 1990 (2) SA 132. (h) It would be anomalous in a case of bodily injury to allow certain claims - such as for loss of support, see Union Government v Lee, supra, and loss of earnings, see Lockhart's case, supra - to survive the death of the injured person, and others not."

In Government Of The Republic Of South Africa v Ngubane 1972 (2) SA 601 (A), counsel for the respondent pointed out that "The claim for pain and suffering in respect of an injury to a freeman was unknown to the Roman civil law or to the actio legis Aquiliae; Hoffa, supra at pp. 950F, 951E; D 9.1.3; D 9.3.7. The Roman-Dutch law allowed an action for pain and suffering but this did not have its roots in the Aquilian action although it was often brought at the same time. It could not form part of the Aquilian action because the Aquilian action lay only for patrimonial loss. Hoffa, supra at pp. 950H to 952F; Union Government v Warneke, 1911 AD at p.
however, that this is a historical legal anomaly since in Roman Law, only patrimonial damages were recoverable under the Lex Aquilia. Damages for

662; Van den Heever, Aquilian Damages in South African Law at p. 35; Gillespie v Toplis, 1951 (1) SA at p. 296; Matthews and Others v Young, 1922 AD at pp. 503 - 5. In contrast to the Aquilian action, the actio injuriarum was incapable of active or passive transmission or cession before litis contestatio, it being regarded as purely personal to the victim. Hoffa, supra at p 930G; Executors of Meyer v Gerick, 1880 Fod 14; Pienaar and Marais v Pretoria Printing Works, 1906 T.S. 654. Since the claim for pain and suffering is sui generis and not an Aquilian action, the Aquilian rules do not apply to the cedability of such a claim and we have to look elsewhere for guidance. (a) The general rule of our law is that, if a claim is based on lex Aquilia, it is actively transmissible and may be freely ceded, but if it is based on or analogous to the actio injuriarum, it is not actively or passively transmissible or capable of being ceded, certainly up to the stage of litis contestatio. Regering van S.A. v Santam Versekeringsmaatskappy Bpk., 1970 (2) SA 41. Damages for pain and suffering are claimable under the lex Aquilia, this being a recognized exception to the rule that in a claim under the lex Aquilia the plaintiff has to show actual patrimonial loss. Union Government v. Warneke, 1911 AD at pp. 665 - 666; Coetzee v S.A.R. & H., 1934 CPD at p. 226; Schnellen v Rondalia Assurance Corporation of South Africa, 1969 (1) SA at p. 520D - H; Voet, 9.2.11 (Gane's trans. vol. 2, pp. 561, 564) (and cf. Grotius, 3.34.2; Vinnius, ad Inst., 4.3.13; Groenewegen, de Leg. Ab. ad Dig., 9.3.7); Lee and Honore, S.A. Law of Obligations, para. 763 (ii)."

The terms between which an injury or loss is sustained under the actio injuriarum and a personal injury under the lex Aquilia are not, however, as clear cut as the previous dicta might suggest. It is of some significance that even at a time when the compartmentalisation of legal concepts was the order of the day, the court also stated that: "The damages for pain and suffering are analogous to the solutum allowed by the actio injuriarum for injured feelings and the claim for pain and suffering has the same personal and non-patrimonial basis as the actio injuriarum. Regering van S.A. v Santam Versekeringsmaatskappy Beperk, supra at p. 374A; Hoffa, supra at pp. 954E, 955C; Sander, chap. 5, para. 12 (Sander's trans., p. 63); Stewart's Executrix v L.M.S., 1944 S.L.T. 13. The Roman-Dutch authorities were against granting compensation for pain and suffering to those who did not suffer the injury. Voet, 9.2.11, 27. See also Melius de Villiers, Roman-Dutch Law of Injuries, pp. 235, 238."

The court seems to have concurred with this exposition of the law on behalf of the respondent since at p. 606 of the judgment it observes that as to the Roman and the Roman-Dutch law, the position is in my view appropriately summarised at p 33 of the typescript of a lecture delivered to the University of Edinburgh by Professor J. C. de Wet, of Stellenbosch University. Tracing the history of liability for wrongful conduct, the learned author says - 'In Roman law, as we have seen, a free man, who had been wounded, could claim medical expenses and loss of earnings from the malefactor, but no claim was allowed for scars and disfigurement, the reason being that the body of a free man had no monetary value. This rule was retained in mediaeval secular law and also in the Canon law. Our Roman-Dutch institutional writers are, however, unanimous in allowing the victim of bodily injuries not only his medical expenses and loss of earnings but also a claim for pain and suffering (dolor) and disfigurement (cicatrix, deformitas). See Grotius, Int. 3.34.2; Vinnius, Ad. Inst. 4.3.13; Groenewegen, de Leg. Ab. ad Dig., 9.3.7; Voet, 9.2.11. That a claim for pain and suffering was not an Aquilian action, the Aquilian rules do not apply to the cedability of such a claim and we have to look elsewhere for guidance. (a) The general rule of our law is that, if a claim is based on lex Aquilia, it is actively transmissible and may be freely ceded, but if it is based on or analogous to the actio injuriarum, it is not actively or passively transmissible or capable of being ceded, certainly up to the stage of litis contestatio. Regering van S.A. v Santam Versekeringsmaatskappy Bpk., 1970 (2) SA 41. Damages for pain and suffering are claimable under the lex Aquilia, this being a recognized exception to the rule that in a claim under the lex Aquilia the plaintiff has to show actual patrimonial loss. Union Government v. Warneke, 1911 AD at pp. 665 - 666; Coetzee v S.A.R. & H., 1934 CPD at p. 226; Schnellen v Rondalia Assurance Corporation of South Africa, 1969 (1) SA at p. 520D - H; Voet, 9.2.11 (Gane's trans. vol. 2, pp. 561, 564) (and cf. Grotius, 3.34.2; Vinnius, ad Inst., 4.3.13; Groenewegen, de Leg. Ab. ad Dig., 9.3.7); Lee and Honore, S.A. Law of Obligations, para. 763 (ii)."

The terms between which an injury or loss is sustained under the actio injuriarum and a personal injury under the lex Aquilia are not, however, as clear cut as the previous dicta might suggest. It is of some significance that even at a time when the compartmentalisation of legal concepts was the order of the day, the court also stated that: "The damages for pain and suffering are analogous to the solutum allowed by the actio injuriarum for injured feelings and the claim for pain and suffering has the same personal and non-patrimonial basis as the actio injuriarum. pain and suffering were equally not recoverable under the *actio injuriarum*. They were recoverable under a separate action altogether but have since been grafted on to the Aquilian action.

8.2.4  

*Dube v Administrator Transvaal*  

**Facts**

The plaintiff attended on 26th June 1961, at a provincial hospital after he had been assaulted the night before and sustained two blows to his left forearm. An X-ray revealed a comminuted fracture of the ulnar bone of the upper forearm near the elbow. The arm was set in plaster. He attended again on 28th June and at that time the hospital's medical practitioner had considered the cast satisfactory. On 3rd July he again saw the medical practitioner at the hospital. The hand was grossly swollen and septic with loss of movement in the fingers. He was then admitted to hospital and treated for sepsis of the hand until 13th July. In January 1962, his arm had to be amputated. According to the medical evidence the plaintiff had sustained a Volkmann's contracture. A Volkmann's contracture is liable to occur with a fracture at or near, especially just above, the elbow joint, and particularly where it requires manipulation for setting or setting the arm in plaster or splints at an acute angle. It is a rare occurrence. Statistics were quoted from an article in vol. 103 (1956 (2)) of the *Journal of Surgery, Gynaecology & Obstetrics*, showing that the incidence amongst arm fractures treated at the Mayo Clinic in America prior to 1935 was .18, and between 1935

---

It continued by saying that: "A strict functional approach should have been adopted. See Lindal v Lindal (supra at 29 - 30). On this approach, the child's lost faculties are priceless (cf Sandler v Wholesale Coal Suppliers 1941 AD at 195). The focus does not fall on an evaluation of her loss, but on her distress and the uses to which money might be put to alleviate that distress and misery. The present case is palpably not an instance where a large award would serve to assist the child by the purchase of special equipment, entertainments or physical facilities. Compare Marine & Trade Insurance Co Ltd v Katz NO 1979 (4) SA at 983B - G. In view of the s 21 (1C) (a ) undertaking given, there is in any event the danger of overlapping in this regard too. Even if damages for pain and suffering and loss of amenities are to be awarded in the present case as a solatium, then the Court is to be concerned with "a fair social value" which is "the dispassionate and neutral value which society at large, on the basis of prevailing money values in that society, would give to it". Munkman (op cit at 18,21). In making such assessments, our Courts have emphasised the application of the principles of conservatism and fairness, and the importance of comparable awards in this regard."

*Dube* 1963 (4) SA 260 (W)
and 1954, .08 per 1,000. Within the knowledge of the medical specialist who gave evidence for the defendant, the plaintiff's was the first case that had occurred at the Hospital in 2,000 cases of arm fractures. Notwithstanding that, Volkmann's contracture is a well-known condition. The possibility of its occurring and developing is stressed in the ordinary course of teaching surgery and it should therefore be known to all practitioners. The signs of such a condition usually manifest within 48 hours of the originating cause but often within a lesser time. The court found on the evidence that the Volkmann's contracture began before 28th June and had become irreversible by the 3rd July. It held that the probable cause was that the plaster was applied too tightly, but that arterial thrombosis or damage could not be ruled out as an additional cause.

The court held that the hospital was liable in the law of delict for damages. It said that the plaintiff's failure to return when the swelling started was attributable to the hospital's failure to warn the plaintiff clearly and unambiguously to return immediately any abnormal symptom was manifested. The plaintiff thus reasonably assumed that the persistence of the pain and the swelling he noticed were occurring in the ordinary course of healing and were not danger signs that he might lose the use of his arm if not attended to immediately. Consequently, said the court, the plaintiff had not been guilty of any contributory negligence in not returning until the 3rd July and that no apportionment of damages need be made.

_Judgment_

The plaintiff's action was founded in delict and not on contract. The court noted that because the hospital accepted the plaintiff on the 26th June as a patient its staff owed him a duty to attend to and treat him with due and proper care and skill. The court stated that it was immaterial whether he was a paying or non-paying patient. The duty that was owed was to exercise that degree of care and skill which the reasonable plasterman and general medical practitioner
respectively would ordinarily have exercised in South Africa under similar circumstances. Any breach of that duty would constitute negligence. It held that the doctors treating the plaintiff were negligent in one or more of the following respects:

(1) applying the plaster initially too tightly;

(2) failing to diagnose the possible onset of a Volkmann’s contracture on the 28th June, and to take other measures to arrest the development of the Volkmann’s contracture;

(3) failing to give the plaintiff on the 28th June a clear and unambiguous instruction and warning to return immediately if the pain persisted and/or swelling developed in the hand and fingers.

The court pointed out that a mistaken diagnosis is not necessarily a negligent diagnosis. It may be due to a reasonable error of judgment but said that it did not think that Dr. Wolf’s failure to react in the proper manner to the plaintiff’s complaint of pain in the hand and fingers on the 28th June was a mere error of judgment, even having regard to the pressure under which she had to work. According to the expert medical evidence on such a complaint of pain being made the reasonable general practitioner exercising ordinary skill and care, would have removed the plaster and taken other precautionary measures. If that had been done on the 28th June the plaintiff’s limb would have been saved. The court held that Dr Wolf was therefore negligent in that respect. The court, quoting from Nathan Medical Jurisprudence65 and saying that his observations are so apposite that they were worth quoting in full, acknowledged that the

---

65 Nathan B Medical Jurisprudence who states at p 46: “In many cases it is reasonable or even necessary for the medical man to make the patient himself responsible for the performance of some part of the treatment which the medical man has undertaken to give. Where, as often happens, the medical man’s course of action depends upon a report by the patient as to his condition or symptoms or as to the progress of the treatment, the medical man has no choice in the matter; he must rely upon the patient for the necessary information by which to determine what action should be taken, and must therefore, in a sense, delegate to the patient part of his own duties. Frequently also it would be quite unreasonable to expect the medical man to be in constant attendance upon the patient or to exercise supervision over every detail of the treatment; he is compelled therefore to delegate to the patient the performance of some part of the treatment or cure... In all these cases where the medical man justifiably delegates to the patient the performance of some part of the treatment, there is a special duty towards the patient to give clear and unambiguous instructions, to explain to the patient in intelligible terms what is required of him and to give him any warning which may be necessary in the circumstances; and a failure in any of these respects may amount to a breach of duty and expose the medical man to liability for any injury which occurs.”
patient can reasonably be required to take care of himself or take responsibility for some aspects of his treatment in certain instances since the medical practitioner cannot be expected to do everything that is necessary for the patient’s care. The court also referred with approval to a dictum in a Canadian case which suggested that the failure of a medical practitioner to warn a patient could in certain circumstances constitute negligence on the part of the practitioner. It observed that there was a special duty owed by the hospital, through its servants, to the plaintiff to give him clear and unambiguous instructions as to what he was to do. The plaintiff should have been carefully instructed to watch out for any swelling, pain, blueness or numbness of the hand and fingers and to return (and the need to do so should have been stressed) immediately any such symptoms manifested itself because each would have been a danger sign. The court held that he should also have been warned of the possible consequence of not obeying such an instruction implicitly, namely, of losing the use of his forearm and hand. Trollip J stated that a plaintiff is generally not guilty of contributory negligence if his ostensible lack of care for his own health or safety was caused by the conduct of the defendant which induced or misled him to believe or assume reasonably that his action or inaction would not endanger his health or safety.

**Discussion**

It is submitted that this case does not support medical paternalism in regarding as negligent the failure of the health services provider to warn the patient concerning certain danger signs and symptoms. The court expressly acknowledged in fact that a health care provider cannot take responsibility for every aspect of a patient’s care and that the patient himself must take some

---

66 *Murrin v Jones*, (1949) D.L.R. 403 in which the court held: “I am prepared to believe that in some kinds of cases, particularly in this domain of medicine and surgery, the failure by a doctor or a surgeon to warn a patient as to the meaning of certain symptoms, the significance of which might not be apparent to a layman, might properly expose a practitioner to a charge of negligence. The physician cannot always be in constant attendance upon his patient, who may have to be left to his own devices, and if the former knows of some specific danger and the possibility of its occurring, it may well be part of his duty to his patient to advise him of the proper action in such emergency.”
responsibility for certain aspects. It is noteworthy that Trollip J also pointed out that not every mistake in diagnosis amounts to negligence. The nub of this case revolves around the fact that the health care provider, a person with expert skill and knowledge, applied a plaster cast to the patient's arm after he sustained a serious injury and failed to tell him of the dangers posed by such a cast when used in conjunction with an injury such as the one he had sustained. The patient was not in a position to have this knowledge as it is not generally known outside of the medical profession and the health care provider in assuming the risk of treating the patient put itself in such a relationship to the patient that it was obliged to exercise a certain degree of care and skill as was required of a reasonable person in the defendant's position. A reasonable medical practitioner would not only have warned the patient about certain danger signs and told him to come back if he noticed them but also would have explained what would happen if he did not immediately seek medical attention. There was a duty upon the provider to ensure that the patient understood the risks to which he had been exposed not only by the injury itself but also the subsequent treatment of it. It is submitted that this is due to the superior position of the provider in terms of knowledge and expertise in relation to that of the patient. The patient, with insufficient medical knowledge, would be likely to assume that now that he has been treated by the experts, the situation is under control and he is on his way to recovery. He is unconsciously relying on the fact that the people who treated him are experts and that they know what is necessary for his recovery. It is submitted that this is reasonable behaviour upon the part of the patient since the people who treated him publicly professed to have the necessary knowledge and skill. They were registered health professionals who had been found by a council of their peers to be suitably qualified and skilled to pursue their professions. This is the reason why in order to transfer the risk for certain aspects of his treatment back to the patient, they had to share with him

---

67 Trollip J cited van Wyk v Lewis, (fn 24 supra) at p 444, p 456 and Esterhuisen v Administrator of Transvaal, (fn 19 supra) at p 723 C to E, p 726 A to C as authority.
the knowledge they had concerning his condition in such a way that he could himself appreciate the risks involved.

The court held that whether or not the patient was a paying patient or a non-paying patient was of no relevance. The implication to be drawn from this is that even if there is a contractual overlay to the relationship, the duty of care, from a delictual perspective remains unchanged. Dube’s case\textsuperscript{68} involved a negligent omission and vicarious liability since the doctor in question was an employee of the state.

The court did not expressly address the question of vicarious liability\textsuperscript{69} although it is clear from its finding that it regarded the employer as vicariously liable as much for the negligent omissions of its employees as for their negligence in applying the plaster cast too tightly. With regard to liability for negligent omissions the court simply referred to the dicta in the Canadian case referred to by Lord Nathan - \textit{Murrin v Janes}\textsuperscript{70}.

The court also referred to the case of \textit{Clarke v Adams}\textsuperscript{71} with regard to the need to warn the patient not only that he must take care to watch out for certain danger signs and signals but also of what will happen if he does not. In that case a physiotherapist, about to give a patient diathermy treatment, gave him the following warning: ‘When I turn on the machine I want you to experience a comfortable warmth and nothing more; if you do, I want you to tell me.’ The patient did not report that the heat was excessive and was badly burned necessitating the amputation of his leg. It was proved that such a warning was the usual one according to ordinary practice, but Slade J., held that it was not sufficiently clear and unambiguous in its terms to warn the patient of the danger

\textsuperscript{68} \textit{Dube} fn 64 supra
\textsuperscript{69} Except to observe that it was not disputed that the Hospital was liable for any negligence by those of its servants who treated and attended to the plaintiff.
\textsuperscript{70} \textit{Murrin} fn 66 supra
\textsuperscript{71} \textit{Clarke} (1950) 94 S. Jo. 599
and consequences of excessive heat, and that the physiotherapist had therefore
been negligent in not giving an adequate warning. Similarly, said Trollip J, the
plaintiff should also have been warned of the possible consequence of not
obeying an instruction implicitly, namely, of losing the use of his forearm and
hand. He said that the very fact that in the hospital's experience so many
patients with fractures do ignore instructions to return, indicated the need, in
cases of fractures at or near the elbow with their concomitant risk of a
Volkmann's contracture, to give not only the instruction to return if abnormal
symptoms are observed but also to impress upon each patient the risk he runs of
failing to do so.

A further point to note about the judgment in *Dube* is that the court held that a
plaintiff is generally not guilty of contributory negligence if his ostensible lack
of care for his own health or safety was caused by the conduct of the defendant
which induced or misled him to believe or assume reasonably that his action or
inaction would not endanger his health or safety. It is submitted that the public
policy principle behind this line of reasoning is that the imbalance between the
provider and the patient in terms of knowledge and skill, needs to be recognised.
The greater the disparity in knowledge between the patient and the provider, the
greater the responsibility of the provider to ensure that the patient is sufficiently
and correctly informed. In other words there is a duty on the provider to reduce
the knowledge gap between himself and the patient sufficiently to discharge his
(the provider's) duty of care. If one follows this line of reasoning through to
what seems to be its logical conclusion one might be tempted to conclude that
the more informed a patient is the less risk the provider carries so that ultimately
a patient who is as informed as the provider, carries the risk for his treatment
himself and the provider bears none. A factual example of such a case would be
where an orthopaedic surgeon requires orthopaedic surgery. Obviously he
cannot conduct the surgery himself and must seek the aid of another orthopaedic
surgeon. It is submitted, however, that whilst they may discuss in greater detail
the specifics of the operation and even the best surgical methods, pins and
screws etc to use, the responsibility for the operation still rests on the orthopaedic surgeon performing it. The reason for this is that the patient, although an orthopaedic surgeon himself, is under anaesthetic at the time of the operation and so is not in a position to actually see the true state of the injury or to know exactly what was done to repair it. If one assumes that the nature of the injury in this example is such that it could lead to a Volkmann’s contracture, one might be tempted to say that the extent of the duty of the orthopaedic surgeon who did the operation to warn the patient of the danger of a Volkmann’s contracture developing is reduced by the patient’s own expertise in this field.

The question, however, is to what extent a provider of health care services would be entitled in the context of the law of delict to assume knowledge on the part of the patient. Patients are people who are usually in pain, who are often not operating optimally mentally due to stress, medication and physical discomfort. They may be suffering from post traumatic stress syndrome or other psychological fallout from their injury which makes them forgetful. Even if they do have knowledge beyond that of the average layperson when it comes to their condition, it is submitted that it would be dangerous for the provider to assume that they are in a position to retrieve and apply that knowledge to their own situation. It would also be dangerous for the provider to assume the extent of that knowledge. It is submitted that to the extent that the provider fails to inform even an expert patient of the risks and dangers associated with his condition and the treatment thereof, he runs the risk of delictual liability. A court may more readily find that there was contributory negligence in such a situation but there is still a measure of risk for the provider and it is quite possible that even though the patient does have a certain amount of expertise in a particular area, he may not know everything there is to know about it.

The court held that the plaintiff in *Dube* was not guilty of any contributory negligence and decided the case in his favour.
8.2.5 \( S \text{ v Mkwetshana}^{72} \)

Facts

The appellant, a medical practitioner, was convicted by a regional magistrate of culpable homicide. At the time of the incident in question he was serving his internship for the 12 months succeeding his qualifying in his profession. He was serving his internship at Edendale Hospital. Previously he had been a student at the medical school of the University of Natal, and had attended King Edward VIII Hospital in Durban during the course of his studentship. In March, 1964, a woman named Alice Nduli who suffered from bronchial asthma was a patient in Edendale Hospital for a short time. At first, she was an out-patient and then became an in-patient for a few days. When her condition improved she was discharged. There were difficulties in returning to her home immediately, because she lived some distance from the hospital, and so she remained a patient over Good Friday, 27th March. On the morning of that day, a staff nurse, Florence Kunene, noticed that the patient was in a distressed condition and that her breathing was bad. The appellant was called. He was apparently the only medical officer available in the vicinity at the time although it was not clear whether he was the only medical officer in the whole hospital, or the only one in that part of the hospital. According to the appellant, when he came to the patient he found her restless, lying on her back, kicking her feet and throwing her arms about. On closer examination he found her lips and tongue were bluish and she was also frothing at the mouth. He diagnosed a severe acute form of asthma and ordered 20 cc’s of aminophylline - a recognised drug for treatment of asthma. He said that he administered this intravenously and waited for some five to seven minutes, but that, contrary to what one would expect, it did not relieve her condition. The medical evidence called for the prosecution showed that aminophylline does function quickly, it may be that even during the course of

72 Mkwetshana 1965 (2) SA 493 (N)
its administration signs of improvement will be seen in the patient. The appellant said that five to seven minutes elapsed and there was no improvement. He then thought that this might be epileptic convulsions which were not previously diagnosed and he consequently decided to treat her with paraldehyde. The appellant ordered and administered 20 cc’s of this drug intravenously. He watched the patient and said that her condition improved. However the patient died shortly afterwards. The staff nurse said she died about 15 minutes after the administration of the paraldehyde. The appellant was prosecuted and convicted of culpable homicide, and sentenced to a fine of R50 or 25 days’ imprisonment.

Judgment

The court noted that a dose of 20 cc’s of paraldehyde intravenously was an excessive dose. The evidence showed that there were four routes for the administration of the drug, namely, orally, by intramuscular injection, intravenously and per rectum, and that the dose varied according to the route. It observed that the particular feature of intravenous administration of the drug is that it operates with considerable rapidity because it is injected into the bloodstream, and the recognised dose is no more than 5 cc’s, and even so, diluted in the proportions one to ten with saline - a sodium chloride solution. The appellant administered the drug in a dose of 20 cc’s without any dilution, and counsel for the defendant conceded that that was a fatal dose and that it would have caused the death of the deceased.

It was contended on appeal that the state failed to prove that the death of the deceased was due to the administration of paraldehyde. Counsel for the accused argued that the state had the burden of proving the cause of death beyond all reasonable doubt - of proving that this, on the evidence, was the administration of paraldehyde, to the exclusion of any other possibility, beyond all reasonable doubt. Counsel emphasised that the appellant himself diagnosed the case to be
one of epilepsy and that this was after he had found that the aminophylline had not done what was expected of it. During the course of the deceased’s presence in hospital she had been put through various tests and it had been found that her serum sodium level was low which suggested the possibility of her having some condition other than bronchial asthma, but it was at no time ascertained that she had any such disease. Nothing further was done to follow up that line during the course of the time that she was in the hospital, and nothing found in the post-mortem examination, conducted a week after her death, disclosed any condition likely to have caused her death other than paraldehyde poisoning.

Counsel for the accused argued that the district surgeon who conducted the post-mortem examination commenced that examination with a predilection in favour of finding paraldehyde poisoning to be the cause of death. He said in evidence that this was given as a suspected paraldehyde poisoning because of the signs pointing to it. Counsel emphasised, however, that the district surgeon had his mind specifically directed to that as the possible, if not probable, cause of death and that consequently, his mind was not directed, as otherwise it might have been, to finding some other cause of death. It was argued that the reasonable possibility that death was due to convulsions or epilepsy has not been excluded. The court noted that the district surgeon did say in clear terms that no findings pointed to the patient having died of a convulsion, and that was a strong piece of evidence negating the possibility raised by counsel for the accused. The court noted that the appellant made a statement on oath on the same day as the post-mortem examination was made. It was a short and abrupt statement that did not elaborate upon what he found and was to the effect that he found the patient restless and dyspnoeic. The accused mentioned the bronchial condition in both lungs and stated that he diagnosed acute bronchial asthma and proceeded to treat the patient as follows, as he then sets out: “(a) 20 cc. aminophylline statim intravenously, plus (b) 20 cc. paraldehyde statim intravenously” as having been given by him.
The court stated that it was significant that he made no mention there of any convulsions or of epilepsy. It acknowledged that he did speak of the patient being restless, but commented that he did not seem to have regarded it as so significant when he made the statement as to suggest that the cause of death was epilepsy, convulsions, or anything other than paraldehyde poisoning. The accused made no statement as to the case of death. The court said that whilst epilepsy can attack at any time, and that there was a possibility that the deceased had epilepsy, there was no evidence from which to draw the conclusion that there was a reasonable possibility of this. It noted that the fact that he administered paraldehyde suggested that he considered the situation to be an emergency and that some remedy of that nature was required for a condition which must have seemed to him to have involved something other than bronchial asthma, because the evidence disclosed that paraldehyde would not be administered for that condition. The court was unable to accept the possibility that epilepsy was the cause of death. It concluded that the magistrate was correct in his finding that this was a case of paraldehyde poisoning, due to the administration of the excessive dose by the appellant.

Counsel for the appellant contended that the administration of paraldehyde by the appellant was not negligent in the circumstances. He relied on the fact that the appellant was an intern, comparatively inexperienced and alone on duty at the time when he was confronted with an emergency. It was argued that he did the best that he could in that emergency, bearing in mind his own limited experience. Counsel referred to the decision in *R v van der Merwe*73 and the summing up of Roper J, to a jury relating to the tests for negligence on the part of a general practitioner in comparison with the test for a specialist.

The court commented that either the appellant knew insufficient about the drug and, nevertheless, took the risk - and imposed on his patient the risks involved in it - or he was aware of the risks and that it was a dangerous drug to use in the

---

73 *Van der Merwe* fn 3 supra
manner in which he was using it, in which case, equally, he would be guilty of negligence. It noted that counsel for the accused would have the court say that because of his inexperience it should not be held against him that he administered a potentially dangerous drug, in a manner which made it dangerous, but said that it was clear that for the accused to have done that, in the light of his inexperience, and particularly his inexperience of this drug and its uses, marks him as having been negligent. The court stated that it was clear from the evidence that the information as to the proper uses of the drug was freely available. Several text-books were referred to in evidence, including text-books which are in use by students during the course of their medical courses, and there was no excuse for a medical man, even though just setting out on his career, that he neither knew those doses and uses, nor troubled to have them available to him. The court observed that although the appellant was alone, at any rate in that part of the hospital, it was not impossible for him, in the circumstances, to have made communication with someone senior to himself. He waited some five to seven minutes while he was watching the patient and in that time, seeing that she was not improving, it was possible, for him either to have telephoned or to have sent a staff nurse for assistance. However, he did none of those things, nor did he refer to any text-book. Knowing nothing from his experience, and recollecting nothing from his training, he administered the drug in a quantity and in a manner which was dangerous for the patient, and indeed caused her death. Consequently said the court, in those circumstances, the appeal failed.

Discussion

This case is consistent with the decision of the court in *R v van Schoor*\(^74\). It reinforces the legal precedent created by the latter. If one attempts a task for which one does not have the requisite knowledge, training or skill, one assumes the risk of adverse consequences arising from such lack of training, knowledge

\(^74\) *Van Schoor* fn 1 supra
or skill. It is submitted that it is based upon the same public policy rationale that imposes liability for consequential damages for latent defect under the law of contract in a situation in which the seller sells goods of his own manufacture or goods in relation to which he publicly professes to have attributes of skill and expert knowledge. The patient cannot assess the level of skill or experience of the health professional. The latter by definition publicly professes to have attributes of skill and knowledge in the delivery of health care services. It is therefore fitting in terms of public policy that the patient or the consumer should be given the benefit of the doubt in such circumstances. Although these cases predate the Constitution it is submitted that their findings are consistent with constitutional values and principles. The constitutional right to bodily and psychological integrity is closely related to the right to freedom and security of the person. The former is expressed in subsection (1) of section 12 of the Constitution while the latter is expressed in subsection (2). In both subsections the list of rights in these categories is not exhaustive due to the use of the word "includes" which precedes the lists. It is submitted that in the context of health care services in particular the potential for infringement of these rights is the norm rather than the exception due to the nature of health services. Consequently people professing to be experts in the rendering of those services walk a fine line every day in terms of the risks of violating one or more of the section 12 rights. Health professionals who make mistakes, do so in this context. Their profession by its nature takes them 'close to the bone' and therefore their responsibilities are and should be accordingly weighted. These rights, combined with that of human dignity, it is submitted are supportive of patient autonomy as opposed to medical paternalism. Security in and control over one's body implies that the person who lives in the relevant body has the power to decide what happens to it. Section 12 (2) specifically mentions the right not to be subjected to medical or scientific experiments without informed consent. This is not, it is submitted, a detraction from the general requirement of informed consent but rather the emphasis on medical research in which people have in the past been used as 'guinea pigs' without their full understanding or, in some cases, even
their knowledge. In a situation where the provider has a clear advantage over
the patient in terms of expert skill and knowledge, more should be required of
the possessor or professor of that expert skill and knowledge in terms of the
distribution of risk between patient and provider. It is interesting that both cases
involved the injection of lethal doses of medicine into the patients. This
situation is one in which the patient is particularly vulnerable because ampoules
of medicine used in injections are not usually first given to the patient in order
that he may inspect the label, with one or two exceptions such as certain forms
of diabetes, patients to not usually inject themselves, neither are they at liberty
to eject or remove the medicine from their bodies once it has been administered.
The emphasis of the court in *Mkwetshana*\(^{75}\) on the need to take into account the
route of administration is not without significance.

Clear evidence of the risks to the patient in medical paternalism is visible in the
next case. Although it too predates the Constitution, it nonetheless recognises
the right to bodily and psychological integrity at common law and to the extent
that the common law concept of the right overlaps with the constitutional law
concept, this case is a reflection of the position at constitutional law as well.

### 8.2.6 *Buls v Tsatsarolakis*\(^{76}\)

**Facts**

The facts appear from the judgment of Nicholas J as follows: The plaintiff was a
bricklayer. On 7 April 1972 he tried to start the engine of a concrete mixer. The
engine backfired and the starting handle struck the plaintiff on his right wrist.
He experienced severe pain and went to the Krugersdorp Hospital. There he saw
Dr. Buls who attempted to examine the hand, but this was so painful that the
plaintiff jerked it away, and Dr. Buls had to abandon his attempt to examine it.

---

\(^{75}\) *Mkwetshana* fn 72 supra

\(^{76}\) *Buls* 1976(2) SA 891 (T)
He then injected the hand and suspecting a fracture of the right wrist referred the plaintiff to the radiological department for X-rays. Two X-ray views were taken, but Dr. Buls found no evidence of a fracture. The plaintiff’s hand was strapped with an elastoplast bandage by the sister in the casualty department. He was given tablets to reduce the swelling and other tablets to relieve the pain, and Dr. Buls told him to return after a week, by which time the part-time radiologist employed by the hospital would have reported on the X-rays. The plaintiff returned to the hospital on 14 April. He was still suffering from pain but it was not as severe. The swelling had almost gone. The radiologist had reported that no fracture was seen on the X-rays, and Dr. Buls communicated this to the plaintiff. He gave him ointment with which to massage the hand, and more tablets for the pain. According to the plaintiff, Dr. Buls told him that he was not to worry and that it was not necessary for him to come back. Dr. Buls, however, said in his evidence that he told the plaintiff that he should come back if he continued to experience pain. The magistrate found that while the plaintiff gave untruthful evidence in certain respects there was no reason to disbelieve Dr. Buls, whose evidence on this point he accepted. This finding was not challenged on appeal. The plaintiff did not return to the hospital. As he continued to experience pain, he consulted Mr. Bryer, a specialist orthopaedic surgeon, on 29 April. Mr. Bryer carried out a clinical examination which led him to suspect a fracture of the scaphoid bone of the right wrist. He referred the plaintiff for X-rays, and these revealed that there was such a fracture. Mr. Bryer then immobilised the plaintiff’s wrist in plaster, which remained in position for a period. The plaintiff subsequently instituted the present action against the defendants, alleging that, as a result of Dr. Buls’ negligence and lack of skill, the proper treatment of his wrist was delayed for three weeks until 29 April. He claimed damages made up as follows:

- Pain and suffering for three weeks .................. R150.00
- Loss of earnings for three weeks .................... R525.00
- Fee - orthopaedic surgeon ........................ R 80.00
Dr. Buls was alleged to have been negligent as follows in the plaintiff’s particulars of claim:

“The first defendant treated plaintiff for the said ailment negligently and unskilfully in that he:

(a) caused two X-ray pictures only of plaintiff’s right wrist be taken by a radiologist in the employ of the Krugersdorp Hospital;
(b) failed to examine plaintiff’s right wrist properly and failed to find that the scaphoid bone of this wrist was broken;
(c) failed to put plaintiff’s wrist in plaster and thus to immobilise it, which is the correct and accepted medical practice;
(d) failed to cause further X-ray pictures to be taken when plaintiff consulted him again on 14 April and complained that he was still suffering much pain;
(e) failed again to immobilise plaintiff’s wrist but advised him to massage it with an ointment;
(f) advised plaintiff wrongly on 14 April that a further consultation and examination of his wrist was not necessary;
(g) undertook the examination of plaintiff’s right wrist and his treatment without possessing the required knowledge and skill.”

Judgment

Nicholas J noted that during the hearing of the appeal a question arose whether the plaintiff’s summons disclosed a cause of action. He observed that the cases of medical negligence in the South African law reports had all arisen out of physical injury or harm sustained by the plaintiff and that the present plaintiff alleged, not that he suffered personal injury or harm as a result of the negligence of Dr. Buls, but that he suffered pecuniary loss as a result of the delay in the treatment of the injury which he had sustained. Nicholas J stated that generally
speaking every man has a right that others shall not injure him in his person and that involves a duty to exercise proper care. He said that every man has a legal right not to be harmed and then asked whether, apart from a contract, there is a legal right to be healed? Observing that it is the professional duty of a medical practitioner to treat his patient with due care and skill, Nicholas J questioned whether, merely by undertaking a case, a medical practitioner becomes subject to a legal duty, a breach of which founds an action for damages, to take due and proper steps to heal the patient? He noted that this is an interesting question but, because it was not argued and because it is not necessary for the purposes of the present decision to answer it, he did not discuss it further.

The court observed that the standard of care required of a medical practitioner who undertakes the treatment of a patient is not the highest possible degree of professional skill, but reasonable skill and care. It stated that in deciding what is reasonable, the evidence of qualified physicians is of the greatest assistance but that the decision of what is reasonable under the circumstances is, however, for the Court. It will pay high regard to the views of the profession, but it is not bound to adopt them. The question in Buls' case was thus not how a specialist orthopaedic surgeon would have acted in the treatment of the plaintiff, but how an average general practitioner, carrying on his duties as a casualty officer in a public hospital, would have acted. Two orthopaedic surgeons gave expert evidence at the trial: one, Mr. Bryer, was called by the plaintiff; the other, Mr. Du Toit, by the defendant. Mr. Bryer's evidence was that Dr. Buls' conduct on 7 April was not subject to criticism. The clinical signs at that stage, so far as they were observable by Dr. Buls in the circumstances, did not clearly point to a...
fracture of the scaphoid, the diagnosis of which is often missed. There would be similar symptoms where there was a soft-tissue injury of the area, and a number of other bones in the wrist could have been injured and which would have given rise to the same symptoms. Suspecting a fracture of one of the bones, Dr. Buls referred the case to the radiological section where the procedure and the views to be taken would be determined by the person in charge. In this case the radiological section did ‘the usual thing in these hospitals’ and took ‘two standard views of the wrist’. Those views did not reveal a fracture, although Mr. Bryer said that to him, as an orthopaedic surgeon, there were suspicious features which would have persuaded him to call for additional X-ray views. Mr. Bryer said that he felt that the general practitioner was perfectly justified in the first instance in doing nothing more than he did but that when the plaintiff came back again a week later still complaining of pain, something more should have been done. So far therefore, the plaintiff had failed to establish a case. In regard to the second visit on 14 April it was Mr. Bryer’s opinion that the plaintiff should then have been re-examined because, at that stage the possibility of a fracture of the scaphoid or of one or other of the bones in the wrist, should have been realised. But, he said, even if it was reasonably certain on clinical examination that the patient had a fracture it is essential that one takes X-rays to confirm the diagnosis. He agreed that it is possible to miss a fracture of the scaphoid even if a number of X-rays are taken. It was the view of Mr. Du Toit that the average time at which a crack-fracture of this bone tends to show up on an X-ray is three weeks after the original fracture. Mr. Bryer considered that the period was ten to fourteen days, but conceded that it could be three weeks. He agreed that some orthopaedic surgeons would request further X-rays in a case where the original X-rays had not revealed the fracture in two weeks, and others in three weeks and that an orthopaedic surgeon was not to be criticised who allowed three weeks to elapse. He did not therefore criticise Dr. Buls for failing to diagnose the fracture of the scaphoid bone on 14 April. He did say, however, that a clinical examination would have revealed this as a strong probability and that, if the doctor feels certain there is a fracture, he should immobilise the wrist
and have further films taken in about 14 days. He agreed that from the plain point of view of diagnosis, there is no criticism if he has missed the fracture the first time, to come back in 14 days for the second X-ray but he should do something to relieve the pain, namely, by immobilising the wrist in a plaster cast.

In the view of Mr. Bryer, therefore, Dr. Buls was not negligent in the respect alleged in para (d) of para. 6, but was negligent in the respect alleged in paragraph (e). In this regard, Mr. Du Toit disagreed. He considered that there was no neglect of duty by Dr. Buls on 14 April. His conduct was that which he would have expected from an ordinary casualty officer. Dr. Buls was not an expert in problems of the type which arose, and he gave to it the attention of a general practitioner. The fracture of the scaphoid bone is a very difficult one to diagnose. At the interview on 14 April Dr. Buls was reassured clinically by the fact that the swelling had gone, if not completely, then at any rate substantially, and that the pain was reduced. He had been informed by the hospital’s radiologist that there was no fracture visible on the X-rays, and the average doctor would have accepted that opinion. He told the plaintiff that if the wrist continued to trouble him, he should come back. In the light of this evidence, and having regard to the onus, it is impossible, said Nicholas J to hold that the plaintiff established the negligence referred to in paragraph (e). So far as paragraph (g) was concerned, he held that there was nothing in the evidence to suggest that Dr. Buls lacked the requisite knowledge and skill to undertake the examination and treatment of the plaintiff in the initial stages, and after 14 April 1972, the plaintiff did not return to the hospital. The plaintiff failed, therefore, to establish any of the particulars of negligence alleged by him. The appeal was upheld with costs.

Discussion
In relation to the question of the legal right to be healed raised by Nicholas J in this case, Strauss submits that the answer is as follows: where a patient consults a doctor who undertakes to treat him, the doctor assumes no greater duty than to treat the patient with due care and skill, unless the doctor has expressly guaranteed that the patient will be healed by his treatment – something which the prudent doctor will not generally do. He notes that this is also the view of the English courts and refers to the case of *Greaves & Co (Contractors) Ltd v Baynham Mickle and Partners* in which Lord Denning states concerning the ‘employment of a professional man’ that “The law does not usually imply a warranty that he will achieve the desired result, but only a term that he will use reasonable care and skill. The surgeon does not warrant that he will cure the patient. Nor does the solicitor warrant that he will win the case”. However, Strauss points out in another chapter that a wrong diagnosis may result in a doctor be held liable for damages if the diagnosis is causally responsible for wrong treatment being given to a patient or the patient suffering injury in another manner. It is respectfully submitted that the correct answer to the question in a contractual setting as to whether or not the patient has a right to be healed or cured is dependent upon the terms of the contract, whether express or implied, in each situation. A contract for cosmetic surgery for instance, in which the surgery is carried out for the express purpose of reducing the size of the patient’s breasts by stated measurements gives a right to very specific performance indeed as does a contract for the carrying out of a hysterectomy in order to remove a diseased uterus. Similarly contracts for the removal of an inflamed appendix, for the supply of eyeglasses to correct a visual defect, for a test for a particular genetic defect in a foetus, or for the termination of a pregnancy, or the insertion of an artificial hip are all quite specific in terms of the expected outcome. Failure to do what is minimally

---

78 Strauss fn 17 supra p 40-41
79 *Greaves* (1975) 3 All ER 99 (CA)
80 Strauss fn 17 supra at p 252
necessary to achieve the anticipated or expected outcome is likely to give rise to legitimate claims for breach of contract.

The question is whether, in the delictual context, the constitutional right of access to health care services including reproductive health care introduces any new, or strengthens any existing, obligation on the part of a provider of health care services to ensure that the envisaged service is properly, correctly or adequately rendered. In the case of a disabled patient who is admitted to hospital for the treatment of pressure sores, for instance, could the failure of the nursing staff to turn the patient regularly so as to ensure his recovery from pressure sores and to prevent the development of new ones be seen as a violation of that patient's constitutional right of access to health care services? If constitutional rights are to be enforced not through the creation of new legal actions but using the existing actions available at common law, then in order to succeed in an allegation that this constituted a violation of his constitutional rights, the patient would have to satisfy all of the requirements of the law of delict with regard to proof of negligence etc. The patient could also, technically speaking, while he is still an inpatient apply to court for an urgent order compelling the hospital to give him proper nursing care on the basis that their neglect of him is violating his constitutional right of access to health care services but this is unlikely to happen in practice. It is submitted firstly that the in the delictual context, the constitutional right of access to health care services, strengthens rather than adds to, the obligations of a health provider to give proper care and treatment to a patient since the right impacts on the question of the wrongfulness or unlawfulness of the provider in not doing so. It is submitted secondly that the constitution also strengthens the idea that even in the absence of a contract there is a legally recognised relationship between a provider and a patient under his care although this has already been recognised in cases such as that of Dube v Administrator Transvaal\textsuperscript{81} discussed previously. It is submitted thirdly that the word ‘access’ must be interpreted broadly to be meaningful and

\textsuperscript{81} Dube fn 64 supra
effective access, i.e. access to services that are likely to effect a cure, alleviate symptoms or otherwise improve the patient’s health status or condition since a narrower interpretation would amount effectively to a denial of the right. To put it differently, access to treatment that does not meet standards of general efficacy, safety and quality is not access for constitutional purposes. It is submitted fourthly that the constitution could in certain circumstances create an obligation on the part of a provider to treat a person in a situation in which the law previously did not recognise such an obligation since the existence of a right of access to health care services, it could be argued, shifts the onus from the person seeking the services to show reasons why a particular provider should have treated him or her, to the provider refusing those services to show reasons why the access was denied. It is submitted fifthly that, due to the fourth submission above, the possibility of a claim in delict involving denial of access, in both obvious and subtle ways, to health care services is greatly enhanced by the existence in constitutional law of a right of access to health care services since previously no such right existed and the question of an obligation to treat a person was thus unlikely to rise except in the narrowest of circumstances.~O

Claassen and Verschoor point out that in Buls, the patient for the first time in South African legal history based his action on pure economic loss suffered by him as a result of the alleged negligence of the defendant-practitioner. They note that in previous cases such claims were usually based on the personal injuries or prejudice suffered by the plaintiff. They point out that only two actionable wrongs are known in South African law, namely damnum injuria datum (damage wrongfully caused) and injuria (injury to personal dignity) and

---

82 Strauss fn 17 supra, writing pre-constitutionally, notes at p3 that as a general rule the independently practising doctor is under no obligation to treat any person requesting his services. As a so-called independent contractor he is at liberty to select or refuse patients at will. He notes, however, that this is qualified in two respects only: First, a doctor who arbitrarily and unreasonably refuses to attend to a seriously ill or injured person may be held liable if the patient cannot manage to get another doctor and suffers harm. Secondly, once a doctor has accepted a patient and has embarked upon a specific course of treatment, he may not unilaterally abandon the patient if abandonment might be harmful to the patient. It is submitted that although Strauss refers only to ‘the doctor’, these rules were applicable to other health professionals and providers of health care services such as public and private hospitals as well. The term ‘provider’ is used in this thesis to indicate all such providers of health care services including ‘doctors’.

83 Claassen and Verschoor fn 5 supra
that the commission of every delict constitutes, between the perpetrator and the injured person, an obligation implying a legal claim in favour of the injured party and aimed at the obliteration of the injury. They further note that in South African law there are mainly three actions which are ex delicto aimed at the recovery of damages, to wit, the actio legis Aquiliae for the recovery of damages, the actio injuriarum for the redress of moral damages where a personality right has been injured intentionally and the action for pain and suffering flowing from negligent impairment of (sic) physical injury. They point out that Neethling et al\(^{84}\) refer to these actions as the three pillars of the South African law of delict.

8.2.7 *Magware v Minister Of Health NO* \(^{85}\)

**Facts**

As the result of an accident on 3 April 1978 plaintiff sustained an unstable bimalleolar fracture dislocation of his right ankle. Plaintiff attended at the casualty department of Harari Hospital on diverse occasions during the period between 3 April 1978 and 27 June 1978 and upon each such occasion he paid the prescribed fee and was treated by the casualty medical staff for his said injury. The aforesaid casualty medical staff were at all times relevant to these proceedings acting in the course and within the scope of their employment with the Ministry of Health, of which Ministry the defendant is the responsible Minister. In the premises, the parties concluded an implied agreement in terms of which defendant undertook through his duly appointed employees to treat plaintiff on each such occasion for his said injury. It was a material term of the said implied agreement that defendant's employees would conscientiously employ reasonable care and skill in their treatment of plaintiff. In breach of the said term of the parties’ agreement defendant's employees failed to apply due

---

\(^{84}\) Neethling, Potgieter and Visser 1989 *Deliktereg*  
\(^{85}\) *Magware* 1981 (4) SA 472 (2)
care and skill in their treatment of plaintiff’s injury in one or more of the following respects:

(a) they applied a plaster of Paris cast to plaintiff’s ankle without ensuring that it was moulded appropriately to stabilise and prevent slippage of the said fracture dislocation to the ankle;

(b) after they had applied the said plaster of Paris cast they failed to check the said fracture dislocation by means of X-rays on 3 or 4 April 1978 as they should have done, and only made such a check on 17 April 1978;

(c) despite the fact that the X-ray taken on 17 April 1978 revealed that the fracture was in an unacceptable position and required immediate correction, they failed to take the appropriate action necessary to correct it.

Alternatively he alleged that the defendant’s employees, in breach of their duty to employ reasonable care and skill in their treatment of plaintiff, were negligent in their treatment of him.

In his plea the defendant denied any contractual relationship between the parties. However, paras 4 and 5 of his plea read as follows:

4. Defendant admits the negligence alleged in para 7, as particularised in para 6, but avers that such negligence consisted only of acts of omission, not giving rise to delictual liability on the part of defendant

5. Save that it is admitted that plaintiff’s injury did not heal as it would have done with the correct treatment, and save that defendant has no knowledge of the quantum of damage alleged, does not admit it and puts plaintiff to the proof thereof, defendant denies the allegations in para 8.

The plaintiff excepted to para 4 of the plea on the basis that the negligence which defendant admitted, as particularised in para 6 of plaintiff’s declaration, was such as can give rise in law to delictual liability on the part of defendant towards plaintiff and in the premises, the defendant’s defence to the alternative basis upon which plaintiff’s claim was founded, namely that his servants’ admitted negligence did not give rise to liability in delict, was bad in law. In the
judgment the plaintiff is referred to as the excipient and the respondent as the defendant.

**Judgment**

Counsel for the defendant, submitted that the negligence alleged by the plaintiff consisted only of acts of omission and that where there were acts of mere omission there was no liability\(^{86}\). Counsel argued that the instant case was one of ineffective treatment and that liability in medical matters depends on a prior act of commission which is something more than the mere acceptance of the patient or the application of ineffective treatment.

Counsel for the excipient referred to two English cases. In England the position appeared to be that doctors and hospital authorities, whenever they accept a patient for treatment, are under a duty to use reasonable care and skill to cure him of his ailment\(^{87}\). Reference was also made by counsel for the excipient to *Barnett v Chelsea & Kensington Hospital Management Committee*\(^{88}\) in which the deceased had, with two other watchmen, reported to the hospital. They told the nurse in the casualty department that they had been vomiting continuously after drinking tea and wished to see a doctor. The nurse telephoned the doctor and informed him of this. He instructed the nurse to tell the watchmen to see their own doctors. Later the deceased died of arsenical poisoning. It was held that, in failing to see and examine the deceased and in failing to admit him to hospital and treat him, the hospital’s casualty officer was negligent and did not discharge the duty of care which in the circumstances was owed to the deceased by the defendant as hospital authority. Smith J noted that *Donoghue v Stevenson* and *Le Lievre v Gold* were referred to in relation to close and direct relations between persons giving rise to a duty to take care, and that Nield J

---

\(^{88}\) *Barnett* (1968) 1 All ER 1068
stated that in his judgment there was here such a close and direct relationship between the hospital and the watchmen that there was imposed on the hospital a duty of care which they owed to the watchmen.

Smith J in *Magware* observed with regard to South African law that it had been decided by the Appellate Division in South Africa that prior conduct or the control of property are not essential to the creation of a duty to act for the safety of others, although they may be factors in the totality of circumstances from which such a duty is inferred\(^8\). He noted that Steyn JA in a minority judgment in *Silva's Fishing Corporation (Pty) Ltd v Maweza*\(^9\) said:

"The Roman law, as also the Roman-Dutch law, recognises the principle that, generally speaking, no one is bound to mind the business of another, even where he can, with no danger or expense to himself, avert serious harm from the other, and that no liability is incurred by refraining from doing so, even if the omission should violate a moral duty. Indeed, Cujacius *Opera Omnia* 8 C329, points out that in general it is culpable to meddle with the affairs of another which do not affect you and are none of your business. But there is a variety of circumstances, some of them unconnected with prior conduct, which impose the duty to act in order to avoid reasonably foreseeable loss to another. The circumstances which will give rise to such a duty may differ according to the conceptions prevailing in a particular community at a given time."

Smith J observed that MacDonald ACJ cited with approval the last sentence of this statement in *King v Dykes*\(^9\) and went on to stated that so far as he was concerned the law to be applied was stated by MacDonald in *King v Dykes*\(^9\). Smith J stated that in deciding whether a legal duty of care exists, one must

---

8. *Minister van Polisie v Ewels* 1975 (3) SA 590 (A). In this case it was held that members of the police force had been under a duty to stop another policeman from assaulting a man in a police station. See, particularly, at 596 - 597 (English translation). At 597 Rumpff CJ, having stated that prior conduct or the control of property are not essential requirements for unlawfulness, goes on to say: "It appears a stage has been reached where an omission is regarded as unlawful conduct when the circumstances of the case are such that the omission not only occasions moral indignation but where the legal convictions of the community require that the omission be regarded as unlawful and that the loss suffered be compensated by the person who failed to act positively. When determining unlawfulness, one is not concerned, in any given case of an omission, with the customary 'negligence' of the bonus paterfamilias, but with the question whether, all facts considered, there was a legal duty to act reasonably." See, also, 1975 South African Law Journal at 361 and 1975 Annual Survey of South African Law at 170.

9. *Silva's Fishing Corporation* 1957 (2) SA 256 (A) at p265

90. *King* 1971 (3) SA 540 (RA)

91. MacDonald ACJ in *King v Dykes* (in 91 supra) at p543 criticised any attempt to categorize events preceding an omission as "prior conduct", among others. He said that the Court must apply the universal and basic test of deciding whether or not a legal duty exists in the particular circumstances of the case.
have regard to all the facts of the case and the conceptions prevailing in the particular community at a given time. 93

Counsel for the excipient submitted that the present case was similar to Dube v Administrator, Transvaal and Blyth v Van den Heever. 94 Both of these cases related to the treatment of a fractured arm. Smith J noted that in Dube Trollip J said that the plaintiff's action was founded on delict and not on contract. Because the hospital accepted the plaintiff as a patient, its staff owed him a duty to attend to and treat him with due and proper care and skill. Blyth was based on negligent omissions. Counsel for the defendant submitted that in each of these cases there was a prior act of commission. Smith J said he thought that this latter submission is correct, but that it was noteworthy that in neither case was there any mention of a prior act of commission as such.

Smith J observed that on the instant case the plaintiff attended at the casualty department of Harari Hospital on diverse occasions and was treated by the casualty medical staff for his injury. They applied a plaster of Paris cast to his ankle. They were negligent in the way they applied the plaster of Paris cast and were thereafter guilty of negligent omissions. This means that they ought as reasonable men to have foreseen that their inaction might entail harm for the plaintiff and that they had the means to avert such harm and that they failed by reasonable action to prevent it. He said that it was clear that there was a moral and professional duty to act reasonably towards the plaintiff and that, on the facts, once the defendant's employees had undertaken treatment and had engaged in applying the plaster of Paris cast, there was set up a special relationship between defendant's employees, the casualty medical staff, and the

---

93 At p 545 of King v Dykes (fn 91 supra) MacDonald ACJ said that in general it is the legal duty of an occupier of land to take steps to prevent a hazard on his land causing harm to persons who, by reason of their proximity, may be harmed if the hazard is not dealt with. He went on to say whether in a particular case such a legal duty exists is to be decided in the main by factors such as those mentioned in Goldman v Hargrave (1967) 1 AC 643: "... a balanced consideration of what could be expected of the particular occupier as compared with the consequences of inaction."

94 Dube fn 64 supra

95 Blyth 1980 (1) SA 191 (A)
plaintiff, different from the relationship between the plaintiff and a disinterested stranger. The plaintiff was in the care of the defendant’s medical staff. Smith J held, on a consideration of the facts and what could be expected of the casualty medical staff as compared with the consequences of inaction, and having regard to the conceptions prevailing in the country, there was a legal duty to act reasonably. The exception was upheld with costs. The defendant was given leave to amend his plea within 12 days from the date of judgment.

Discussion

This case is another one in which the court found that there was an obligation between the provider and the patient on the basis of the law of delict and that a contractual relationship was not a *sine qua non* of that relationship. This case and the South African cases cited by the court in its judgment contain persuasive justification for the broad interpretation of the term ‘access’ suggested by the writer in the discussion under *Buls v Tsatsarolakis*. Health care services rendered to patients must be of a standard of quality, efficacy and safety that can reasonably be expected of persons who are qualified and duly licensed to render the services in question. There is a duty on providers of health care services to act reasonably in the rendering of those services. In this case the actions of the defendants amounted to negligent omissions. Strauss refers to the US case of *Hurley v Eddingfield* in discussing the right of a doctor to refuse to treat a patient. In this case the Indiana Supreme Court held expressly that ‘the state does not require and the doctor does not engage that he will practice at all or on other terms than he may choose to accept.’ In this case, reports Strauss, a doctor refused to attend an ailing man, although there were no other patients demanding his services at the time. He failed to give any reasons for his refusal. Strauss notes that the right of a doctor to arbitrarily refuse to

96 *Buls* fn 76 supra
97 *Hurley* 156 Ind 416, 59 NE 1058 (1901)
accept any person as a patient - even in a dire emergency - has subsequently been reaffirmed by numerous American authorities. These authorities, he says, also emphasise that the mere fact that a doctor on previous occasions rendered a patient services does not affect the right of the doctor to subsequently refuse to attend that patient. In South African law, says Strauss, the doctor’s right of refusal was traditionally justified on the ground that no one could be held liable for a so-called “mere omission”. Strauss points out that according to the customary view, liability for an omission could only be incurred in special circumstances such as the following:

- Where the defendant has by a ‘positive’ act created a potentially dangerous situation and refrains from taking steps to avoid the danger. In the medical situation an example would be where a doctor spontaneously commences treatment of the victim of a traffic accident and then, when the patient is still in need of continued treatment, ‘abandons’ him;
- Where the defendant has assumed control over a dangerous object and then neglect to exercise proper care over it. A possible medical example would perhaps be where Dr A has commenced a blood transfusion; his attendance elsewhere is required urgently and he requests his colleague, Dr B, to carry on with the transfusion; B fails to exercise proper care over the apparatus or the procedure.
- Where the defendant is under a statutory duty to act and neglects to do so e.g. a district surgeon or medical officer of health fails to vaccinate patients who present for compulsory vaccination.
- Where the defendant has by contract assumed certain duties and fails to carry these out, e.g. a casualty officer in the employ of a hospital authority fails to attend an injured patient brought into his ward.

Strauss notes that in all these cases the plaintiff would have to prove that the doctor’s omission was either intention or accompanied by negligence.

It is submitted with regard to the situation in Hurley that in South Africa it is highly unlikely, in view of the constitutional right of access to health care
services, that a provider would be able to get away with behaving in such a manner. A provider approached for treatment by a person would have to have substantial reasons for not doing so in order to swing the balance in his favour. Furthermore the rigid distinction in South African law previously between wrongful acts and omissions has become increasingly blurred since *Minister van Polisie v Ewels* and, it is submitted, that in view of the test for wrongfulness currently used by the courts based as it is on the legal convictions of the community or the *boni mores*, there is no sound reason for artificially maintaining such a distinction or seeking to find prior conduct on the part of the defendant such as the examples given by Strauss above indicate. To suggest otherwise would be to suggest different tests for wrongfulness depending on whether it was an act or omission that caused the harm. This is not only logically unnecessary but, it is submitted, legally incorrect if the test of wrongfulness is based on public policy informed by the values and principles of the Constitution since the latter do not vary in their substance depending on whether there was an act or an omission. In fact in constitutional terms, the denial of a right, eg the right of access to health care services, can be seen as an omission to act in the required manner as much if not more than as a positive action (a refusal) to act in the required manner.

8.2.8  

*S v Kramer*

**Facts**

On the morning of 4 December 1981 the deceased, a 10 year old girl was admitted to the Rydal Clinic in Boksburg where she was to undergo a tonsillectomy and adenoidectomy. She was a healthy, happy child with no other physical problems. The deceased was treated by accused No 1 who *inter alia* gave her tablets in preparation for the operation. On arriving at the clinic the

---

98 *Ewels fn 89 supra*
99 *Kramer 1987 (1) SA (N)*
deceased was weighed, prepared for the operation and taken to the theatre. In the theatre, accused No 1 was to perform the duties of a surgeon and accused No 2 the duties of an anaesthetist. Accused No 2 examined the deceased in the theatre. Thereafter he administered atropine, prabanthol and scolene. Pure oxygen was thereafter administered through a face mask for a few minutes. Accused No 2 then chose an endotracheal tube which he inserted through the nose into the trachea with the aid of a laryngoscope and Mcgil forceps. Sister Lansdown then connected the tube to the Boyles machine and secured the connections. The deceased was ventilated manually for some time. Accused No 1 then asked accused No 2 for permission to proceed with the operation, which permission was given. A mouth gag was put in and accused No 1 started curretting the adenoids. That having been completed, accused No 1 started to remove the left tonsil. As he was doing that he noticed an excess of bleeding. The blood was dark in colour and the deceased was also showing signs of waking up. It was then also obvious that the deceased was cyanosed. Accused No 1 removed the left tonsil, sucked the blood in the throat away and, with the aid of a laryngoscope, came to the conclusion that the tube was not in the trachea. He immediately ordered further doses of phabanthol and scolene to be administered, removed the tube and re-intubated the deceased with another tube. The deceased was ventilated. Her colour improved. She suddenly became cyanosed again and as no pulse was palpable, cardiac massage was started. Attempts were made to stimulate the deceased’s heart with a defibrillator but to no avail. The deceased died in theatre. In convicting accused No 1 of culpable homicide the court a quo found that he was negligent in the following respects:

(a) Accused No 1 should have ensured that the endotracheal tube had been correctly inserted by accused No 2. The court a quo found that this duty on accused No 1 Arose as a result of the following:

(1) Accused No 1 knew that accused No 2 was a relatively inexperienced anaesthetist.

(2) Accused No 1 knew that each and every anaesthetist can place an endotracheal tube wrongly.
(3) Accused No 1 admitted at the inquest that had he checked if the tube had been correctly placed the deceased's death could have been avoided.

(b) Accused No 1 should not have removed the left tonsil after he had seen the dark blood. In doing so he delayed commencing the resuscitative measures.

(c) Accused No 1 should not have ordered accused No 2 to inject more scolene, a drug that would paralyse the lungs of the patient and prevent her from breathing normally.

Accused No 1 appealed against his conviction on the following grounds:

1. The court erred in convicting accused No 1 of culpable homicide.

2. The court should have found that the state failed to prove beyond reasonable doubt that:
   (a) accused No 1 was negligent, either as alleged in the further particulars to the charge sheet or at all;
   (b) accused No 1's negligence, if any, was causally connected to the death of the deceased.

3.1 The court erred in finding that accused No 1 delayed in taking steps to ensure that the intratracheal tube was correctly placed and/or to take resuscitative measures.

3.2 The court should have found that once accused No 1 saw that the deceased was bleeding excessively in the throat and that the blood was dark in colour, he:
   (a) acted immediately in order to ascertain precisely what the cause was of these two phenomena; and/or
   (b) immediately took steps to establish an airway.

3.3 The court should have found that, on Professor Cooper's evidence, the state failed to prove that accused No 1 had not acted properly in the emergency situation in which he, as surgeon, found himself.
4.1 The trial court erred in finding that accused No 1 should not have told accused No 2 to use Scoline on the second occasion.

4.2 The trial court should have found that it was essential for an intratracheal tube to be reintroduced and that in order to do so a muscle relaxant, such as Scoline, had to be used.

5.1 The trial court erred in finding that, before commencing the operation, accused No 1 should have checked to see that the intratracheal tube had been correctly placed by accused No 2.

5.2 This finding was in direct conflict with the evidence of Professor Cooper, whose evidence it was that it was not the surgeon's function to ensure that the intratracheal tube had been correctly placed by the anaesthetist.

5.3 The trial court furthermore erred in finding that accused No 1 should have foreseen that accused No 2 might insert the intratracheal tube incorrectly.

5.4 The trial court should have found that accused No 1, as surgeon, was entitled to assume that accused No 2, who was qualified to act as anaesthetist, would insert the intratracheal tube correctly.

In convicting accused No 2 of culpable homicide the court a quo found that he was negligent in the following respects:

(a) he should not have relied on Sister Lansdown to choose an appropriate length of endotracheal tube as it was possible that the tube which was inserted was too short or that it was not inserted deep enough into the trachea;

(b) he did not insert the tube into the trachea at all;

(c) he did not monitor the patient's condition adequately and therefore did not timeously detect that the supply of oxygen to the patient's lungs was inadequate. In coming to this conclusion the court a quo found that accused No 2 should have made use of a blood pressure cuff and an ECG machine;

(d) he should not have frozen at the first signs of a crisis as he was busy with a dangerous undertaking and the patient's life was in his hands.
Accused No 2 appealed against his conviction and sentence. The grounds on which the appeal was based were as follows:

1. The learned magistrate erred in finding that appellant was negligent; alternatively that his negligence caused the death.

2. Regarding the finding that appellant was negligent in relying on an experienced nurse to check the anaesthetic drugs for him, there was no evidence that this conduct constituted negligence or that any mistake was made connected with the drugs or that any such mistake caused the death.

3. Regarding the finding that he was negligent in relying on an experienced nurse to choose an appropriate length of endotracheal tube, there was no evidence that this conduct constituted negligence or that any mistake was made connected with the length of the tube or that any such mistake caused the death.

4. Regarding the finding that he was negligent in failing to check that the endotracheal tube was inserted deeply enough into the trachea, there was no evidence of any such failure or that any such failure caused the death.

5. Regarding the finding that he was negligent in failing to insert the endotracheal tube into the trachea at all:
   5.1 the learned magistrate erred in that he relied entirely on appellant's admission at the inquest that it was possible that he had inserted the tube incorrectly;
   5.2 there was evidence that the time from oxygenation to the time when the blood went dark, i.e. over 6 minutes, indicated that the tube had been inserted correctly.
6. Regarding the finding that he was negligent in not putting a blood pressure cuff on the child, there was no evidence that this constituted negligence or that the child's life would beyond a reasonable doubt have been saved had the blood pressure cuff been put on.

7. Regarding the finding that he was negligent in not using an ECG, there was no evidence that this constituted negligence or that the child's life would beyond a reasonable doubt have been saved had he used one.

8. The learned magistrate should therefore have held that it had not been proved beyond a reasonable doubt that appellant was negligent in any manner which caused the death and should have acquitted him.

Judgment

Van der Merwe J referred to the authorities, stating that before dealing further with the facts of this appeal, the findings of the court a quo and the grounds of appeal it was necessary to refer briefly to the test to be applied in concluding that a medical practitioner was negligent in the performance of his duties. He noted that: In Mitchell v Dixon 1914 AD 519 at 525 it was stated that 'A medical practitioner is not expected to bring to bear upon the case entrusted to him the highest possible degree of professional skill, but he is bound to employ reasonable skill and care; and he is liable for the consequences if he does not.' In Van Wyk v Lewis (fn 24 supra) at p 444 Innes CJ again dealt with the degree of skill and care expected from a medical practitioner where he explained the principle laid down in the Mitchell case supra as follows: 'It was pointed out by this Court, in Mitchell v Dixon 1914 AD at 525, that "a medical practitioner is not expected to bring to bear upon the case entrusted to him the highest possible degree of professional skill, but he is bound to employ reasonable skill and care." And in deciding what is reasonable the Court will have regard to the general level of skill and diligence possessed and exercised at the time by the members of the branch of the profession to which the practitioner belongs. The evidence of qualified surgeons or physicians is of the greatest assistance in estimating that general level. And their evidence may well be influenced by local experience, but I desire to guard myself from assenting to the principle approved in some American decisions that the standard of skill which should be exacted is that which prevails in a particular locality where the practitioner happens to reside. The ordinary medical practitioner should, as it seems to me, exercise the same degree of skill and care, whether he carries on his work in the town or the country, in one place or another. The fact that several incompetent or careless practitioners happen to settle at the same place cannot affect the standard of diligence and skill which local patients have a right to expect.' In Webb v Isaac 1915 ELD 273 at 276 where Graham JP was reported to have said: 'The law upon the duties of a medical practitioner and the amount of skill which is expected of him has been discussed in the case of Mitchell v Dixon which was decided by the Appellate Court quite recently. In that case, the Chief justice in giving judgment said that the plaintiff's case was based upon negligence, that is, upon the want of reasonable skill which the law requires under the circumstances, and he pointed out that a medical practitioner is not expected to bring to bear upon a case the highest possible degree of professional skill, but that, if he did not employ reasonable skill, he was liable for the consequences. The learned Chief justice went on to point out that the burden of proof that the injury, of which the plaintiff complained was caused by defendant's negligence,
observed that these principles are applicable to a medical practitioner in the performance of any task he has undertaken, whether it is general diagnosis and treatment or whether he is performing a task in the operating theatre. Problems that may arise as a result of an operation are complicated by the fact that in an operation a number of different people take part, each with his own important duties to perform in the course of the operation. The court stated that if a mishap should occur during the operation, it is of importance to ascertain who was responsible for the mishap and to what extent any other member of the operating team can be held liable for the actions of that person.

In the present case it was never suggested that any one of the two nurses was responsible for the mishap or that the accused were liable as a result of negligence on the part of any one of the nurses. The court was of the opinion

rested throughout upon the plaintiff: that the mere fact that the accident occurred was not in itself prima facie proof of negligence, and that the maxim res ipsa loquitur did not apply. There are excellent reasons for this rule of law, because it seems to me that, if the law required in every case that a practitioner should have the highest degree of skill, it would lead to this result - that in remote country districts, and even in country districts at no very great distance from the large centres, it would be impossible to find a country practitioner who would take the risk of attending a patient, if he was always expected to exercise the highest degree of skill obtainable in the medical profession. The law requires of a doctor a reasonable degree of skill, which is dependent upon the particular circumstances of the case which he has under treatment.'

See also Coppen v Impey 1916 CPD 309 at 314 where Kotze J was reported to have said: 'But taking it that the probability is that these ulcers and the consequent condition of the plaintiff's right-hand, are attributable to such a burn, I have next to consider whether this burn is due to negligence or unskilfulness on the part of Dr Impey or his assistant, as alleged in the declaration. Before doing so it will be advisable to state succinctly the law applicable to the responsibility of a medical man in the treatment of his patient. While, on the one hand, he does not undertake to perform a cure, or to treat his patient with the utmost skill and competence, he will, on the other hand, be liable for negligence or unskilfulness in his treatment; for, holding himself out as a professional man, he undertakes to perform the service required of him with reasonable skill and ability.' See further Buls and Another v Tsatsarolakis [fn 76 supra] at p 893 in fine - 894D. See also Boberg, The Law of Delict [fn 28 supra] at p 346: 'Obviously the ordinary reasonable man test of negligence cannot be applied to an activity calling for expertise that the ordinary man does not possess. One cannot judge a surgeon's conduct by asking how a diligens paterfamilias would have operated, for either he would not have operated at all (which is most likely) or, if he would have operated (in some rare emergency), he would no doubt have done worse than even the most barbarous surgeon. And so there emerges the reasonable expert - a practitioner like the actor, both possessing no special flare or frailty; the reasonable doctor, the reasonable auditor, the reasonable mechanic. It is he who looks over the actor's shoulder to see if he attains the standard of his peers, for if he does not, he is negligent. That standard, it has been held, is not the highest level of competence: it is a degree of skill that is reasonable having regard to "the general level of skill and diligence possessed and exercised at the time by the members of the branch of the profession to which the practitioner belongs" (per Innes CJ in Van Wyk v Lewis fn 22 supra at 444). Thus it was held in Buls v Tsatsarolakis [fn 69 supra] that a general medical practitioner is not expected to display the knowledge and skill of a specialist orthopaedic surgeon.'

The court noted that the same principles are applied in English law. See, inter alia, Mahong v Osborne [1939] 1 All ER 535 at 548A - C: 'Before I discuss the Judge's summing up, it is desirable to recall the well-established legal measure of a professional man's duty. If he professes an art he must be reasonably skilled in it. There is no doubt that the defendant surgeon was that. He must also be careful, but the standard of care which the law requires is not insurance against accidental slips. It is such a degree of care as a normally skilful member of the profession may reasonably be expected to exercise in the actual circumstances of the case in question. It is not every slip or mistake which imports negligence, and, in applying the duty of care to the case of a surgeon, it is peculiarly necessary to have regard to the different kinds of circumstances that may present themselves for urgent attention.' See also Medical Negligence by Nathan [fn 65 supra] at p 22.
that, in general, neither the surgeon nor the anaesthetist was liable for the other's negligence. It held that this general rule would, however, be subject to exceptions, for example, where the surgeon knew that the anaesthetist was incompetent or not in a fit condition to perform his duties. Van der Merwe J said that there may also be other exceptions.101 He referred to the *dicta* of Wessels JA in *Van Wyk v Lewis*102 and said that the same principles hold true for the surgeon and the anaesthetist. They are not agents of one another. They are not employed and controlled by one another. Each one performs a specific specialised function as part of a team consisting of surgeon, anaesthetist and nursing staff. The court agreed with the submission on behalf of accused No 1 that there was no evidence produced that there was a duty on accused No 1 to check that accused No 2 had correctly placed the tube. It said that on the evidence there was nothing which occurred prior to the operation on the day in question which should have alerted accused No 1 to the danger that the deceased was not receiving an adequate supply of oxygen. There was no evidence to justify the court *a quo*’s finding that because of accused No 2’s relative inexperience as an anaesthetist and the fact that any anaesthetist can make a mistake, accused No 1 should have checked that the tube had been correctly placed. Van der Merwe J was therefore of the opinion that there was no duty in law on accused No 1 to have looked down the trachea of the deceased to check the position of the tube before commencing the operation.

---

101 He referred to *Helgesen v SA Medical and Dental Council 1962 (1) SA 800 (N)*, Meredith Malpractice Liability of Doctors in Hospitals at p 102 and SA Strauss & M J Strydom *Die Suid-Afrikaanse Geneeskundige Reg.*, fn 16 supra at 281.
102 *Van Wyk fn 24 supra* at p 460: “In determining whether a surgeon conducting an abdominal operation in a hospital is entitled to place reliance on the counting of the swabs by a qualified and competent hospital sister and whether by so doing he has exercised a reasonable degree of skill, care and judgment, we must consider the prevailing practice of the profession and all the circumstances surrounding the operation. The Court can only refuse to admit such a universal practice if in its opinion it is so unreasonable and so dangerous that it would be contrary to public policy to admit it. In determining whether such a practice is reasonable or not, the Court must take into consideration the advance of medical science and modern practice. Thus in the present aseptic treatment of patients, it is difficult for the surgeon to do all the work alone: all possible germs must be destroyed which may be deleterious to the patient: the rooms, the instruments and all the other appliances must be rendered aseptic as far as possible. If the doctor were required to do all these things personally it would not be for the benefit of patients generally but to their detriment. Important and necessary work preliminary to an operation and upon which the success or failure of the operation may depend, must necessarily be left to the hospital sister and her nurses. We must therefore admit that in operations some team-work, as it has been called by several witnesses, is essential. The work has become specialised so as to enable the surgeon to devote all his energy and attention to the highly skilled and difficult work of isolation, dissection and purification. To what extent a doctor should or should not rely upon the team-work of the hospital assistants depends entirely on the nature of the particular case.”
The concession made by accused No 1 at the inquest that had he looked down the trachea the death of the deceased could have been avoided, is to state the obvious. In making the concession accused No 1 did not say that it was his duty to check the position of the tube.

Van der Merwe J held that the court *a quo* was wrong in finding that accused No 1 was at fault to have ordered accused No 2 to inject more scolene, a drug that would relax muscles and therefore also paralyse the lungs of the patient. He said that accused No 1 was faced with two problems, namely, a patient who was obviously not receiving a sufficient supply of oxygen and who was ‘too light’ - that is, waking up. Accused No 1 had to establish an airway. He also had to prevent blood going into the lungs. He furthermore had to administer anaesthetic gasses which were at that stage supposed to be administered into the lungs. He therefore decided to intubate again. In order to insert a new tube a muscle relaxant was necessary. It was common cause that accused No 1 succeeded in inserting the second tube very quickly. The court found that accused No 1, when faced with the emergency acted swiftly. Accused No 2 at that stage ‘froze’ and accused No 1 had to take emergency measures to try and save the patient’s life. It held that accused No 1 acted reasonably in trying to create an airway in the way in which he did and that even if it could be said that some other measure could have been taken to establish an airway without administering a further dose of scolene, accused No 1 could not be found to have been at fault for the way in which he acted in the situation of extreme emergency. Accused No 1 took all reasonable measures to resuscitate the deceased under the prevailing circumstances.

The court found that the state failed to prove that accused No 1 was negligent as alleged in the further particulars to the charge sheet or at all. In his opinion accused No 1 was therefore wrongly convicted. On behalf of accused No 2 it was submitted that the evidence was to a large extent uncertain and conflicting. It was, however, submitted that a certain period of time had elapsed from the
moment the oxygen mask was removed (which was used to oxygenate the patient with pure oxygen) until the time the first dark blood was observed. This lapse of time, it was argued, proved that the tube was initially correctly inserted. Therefore it was submitted that the fact that the tube was later found to be displaced, was not due to any fault on the part of accused No 2. It was further submitted that the tube must have been displaced by accused No 1. It was also submitted that everything which happened after it was discovered that the tube was displaced was irrelevant as nothing could have saved the deceased’s life. According to the expert witness, Professor Cooper, if a tube of the correct length had been used and if it had been properly placed, it would not have slipped out of the trachea. Sister Lansdown was a person with long experience in nursing. From what she observed she was of the opinion that accused No 2 did not insert the tube correctly. Sister Lansdown testified as to the time lapse from the time that accused No 1 had begun operating on the patient until the dark blood was observed. According to her there was an insufficient lapse of time for the patient to have reached such an advanced state of deoxygenation that a darkening of the blood could have been caused. Accused No 2 also elected, as did accused No 1, not to testify. He therefore did not place on record the relevant time lapse. The estimates referred to on behalf of accused No 2 were derived from estimates given by Professor Cooper under cross-examination. The court observed that from the direct evidence of Sister Lansdown, who the court on the record as a reliable witness, the estimates of time relied on behalf of accused No 2 appeared to be incorrect. It held that the evidence for the state proved beyond reasonable doubt that the length of time from intubation till the blood turned dark is consistent with the tube not having been inserted properly and that the court a quo correctly found that accused No 2 failed to insert the tube correctly.

The court observed that from Professor Cooper’s evidence it was clear that it was accused No 2’s duty to monitor the deceased continuously and that it was possible for an anaesthetist to monitor a patient adequately using his senses and
simple apparatus such as a stethoscope and a blood pressure apparatus. The anaesthetist is therefore the person who will and must be able to detect an incorrectly placed or displaced tube. It found that accused No 2 did not at any stage whatsoever detect an incorrectly placed or misplaced tube. From the evidence it was clear that the condition of incorrect placement or displacement must have continued for a couple of minutes during which it should have been detected had accused No 2 performed his duties properly. The court stated that it was clear that the reason for monitoring a patient is to detect an insufficient supply of oxygen timeously and that early signs of an insufficient supply of oxygen can be detected by an increase of heartbeat, an irregular pulse rate and an increase of blood pressure. It held that there was therefore no merit in the argument that there was no evidence as to what symptoms should have been observed and that there was also no merit in the argument that there was no evidence as to when the symptoms would have been observed. Van der Merwe J held that even if it was wrong to find that the tube was initially incorrectly placed, accused No 2 could still be faulted for his failure to monitor the deceased properly and thereby detecting the misplacement of the tube timeously. This failure by accused No 2 led to the crisis which arose. On being told about the crisis accused No 2 ‘froze’ and accused No 1 had to undertake resuscitation of the patient. He said that although accused No 2’s failure to act promptly in the emergency might be frowned upon, it did not cause the death of the deceased as accused No 1 did whatever was possible. The court ruled that accused No 1’s conviction and sentence must be set aside while accused No 2’s appeal must be dismissed.

Discussion

The judgment in this case indicates what one would have thought is a fairly obvious principle in law – that one person cannot be held liable for another’s wrongdoing in circumstances where there is no relationship of control or accountability between them. There is furthermore no duty upon one health
professional to assess the competence of another in a situation in which they are operating as a team and to act in a way that minimises the risk of any deficits in the skill or knowledge of the other professional. The court did say that there may be exceptions for instance in a situation in which the one doctor knows that the other is not fit to perform his duties or is incompetent\(^{103}\). It is submitted, however that this is a far cry from a duty to ensure that the other health professionals in the team are competent and sufficiently skilled since this is the duty of the relevant statutory professional body which is required to register them as such on sufficient proof of such professional skill and knowledge. The rule *imperitia culpa adnumeratur* cannot be applied to the team as such, i.e. to a group of individuals collectively. Each must stand on his own two feet in terms of his competence and skill to perform the work he has undertaken. Each member of the team is entitled to rely on the others to perform their roles correctly and effectively and they cannot be held jointly and severally liable for each other’s mistakes.

Strauss makes the interesting point that depending upon the severity of the injury and the availability of better qualified professionals, a doctor, nurse or paramedic may in a case of dire emergency – where the patient is at death’s door – attempt measures which go far beyond his or her training, competency or experience. He uses the actions of the surgeon in trying to save the patient in this case and assuming the role of the anaesthetist when the latter ‘froze’ as support for this conclusion. He points out that in cases of extreme emergency even unqualified laymen may render aid to the injured although it would be held unreasonable for a layman to treat a critically injured person if expert medical aid is immediately available.

\(^{103}\) Claassen and Verschoor *(fn 5 supra)* observe at p 109 that a physician can also be held liable where he knew, or by exercising reasonable care should have known, that one or the other practitioners committed an unlawful act and where he has allowed him to proceed without any objection. They note, however, that Strauss and Strydom *(fn 16 supra)* point out that in this case the practitioner’s liability is based on his own negligence rather than that of his colleague. They also note at p 108 that where a practitioner is absent from his practice for a period of time and he has arranged for his patients to be treated by an independent *locum tenens* he will not normally be held liable for the negligent conduct of the *locum tenens* unless the relationship between them is one of employer/employee. Reasonable care must, however, be exercised in the selection of a *locum tenens*.
The concept of scope of practice is a very important element of the lawful delivery of health care services in South Africa. In terms of section 34 of the Health Professions Act, registration is a prerequisite for practising a profession in respect of which a professional board has been instituted.

Section 36 provides for penalties for practising as a medical practitioner or as an intern, or for performing certain other acts, while unregistered. Penalties

---

104 Health Professions Act fn 7 supra
105 Section 34 provides that:
(1) Subject to the provisions of sections 33 (2) (c) and 39, no person shall practise for gain within the Republic any other health profession the scope of which has been defined by the Minister in terms of section 33 (1), unless he or she is registered in terms of this Act in respect of such profession.
(2) Any person who contravenes the provisions of subsection (1) shall be guilty of an offence and on conviction liable to the penalties mentioned in section 39.
106 Section 36 provides that:
(1) Subject to the provisions of subsections (2) and (3) and section 37 any person, not registered as a medical practitioner or as an intern, who-
(a) for gain practises as a medical practitioner (whether or not purporting to be registered);
(b) for gain-
(i) physically examines any person;
(ii) performs any act of diagnosing, treating or preventing any physical defect, illness or deficiency in respect of any person;
(iii) advises any person on his physical state;
(iv) on the ground of information provided by any person or obtained from him in any manner whatsoever-
(aa) diagnoses such person's physical state;
(bb) advises such person on his physical state;
(cc) supplies or sells to or prescribes for such person any medicine or treatment;
(v) prescribes or provides any medicine, substance or thing;
or
(vi) performs any other act specially pertaining to the profession of a medical practitioner;
(c) except in accordance with the provisions of the Medicines and Related Substances Act, 1965 (Act 101 of 1965), the Pharmacy Act, 1974 (Act 53 of 1974), the Health Act, 1977 (Act 63 of 1977), the Nursing Act, 1978 (Act 50 of 1978), the Chiropractors, Homeopaths and Allied Health Service Professions Act, 1982 (Act 63 of 1982), and sections 33, 34 and 39 of this Act, performs any act whatsoever having as its object-
(i) the diagnosing, treating or preventing of any physical defect, illness or deficiency in any person; and
(ii) by virtue of the performance of such act, the obtaining, either for himself or for any other person, of any benefit by way of any profit from the sale or disposal of any medicine, foodstuff or substance or by way of any donation or gift or by way of the provision of accommodation, or the obtaining of, either for himself or for any other person, any other gain whatsoever;
(d) pretends, or by any means whatsoever holds himself out, to be a medical practitioner or intern (whether or not purporting to be registered) or a healer, of whatever description, of physical defects, illnesses or deficiencies in man;
(e) uses the name of medical practitioner, intern, healer or doctor or any name, title, description or symbol indicating, or calculated to lead persons to infer, that he is the holder of any qualification as a medical practitioner, physician or surgeon, or as an obstetrician or intern or of any other qualification enabling him to diagnose, treat or prevent physical defects, illnesses or deficiencies in man in any manner whatsoever, or that he is registered under this Act as a medical practitioner or an intern;
(f) except in accordance with the provisions of the Medicines and Related Substances Act, 1965, the Pharmacy Act, 1974, the Health Act, 1977, the Nursing Act, 1978, the [Associated] Chiropractors, Homeopaths and Allied Health Service Professions Act, 1982, and sections 33, 34 and 39 of this Act, by words, conduct or demeanour holds himself or herself out to be able, qualified or competent to diagnose, treat or prevent physical defects, illnesses or deficiencies in man or to prescribe or supply any medicine, substance or thing in respect of such defects, illnesses or deficiencies; or
(g) (i) diagnoses, treats or offers to treat, or prescribes treatment or any cure for, cancer;
(ii) holds himself out to be able to treat or cure cancer or to prescribe treatment therefor; or
(iii) holds out that any article, compound, medicine or apparatus is or may be of value for the alleviation, curing or treatment of cancer, shall be guilty of an offence and on conviction liable to a fine or to imprisonment for a period not exceeding twelve months or to both such fine and such imprisonment.
for practising as a psychologist or as an intern-psychologist, or for performing certain other acts, while unregistered are provided for in section 37 while section 38 provides for penalties for practising as a dentist, or for performing certain other acts, while unregistered. Section 39 prohibits the performance for gain of certain acts deemed to pertain to other health professions by unregistered persons registrable in terms of the Health Professions Act\(^\text{107}\).

The Rules Specifying the Acts or Omissions In Respect of Which Disciplinary Steps May Be Taken By and Professional Board and the Council\(^\text{108}\) state that one of the acts by a practitioner in respect of which such steps can be taken is the performance, except in an emergency, of professional acts for which the practitioner is inadequately trained and/or insufficiently experienced, and/or under improper conditions and/or in improper surroundings.

Section 27 of the Nursing Act\(^\text{109}\) contains similar provisions in respect of persons practising as registered nurse, midwife, enrolled nurse or nursing auxiliary or for performing certain other acts while not registered or enrolled.\(^\text{110}\)

\(^{107}\) Section 39 provides that:
1. No person shall perform for gain any act deemed under section 33 to be an act pertaining to any other health profession unless he or she-
   a. is registered in terms of this Act in respect of such profession;
   b. is registered in terms of this Act in respect of any other profession to which also such act is under section 33 deemed to pertain; or
   c. practises another health profession in respect of which the registrar in terms of this Act keeps a register and such act is deemed to be an act which pertains to such professions registered under section 32 in respect of any other profession to which also such act is under section 33 deemed to pertain; or
   d. is a medical practitioner and such act is an act which also pertains to the profession of a medical practitioner;
   e. is a dentist and such act is an act which also pertains to the profession of a dentist; or
   f. is registered or enrolled as a nurse under the Nursing Act, 1978 (Act 50 of 1978), and such act is an act which also pertains to the profession of a nurse.
2. Any person contravening the provisions of subsection (1) shall be guilty of an offence and on conviction liable to a fine not exceeding R500 or to imprisonment for a period not exceeding 12 months, or to both such fine and such imprisonment.

\(^{108}\) Government Notice No R.1329 dated 12 August 1994 in Government Gazette No 15907. Rule 29 also includes as an act subject to disciplinary action "the performance, except in an emergency, of professional acts where conditions calling for medical attention are observed or suspected, except in close collaboration with a medical practitioner."

\(^{109}\) Nursing Act fn 13 supra

\(^{110}\) Section 27 specified that:
1. A person who is not registered or enrolled in a particular capacity-
   a. who makes use of a title which only a person who is registered or enrolled in that capacity may use, whether he makes use of such title alone or in combination with any word or letter;
In terms of section 41(1) of the Nursing Act, no remuneration shall be recoverable in respect of any act specially pertaining to the profession of a registered or enrolled person when performed by a person who is not authorized under this Act to perform such act for gain.

It is clear from the foregoing that -

- a layperson who acts as a health professional except in emergency situations where no health professional is present is breaking the law and runs the risk of criminal prosecution;

- a health professional who, except in emergency circumstances, exceeds the scope of practice for which he or she is registered is breaking the law and runs the risk not only of criminal prosecution but also disciplinary action by the relevant professional body (the Nursing Act states expressly in section 27(4) that the provisions of subsection 2(a) and (b) which render it an offence to perform for gain an act pertaining to the profession of nursing or midwifery, do not apply with reference to a person rendering assistance in a case of emergency. Similarly section 38(3) of the Health Professions Act provides that nothing in section 38 shall be construed as prohibiting a medical practitioner, not registered also as a dentist, from

(b) who holds himself out or permits himself to be held out, directly or indirectly, as being registered or enrolled in that capacity; or

(c) who wears a uniform, badge or other distinguishing device, or any misleading imitation thereof, prescribed in respect of a person registered or enrolled in that capacity,

shall be guilty of an offence.

(2) Subject to the provisions of subsection (4) and the Medical, Dental and Supplementary Health Service Professions Act, 1974 (Act 56 of 1974), a person-

(a) who is not registered as a nurse or enrolled as a nurse or a nursing auxiliary and who for gain performs any act pertaining to the profession of nursing;

(b) who is not registered or enrolled as a midwife and who for gain performs any act pertaining to the profession of midwifery; or

(c) who is not registered or enrolled as a midwife and who makes any internal examination of the genitals of a woman while attending to the woman in relation to a condition arising out of or in connection with pregnancy,

shall be guilty of an offence.

(3) A person who, knowing that another person is not registered or enrolled in a particular capacity-

(a) describes such person as the holder of a title which only a person who is registered or enrolled in that capacity may use, whether he describes such other person by making use of such title alone or in combination with any word or letter; or

(b) holds such other person out, directly or indirectly, as being registered or enrolled in that capacity, shall be guilty of an offence.
performing in the course of his practice acts pertaining to the practice of dentistry in cases of emergency or where no dentist is readily available.)

Generally speaking the law allows acts and omissions in an emergency that it would not otherwise allow and it is submitted that generally speaking, health professionals would be relatively safe from legal threat in acting outside of the scope of their practice in an emergency situation provided that they act reasonably and only to the extent necessary to remedy the situation. It should be borne in mind, however, that whether or not the situation involved an emergency can in itself be a tricky question to answer. The problems with the definition of an emergency situation in the context of health services delivery have been discussed in more detail elsewhere in this thesis. It is sufficient for present purposes to note that if the health professional in question reasonably believed the situation to be an emergency and acted in order to address the perceived threat, he or she should not be penalised for that reasonable belief if the situation was subsequently found not to be an emergency. It is easy to be wise after the event in the relative calm of a courtroom but a tendency to judge too harshly someone who has acted with the best of intentions in the genuine and reasonable belief that a situation was an emergency is likely to result in an undesirable reluctance or unwillingness on the part of health professionals to act except in the most obvious emergency situations. This would not be consistent with the spirit of the constitutional provision that no one should be refused emergency medical treatment.

The question of when, if ever, a health professional may exceed his or her scope of practice in non-emergency situations in the course of routine activities in the health sector is another matter. The public sector in South Africa is critically short of many different kinds of health professionals including nurses, pharmacists, general medical practitioners and specialists and especially in the rural areas. What is the position of a single nursing sister operating a clinic in the middle of nowhere who is faced with a situation in which a person comes to
the clinic seeking medical assistance and the assistance that is required falls outside of her scope of practice as a nurse? The situation is not an emergency but could become one if she does not render the required assistance and there is no transport available to the nearest facility where there is a practitioner available within whose scope of practice the required treatment falls.

Section 38A of the Nursing Act anticipates this situation to a significant extent. It states that:

"Notwithstanding the other provisions of this Act and the provisions of the Medicines and Related Substances Control Act, 1965 (Act 101 of 1965), of the Pharmacy Act, 1974 (Act 53 of 1974), and of the Medical, Dental and Supplementary Health Service Professions Act, 1974 (Act 56 of 1974), any registered nurse who is in the service of the Department of Health, Welfare and Pensions, a provincial administration, a local authority or an organization performing any health service and designated by the Director-General: Health, Welfare and Pensions after consultation with the South African Pharmacy Board referred to in section 2 of the Pharmacy Act, 1974, and who has been authorized thereto by the said Director-General, the Director of Hospital Services of such provincial administration, the medical officer of health of such local authority or the medical practitioner in charge of such organization, as the case may be, may in the course of such service perform with reference to-

(a) the physical examination of any person;
(b) the diagnosing of any physical defect, illness or deficiency in any person;
(c) the keeping of prescribed medicines and the supply, administering or prescribing thereof on the prescribed conditions; or
(d) the promotion of family planning,

any act which the said Director-General, Director of Hospital Services, medical officer of health or medical practitioner, as the case may be, may after consultation with the council determine in general or in a particular case or in cases of a particular nature: Provided that such nurse may perform such act only whenever the services of a medical practitioner or pharmacist, as the circumstances may require, are not available."

The proviso is important. It is only in the absence of the services of a medical practitioner or pharmacist that the activities listed in section 38A may be performed by a nurse. The authority can be specific or general and the section can apply in respect of the public sector or the private sector. In practice it is submitted that it is unlikely to be applied in the case of the private sector unless there are no nearby public sector facilities available to deliver the required service either. This section certainly is not a license to nurses to act as they see
fit in circumstances where there is no medical practitioner or pharmacist since it requires the authorisation of the Director General, a director of hospital services a medical officer or medical practitioner and that authorisation is only given after consultation with the relevant council.

Generally speaking, however, it is submitted that except in cases of emergency, section 27 of the Constitution does not sanction the provision of medical treatment by persons who are unqualified to do so and who do not have the necessary skills and experience. The shortage of health care professionals in the public sector is a problem that needs to be addressed by the South African government under the auspices of section 27(2) of the Constitution which require it to take reasonable legislative and other measures, within its available resources, to achieve the progressive realisation of the right of access to health care services. As stated previously access in this context cannot be interpreted to mean access to health care services that do not meet with certain minimum standards of quality, safety and efficacy.

Claassen and Verschoor\textsuperscript{111} observe that the question often arises whether a practitioner can be held liable for the conduct of physicians nurses and professional assistants employed by a hospital authority but who are assisting the independent practitioner in the treatment of his patients on the hospital premises. Are the said staff members in such an even still regarded as employees of the hospital or are they regarded as servants of the independent practitioner \textit{pro hac vice}? They note that according to Holder, a surgeon is not liable for the negligent routine conduct performed by the hospital staff in preparing a patient for an operation. They same goes for the conduct of hospital staff after the completion of an operation because the surgeon can reasonably accept that they are competent to perform their duties. A surgeon can however, be held directly responsible where he leaves negligent instructions regarding the post-operative care of a patient to the hospital staff. Claassen and

\footnote{Claassen and Verschoor fn 5 \textit{supra}}
Verschoor\textsuperscript{112} note that some American courts have applied the so-called captain of the ship doctrine in order to resolve some of the issues raised above. According to this doctrine, the surgeon is responsible for everyone who assists him during an operation. It was argued that the surgeon, as captain of the ship, exercised absolute control over every aspect of a particular procedure. They note that the captain of the ship doctrine was finally sunk in \textit{Sparger v Worley Hospital Inc}\textsuperscript{113} when the court remarked:

"We disapprove if the captain of the ship doctrine and hold that it a false special rule of agency. Operating surgeons and hospitals are subject to the principles of agency law which apply to others."

It is the view of the writer that this is a doctrine well sunk and that it has no place in South African law. Claassen and Verschoor also discuss the borrowed servant doctrine which acknowledges the fact that a particular employee can be borrowed by one employer from another to perform a certain task which is in the interests of both employers and influences their common objectives. They note that Strauss and Strydom point out that the idea of borrowed servants was introduced to South African law in the decision of \textit{Hartl v Pretoria Hospital Committee}\textsuperscript{114} but that it was rejected unambiguously in \textit{Van Wyk v Lewis}\textsuperscript{115} by ruling that a visiting surgeon was not liable for the failure of a hospital nurse to perform an independent duty. They note that according to Burchell and Schaffer\textsuperscript{116} the relationship between a surgeon and a nurse cannot be equated to that existing between an employer and employee and it is not even analogous thereto even if the nurse may have been under the control of the surgeon during the operation. These authors contend that although the nurse is under the control of the physician during the performance of the operation, the hospital never turns over its full right to exercise control over its employees to an independent practitioner. The nurse remains in the hospital’s employment and

\end{itemize}
any loss suffered by a patient as a result of the former’s negligent conduct should be placed on the broad shoulders of the hospital authority. It is submitted with respect that this is the correct view since it accords with the South African case law on the subject, notably the decision in Van Wyk v Lewis.

It must be noted that in the public sector doctors are usually employees of the state just like the nurses and other health professionals they work with. Questions of this nature are therefore more likely to arise in the private sector context where, although nurses and professional assistants may well be employed by the hospital, medical practitioners tend to be self-employed.

8.2.9 Pringle v Administrator, Transvaal 117

Facts

The plaintiff instituted a claim for damages against the Administrator of the Transvaal, being the representative of the Transvaal Provincial Administration, under whose jurisdiction the J G Strijdom Hospital fell. On 5 October 1984 an operation was performed upon the plaintiff at the J G Strijdom Hospital by Dr Schewitz duly assisted by Drs Scoccianti, Reidy and Lever. These medical practitioners were acting within the course and scope of their employment with the J G Strijdom Hospital and/or the Transvaal Provincial Administration.

The plaintiff alleged that the medical practitioners had a duty of care to perform the operation with the requisite degree of skill and expertise, but in breach thereof one or more or all of the medical practitioners performed the operation negligently in that:

117 Pringle 1990 (2) SA 379 (W)
(i) the plaintiff's superior vena cava was torn during the course of the operation;
(ii) the medical practitioners failed to detect the tear in the plaintiff's superior vena cava at a time when they could and should have done so;
(iii) they failed to appreciate that the tumour being removed was attached to the superior vena cava and that its removal could result in the severing of the vena cava unless special precautions were taken;
(iv) they failed to test whether the removal of the tumour would result in excessive loss of blood under circumstances in which they could and should have done so;
(v) they failed to detect that the plaintiff was losing an excessive amount of blood at a time when they could and should have done so;
(vi) they failed to avoid the consequences which resulted when, by the exercise of reasonable care and skill, they could and should have done so;
(vii) that, once haemorrhaging occurred during the operation, they failed to proceed immediately with sternotomy or right thoracotomy in order to stabilise and prevent further or recurrent bleeding.

In the alternative to the aforesaid it was pleaded that the medical practitioners owed a duty of care to the plaintiff to perform the correct and/or appropriate surgical procedure, but in breach of that duty the medical practitioners performed a surgical procedure called 'mediastinoscopy', which was neither correct nor appropriate.

It was alleged that one or more or all of the medical practitioners were negligent in that they failed to warn the plaintiff that the operation in question had a high morbidity rate.

The plaintiff claimed that as a consequence of their negligence she suffered brain damage which has resulted in permanent damage to her eyesight and her
permanent inability to work. She claimed damages in the sum of R97 228 made up as follows:

(a) Loss of earnings at R950 per month for a period of seven years - R77 228
(b) General damages for pain and suffering, shock, loss of amenities of life and disablement - R20 000

Total - R97 228

At a pre-trial conference held on 29 July 1988 certain admissions were made and certain agreements arrived at:

(a) Dr Schewitz performed the bronchoscopy and mediastinoscopy by himself in the presence of two anaesthetists.
(b) Dr Scoccianti and Dr Sishy were present at the second operation and Dr Conlan came into the theatre when the mediastinum was packed.
(c) The defendant admitted the operation report prepared by Dr Schewitz dated 5 October 1984 without formal proof, as also the operation record.
(d) It was admitted by the defendant that the plaintiff's superior vena cava was torn during the initial operative procedure, i.e. the mediastinoscopy.
(e) It was also admitted that the plaintiff suffered brain damage as a result of the operation.
(f) It was admitted that the thoracotomy was commenced at approximately 12:30 and was concluded at approximately 13:30.
(g) The defendant was prepared to admit the correctness of the actuarial calculations done by Mr G W Jacobson but was not prepared to admit the correctness of the assumptions on which such calculations were based.
(h) The defendant admitted that the X-rays were taken in the resuscitation room at some time between 12:10 and 12:30.

The medical expert witnesses who were to be called by each side met for a medical pre-trial conference as a result of which a minute was handed in, the salient points of which are as follows:
(i) The patient had a previous history of carcinoma.
(ii) The patient presented with opacity of the right lung.
(iii) An investigation of the mass of the right lung was necessary.
(iv) There was no unanimity amongst the medical experts in regard to which procedure should have been followed. The type of operation to be performed is a matter of personal choice for the surgeon performing the operation.
(v) During the course of the mediastinoscopy procedure performed by Dr Schewitz, the patient’s superior vena cava was torn as a result of which torrential bleeding occurred.
(vi) The mediastinum was packed. The plaintiff lost approximately two litres of blood, and a right thoracotomy was performed to repair the damaged vena cava.
(vii) After the mediastinum was packed there was a time-lag before the thoracotomy was performed. There was a dispute between the medical experts on the reasonableness of the delay which occurred between the first and second operative procedures.
(viii) The plaintiff went into renal failure and suffered localised brain damage which has resulted in a permanent visual disability.

The plaintiff testified that she was not told what was involved in the operation, but if she had been told that the operation was serious, she would have thought about it and possibly even obtained a third opinion. She testified that before the operation she had lived a very full and busy life, baking, icing cakes, knitting clothes, sewing and gardening. She drove a car and was completely independent. After the operation she was unable to work and could also no longer drive a car. A number of witnesses testified to the change in the personality and character of the plaintiff post-operatively as compared to the person she was prior thereto.
Judgment

The court held that there was no room for the application of the maxim *res ipsa loquitur* on the strength of the decision in *Van Wyk v Lewis*¹¹⁸ saying that the maxim could only be invoked where the negligence alleged depends on absolutes. In *Pringle* the initial problem was caused by the perforation of the superior vena cava. The court said that if the evidence showed that by the mere fact of such perforation negligence had to be present, then the maxim would have application. It found that no such evidence, however, had emerged and that since the question of whether negligence was present or not depends upon all the surrounding circumstances, this makes the application of the maxim ‘totally inapplicable in cases such as the present.’

The court observed that in determining what standard of diligence it was the surgeon's duty to observe, the law in South Africa was clearly stated in *Van Wyk v Lewis* - a medical practitioner is not expected to bring to bear upon the case entrusted to him the highest possible degree of professional skill, but his is bound to employ reasonable skill and care. Blum AJ noted that in deciding what is reasonable the court will have regard to the general level of skill and diligence possessed and exercised at the time by the members of the branch of the profession to which the practitioner belongs. He referred to the English case of *Whitehouse v Jordan*¹¹⁹ in which Lord Edmund Davies referred to McNair J in *Bolam v Friern Hospital Management Committee*¹²⁰, where the latter said:

"Where you get a situation which involves the use of some special skill or competence then the test as to whether there has been negligence or not is not the test of the man on the top of the Clapham omnibus because he has not got this special skill. The test is the standard of the ordinary skilled man exercising and professing to have that special skill."

¹¹⁸ *Van Wyk* fn 24 supra
¹¹⁹ *Whitehouse* [1981] 1 All ER 267 (HL)
¹²⁰ *Bolam* [1957] 2 All ER 118 at 121
Also with regard to the standard of diligence and skill to be applied, Blum AJ referred to *S v Kramer and Another*\(^{121}\)

Dr Schewitz noted that the plaintiff had had a mastectomy for carcinoma of the breast 29 years previously. Following an incidental chest X-ray a small nodule was noted in the right chest. The first procedure which was performed was a bronchoscopy which was normal in all respects. However, while the mediastinoscopy was being performed torrential venous bleeding occurred when the right paratracheal node was biopsied. As a result of this bleeding the mediastinum was packed for ten minutes, following which the bleeding had stopped. The plaintiff at this stage had lost approximately 200cc of blood. The mediastinum was packed with surgical and the wound closed. A chest X-ray taken following the procedure while the plaintiff was still in theatre showed that the plaintiff had bled into the right chest. The plaintiff's blood pressure had also dropped, and she was immediately brought back to the theatre where a right thoracotomy over the fifth rib was performed. During this procedure it was found that the superior vena cava had been torn 1 cm above the azygos vein. There were also two litres of blood in the chest. The rupture of the superior vena cava was repaired. The phrenic nerve, which was right next to the tear, had been damaged. Subsequently Dr Schewitz testified that in fact this nerve was not damaged. The nodule was found in the upper lobe and was typical of a benign lesion. A wedge resection on the nodule itself was performed with the nodule being sent for histology and which was indeed confirmed to be benign. Two chest drains were inserted and the wound was closed in layers. Post-operatively the plaintiff was returned to the intensive care unit for observation, although she did not need ventilation. From the hospital records it appears that the plaintiff went into acute renal failure the following day and required haemodialysis.

\(^{121}\) *Kramer* 1987 (1) SA 887 (W) at 893E - 895C.
The plaintiff alleged that the procedure adopted, namely the mediastinoscopy, was neither correct nor appropriate. There was no unanimity amongst the experts with regard to which procedure should have been followed. The doctors agreed that the type of operation to be performed is a matter of personal choice for the surgeon performing the operation. Blum AJ posed the question whether in this light of this it could possibly be said that the procedure selected by Dr Schewitz was either incorrect or inappropriate? After discussing the various expert evidence that was placed before it, the court decided that the plaintiff had not discharged the onus of proving that the procedure was neither correct nor appropriate. It said that the procedure adopted was clearly a matter of personal choice.

It was common cause that the cerebral defect was caused by some loss of blood to the vital organs at some time after the superior vena cava was torn and until it was sutured. In other words, plaintiff suffered an occipital lobe thrombosis. After considering the evidence the court held that in the final analysis it was not satisfied that the plaintiff had shown on a balance of probabilities that if the medical practitioners had proceeded to do a thoracotomy immediately the damage would not have been done, and that consequently any delay which occurred through waiting for X-rays before making a diagnosis was unreasonable and therefore negligent. With regard to the allegation that the medical practitioners failed to appreciate that the tumour being removed was attached to the superior vena cava and that its removal could result in the severing of the vena cava unless special precautions were taken the court noted that Dr Schewitz stated quite categorically that in this regard the mass was in the lung. The gland in the mediastinum which was to be excised was not attached to the superior vena cava. Accordingly Blum AJ held that this ground of negligence must fail.

Another allegation of negligence was that the medical practitioners failed to warn the plaintiff that the operation in question has a high morbidity rate. The
court stated that from the evidence it was clear that the procedure preferred by Dr Meintjes had a higher morbidity rate, and that in mediastinoscopy the morbidity rate is recognised as being low. Consequently it held that there was therefore no substance in this allegation.

The very vexed and difficult question, however, which remains to be decided, is whether the fact that the plaintiff's superior vena cava was torn during the course of the said operation, and that the plaintiff lost an excessive amount of blood into the pleural cavity as a result of the tearing, not only of the superior vena cava but of the mediastinal pleura, amounts to negligence.

Blum AJ, apparently oblivious of the fact that he had stated earlier in the judgment that the maxim of *res ipsa loquitur* was not applicable, observed with reference to the minority judgment of Kotze JA in *Van Wyk v Lewis*\(^{122}\) that it has been stated that, where a plaintiff has proved certain facts from which, if not satisfactorily rebutted or explained, the conclusion may reasonably be drawn that there has been an absence of the necessary care and skill on the part of the medical man, a case of negligence against the defendant has been established, rendering him liable in damages. He noted the difficulty of the case and then commented that as to the crucial issue as to exactly what happened there was only the direct evidence of Dr Schewitz. Blum AJ noted that in cross-examination it was put to Dr Schewitz that the tearing of the vena cava was negligent. He replied that an event such as this had happened in the hands of the most experienced surgeon, and he did not think that one could call a complication a mistake or negligence. Blum AJ also noted that Dr Kinsley said, in his view, there was no question of negligence in the management of the case. He also did not agree with the proposition put to him that there was simple negligence by the surgeon. It is, however, said Blum AJ a matter for the Court and not the expert witnesses to determine whether there has been negligence or not. He then asked whether it could be said that the surgeon committed an error.

---

\(^{122}\) *Van Wyk* fn 24 *supra* at p 452
of clinical judgment? Referring to the *Whitehouse* case\textsuperscript{123} supra, Blum AJ noted that Lord Edmund Davies said:

'To say that a surgeon committed an error of clinical judgment is wholly ambiguous, for while some such errors may be completely consistent with the due exercise of professional skill, other acts or omissions in the course of exercising clinical judgment may be so glaringly below proper standards as to make the finding of negligence inevitable.'

He observed that there was no suggestion that any act or omission by Dr Schewitz was so glaringly below proper standards as to make a finding of negligence inevitable. But, said Blum AJ in considering the statement by Lord Edmund Davies previously quoted that if a surgeon fails to measure up to that standard in any respect ("clinical judgment" or otherwise), he has been negligent and should be so adjudged and in attempting to determine whether in fact Dr Schewitz failed that test or not, the only evidence which is of assistance is the evidence of Dr Schewitz himself. Dr Schewitz stated that the biopsy did not bite cleanly and that he tugged at it, bleeding occurred and he immediately let go of the tissue to decrease the bleeding. The court noted that in cross-examination it was put to him that he 'tugged' at the lymph-node and pulled the vena cava. His answer to this was: 'In retrospect I would have to say that I tugged too hard.' He agreed furthermore with the proposition that once the bleeding had occurred he appreciated that he had torn a major vessel and that it could conceivably be the superior vena cava with possible dire consequences. He agreed further that the paratracheal gland which was to be excised, where it was situated was adjacent to the superior vena cava but not attached to it, and that its texture is different from the vein itself and possible to distinguish. Once again he stated: 'There must have been excessive force because the event occurred. I am more experienced and it makes a similar event unlikely.' Blum AJ stated that in deciding whether Dr Schewitz, in attempting to excise the nodule in the manner in which he did, employed reasonable skill and care, and applying the test as set out by Innes CJ in Van Wyk's case *supra*, he took into

\textsuperscript{123} *Whitehouse* fn 119 *supra* at p 276H
consideration the fact that the mediastinum is a confined area in which there are
certain major vessels, the superior vena cava being one of them. He said that it
may be described as a surgical minefield. The gland in which the excision was
to take place was adjacent to the superior vena cava. Had the forceps excised the
nodule cleanly, no doubt the claim would not have arisen. He observed that
there was no explanation as to how or why the forceps did not ‘bite cleanly’, in
Dr Schewitz’s words. He then tugged at the gland in order to make the nodule
come away, and the bleeding occurred immediately. Not only was the superior
vena cava perforated, but the blood found its way through the mediastinal
pleura, which was also torn, into the pleural cavity.

Dr Kinsley testified in regard to the tearing of the superior vena cava that this
could only have happened in two ways. It was either biopsied directly or torn
indirectly through traction on the gland. Either eventuality, said Blum AJ,
caused him concern. He observed that the biopsy forceps is a cutting instrument,
but since it did not cut through the gland it would appear that the tissues were
more leathery or fibrous. Dr Kinsley explained that in elderly persons, and
females particularly, the superior vena cava is usually more friable than in other
persons. He postulated the possibility that because of radiotherapy in earlier
years when the plaintiff had the mastectomy, the superior vena cava may have
become more friable while the tissues became more leathery.

Blum AJ referred to *Bochris Investments*\(^{124}\) in which the court cautioned against
the insidious subconscious influence of *ex post facto* knowledge. He stated that
negligence is not established by showing merely that the occurrence happened
(unless the case is one where *res ipsa loquitur*), or by showing after it happened
how it could have been prevented. He observed that the diligens paterfamilias
does not have “prophetic foresight” and noted that in *Overseas Tankship (UK) Ltd v Morts Dock and Engineering Co Ltd (The Wagon Mound)*\(^{125}\) Viscount

\(^{124}\) *S v Bochris Investments (Pty) Ltd* 1988 (1) SA 861 (A) at p 865f - 867C

\(^{125}\) *Wagon Mound* 1961 AC 388 (PC) ([1961] 1 All ER 404 at 424 (AC) and 414G - H (in All ER)
Simonds said: "After the event, even a fool is wise. But it is not the hindsight of a fool; it is the foresight of the reasonable man which alone can determine responsibility."

Blum AJ said that he was mindful of the test of foreseeability which had to be applied, namely: ought Dr Schewitz to have reasonably foreseen that if excessive force was used to excise the lymph-node, damage could be caused, more particularly to the superior vena cava? He noted that the evidence was that the perforation of the superior vena cava is one of the recognised complications of mediastinoscopy, albeit, in Dr Kinsley’s view, of rare occurrence. He said he was also mindful of all the pressures and the tensions which operate on a surgeon during his work. However, in the light of all the evidence and the only possible explanations as to how the perforation of the superior vena cava and the mediastinal pleura occurred, he said he was driven to find that on this particular aspect, and by using the ‘excessive force’ which he conceded, Dr Schewitz did not apply that skill and diligence possessed and exercised at the time by the members of the branch of the profession to which he belonged. He held that in tearing the superior vena cava, while attempting to biopsy the lymph-node in the gland adjacent thereto, Dr Schewitz was negligent.

In considering the quantum of damages, Blum AJ took into account the fact that the plaintiff was sixty three at the time of the operation and had reached the age of sixty seven and a half at the time of trial, without further incident. He said that her life expectancy has not been reduced as a result of the incident. Judging from the plaintiff’s general work record and her health up to the time of the present incident, even having regard to the fact that she had a mastectomy in 1955, and having further regard to the various factors which courts take into account in assessing accrued loss, Blum AJ was of the opinion that a 5% contingency deduction was fair and reasonable, and accordingly found that the plaintiff’s accrued loss of income amounted to R43 178. Insofar as prospective loss is concerned, again having regard to unforeseen contingencies for the next
three years it was Blum AJ’s opinion that a contingency deduction of 15% was fair and reasonable, and thus the amount of the plaintiff’s prospective loss was R34 305. Accordingly he awarded judgment in favour of the plaintiff in the sum of R93 482 and costs, including the qualifying fees of Dr Meintjes and Mr G W Jacobson.

Discussion

Pringle’s case illustrates rather well the difficulties faced by a patient who is trying to prove medical negligence. It was abundantly clear that Blum AJ experienced intense difficulty in coming to a decision in this case and that the fact that res ipsa loquitur could not be applied only added to this difficulty. He pointed out several times in the course of the judgment that the only significant evidence as to what happened during the surgery was that of the surgeon himself. He clearly went through the evidence with a fine toothcomb hoping to find some indication as to which way his decision should go. At one point, when he referred to the judgment of Kotze JA in Van Wyk v Lewis it almost seemed as though he was wishing subconsciously or even consciously that he could apply the res ipsa loquitur maxim. The basis upon which Blum AJ came to the conclusion that the doctor in Pringle had been negligent was scant indeed. On the evidence available from the judgment, it seems quite clear that the court’s decision could just as easily have gone the other way. Whilst the surgeon may have made a mistake or an error of judgment in pulling too hard, this in and of itself does not signify negligence. He could not necessarily have foreseen that this would tear the vena cava. How hard is too hard? In layman’s terms it may be the coarse difference between a gentle tug and a ripping motion but in a surgeon’s terms it may be the very fine difference between a gentle tug and a gentler tug. In fact, the tear in the vena cava was small by all accounts. According to the judgment, the bleeding was controlled by one prolene suture, which, the court observed, is ‘fairly small’. There was much evidence that even an experienced surgeon could have made the same mistake. The surgeon was
not even in a position to know that he had torn the vena cava after the event. Blum AJ observed that it seemed clear from the evidence that, because of the blood that welled up in the mediastinum and the apparent subsidence thereof once it was plugged by surgical, the medical practitioners, and more particularly Dr Schewitz, were not in a position at that stage to detect that there had been a tear in the plaintiff’s superior vena cava. The fact that the harm even once it had been done was far from obvious tends to suggest that the force used by the surgeon to tug on the tissue he was trying to remove may also not foreseeably have led to a tear in the vena cava. It is submitted that the statements of the surgeon upon which the court relied in deciding for the defendant are indicative of causation rather more than negligence. Dr Schewitz said ‘In retrospect I would have to say that I tugged too hard’ and ‘There must have been excessive force because the event occurred. I am more experienced and it makes a similar event unlikely.’ If one analyses these statements more closely it is obvious –

(a) that they are conclusions drawn after the event by the doctor and are not reflections on his actions at the time of the surgery;

(b) that they are conclusions based upon the fact that the vena cava tore;

(c) that they are conclusions as to the cause of the tear in the vena cava rather than negligence with regard to his actions that led to the tear.

Indeed in cross-examination it was put to Dr Schewitz that the tearing of the vena cava was negligent. He replied that an event such as this had happened in the hands of the most experienced surgeons, and he did not think that one could call a complication a mistake or negligence. It is submitted that, at least from the evidence supplied in the judgment itself, there was no proof of negligence on a balance of probabilities. Blum AJ himself admitted in the judgment ‘that there is no suggestion that any act or omission by Dr Schewitz was so glaringly below proper standards as to make a finding of negligence inevitable.’ It is submitted, albeit on the strength of the judgment alone, that it would seem that in Pringle’s case there was proof only of a medical accident. One must of course heed the warnings of Blum AJ about being wise in retrospect and obviously all of the evidence is not available in the judgment.
The point is simply that Pringle's case seems to be a very good example of a borderline situation in which the court essentially had to make a 'judgment call' in the colloquial sense. It had to come down on either one side of the fence or the other and in Pringle's case it came down on the side of the plaintiff. Given the difficulty experienced by the court, how much more difficult, one might ask, is the position of the plaintiff who may only have access to all of the relevant information for the first time in the course of litigation in seeking to prove all of the elements of a delict that occurred at a time when she was unconscious. How wrong is it to allow a plaintiff in such circumstances the small concession permitted by the *res ipsa loquitur* principle? In Pringle's case she went into hospital without a torn superior vena cava, she went into the operating theatre without a torn vena cava, and she came out of the operating theatre with a torn vena cava. The operation she had did not involve her vena cava directly. The perforation of her vena cava was not a normal event in the course of the operation. Indeed, according to the evidence from the judgment, it was quite a rare complication. The small shift of the evidentiary burden that would have been permitted in terms of the *res ipsa loquitur* in this case should not have worked any grave injustice to the defendant who was in possession of all the facts and in the case of Dr Schweitzer witnessed the whole sequence of events first hand. One has to wonder whether the fact that the defendant was an institution, and a large one at that, may have had any bearing on the court's decision and whether if it had been a private practitioner this would have had any bearing on the outcome. Put another way and in a slightly different context, one also has to wonder whether the court felt that the balance of power in terms of knowing exactly what had happened was in favour of the defendant and that for this reason, it favoured the plaintiff. There does not seem to have been sufficient evidence on a balance of probabilities that there was negligence on the part of the doctors involved. Indeed one has to wonder whether the judgment in Pringle's case was not due to the indirect application by the court of the maxim of *res ipsa loquitur* in nebulous form and subconscious fashion.
In light of the fact that the test for medical negligence is the general principal that the highest degree of professional skill and knowledge is not required of a medical practitioner but only a reasonable level of knowledge and skill, Carstens\textsuperscript{126} poses the question whether a medical practitioner who entertains a different school of thought concerning the medical treatment that should be applied would be negligent if he deviates from the generally accepted technique used by other medical practitioners in operations or treatment. He says it can also be asked what the position would be if there is more than one school of thought in respect of the type of treatment that a patient ought to receive. Carstens notes that in South African positive law direct authority could not be found concerning the concept of different schools of thought within medical practice and its influence on medical negligence. Carstens asks whether, if there is more than one school of thought concerning the nature of the treatment a patient ought to receive, is the doctor bound to that standard of practice which is applied by practitioners of that school of thought to which he subscribes? He refers to \textit{Kovalsky v Kriege}\textsuperscript{127} in which a doctor tried to stop the bleeding following on from a circumcision by using ferrous chloride and other doctors gave evidence that they would have used other methods – specifically the use of arterial clamping and tying off. The defendant doctor was not held liable in this case. With regard to the decision in \textit{Pringle}, he notes that the choices between different diagnostic techniques came into the debate. The court in this case had to rely heavily on expert medical testimony and in the pretrial conference there was no agreement between the medical experts as to the process or method that should have been used. It was agreed that the surgeon who had to do the operation could exercise his own personal preference concerning the execution of the operation. The court came to the conclusion that the plaintiff had not discharged the onus of proving that the surgical method or technique used by the surgeon was an incorrect or unsuitable procedure. In Carstens’ opinion the

\textsuperscript{126} Carstens PA ‘Nalatigheid en Verskillende Gedagterigtings (‘Schools of Opinion) Binne Die Mediese Praktyk: \textit{Pringle v Administrator Transvaal 1990 (2) SA 379 (W)’ 1991 THRHR 673.}
\textsuperscript{127} Kovalsky 1910 CTR 822
general guidelines in respect of the recognition of different schools of thought within the practice of medicine should not be rigidly applied in the adjudication of professional liability where a procedure or technique is used that is not in accordance with the usual medical practice. He says that the application of a deviating practice by a doctor does not necessarily indicate negligence and points out that each case has to be considered with regard to its particular circumstances. He points out that the practice of medical science is inherently risky and that rigid application of the general guidelines could have an inhibitory effect on the effective development or application of new medical procedures which are necessarily experimental in nature and which carry the risk of possible harmful consequences for the patient. He states that the general guidelines should not be applied in a manner that places a damper on the renewal and improvement of medical procedures provided that such procedures are medically responsible and reasonable. The present writer respectfully concurs with these views. Where a number of different but equally legitimate and acceptable or recognized options are open to the reasonable provider, he or she cannot be blamed for using one that is less commonly used than the other. It is submitted that the reasonable doctor does not necessarily follow the most wellworn paths of medical science but uses instead those techniques and procedures which in his or her professional judgment carry the highest likelihood of success.

8.2.10 Collins v Administrator, Cape

Facts

The plaintiff sued for damages both in his personal capacity and in his capacity as father and natural guardian of his minor daughter, Lee-Ann. The action was a sequel to a tragic incident which occurred at the Tygerberg Hospital on 21 October 1991, when Lee-Ann suffered severe cerebral hypoxia following the

128 Collins 1995 (4) SA 73 (C)
displacement of a tracheostomy tube on which she was dependent for ventilation. At the time she was barely 16 weeks old. As a result of irreversible brain damage she was in what is described as a permanent vegetative state. Although her brainstem function was sufficient to maintain adequate ventilation and circulation she had no intellectual function. She had no awareness of environmental stimuli and no apparent awareness of herself. There was no hope of recovery and she would in all probability die within the next few years. Two questions required determination. The first was whether the mishap was attributable to the negligence of any of the members of the hospital staff who were involved in the care of Lee-Ann at the relevant time. The second, which arose only if the answer to the first was in the affirmative, was the quantum of damages to which the plaintiff was entitled. It was common cause that at all relevant times the members of the hospital staff were acting in the course and scope of their employment with the defendant.

Lee-Ann was born on 26 June 1991. Shortly after her birth she was observed to have a respiratory problem and she was immediately intubated with an endotracheal tube. Subsequent and more detailed examination revealed swelling of the vocal chords and the supraglottis. After 16 days there was no improvement and on 12 July 1991 a tracheostomy was performed. It was common cause that the procedure was mandatory at that stage. It involved establishing a portal in the trachea with the insertion of a neonatal tracheostomy tube. The object was to create an airway below the larynx and so bypass the obstruction in the larynx. The tube was made of a plastic material. The portion which actually enters the trachea was 30 mm in length, slightly curved and flexible. The external part of the tube had a flange with islets on either side, through which a tape was passed and tied around the patient’s neck. The tension of the tape around the patient’s neck is of vital importance to ensure that the tube remains in position. One of the grounds of negligence relied upon by the plaintiff was that the tension of the tape was inadequate.
Following the tracheostomy, Lee-Ann was first placed in the neonatal intensive care unit for a few days and thereafter, on 16 July 1991, moved to the paediatric tracheostomy unit which was a high care unit as opposed to an intensive care unit. Upon examination on 20 August 1991 it was found that the swelling had subsided but that she had an infantile, omega-shaped, epiglottis which at that stage remained non-functional. She was, therefore, still wholly dependent upon the tracheostomy tube for ventilation, but the prognosis was a good one. A number of nurses attached to the paediatric tracheostomy unit gave evidence. They all said that it was standard practice to check the tension of the tape holding the tracheostomy tube in place whenever anything was done to the patient, whether it be the clearing of the trachea, the cleaning of the tracheostomy site or anything else. This, they said, was effected, first by ensuring that nothing larger than a little finger could be inserted between the tape and the back of the patient’s neck and, secondly, by drawing the flange of the tube away from the neck anteriorly to ensure that there was not too much ‘play’. Many of the nurses were unable to explain why it should be necessary to constantly check the tension of the tapes, but they were all very conscious of the need for the tension to be correct. Dr Gie explained that provided the knot tying the two ends together does not slip, the tension would not vary. He said that every Thursday the tracheostomy tube of every patient in the unit was changed and unless the knot came undone the tension of the tape would accordingly remain constant. He explained that the unit was run in such a way that, as a matter of procedure, the nurses were required constantly to monitor the tension of the tapes.

On Thursday, 17 October 1991, Lee-Ann’s tracheostomy tube was changed by Dr Heyns, a medical officer attached to the unit. He was assisted by staff nurse Humphries and nursing assistant Jansen. All three gave evidence and testified that they were satisfied that the tension of the tape was correct. Other nurses who cared for Lee-Ann between Thursday and Monday morning also testified that on various occasions they had monitored the tension of the tape and found
it to be adequate. The two nurses on duty in room 13 on Sunday night, that is to say from 7 pm on Sunday, 20 October, to 7 am on Monday, 21 October, were nurse Pieterse and nurse Manel. Neither observed anything untoward in the condition of Lee-Ann. The nurses’ Continuous Report records that at 5.20 am nurse Pieterse cleared Lee-Ann’s trachea by means of the suctioning process and also cleaned the tracheostomy site. It records also that at 6 am the suctioning procedure was repeated. This was confirmed by nurse Pieterse who said that she had found all to be well with the patient. At about 6.45 am nurse Pieterse went to see one of the matrons in the hospital about study leave she wished to take, leaving nurse Manel alone in Room 13. She testified that Lee-Ann was at that stage peaceful and clearly nothing was amiss. This was confirmed by nurse Manel. The latter testified that when the day nurses had not arrived by approximately 6.55 am she did a ward round on her own, checking the tension of each patient’s tracheostomy tape.

The usual procedure was to do the round with the new nurse, but as the latter had not yet arrived, she did the round on her own. At about the same time, staff nurse Bezuidenhout and senior nursing assistant Jansen arrived at the unit. Both were scheduled to do the day shift in room 13 but because the day nurses scheduled for room 14 had not yet arrived and were late, nurse Bezuidenhout took over in room 14 and nurse Jansen took over in room 13. Nurse Bezuidenhout explained that it was not unusual for both night nurses on duty in any of the rooms to leave as soon as the first of two day nurses arrived and that it was not considered unacceptable for one nurse to hold the fort in a room until her colleague arrived shortly thereafter. Nurse Manel testified that when nurse Jansen arrived she reported to the latter that all was well and then left. Before doing so, she observed, she said, that all the patients were awake and that there were no problems. This was confirmed by nurse Jansen. She testified that she stood in the middle of the room and observed all the patients. It was then shortly before 7 am. The children were clamouring for her attention. One child in particular, Charlton, who was in the cot diagonally opposite Lee-Ann, attempted
to climb out of his cot. Nurse Jansen said she walked to the cot and lifted him up. The room was relatively small, being 7.5 by 6.5 meters and she had to take only a few steps to get to the cot. After picking up Charlton she turned around and looked back in the direction of Lee-Ann's cot. It was then that she observed that Lee-Ann's tracheostomy tube was displaced and to the left of the opening in the child's neck. She immediately put Charlton down on the floor and rushed to Lee-Ann. The latter was already limp and her colour was pale with indications of cyanosis. Nurse Jansen said she had observed no earlier signs of restlessness or distress. She said she immediately attempted to replace the tracheostomy tube. In the meantime, and while she was crossing the floor on her way to Lee-Ann's cot, she had screamed to nurse Bezuidenhout next door. This was confirmed by nurse Bezuidenhout, who testified that on hearing the scream she had immediately run into room 13. There, she observed nurse Jansen attempting to replace the tracheostomy tube. When saw Lee-Ann's colour, which she described as grey, she realised at once the gravity of the situation. Without pausing she pushed the emergency trolley towards nurse Jansen and rushed off down the corridor to summon the doctor on call. She returned with Dr Ravenscroft who took over from nurse Jansen. By this time other nurses had arrived or were arriving at the ward. Nurse Bezuidenhout estimated that it took her a minute, or even less, to return with Dr Ravenscroft. In the meantime, nurse Jansen had been unsuccessful in reinserting the tracheostomy tube. She had at first attempted to put back the tube without cutting the tape. When this proved impossible she cut the tape and tried again but still without success. She was unable to explain why she had been unable to replace the tube. Because of the mobile nature of the tissue around the neck, recannulation may involve more than simply putting the tracheostomy tube back into the surgical opening in the skin. It may also be necessary to move the tube around to find the opening in the muscle of the trachea. Where decannulation occurs within a week of the tracheostomy, recannulation can be very difficult to achieve. Once, however, the tube has been in place for a longer period, the formation of epithelial tissue results in the establishment of something in the nature of a permanent cannula.
or tube so that replacement of the tracheostomy tube ought to present no difficulty. In the present case, of course, the tracheostomy had been performed more than three months previously. When Dr Ravenscroft arrived in the ward she took over from nurse Jansen and immediately, without any difficulty, replaced the tracheostomy tube and commenced the standard resuscitation procedure. At that stage there was no spontaneous breathing, no heartbeat and the patient's pupils were dilated. Something like 15-20 minutes elapsed before a spontaneous heartbeat was obtained and about 30 minutes elapsed before the patient began spontaneous breathing, that is to say without being artificially ventilated. The duration of the cerebral hypoxia was, however, such as to result in irreversible brain damage. After an initial prolonged coma, Lee-Ann passed into a permanent vegetative state from which she would never recover.

**Judgment**

The question was whether the failure on the part of the hospital staff promptly to replace the tracheostomy tube amounted to negligence in the circumstances. It is trite law, said Scott J, that a patient in a hospital is entitled to be treated with due and proper care and skill. The degree of care and skill that is required is that which a reasonable practitioner would ordinarily have exercised in South Africa under similar circumstances. The court observed that the need for particular care and vigilance in the case of paediatric tracheostomy patients was obvious. Not only was the possibility of accidental decannulation readily foreseeable, but unless immediately remedied the consequences would be fatal. This need for care and vigilance was reflected in the staff allocated to the tracheostomy unit. The court noted that there were undoubtedly other similar units elsewhere in the world where the staff to patient ratio is higher but that a standard of excellence cannot be expected which is beyond the financial resources of the hospital authority. It accepted as reasonable a staff allocation of two nurses to each room of the unit with an overseeing sister during the day and

---

129 *Dube v Administrator, Transvaal* fo 64 supra
an overseeing sister shared with other wards at night. The court also said that it must be accepted that one of the two nurses in each room will from time to time be absent in some circumstances. Scott J observed that at the time of the accident there were only two nurses on duty in the unit, nurse Bezuidenhout in room 14 and nurse Jansen, in room 13. The day sister had not yet arrived and the night sister who covered the tracheostomy unit as well as the medical ward had by that time already left, after handing over to the sister in charge of the medical ward on the same floor. He pointed out that such a state of affairs was acknowledged by Dr Gie in evidence as being undesirable. The younger and higher risk patients were accommodated in room 13. Of these the youngest and the most vulnerable was Lee-Ann, hence her prime position in the room close to the nurses’ desk. Scott J noted that nurse Jansen, who was left alone in room 13, was well aware of the risk of accidental decannulation and the need for vigilance and that so were the other members of staff who were prepared to walk off leaving her to hold the fort single-handed. He commented that it was also probably a bad time of day to be left alone as the patients had all recently woken up and were clamouring for attention. But this, he said, was all the more reason to keep them under careful observation. In other words, in the circumstances in which she found herself, nurse Jansen was obliged to ensure that she did not devote her attention solely to one child for too long a period. It was her duty, said Scott J, constantly to be aware of how each child was faring. Having regard to the relatively small size of the room all that would have been required was a regular glance at each child.

He observed that the impression given by nurse Jansen in her evidence was that her attention was devoted to the child attempting to climb out of its cot only for a few seconds. She said that while standing near the middle of the room where she could keep an eye on all five patients she saw the one child climbing out of its cot. She hurried to him and picked him up. She then looked back in the direction of Lee-Ann and saw that the tracheostomy tube was not in place. By that time, however, Lee-Ann was already limp. In other words, she was
unconscious. The doctors who gave evidence were agreed that on losing her tracheostomy tube Lee-Ann would in all probability have thrashed around in obvious distress or, as Dr Thomson, the paediatric neurologist, put it, she would have been fighting for her life. On the assumption that her oxygen supply was totally cut off, which would appear to have been the case, it would have taken in the region of about a minute for Lee-Ann to lose consciousness. All this, however, was missed by nurse Jansen. By the time she became aware of the problem Lee-Ann was already unconscious. She clearly devoted her sole attention to the child climbing out of his cot for a longer period than she subsequently thought. In doing so she failed, said Scott J, to exercise the care towards Lee-Ann which in all the circumstances was required of her.

The court observed that inexplicably, she was unable to replace the tracheostomy tube. She could offer no explanation for this, nor did any reason present itself. Dr Ravenscroft, when she arrived, had no difficulty. In her words, she just put the tube in. But this meant that another valuable minute was lost before ventilation could be recommenced. There can be no doubt, said the court, that the skill required of a nurse in the position of nurse Jansen, that is to say one of only two nurses present in the unit, must include the ability, in the absence of some particular problem, to replace a tracheostomy tube in an emergency. There was nothing to suggest that there was any particular problem with regard to the replacing of the tube, and in failing successfully to do so, nurse Jansen, in the judgment of the court, failed to exercise the skill expected of a reasonable nurse in her position. The court noted that situation was exacerbated by the absence in the unit of a sister or even a third nurse. It said that had the sister or another nurse been present, she could have taken over from nurse Jansen when the latter found that she could not replace the tracheostomy tube. The court held that nurse Bezuidenhout could not be blamed. When she came into room 13 she observed nurse Jansen attending to the matter of replacing the tracheostomy tube. Lee-Ann's colour told her all. In running down the passage for help she probably did the right thing. The fact that she had to
leave the patients in room 14 unattended served, however, merely to highlight
the insufficiency of the staff on duty at the time. In the view of the court, the
hospital staff were negligent in failing to exercise proper care and skill in
relation to Lee-Ann.

Scott J then turned to the question of damages and specifically, general
damages. In this regard the plaintiff claimed in his representative capacity the
sum of R200 000 for pain, suffering, shock, discomfort and loss of amenities of
life. In this context, the court observed that Lee-Ann lay in what Dr Thomson
described as a decerebrate posture. Her neck was extended. Her arms are
extended and internally rotated with her fists clenched. She developed
tremulous movements of her limbs when stimulated during examination. There
was no cortical function. Her eyes were open but she was cortically blind. Her
gaze was dysconjugate, i.e., her eyes were in a squinting position. She was
unable to swallow and she was fed by means of a naso-gastric tube. She had no
awareness of environmental stimuli, nor any apparent awareness of herself. She
had no awareness of pain. She was ventilated adequately with a tracheostomy
tube. She was in every respect, said the court, a ‘cabbage’ case.

There was some difference of opinion as to her present life expectancy. Dr
Thomson thought she could live for another seven years. This view was based
on his general experience and in particular on the fact that Lee-Ann had already
survived for three years. Dr Gie, on the other hand, was of the view that even if
Lee-Ann were to continue to receive antibiotic and other active treatment she
would not survive for more than approximately another two years. In support of
this view he emphasised that subsequent to the accident Lee-Ann had already
experienced something in excess of 10 bouts of pneumonia and on one occasion
had had to be artificially ventilated for as long a period as 14 days. He explained
that all this resulted in progressive lung damage which rendered her body less
able to cope with the following bout of pneumonia and that it was inevitable
that she would die of pulmonary disease. The court preferred Dr Gie’s opinion
due to his having a special interest in paediatric pulmonology, and his being the
person with particular knowledge of Lee-Ann’s clinical history. Both doctors
agreed that Lee-Ann would remain in a permanent vegetative state until she
died and that the latter event would probably occur within a matter of a few
years.

It followed, said the court that it was of no consequence to Lee-Ann what
amount, if any, was awarded to her in respect of non-pecuniary damages. Not
only would she never know of the award, she would receive no benefit from it
whether knowingly or unknowingly. As counsel for the defendant poignantly
put it, ‘one cannot even buy her a teddy bear’. Scott J stated that there was
something unreal in attempting to compensate her. He said it was like trying to
compensate a dead person with money. He observed that had she not been
resuscitated and had she died, her claim for non-pecuniary damages would have
died with her. It would not have passed to her estate. In truth, said Scott J, she
was more dead than alive. Her body continued to function, but her mind was
gone. Her parents seldom visited her. Their failure to do otherwise, he said, was
understandable. There was nothing to visit. He noted that Lee-Ann merely
existed, lying in hospital waiting for her tenuous link with this world to be
finally severed. Counsel for the defendant, submitted that as no award of non-
pecuniary damages would serve any purpose, it would be proper in all the
circumstances for no award to be made under this head.

Scott J observed that the problem of how to compensate persons in such a
condition, frequently referred to in the cases as the ‘unconscious’ plaintiff, has
been the subject of much debate and difference of judicial opinion. The question
was considered in England by the Court of Appeal in Wise v Kaye and
Another and by the House of Lords in the two subsequent decisions of West &
Son Ltd and Another v Shephard\textsuperscript{132} and Lim Poh Choo v Camden and Islington Area Health Authority\textsuperscript{133}. Scott J summed up as follows the position in England as reflected in these cases as far as non-pecuniary damages are concerned, i.e. damages for pain and suffering and loss of amenities of life. Since an unconscious person is spared pain and suffering, he or she will not qualify for damages under this head. Similarly, because he or she is spared the anguish which may result from the knowledge of what in life has been lost or from the knowledge that life has been shortened, he or she will also not be entitled to damages in respect of this subjective element of the loss of amenities of life. But the fact of unconsciousness does not eliminate the actuality of the deprivation of the ordinary amenities of life and for this objective element of the loss, he or she is entitled to substantive damages. Scott J stated that the approach to the question of pain and suffering and the subjective element of the loss of amenities of life presented no difficulty. Since an unconscious plaintiff suffers no pain and has no feelings there is ipso facto no ‘loss’ to be compensated. He pointed out that this approach is consistent with that adopted in Sigournay v Gillbanks\textsuperscript{134}.

The difficulty, said Scott J, lies with the so-called objective element of the loss. He noted that it is inherent in the speech of Lord Scarman in the Lim Poh Choo case and in the majority speeches in the H West & Son case that the award of non-pecuniary damages in respect of the actuality of the loss is to be determined without regard to the fact of the plaintiff’s unconsciousness and without regard to the use to which the money so awarded may thereafter be put. It was, furthermore, fundamental to the approach adopted in the majority speeches that it was the objective element of the loss which was the greater, and not the subjective element, so that the award for the actuality of the deprivation of amenities of life must be substantial, notwithstanding the unconsciousness of

\textsuperscript{132} West [1965] 2 All ER 625 (HL)  
\textsuperscript{133} Lim Poh Choo [1979] 2 All ER 910 (HL)  
\textsuperscript{134} Sigournay 1960 (2) SA 552 (A)
the plaintiff. The court observed that the conclusion in the three English cases has not been without dissent and that Lord Scarman in the *Lim Poh Choo* case spoke of the ‘formidable logic and good sense of the minority opinions expressed in *Wise v Kaye* and *H West & Son Ltd v Shephard*, and of Lord Denning’s ‘powerful dissent’ in the Court of Appeal in the *Lim Poh Choo* case.

Scott J noted that a complicating factor has been the position in England with regard to the claim for loss of expectation of life. Such a claim is by statute transmissible to the deceased’s estate so that it is possible for damages to be awarded against a tortfeasor where the victim could not enjoy the proceeds of the judgment. Prior to 1941 the measure of damages to be awarded in such cases was so vague that in practice this head of damage got out of hand. In that year the House of Lords in *Benham v Gambling* decided that the damages in such cases had to be diminished and that only very moderate amounts would be allowable. Viscount Simon LC referred to the extreme difficulty in putting a money value on a prospective balance of future happiness and ultimately awarded a nominal sum of £400. In the *H West & Son* case both Lord Reid and Lord Devlin in their dissenting speeches referred to *Benham v Gambling* and relied on this case, at least partly, to justify their conclusion that far greater weight should be attached to the subjective element of the loss rather than the objective element, so that in the case of an unconscious plaintiff only a moderate figure should be awarded respect to his objective loss of amenities of life. A similar approach was adopted by Diplock LJ in his dissenting judgment in *Wise v Kaye* and by at least three Judges in the Australian High Court case of *Skelton v Collins*. A fact which was also of concern to Lord Reid and to Lord Devlin was the inability of the plaintiff to derive any benefit from the award, although neither considered this to be a decisive consideration.

---

135 *Benham* [1941] 1 All ER 7 (HL)
136 *Skelton* (1966) 115 CLR 94
The court observed that there were only two reported cases involving the compensation of an unconscious plaintiff in South African law. The first, *Gerke NO v Parity Insurance Co Ltd*\(^{137}\), was a case of a 21-year-old man who had been rendered permanently unconscious in a motor accident. His condition was described as 'vegetative' and he was expected to live for only another six months. In his judgment, Ludorf J referred to *Wise v Kaye and Another* (supra) and quoted at length from *H E West & Son Ltd and Another v Shephard* (supra). After confessing that he had been influenced by the reasoning of the Law Lords in the latter case, the Judge disposed of the problem of the plaintiff's unconsciousness on the simple basis that, as unawareness was not a disqualification for a claim for loss of earnings, it should not be a disqualification for a claim for loss of amenities of life as the latter claim 'has been classified with a claim for patrimonial loss'. Scott J stated that he did not think that it followed at all that, simply because awareness is not a requirement for a claim for loss of earnings, it should also not be required for a claim for loss of amenities of life. He said that although the former has its own peculiar problems in relation to an unconscious plaintiff, the claim is one which is of a pecuniary nature and is accordingly very different from the latter which is non-pecuniary. He stated that the fact that the latter may have been 'classified' in a particular way can surely not change its true nature. This aspect of the case has been severely criticised.\(^{138}\)

With regard to the award in respect of loss of expectation of life, Scott J observed that the suffering and anguish experienced by a conscious plaintiff will ordinarily be increased by the prospect of a premature death. Where, however, the plaintiff is unconscious, he is unaware of this. He is spared both pain and the anguish of knowing that his life has been cut short and therefore has no claim for this subjective element of the loss. He notes that this is self-evident and is the position both in England and Australia. In the *Gerke* case the plaintiff was unconscious and the award must therefore, said Scott J, have been founded upon

\(^{137}\) *Gerke* 1966 (3) SA 484 (W)

\(^{138}\) For a summary of some of the criticisms levelled at this judgment see Boberg (fn 28 supra) at p 567-9.
the objective fact of the loss of expectation of life. He pointed out that the award
on this basis has its roots in the English statutory provision in terms of which a
claim for loss of expectation of life is transmissible. In South Africa, a claim for
loss of expectation of life, like the claim for pain and suffering, is not
transmissible to the claimant’s heirs. Scott J was of the view that there appears
to be no justification for the importation from England of this ‘rather special
head of damages’.

In support of the award under this head, Ludorf J in Gerke also referred to
Goldie v City Council of Johannesburg and Dickinson v Galante. Scott J
said that it appears from the passages quoted that in the former case counsel for
the plaintiff disavowed any specific claim for shortened expectation of life
along the lines of that accepted in Benham v Gambling (supra), and in the latter
case Thomas J rejected the notion of a claim for diminished expectation of life
per se. In the third case cited, Roberts NO v Northern Assurance Co Ltd, Scott J
notes that Burne J appears to have accepted the existence of a claim for
the objective loss of life expectation on the basis of what was said by Lord
Morris in the H West & Son case without further ado. The other aspect of the
award in Gerke upon which Scott J commented was that Ludorf J appears to
have accepted the minority view in the H West & Son without alluding to that
fact.

Scott J stated that the majority view in the H West & Son case was that it is the
objective element of the loss which is the greater and not the subjective element.
The other reported case to which the court was referred involving the claim of
an unconscious plaintiff for non-pecuniary damages was Reynneke v Mutual &
Federal Insurance Co Ltd. This case concerned a 16-year-old girl who was

142 Luntz ‘Damages in cases of Brain Injury - Some Developments’ (1967) 84 SALJ at p 6 also criticises the
decision in Gerke
143 Reynneke 1991 (3) SA 412 (W)
left in a persistent vegetative state after being knocked down by a motor car. At
the time of the trial her life expectancy was estimated at 7.5 years and it was
accepted that she would not recover consciousness. On the strength of the
English cases, Claasen AJ drew a distinction between the subjective element of
the loss, that is to say, pain, suffering, mental anguish, fear, anxiety, etc, on the
one hand, and on the other, the objective element of the loss, that is to say, loss
of amenities of life, reduced expectation of life, disfigurement etc. As far as the
latter element is concerned, he felt that in view of the decision in Southern
Insurance Association Ltd v Bailey NO¹⁴⁴ some allowance had to be made for
the unlikelihood of the claimant being able to make use of any amount so
awarded and to this extent departed from the decision in H West & Son v
Shephard in which it was held by the majority that the use to which any award
could be put was irrelevant. Claasen AJ concluded that subject to such an
allowance an award had to be made in respect of the objective element of the
loss (and also the subjective element, notwithstanding the claimant's
unconsciousness) and awarded an amount of no less than R50 000 for the
objective element of the loss. He then disposed of the problem of compensating
an unconscious patient with an award of non-pecuniary damages in a single
paragraph stating that:

'The principal criticism levelled at awarding damages to a "cabbage" for pain and
suffering and loss of amenities of life is that money is paid for enjoyment of life to a
person who does not know that he had suffered such loss of enjoyment. It is said one is
consoling someone with money who does not know that he needs consolation and it is
said that consolation presupposes consciousness and some capacity of intellectual
appreciation. In my view the fallacy in this argument is that it equates a dead man with
an unconscious man. It also implies that it is "cheaper to kill a man than to maim
him".'

Scott J said he had difficulty in appreciating the fallacy to which he refers and
argued as follows. An unconscious person is as inconsolable as a dead person
and to this extent there is a similarity between the two. Indeed this is the
objection to awarding non-pecuniary damages to a permanently unconscious

¹⁴⁴ Bailey 1984 (1) SA 98 (A)
person. It is no different from awarding damages to a dead person. As far as it being cheaper to kill a man than to maim him, this is undoubtedly so in the absence of a dependant’s claim. But the reason is that the action is compensatory and not punitive. Scott J noted that a further justification for the award relied upon by Claasen AJ was that the unconscious plaintiff ‘has a right to be visited by her family while still alive’ and that an award of general damages could be used to pay the transport costs of her family and friends. Claasen AJ considered that ‘in such instances the money is in fact employed to console her and to alleviate her lot in life, however small’. He felt, accordingly, that ‘the defendant could not be heard to say “Suzette is not aware of the presence of her family and friends and therefore I should not be forced to pay any contribution towards the costs of having them at her bedside”’. Scott J agreed that an award of non-pecuniary damages could be used by a conscious plaintiff to have her family and friends visit her and in this way the award would provide some consolation for her loss. The use of the award in this manner could therefore be a factor to which a court may have regard when considering the quantum of non-pecuniary damages to be awarded.\textsuperscript{145} But, said Scott J, where the plaintiff is unconscious, neither the award nor the visit can provide any consolation and the award accordingly serves no purpose. He thus refused to agree with the reasoning of Claasen AJ. He said that there may be a pecuniary claim for such transport costs, but no such claim was made in the present case and it is unnecessary to consider the matter. Scott J noted that Claasen AJ awarded the sum of R10 000 in respect of reduced life expectancy and stated that for the reasons given when considering the Gerke case, he considered this award to have been unjustified.

Scott J identified two principal objections to what is essentially the English approach, involving a notional distinction between a subjective and objective element of the loss of amenities of life and the award of non-pecuniary damages in respect of the objective loss or the actuality of the loss. He stated that there

\textsuperscript{145} Marine & Trade Insurance Co Ltd v Katz NO 1979 (4) SA 961 (A) at p 983B-E
would appear to be unanimity that an unconscious person is not entitled to damages for pain and suffering or anguish, that is to say the subjective element of the loss of amenities, since he or she suffers no pain and experiences no anguish and that the objections to the English approach are the following -

- First, the award of non-pecuniary damages in respect of the actuality of the loss serves no purpose as the money awarded cannot be used for the benefit of the unconscious plaintiff.
- Second, it can provide no consolation to an unconscious plaintiff, as consolation presupposes consciousness and some capacity of intellectual appreciation. A conscious person who, by reason of his injuries, is incapable of deriving any advantage from a monetary award can notionally obtain some consolation from the receipt of money and from being able, if he pleases, to give it away. An unconscious person cannot even have this consolation.

Scott J noted that the so-called ‘functional’ approach involves the award of non-pecuniary damages only to the extent that such damages can fulfil a useful function in making up for what has been lost in the sense of providing for physical arrangements which can make the victim’s life more endurable. He observed that in Southern Insurance Association Ltd v Bailey NO it was argued on behalf of the appellant (the defendant) that the functional approach should be adopted in South Africa. Nicholas JA, who delivered the judgment of the Court, referred to the Lim Poh Choo case and noted that in England the functional approach had been rejected by the highest Court, but, after a brief review of various dicta in South African cases, stated:

‘This Court has never attempted to lay down rules as to the way in which the problem of an award of general damages should be approached. The accepted approach is the flexible one described in the often quoted statement of Watermeyer JA in Sandler v Wholesale Coal Suppliers Ltd 1941 AD 194 at 199: “The amount to be awarded as compensation can only be determined by the broadest general considerations and the figure arrived at must necessarily be uncertain, depending upon the Judge’s view of what is fair in all the circumstances of the case.”

I do not think that we should now adopt a different approach. To do so might result in injustice of the kind referred to in Lord Scarman’s speech in the Lim Poh Choo case.
This does not mean, of course, that the function to be served by an award of damages should be excluded from consideration. That is something which may be taken into account together with all the other circumstances.’

Scott J said that it was apparent from the ultimate paragraph of this passage that the Appellate Division has taken a view which is different from that adopted in the Lim Poh Choo case. The approach in England to the question of the unconscious plaintiff as confirmed in the Lim Poh Choo case involves disregarding entirely the use to which non-pecuniary damages may be put. Once, however, it is accepted that the function to be served by an award of damages is a relevant consideration it is difficult to see how the English approach can be followed, even in a modified form. The objection to the English approach to compensating an unconscious plaintiff is not merely that the amount awarded will not serve a useful purpose in ameliorating the loss, which is the aim of the functional approach. The objection is that it will not serve any purpose at all, whether useful or otherwise. In the Reyneke case Claasen AJ thought the solution was a ‘paring down’ of the damages to take into account the fact that the plaintiff is unable to derive any benefit from the award.

But the problem, said Scott J, is a paring down to what? Whatever the amount awarded, it will have no relevance whatsoever to the person whom it is sought to compensate. Where, as a result of injury, a plaintiff is mentally retarded even to the extent that he may have no insight into his loss, provided only that he has awareness, an award of non-pecuniary damages can be utilised for his benefit even if the expenditure is frivolous and does no more than amuse him. Where the plaintiff is unconscious and all his physical needs have been taken care of, the truth of the matter is that it is not possible to compensate him for his loss. He said it is like paying a dead person money in order to compensate him for the loss of his life. It is true that, if no award of non-pecuniary damages were to be made on account of the unconsciousness of the victim, it would mean that the wrongdoer would benefit. But the simple answer is, of course, that the action is
not punitive, it is compensatory. There is accordingly no basis in our law for an approach such as that adopted in Germany where a nominal award, it would seem, is made to reflect society's demand that some retribution be made for the injustice done to the plaintiff. The same is true of Professor Boberg's suggestion that the courts continue to award a 'nucleus of damages for loss of amenities of life to the unconscious plaintiff a la Gerke' so as to enable 'the law to express society's sympathy with the victim and its sense of outrage at his grievous loss' or the solution offered by Visser and Potgieter Law of Damages at 96, that the award serve as a 'symbolic reparation of the damage' and 'to effect retribution for the injustice, and to soothe the community'. To adopt such a 'solution' would be to import into our modern delictual action a penal element for which, in the view of Scott J there is no justification.\(^\text{146}\)

In asking whether a departure from the English approach is justified, Scott J stated that it is difficult in the first place to resist the conclusion that the English approach and, indeed, the distinction between the subjective and the objective element of the loss of amenities of life owes its existence to the Law Reform (Miscellaneous Provisions) Act, 1934, in terms of which a claim for loss of expectation of life was rendered transmissible. He states that because of this the need arose to place a value on the loss viewed objectively and it would seem that the distinction between the subjective and objective element of the loss was then simply applied to the case of the unconscious plaintiff. But in South Africa a claim for loss of expectation of life is not transmissible and the need for the distinction does not arise. Nor, says Scott J, is there any logic to it unless the claim in respect of the objective element is, or ought to be, transmissible, because in the end it is only the heirs of the unconscious plaintiff who get the benefit. He noted that the position in England is hardly satisfactory, that there has been a remarkable difference of judicial opinion on the subject and that the need for review would seem to be acknowledged. Scott J stated that he saw no

\(^{146}\) The court also referred to Van der Merwe and Olivier Die Onregmatige Daad in die Suid-Afrikaanse Reg 6th ed at 195 where the learned authors point out that in our modern law of delict there is no room for penal damages.
reason to blindly follow the English law approach. He said that the persons who
will really be prejudiced if an award of non-pecuniary damages is not made are
Lee-Ann’s parents, the plaintiff and his wife. He said that he had much
sympathy for them. The accident and its consequences must have caused them
much grief and sorrow but they do not claim damages for their grief and
inevitable bereavement. Nor, said Scott J, as a matter of policy, could such a
claim ever be entertained because the social burden would be too great. He
observed that free medical treatment had recently been afforded in South Africa
to all children under the age of six years and that all this costs money. The same
is true, said Scott J, in the case of other public bodies which are defendants in
actions arising out of bodily injuries.

Scott J acknowledged that his decision would constitute a radical departure from
the decisions in Gerke and Reyneke. He said that there are also, no doubt, other
unreported cases in which damages have been awarded in similar
circumstances. Nonetheless, said Scott J, there was no great body of precedent
which, in his view, would justify the perpetuation of an award of damages
which he regarded as being contrary to principle and the law. Finally, he
considered the question of whether the decision in Bailey’s case not to embrace
the functional approach obliged him to make an award of non-pecuniary
damages in the present case. He concluded that it did not saying that the
functional approach involves limiting an award to an amount which can serve a
useful purpose. In the circumstances of the present case, Scott J argued that an
award would not only serve no useful purpose, it would serve no purpose at all,
whether useful or otherwise. The claimant, by reason of her condition, is in
truth, incapable of being compensated by a monetary award. In the Bailey
case, said Scott J, the court was not concerned with the case of an unconscious
plaintiff and was accordingly dealing with a very different situation.

Discussion
This decision is controversial in the sense that there is a feeling that the award in damages does not sufficiently recognise or acknowledge the extent of the loss sustained. Whilst the logic that damages awarded in terms of the law of delict are compensatory and that therefore the extent to which the plaintiff is able to experience the loss must be taken into account is perfectly understandable there is somehow an absence of satisfaction that justice has been done. Possibly the problem is that this approach is too utilitarian\(^{147}\). Its basis in cold hard logic does not accord with the general sense of the value of human life and the fact that if one cannot exercise the right to life none of the other rights have any meaning.

Although it could be argued that biologically those in a persistent vegetative state are still alive in medical and legal terms, the court in \textit{Clarke v Hurst}\(^{148}\) argued convincingly that for all other purposes they are not. The question then

\begin{footnotesize}

\begin{enumerate}
\item Hurley S 'Distributive Justice and Health' \textit{Fairness and Goodness: Ethical Dimensions Of Health Resource Allocation} expresses the matter in a slightly different context thus: "We begin with the 'what' question. One view is that distributive justice is ultimately concerned with welfare. It's an attractive thought that each person's welfare matters just as much as any other's, the peasant's as much as the aristocrat's. There should be no favouritism: we should not treat a given benefit to one person as more important than an equal or greater benefit to another. This thought is one of the motivations for utilitarianism. According to utilitarianism, you should allocate each unit of resource to the person who will get the most welfare from it. To allocate a unit of resource to someone who will get less additional welfare from it than someone else would have got from it is to treat the former's welfare as more important than the latter's. The effect of allocating each unit of resource to the person who gets the most welfare from it is to maximize total welfare. In this way the no-favoritism ideal can motivate the position that aims to maximize welfare. However, this way of thinking has unattractive implications concerning some unhealthy or disabled persons. Consider someone who is blind and, in order to be mobile, maintains a seeing-eye dog. Or someone who needs regular dialysis. It seems that many such persons would get less welfare from any given allocation of income than would someone bursting with health. A substantial part of a resource allocation to an unwell or disabled person may have to be spent just raising her to a minimal level of welfare, one which healthy persons take for granted: in paying for food for the seeing-eye dog or for dialysis for example. There are of course many other possible answers to both the 'what' and the 'how' questions, and other possible views about justice, such as libertarian views and views that urge the maximization of welfare or of resources, which are not included in this schema... It seems that, in most cases at least, health generates welfare out of resources more efficiently than lack of health. But utilitarianism treats health conditions, along with other conditions, as merely the means to more or less welfare. This means that the utilitarian, who aims to allocate each unit of resource where it will produce the most welfare, will direct resources away from the unhealthy and disabled in favor of the healthy, to the extent the healthy are more efficient generators of welfare. As a result, the unhealthy and disabled will be left with lower total levels of resources, and lower total levels of welfare, than the healthy. This result conflicts with the Intuitions many people have about just resource allocations. If the welfare benefits in question are very small, or if a much greater welfare benefit could be provided to the healthy than to the unwell, many people do favor allocations that benefit the healthy and maximize welfare. However, where substantial benefits are in question and equal welfare benefits could be provided to healthy and the unwell, many think we should allocate resources to the unwell. Moreover, they would favor the unwell even if a somewhat greater welfare benefit could be provided to the better off (Daniels and Sabin 1997, 120). Allocations that increase the welfare of the unwell or disabled are in some cases regarded as more important or more urgent than allocations that increase the welfare of the healthy, even if the former do not maximize welfare."

Acocella N in "Theories of Justice: Social Conditioning and Personal Responsibility in Roemer's Contribution" (http://host.uniona1.it/progett/eps/communicazen/justice.pdf) points out that: "Theories of justice differ essentially because of different visions, i.e., the intertwining of value judgments and analytic elements concerning the way human "systems" work (from and economic, social, psychological and biological point of view). Differences in the system of value judgments are thus one of the two causes of divergences in theories of justice."

\item Clarke v Hurst 1992 (4) SA 630 (D)
\end{enumerate}
\end{footnotesize}
is whether the approach of Scott J in *Collins* saying that attempting to compensate a person in a persistent vegetative state is like trying to compensate a dead person, accords with public policy and perceptions of justice. The problem seems to be that if one extends the logic in the abstract, one is faced with a situation in which damages or compensation should be commensurate with the capacity of the plaintiff to experience loss, the subjective awareness of the plaintiff of extent of that loss, as opposed to the value placed by society as a whole on that which is lost. In the context of the law of delict, one runs into problems here with the fact that the concept of wrongfulness is based on the legal convictions of the community and that once an act or omission has been found to be wrongful, there should be a measure of compensation which satisfies society’s rather than the plaintiff’s sense of justice. Of course wrongfulness is only one element of the law of delict and the other elements are not all necessarily dependent on the legal convictions of society for their content.

One gets into all kinds of ethically and legally tricky situations in entering a logical arena in which compensation is dependent upon the ability of the plaintiff to comprehend and experience the loss. Take the example of a man who has injured his hand in an industrial accident. Assume that such claims are still settled in terms of the law of delict and not under workmen’s compensation law. The hand had to be partially amputated with the result that he is now left with a very unsightly, badly scarred, but still relatively functional ‘claw’ in which he still has the use of a thumb and two fingers. This man is inordinately conscious of his personal appearance and is profoundly psychologically affected by the partial loss of his hand. He feels he would rather have it amputated and replaced by a prosthesis which although it may be less functional than what he has now, would be more aesthetically pleasing to him and easier to live with psychologically. He approaches a doctor with the request that the remainder of his hand is amputated. How should the doctor respond? Should his decision be based on the view of society that it would be wrong to amputate the hand
because it is more functional than a prosthesis would be and that the amputation is technically medically unnecessary or should he accede to the patient’s wishes on the basis that the latter values a prosthesis more highly than his semi-amputated hand? If one uses the logic that this man’s awareness of the partial loss of his hand is more acute than that of most men, must he then receive a greater award in damages than would ordinarily be granted or does this principle of subjective consciousness of loss operate in only one direction – to decrease the quantum of damages that should be awarded to the patient?

Take another example of two people, both final year medical students with similar future prospects, who consent to a clinical trial for a new drug. One of them was once blind for a number of years when he was younger before an operation restored his sight. The other has enjoyed normal sight throughout his life. In the course of the trial they both go blind as a result of the negligent and wrongful actions of the researchers. Could it be argued that:

(a) Because the one knew what it was like to blind some years ago, and is better adapted to living without his sight, the extent of his loss is not as great as that of the other who has to adapt to a totally new set of circumstances?
(b) Because one did not know what it was like to be blind, his consent to the trial was less meaningful and not as informed as that of the one who knew what it was to be blind even though the consent procedure that was followed was the same for both of them?
(c) Because the one had already been blind previously and subsequently had it restored, his sight was more valuable to him than that of the one who had never been blind and so his loss was greater?
(d) The extent of the damages payable to them should be the same based on the value that is generally placed by society on the ability of a medical doctor to see?

Scott J’s approach to distributive justice in the case of Collins is distinctly utilitarian in the sense that the resources must remain where they are most
of damages that is influenced by public policy – only the element of under-resourced. In terms of traditional legal reasoning, it is not the calculation of damages that is influenced by public policy – only the element of wrongfulness\(^\text{149}\). Even in cases where wrongfulness is proven, this on its own is...

\(^{149}\) In fact the argument that there are no public policy considerations applicable in assessing the quantum of damages is not correct. The element of legal causation for the purpose of limiting the extent of the damages for which a defendant is liable is also very much dependent on public policy considerations. With regard to the purely compensatory nature of damages in delict, see the dicta of Scott J in *Zystet and Others v Santam* 1996 (1) SA 273 (C) where he states: "The modern South African delictual action for damages arising from bodily injury negligently caused is compensatory and not penal. As far as the plaintiff's patrimonial loss is concerned, the liability of the defendant is no more than to make good the difference between the value of the plaintiff's estate before the commission of the delict and the value it would have had if the delict had not been committed. See *Dippenaar v Shield Insurance Co Ltd* 1979 (2) SA 904 (A) at 917B. Similarly, and notwithstanding the problem of placing a monetary value on a non-patrimonial loss, the object in awarding general damages for pain and suffering and loss of amenities of life is to compensate the plaintiff for his loss. It is not uncommon, however, for a plaintiff by reason of his injuries to receive from a third party some monetary or compensatory benefit to which he would not otherwise have been entitled. Logically and because of the compensatory nature of the action, any advantage or benefit by which the plaintiff's loss is reduced should result in a corresponding reduction in the damages awarded to him. Failure to deduct such a benefit would result in the plaintiff recovering double compensation which, of course, is inconsistent with the fundamental nature of the action. Notwithstanding the aforegoing, it is well established in our law that certain benefits which a plaintiff may receive are to be left out of account as being completely collateral. The classic examples are (a) benefits received by the plaintiff under ordinary contracts of insurance for which he has paid the premiums and (b) moneys and other benefits received by a plaintiff from the benevolence of third parties motivated by sympathy. It is said that the law balks at allowing the wrongdoer to benefit from the plaintiff's own prudence in insuring himself or from a third party's benevolence or compassion in coming to the assistance of the plaintiff. Nor, it would seem, are there the only benefits which are to be treated as res inter alios actae. In *Mutual and Federal Insurance Co Ltd v Swanepoel* 1988 (2) SA 1 (A) it was held, for example, that a military pension which was in the nature of a solutum for the plaintiff's non-patrimonial loss was not to be deducted. Nonetheless, as pointed out by Lord Bridge in *Hodgson v Trapp and Another* [1988] 3 All ER 870 (HL) at 874a, the benefits which have to be left out of account, though not always precisely defined and, 'though not, always necessarily to the fundamental rule and 'are only to be admitted on grounds which clearly justify their treatment as such'. It is submitted this baulking of the law to which Scott J refers is based on none other than consideration of public policy. In fact Scott confirms this subsequently in the judgment when he goes on to observe: "It is doubtful whether the distinction between a benefit which is deductible and one which is not can be justified on the basis of a single jurisprudential principle. In the past the distinction has been determined by adopting essentially a casuistic approach and it is this that has resulted in a number of apparently conflicting decisions. Professor Boberg in his *Law of Delict* vol 1 at 479 explains the difficulty thus: 'Where under the rule itself is without logical foundation, it cannot be expected of logic to circumscribe its ambit.' But, whatever the true rationale may be, if indeed there is one, it would seem clear that the inquiry must inevitably involve to some extent, at least, considerations of public policy, reasonableness and justice (see *Santam Versicherungsmatakkapippy Bpk v Bylerweld* 1973 (2) SA 146 (A) at 150E-F and 153B-C; see also Neddling, Potgieter and Visser The *Law of Delict* 2nd ed at 221-2). This in turn must necessarily involve, I think, a weighing up of mainly two conflicting considerations in the light of what is considered to be fair and just in all the circumstances of the case. The one is that a plaintiff should not receive double compensation. The other is that the wrongdoer or his insurer ought not to be relieved of liability on account of some fortuitous event such as the generosity of a third party.

Another case which clearly demonstrates the relevance of public policy considerations to the quantum of damages is *Jones v Krok* 1996 (1) SA 504 (T). In that case Kirk-Coles J stated obiter that: It is the policy of South African law and practice that for breach of contract the injured party is entitled to no more than compensation for the damages actually suffered by him. The quantum is not in any way dependent upon, or influenced by, the reprehensible behaviour of the defendant or the flagrancy of the breach (Administrador, Natal v Eduard* 1990 (3) SA 581 (A) ). The same applies to the assessment of the quantum of damages under the lex Aquilia: see *Santam Versicherungsmatakkapippy Bpk v Bylerweld* 1973 (2) SA 146 (A) 152H. It is thus true that the award of punitive damages in such cases, in which category falls the award in this case, is alien to our legal system The mere fact that awards are made on a basis not recognised in this country does not entail that they are necessarily contrary to public policy. Whether a judgment is contrary to public policy depends largely upon the facts of each case... In principle it would be wrong to refuse to enforce a foreign order of punitive damages...
insufficient to succeed in a claim in delict. The object of pursuing such a claim is compensation for the loss suffered. Therefore the nature and extent of that loss, i.e. damages must be proven. Where the loss is so great that no amount in damages will constitute satisfactory compensation, the utilitarian approach is that no award of compensation can be made.

In discussing the concept of justice in relation to health Kolm notes fairness about health gives rise to innumerable considerations in the field of health care. At a more global level, he says, there is a tradition of concern about fairness and health induced by the correlations between health and socio-economic status. He notes that the field of conceptual justice is neither the application of a simplistic universal principle (or bundle of a few principles), nor an amorphous heap of ad hoc criteria found and applied according to intuition. It is a structured, rational, deductive construct starting from necessary concepts, properties and distinctions and unfolding to applications. A basic issue is whether justice about a particular good, such as health, makes sense, or whether justice should be considered globally. Kolm makes the point that concerning health, the answer is both ambivalent and special because of the particular importance it can have.

If one applies utilitarianism to one aspect of justice as applicable within the ambit of the law of delict then this same principle should be extent to other
practical mechanisms for the achievement of justice in other areas of law. In health care the utilitarian approach is particularly problematic and is not generally supportive of constitutional values\textsuperscript{151}. Why should one not allow poor people to sell their organs if it will improve their lives? Why should they not be able to sell blood and gametes? After all these things are a resource which they possess and upon which others place value. Why should unemployed people who contribute nothing to the economy who have AIDS be treated with expensive antiretroviral drugs if it is cheaper simply to let them die? Of what value to society are their lives? By prolonging their lives one is simply giving them greater opportunity to create AIDS orphans who will become a growing and unnecessary burden on already overstretched state resources. Are such lives of any greater value to society than the life of the baby in Collins?\textsuperscript{152}

On the other hand, the argument that the criminal law exists to punish people is a valid one. The argument that the standard of proof in criminal law should not be undermined by allowing punitive measures to be imposed \textit{via} the back door of the law of delict which imposes a lower standard of proof is also valid.

\textsuperscript{151} Hurley S, fn 147 supra points out that utilitarianism requires the allocation of each unit of resources to the person who will get the most welfare from it but that this way of thinking has unattractive implications for unhealthy or disabled persons. Utilitarianism, she says, treats health conditions, along with other conditions as the means to more or less welfare. She states that one prominent answer draws a fundamental distinction between welfare and resources and claims that what justice requires us to equalize is resources, not welfare. Welfare is a matter of the satisfaction of an individual's preferences and ambitions. These are down to the person herself and do not make a call on justice. The difference between someone whose preferences and ambitions are well adapted to his disability and someone whose preferences and ambitions are not so adapted to his similar disability does not make it just to compensate only the poorly adapted person. Each person should be treated as responsible for his preferences and ambitions as free to make what he will from his circumstances against a background of fair equality and resources. Resources, by contrast, are a matter if someone's endowments and the circumstances she finds herself in. Someone born into a rich and prominent family or highly gifted has to that extent valuable endowments which someone born into poor and obscure circumstances, or without special gifts, lacks. The former person has on this account greater resources than the latter. Similarly someone born with normal vision and good health has a valuable endowment and to that extent has greater resources than someone born blind or susceptible to major health problems. Such endowments are like different internal circumstances people find themselves in. They are not down to the people themselves in the way their different preferences and ambitions are. Ronald Dworkin, she says, distinguishes inequalities of welfare that result from people's different preferences or tastes or ambitions from inequalities in resources, differences in circumstances or endowments. He conceives justice as requiring equality of resources but not equality of welfare. For example, to have expensive tastes is to have a welfare deficit relative to someone with less expensive tastes, other things equal. Nevertheless, someone's expensive tastes are down to him and do not in themselves make a call on justice. Similarly if people who have the same endowments have different preferences and ambitions and accordingly make different choices in life that lead to their being better or worse off, the Dworkian aim to equalize resources will leave such inequalities alone. Some people may choose to work hard and get rich whereas others take lots of leisure and don't get rich. Some may assiduously avoid risks and insure heavily against risk, while others may blithely run risks and fail to insure. To the extent the resulting differences reflect differing preferences and ambitions, they are not unjust.
However, not every wrongdoing is prosecuted for any number of reasons, not every criminal is convicted, and not every victim receives justice in the criminal justice system. In fact in terms of constructive justice the criminal legal system seems to offer relatively little. It takes people out of circulation and marginalizes them in the eyes of society and in their own eyes. With regard to deterrent value, it can be argued that there is no deterrent value in claims pursued in terms of the law of delict - that this deterrent value is located rather within the criminal law. In response, it is submitted that it is not the role only of the criminal law to uphold, maintain and enliven the values and principles of the Constitution and that justice in the form of ‘reparation’ rather than mere compensation is an avenue that is worth exploring in the particular context of the civil law and the situation in Collins. There are those who would observe that in South Africa the criminal law serves only as a deterrent to those who are not criminally inclined to begin with since there seems to be little or no deterrent value for the criminally inclined in the threat of criminal prosecution and sanction given the high levels of extremely violent and brutal crime that plague this country.

It is submitted that the foregoing discussion indicates that mere logic is not always sufficient to arrive at legal answers which are acceptable to the community served by a particular legal system. Law is a combination of interwoven values and logical constructs that does not constitute an end in itself but is rather a vehicle for realizing the social, humanitarian, economic, political and other goals of the society that effects it. Where many people feel a deep sense of unease with a judgment such as that in Collins v Administrator Cape, it is important to explore and understand the reasons why. At the end of such exploration, one might concede that the conclusion was correct although it seems counter-intuitive until a closer examination is made of the issues involved. It may be that public policy dictates that the decision of the court in
Reyneke\textsuperscript{152}, is preferable to that in Collins on grounds similar to those that do not allow a wrongdoer to benefit from the fact that a plaintiff had the foresight to take out an insurance policy that covers him in the event of the materialization of the risk that was precipitated by the defendant. It may be that if justice is not to be done – as opposed to cold legal mathematics – then there should in cases such as that of Collins, be some kind of recognition in damages of the magnitude of the loss from the perspective of society and not only the plaintiff. Health in particular is a concept that cannot be reduced to sums of money. In a sense it is very much akin to concepts such as reputation or dignitas. It is not coincidental that in actions relating to health there is always likely to be a claim not only for patrimonial loss but also for non-patrimonial 'loss' described in terms of pain and suffering, loss of amenities of life, etc. The law recognizes this form of 'loss' and award damages sounding in money in respect thereof. Like a reputation, once lost, health may be difficult, if not impossible, to recover. Even more than a reputation, however, it is essential to the ability to enjoy life and it is central to the capacity to be human in the fullest sense. Why should a wrongdoer whose wrong is so profound that it destroys the capacity to appreciate the extent of that loss it had caused, not itself suffer loss as a result of its wrongdoing? If justice can be described in terms of the old adage, an eye for an eye, then this can to some extent explain why the decision in Collins offends a sense of justice even though mathematically and logically, it may be correct.

8.2.11 \textit{C v Minister of Correctional Services}\textsuperscript{153}

\textbf{Facts}

The facts as they appear from the headnote are as follows. During September 1993, while the plaintiff was a prisoner in the custody of the defendant at the Johannesburg Prison, a blood sample was taken from him which was later subjected to a test for the HIV virus. On the day in question the plaintiff was a

\textsuperscript{152} Reyneke fn 143 supra

\textsuperscript{153} C v Minister 1996 (4) SA 292 (T)
member of a group of prisoners standing in a row in a passage in a hospital
when he had been informed, together with the other prisoners, by K, a sergeant
in the Department of Correctional Services employed as a medical health aid
and as a nurse, that the blood test was for HIV and other transmissible sexual
ilnesses and that he had the right to refuse to undergo the test. This information
was subsequently repeated to the plaintiff by K in the closed consulting room
where the blood was taken, and in the presence of W, a prisoner assisting K
with the drawing of blood. The plaintiff was accordingly fully aware that the
test was, *inter alia*, for the HI virus and that he had the right to refuse to be
tested when he consented to undergo the test. The Department of Correctional
Services had adopted the concept that informed consent was a prerequisite for
testing prisoners and had specified what norms were applicable. The informed
consent policy as determined by the department had already been in operation
by March 1993. In terms of these norms prisoners who had been involved in
high-risk behaviour (prior to imprisonment the plaintiff had been involved in
homosexual relationships which placed him in the high-risk category) had to
receive pre- and post-test counselling by a competent member and the prisoner's
informed consent had to be obtained prior to the HIV test being administered.
Pretest counselling entailed informing the prisoner of the meaning of HIV
infection; the manner of transmission of the disease; the nature of the test and
that consent was required; the social, psychological and legal implications of the
test; what was expected if the result of the test proved positive; and the prisoner
had to be granted time to consider the information before consenting to the test
being administered. In the event of a positive blood test, post-test counselling
required that psychologists, social workers and nursing staff be at hand to
support the prisoner and to provide advice so that the result could be accepted.
At the time that K took the blood sample of the plaintiff for the HIV test he had
been unaware of the norm of informed consent adopted by his department. The
plaintiff, who was subsequently advised that he had tested positive for HIV,
instituted an action for damages in a Provincial Division against the defendant
on the grounds of alleged wrongful invasion of his right to privacy.
Judgment

Kirk-Cohen J observed that consent is a defence to many acts which would otherwise be a delict. An obvious example is consent to surgery and that in recent years the concept that consent must be 'informed consent' has found favour with South African courts. In regard to surgery, he noted that informed consent postulates full knowledge of the risks involved and, after being made aware thereof by the surgeon, the patient is then entitled to exercise his fundamental right to self-determination. He referred to Seetal v Pravitha and Another NO154 where it was stated in the headnote that a blood test on an adult without his consent is unquestionably an invasion of his privacy. On the other hand, the privacy of the individual is not in law absolutely inviolable. The debate about compulsory blood tests amounts to a showdown between the idea that the truth should be discovered whenever possible and the idea that personal privacy should be respected. Both ideas are important but neither is sacrosanct. The resolution of that debate will depend largely upon the store the Court sets by each idea, on its own sense of priority in that regard. Kirk-Cohen J noted that since the decision in Seetal, and with the ever growing scourge of the HIV virus and Aids, much thought has been given to what the minimum requirements of consent, with particular reference to blood tests for the HIV virus, should be. This too has been referred to almost universally as informed consent. He observed that speaking generally, it is axiomatic that there can only be consent if the person appreciates and understands what the object and purpose of the test is, what an HIV positive result entails and what the probability of AIDS occurring thereafter is. Evidence was led in this case on the need for informed consent before the HIV test is performed. Members of the medical profession and others who have studied and worked with people who have tested HIV positive and with Aids sufferers have developed a norm or recommended minimum requirement necessary for informed consent in respect of a person

154 Seetal 1983 (3) SA 827 (D)
who may undergo such a blood test. Because of the devastation which a positive result entails, the norm so developed contains as a requirement counselling both pre- and post-testing, the latter in the event of a positive result. These requirements have become almost universal in the Republic of South Africa. The judge quoted from the manual prepared by the Department of Correctional Services as to the protocol to be follows before testing a prisoner for HIV\(^{155}\). It was admitted that this was the standard in all prisons. He observed that he was not called upon to adjudge what the requirements of consent or informed

---

\(^{155}\) The manual was entitled "Management Strategy: AIDS in Prisons." The parts quoted by the court are reproduced below for the sake of convenience and to indicate the procedures that should be followed in order for consent to be informed in the case of HIV tests. The court noted that the Department of Correctional Services had itself adopted the concept that informed consent is a prerequisite for testing prisoners and had specified what the norms are. It noted that they were in accord with the views and suggestions of all major contributors in the country.

Paragraph 2.2 reads as follows: "Possible HIV infected persons: Once a person has been exposed to HIV (by high-risk behaviour) he/she can contract the HIV infection. For a period of three weeks to six months, blood tests can be negative and this person will show no signs or symptoms of the disease. This is known as the window period. During this period an infected person can pass on the virus to another person. For this reason the person is considered to be HIV infected and must be treated in the same manner as a positive HIV infected person."

Paragraph 5 provides: "Pre- and post-test counselling to prisoners who are/were involved in high-risk behaviour prior to admission: All individuals who are identified as being involved in high-risk behaviour should be counselled. Pre- and post-test counselling is of the utmost importance and should be done by a competent member (see Counselling to Prisoners point 14). Informed consent must be obtained from a prisoner prior to an HIV antibody test being administered. If the prisoner refuses permission for the tests to be done, it must be brought under (sic) the attention of the medical officer."

The relevant paragraph, or as it is here called ‘point 14’, reads as follows:

"14. Counselling to Prisoners

14.1 Pretest: potentially HIV infected persons. A prisoner may experience anxiety if he believes he may be HIV infected. The purpose of pretest counselling is to ensure that the prisoner is aware of: what HIV infection means, and is prepared for the progress of the infection; the manner of transmission of the disease and that high-risk behaviour must be avoided; the nature of the test and that his/her consent is required before the test can be administered; the social, psychological and legal implications of the test; and what is to be expected should the result of the test prove positive. The prisoner must be persuaded to avoid high-risk behaviour should the test prove negative. The prisoner must also receive information to avoid the spreading of the disease if he is HIV infected. With the above information the prisoner could more readily give his permission for the tests to be done. Should the blood tests return a positive result the prisoner may be less shocked if he received pretest counselling.

14.2 Post-test counselling: negative blood test result. Should the blood test return a negative result, the prisoner will most likely feel relieved and happy. This is a crucial time during which to inform the prisoner: that he must understand that prior to the test he was engaged in high-risk behaviour, and that his/her consent was required before the test was administered: the virus can be inactive for three months while tests are negative. This is known as the window period. During this time spreading of the infection can take place while the infected person is not aware of his infection. That he may need the help of a psychologist or social worker to help him/her to change his behaviour.

14.3 Post-test counselling: positive blood test results. Comprehensive counselling to prisoners who are informed that their blood tests have proved positive is vitally important. Whereas some prisoners will be relieved to know that they are HIV-infected, others will be shocked to realise that they are infected. Psychologists, social workers and nursing staff should be at hand to support the prisoner and to provide advice so that the result can be accepted. Counselling must therefore be geared towards: helping the prisoner to accept the result; giving the prisoner guidance as regards breaking the news to relatives; giving advice as to the persons to whom the prisoner should disclose his condition; conveying the implications of any further pregnancies; convincing the prisoner that he/she can carry on with a normal life, as they are only HIV-infected and do not as yet have AIDS; and convincing the prisoner to avoid high-risk behaviour, thus preventing the further spreading of the disease."

1018
consent should be and to what extent personal privacy should, or should not, be respected as referred to in Seetal's case. The norm laid down by the department and, as a prisoner, the plaintiff was entitled to the right of informed consent as determined by the department which controlled his incarceration in prison. It was not granted to him and it is obvious to what extent the consent obtained fell short of the informed consent laid down by the department itself. Counsel for the defendant submitted that the deviation from the norm laid down by the department was minimal and not wrongful. That, said the court, depended on the circumstances. It referred to the following facts:

1. The first information about the test, its object and the right to refuse to submit to the test was communicated to the plaintiff as a member of a group of prisoners standing in a row in a passage. There was no privacy and little time to reflect.

2. No information on the right to refuse was communicated to each prisoner individually prior to his entering the consulting room.

3. What was repeated to each one of them in the consulting room was not said by anyone trained in counselling. It was also not said to each of them privately but in the presence of a co-prisoner, De Waal.

4. No reasonable time for consideration and reflection was accorded to each prisoner in the consulting room before he was asked whether he consented to the test.

In these circumstances, said the court, the deviation from the accepted norm of informed consent, including the fact that there was no precounselling, was of such a degree that the deviation was material and wrongful.

Kirk-Cohen J then turned to the question of whether the plaintiff had proved the necessary animus iniurandi required for the actio iniuria. He referred to *Whittaker v Roos and Bateman* in which Solomon J stated that:

---

156 *Whittaker 1912 AD 92.*
"It seems to me that we have present here all the requisites which are necessary to found an action of injuria. Those requisites are well laid down by De Villiers in his work on the law of injuries as follows: First: "An intention on the part of the offender to produce the effect of his act"; in other words, the animus injuriandi. It is not necessary in order to find that there was an animus injuriandi to prove any ill-will or spite on the part of the defendants towards the plaintiffs; and it is quite immaterial what the motive was or that the object which the defendants had in view was a laudable one. It is sufficient that the injuries suffered by the plaintiffs were inflicted by the defendants, not accidentally or negligently, but with deliberate intention."

and noted that the Appellate Division in *Minister of Justice v Hofmeyr*157 reaffirmed the principles laid down in Whittaker's case. Kirk-Cohen J found that the principles enunciated by the Appellate Division in Whittaker's and Hofmeyr's cases in regard to the definition of *animus iniuriandi* applied to the present case. In his opinion the fact that those cases dealt with imprisonment and the present case dealt with informed consent to undergo a blood test was of no consequence. They both deal with an invasion of privacy. Ill will, spite and motive are irrelevant. Despite Sergeant Kinnear's *bona fides*, the defendant was in the same situation as were the defendants in the two Appeal Court cases. Consequently, he ruled that the requirements of *animus iniuriandi* in the present case were the same as those laid down in the two cases *supra* and those requirements had been proved. In the result the plaintiff had proved the requirements of the *actio iniuriarum*. With regard to damages the court held that had the plaintiff received the pretest counselling postulated for informed consent, the emotional blow would, on the probabilities, have been diminished. It said that this must be weighed against the fact that, as an intelligent person, he did *de facto* consent when he was told what the test was for and that he had a choice whether to subject himself to that test or not. Also to be weighed were the circumstances under which the plaintiff was asked to consent. The court observed that counsel for the plaintiff in its view correctly conceded that the plaintiff was entitled to not much more than nominal damages if the defence version of the facts was true. It held that the present case was distinguishable,

on the facts, from that of Jansen van Vuuren and Another NNO v Kruger\textsuperscript{158} since the plaintiff's case is not based on publication and, in addition, he did consent to the test being done.

In all the circumstances it considered an award of R1 000 adequate. Concerning costs Kirk-Cohen J observed that the plaintiff was entitled to test his right to informed consent. The submission was made that he was entitled to do so in the Supreme Court. For the defendant it was submitted that the plaintiff's case was based on false evidence, that there was no merit in it and he was not entitled to any costs, let alone Supreme Court costs. The trial lasted four and a half days. Much of the time was taken up on the disputed facts. The fact that the plaintiff was untruthful and his damages small, had to be balanced against the stance of the defendant. The defendant did not concede that the plaintiff could rely upon the policy of informed consent introduced by his department. Nor was there any explanation tendered why the policy, then already adopted and in practice, was not applied in September 1993 in the Johannesburg Prison. Weighing all factors, the court held that the plaintiff was entitled to establish that his right to privacy was breached and he was entitled to do so in the Supreme Court because the issue at stake was important. In the end, despite his own false evidence, he had been successful. On balance there were insufficient reasons to deviate from the norm that costs should follow the event.

Discussion

The issue of informed consent around which this case revolves has been discussed in some detail in the Castell v de Greef\textsuperscript{159} the facts and judgment of which are given in the section on the private sector. The present case is of importance because it emphasises the weight of the right to privacy and the fact that it belongs to everyone. It also indicates the importance of the manner in

\textsuperscript{158} Jansen van Vuuren 1993 (4) SA 842 (A)
\textsuperscript{159} Castell 1993 (3) SA 501 (C), 1994 (4) SA 408 (C)
which proper consent, i.e. informed consent, is obtained. It is submitted that
there is no difference in legal principle between informed consent for the
purpose of testing for HIV and AIDS and any other life threatening disease. The
fact that HIV and AIDS are a major problem in South Africa has thrown the
spotlight on this disease but any temptation to assume that there are legal
principles that are unique to the disease would be wrong. The same pre and post
test considerations would apply to tests for other dangerous illnesses namely,
the impact of a positive result on the patient’s psychological and emotional
wellbeing, the need to ensure that the patient understands the disease and how it
should be managed, any lifestyle changes that may be necessitated in order to
effect its management and the importance of observing drug regimens and the
signs and symptoms to look out for in order to identify the need for immediate
further medical attention. HIV and AIDS has merely thrown the spotlight on the
importance of informed consent in a way that few other diseases probably could
have done, largely due to the social stigma that is attached to it and the fact that
it is presently incurable. It is submitted that the principle in the South African
law of delict that recognises the possibility of damages for emotional shock will
ensure that future cases in these circumstances are similarly decided whether the
disease is HIV/AIDS or some other incurable, life threatening disease.

In the broader medical context this case has firmly established that ill-will or
spite is not a prerequisite to establish the animus injuriandi necessary to ground
an action for injuria in cases involving a lack of informed consent. It is
important to distinguish the question of the invasion of privacy from that of the
failure to obtain informed consent. It was, it is submitted, rather more the
circumstances in which the consent was purportedly obtained\textsuperscript{160}, than the failure
to obtain adequate informed consent that grounded the claim for injuria. Indeed
the court found that the plaintiff had known of the purpose of the test, that he
did de facto consent when he was told what the test was for and that he had a

\textsuperscript{160} At p 307 of the judgment, Kirk-Cohen stated: “Also to be weighed are the circumstances under which the
plaintiff was asked to consent, to which I have referred.”
choice whether to subject himself to that test or not. If anything, the damages were awarded for emotional shock that he experienced when he was informed of the HIV positive test result. The court observed that the plaintiff’s evidence was that the major upset occurred when he heard of the result of the test. As he said, when he heard of the result of the test, ‘was dit vir my soos ‘n doodvonnis’. It said that had he received the pretest counselling postulated for informed consent, the emotional blow would, on the probabilities, have been diminished. The question in this case, it could be argued, was not so much a lack of informed consent (since the plaintiff had consented to the test, knowing what it was for and also apparently knew the implications of being HIV positive - otherwise he would no have been as upset as he was on being told of the test result) as the lack of privacy in which it was obtained and the failure to take reasonable precautions to prepare the plaintiff for the possibility of a positive test result. The court found that on the probabilities he had not been “upset about the manner of the test to which he consented. Had he really been upset about the test itself, one would have expected him to have asked to see his confidante, Lieutenant Warren, at that stage. Equally, he did not ask to see her after the second test.” The court had assessed the plaintiff as an intelligent person. Post-test counselling was successfully conducted. Although only the court was privy to every small factual detail of this case, it does seem that, by the standard for informed consent given by Kirk-Cohen J that “speaking generally, it is axiomatic that there can only be consent if the person appreciates and understands what the object and purpose of the test is, what an HIV positive result entails and what the probability of AIDS occurring thereafter is”, there is a possibility that the plaintiff may in fact have given informed consent to the test. It is submitted that the failure to follow a specified protocol for the obtaining of informed consent does not necessarily mean that the consent is not informed (although the judgment in this case seems unfortunately to give the opposite impression) just as the rigid observation of a particular protocol for informed consent does not mean that it was necessarily informed. This is undesirable as it could have the effect of entrenching in law a protocol or policy
that should be subject to change with changing conditions and improved knowledge about the disease. A protocol simply increases the chances that the patient’s consent is informed and serves as valuable evidence to this effect if it has been followed. Failure to follow the steps it outlines makes it more difficult to show that informed consent was obtained. Since medical interventions are \textit{prima facie} unlawful, the onus of proving that informed consent has been obtained is likely to rest on the defendant.

It is submitted that there are many intelligent people who, knowing the implications of HIV infection and having received pre-test counselling, may well still be shocked at the news that they themselves have tested positive for the disease. With respect, it is unfortunate that the judgment in \textit{C v Minister of Correctional Services} did not deal more precisely with the issues of informed consent in the light of the maxim \textit{volenti non fit injuria} (and the principles discussed by Ackermann J in \textit{Castell v de Greef}) in relation to the question of damages for emotional shock claimed under the \textit{actio injuriarum}. Whilst it is clear that in principle informed consent to a test for HIV should be as capable of vitiating liability for emotional shock under the \textit{actio injuriarum} as it should of vitiating liability for patrimonial loss in an action based on the \textit{lex Aquilia}, the question as to whether consent was informed or not, should not be confused with the question of liability for emotional shock. Whilst the presence of informed consent would undoubtedly have a bearing on the cause of emotional shock and even the wrongfulness of the emotional shock, it is submitted that emotional shock is not a necessary consequence of failure to obtain properly informed consent and can still occur even though informed consent has been obtained. A reading of \textit{C v Minister Correctional Services} tends almost to suggest that there was adequate consent to the test itself but that the plaintiff was not sufficiently prepared to receive a positive test result. In other words, although he knew what the test entailed, had consented to it and understood the nature of HIV and its consequences, he had not entertained the idea that he might be HIV positive. This may have been due to the fact that he was not given
sufficient time to consider whether or not he wanted to have the test and was not given sufficient privacy to raise any questions or concerns he might have had when the possibility of being tested was put to him. He was possibly expecting a negative test result. Such expectation may or may not have been precluded by the pre-test counselling. Although there was a requirement in the protocol of the Department of Correctional Services that pre-test counselling should include the social, psychological and legal implications of the test and what is to be expected should the result of the test prove positive, this does not necessarily mean that the plaintiff would have revised any belief he had that he was not HIV positive. It is respectfully submitted that whilst the conclusion in this case was ultimately the correct one, the analysis of the legal principles involved could have been clearer, especially given the fact that Ackermann J did such a clear legal analysis in the case of Castell v de Greef which was decided previously.

The failure to obtain informed consent will not necessarily amount in every case to an invasion of privacy. The problem in the present case was that the circumstances in which the informed consent was sought did not sufficiently recognise or protect the right of the plaintiff to privacy. It is submitted that in circumstances where the patient is unable to ensure that her surroundings are suitably private and that intimate conversations cannot be overheard by others, for example because she is confined to a hospital bed in an open ward, there is a responsibility upon those who can control the patient’s environment to ensure that there is sufficient protection and respect for the patient’s right to privacy. For example, it would be inadvisable to adopt the view that because a patient is not in a private ward, he or she has given up the right to privacy. A patient’s right to privacy in a health institution can be invaded in many ways. Allowing a patient to be questioned by the press as to his or her condition or giving

161 In National Media Ltd and Another v Jooste (fn 27 supra) the Appellate Division observed that: “A right to privacy encompasses the competence to determine the destiny of private facts... The individual concerned is entitled to dictate the ambit of disclosure, for example to a circle of friends, a professional adviser or the public (cf Jansen van Vuuren and Another NNO v Kruger 1993 (4) SA 842 (A); Neethling Persoonlikeidsreg 3rd ed at 238-9).”

1025
information to the press about a patient without his or her consent\(^{162}\) or allowing a patient to be photographed\(^{163}\) when he or she is not in a position to take steps

\(^{162}\) In *National Media Ltd and Another v Jooste* (fn 27 supra) Harms JA quoted the following words by Warren and Brandeis 'The Right to Privacy' (1890) 4 Harvard Law Review 193: and noted that they were well said: "The press is overstepping in every direction the obvious bounds of propriety and of decency. Gossip is no longer the resource of the idle and of the vicious, but has become a trade, which is pursued with industry as well as effrontery. To satisfy a tramp's taste the details of annual relations are spread broadcast in the columns of the daily papers. To occupy the indolent, column upon column is filled with idle gossip, which can only be procured by intrusion upon the domestic circle. The intensity and complexity of life, attending upon advancing civilisation, have rendered necessary some retreat from the world, and man, under the refining influence of culture, has become more sensitive to publicity, so that solitude and privacy have become more essential to the individual; but modern enterprise and invention have, through invasions upon his privacy, subjected him to mental pain and distress, far greater than could be inflicted by mere bodily injury. Nor is the harm wrought by such invasions confined to the suffering of those who may be made the subjects of journalistic or other enterprise. In this, as in other branches of commerce, the supply creates the demand. Each crop of unseemly gossip, thus harvested, becomes the seed of more, and, in direct proportion to its circulation, results in a loss of its relative importance. Even gossip apparently harmless and of no moment. Even and perfectly innocent gossip, circulated, is potent for evil. It both belittles and perverts. It belittles by inverting the relative importance of things, thus dwarfing the thoughts and aspirations of a people. When personal gossip attains the dignity of print, and crowds the space available for matters of real interest to the community, what wonder that the ignorant and thoughtless mistake its relative importance. Easy of comprehension, appealing to that weak side of human nature which relishes the misfortunes and frailties of our neighbours, no one can be surprised that it usurps the place of interest in brains capable of other things. Triviality destroys at once robustness of thought and delicacy of feeling. No enthusiasm can flourish, no generous impulse can survive under the blighting influence."

In that case the issue was whether the appellants (the publisher of two weekly magazines, the Huisgenoot and You, and the news editor of the former) had wrongly breached the respondent's right to privacy by publishing details of private affairs for 'public delection' (Mellus de Villiers *The Roman and Roman-Dutch Law of Injuries* (1899) at 138 n 32). These magazines have the identical content, the one in Afrikaans and the other in English. The court in its judgment observed that: "The respondent had decided to make the private facts known to the public. This decision contracted her right to privacy because she no longer had the wish to keep these facts secret. The publication of the article could therefore not impinge on her right to privacy. This submission is unsound because it attaches no value to the agreement between the parties. As indicated, her willingness to reduce the compass of her privacy was subject to specific conditions or terms and they have not been complied with. That, according to Mr. Burger, is beside the point because the cause of action is not one based upon a breach of contract. The response, I fear, is too simplistic. A right to privacy encompasses the competence to determine the destiny of private facts (see Neethling's comment on the judgment of the Court a quo: (1994) 37 THRHR 703 at 706). The individual concerned is entitled to dictate the ambit of disclosure, for example to a circle of friends, a professional adviser or the public (cf *Jansen van Vuuren and Another NNO v Kruger* 1993 (4) SA 842 (A), Neethling *Persoonlikeheidsre d* 3rd ed at 238-9). He may prescribe the purpose and method of the disclosure (of the facts in *O'Keeffe v Argus Printing and Publishing Co Ltd and Another* 1954 (3) SA 244 (C)....). Similarly, I am of the view that a person is entitled to decide when and under what conditions private facts may be made public. A contrary view will place undue constraints upon the individual's so-called 'absolute rights of personality' (*Minister of Justice v Hofmeyr* 1993 (3) SA 131 (A) at 1451). It will also mean that rights of personality are of a lower order than real or personal rights. These can be limited conditionally or unconditionally and irrespective of motive. The appeal was dismissed with costs.

In *Bernstein And Others v Bester and Others NNO* 1996 (2) SA 751 (CC) the constitutional court noted that: "In *Financial Mail (Pty) Ltd and Others v Sage Holdings Ltd and Another* [1993(2) SA 451 (A)] it was held that breach of privacy could occur either by way of an unlawful disclosure upon the personal privacy of another, or by way of unlawful disclosure of private facts about a person. The unlawfulness of a (factual) infringement of privacy is adjudged 'in the light of contemporary boni mores and the general sense of justice of the community as perceived by the Court'. Examples of wrongful intrusion and disclosure which have been acknowledged at common law are entry into a private residence, [S v I and Another 1976 (1) SA 781 (RA); S v Boshoff and Others 1981 (1) SA 593 (T)] the reading of private documents [Reid-Daly v Hickman and Others 1981 (2) SA 315 (ZA)]; listening in to private conversations [S v A and Another 1971 (2) SA 293 (T)]; the shadowing of a person [Epstein v Epstein 1906 TH 87], the disclosure of private facts which have been acquired by a wrongful act of intrusion, [eg *Financial Mail (Pty) Ltd and Others v Sage Holdings Ltd and Another supra*] and the disclosure of private facts contrary to the existence of a confidential relationship. [Neethling *Persoonlikeheidsre d* at 234–8; Neethling, Puigier and Visser *Law of Delet* at 334] (Footnotes omitted)

163 In *La Grange v Schoeman And Others* 1980 (1) SA 885 (E) for instance it was held that there is a difference between the publication of reports of judicial proceedings in which avermints injurious to someone are made and the publication of the photograph of the person concerning whom the injurious remarks are made. Accepting without reservation the right of the public to be informed of what takes place in courts of justice and the desirability that they should be so informed, the question remains whether the public has the right to be
to avoid such intrusions could lead to a claim for invasion of privacy as much against the institution as against the primary offender. Allowing a patient’s chart to hang at the foot of his bed so that all who pass by are able to peruse it at their leisure or posting diagnoses and treatments for patients in a particular ward up on a notice board in or outside of the ward in places where they are visible to any member of the public that passes by are other examples of a lack of respect for patient privacy and could give rise to legal action against the institution that allows such practices.

8.2.12  
Silver v Premier, Gauteng Provincial Government

Facts

informed, by means of a photograph in a newspaper, what the person, concerning whom injurious statements are made in court, looks like. Our law does not give publishers a privileged right ‘to satisfy the curiosity of the public’ by the publication of photographs of such persons. Kannemeyer J held in this case that while it might be that to publish a photograph of a person taken against his will would not, were that person not one concerning whom injurious allegations had been made in court, ground an action for injuria if that person had been ‘catapulted into the public eye’ against his will, this did not mean that the photographer could compel such a person to submit to being photographed or require him not to take steps to prevent such a photograph being taken and that the applicant had no right to photograph the third respondent, if he did not wish to be photographed, and no right to claim to be entitled to do so at any time, even if third respondent did not object to being photographed. Kannemeyer J stated that he was unpersuaded that in our law, ‘community custom’ - to adopt the words used in the American Restatement - gives publishers a privileged right ‘to satisfy the curiosity of the public’ as to the appearance of the first and second respondents in the instant case. De Villiers, in his work on Injuries, at 24 and 25 says: "The specific interests that are detrimentally affected by the acts of aggression that are comprised under the name of injuries are those which every man has as a matter of natural right, in the possession of an uninjured person, dignity and reputation. By a person’s reputation is here meant that character for moral or social worth to which he is entitled amongst his fellow-men; by dignity that valued and serene condition in his social or individual life which is violated when he is either publicly or privately subjected to offensive and degrading treatment, or when he is exposed to ill-will, ridicule, disesteem or contempt. The rights here referred to are absolute or primordial rights. ... every person is bound to respect them; and they are capable of being enforced by external compulsion. Every person has the inborn right to the tranquill enjoyment of his peace of mind, secure against aggression upon his person, against the impairment of that character for moral and social worth to which he may rightly lay claim and of that respect and esteem of his fellow-men of which he is deserving and against degrading and humiliating treatment; and there is a corresponding obligation incumbent on all others to refrain from assailing that to which he has a right." While the first and second respondents cannot object to the publication of a report of the legal proceedings during which they were alleged to have been Mr Mohapi's assailants there is no justification in law which requires them to suffer the added indignity and inconvenience of having their photographs published in the press to satisfy curiosity and to make it possible for the public at large to identify them, as they go about their lawful avocations, as the people referred to in the press reports of the Mohapi case. If they are able to be so identified their right to 'tranquill enjoyment of peace of mind' will be assailed for their privacy will be invaded and they will be open to possible ill-will and disesteem. Further they will not be secure against aggression upon their persons. In this regard the fears mentioned by these two respondents for their personal safety and that of their families cannot be brushed aside.

Silver 1998 (4) SA 569 (W)
The plaintiff was admitted to the Johannesburg General Hospital on 20 April 1994 suffering from pancreatitis. By the time that the plaintiff was discharged, his ability to walk properly had been permanently impaired. The essence of the plaintiff's case was that his disability resulted from infection which entered and spread from a sacral bedsore, which he alleged he sustained in consequence of the negligent omission on the part of the nursing staff to apply proper pressure part care whilst he was in the general surgical ward of the hospital. The defendant argued that the plaintiff's disability was occasioned by complications which resulted from the pancreatitis from which the plaintiff was suffering on his admission. The negligence relied upon is that the nurses ‘failed to take proper precautions in preventing the development of a pressure sore’ and the plaintiff alleged that ‘in consequence of the negligent conduct the plaintiff developed a pressure sore which resulted in necrotising fasciitis and ultimately resulted in paralysis of the lower limbs’.

It was common cause that after admission to the general surgical ward, the plaintiff’s condition deteriorated rapidly; that he could not be admitted to the Intensive Care Unit (‘ICU’) immediately and that he was nursed in the general surgical ward; that when he was admitted to the ICU, the following observation was recorded: ‘Both buttocks grey in colour? Bedsores’ and that whilst the plaintiff was in the ICU, the ‘bedsores’ degenerated into an open wound about 11 cm square over the sacrum and extending to the buttocks on both sides. It was also common cause that the plaintiff was at risk for the development of pressure sores because of the following factors:

(a) The plaintiff is and was a diabetic. His circulation and the perfusion (movement of blood through the tissues) in his skin would be impaired as a result.

(b) The plaintiff had to be dialysed, which was done peritoneally (i.e. catheters were inserted into the abdominal cavity to circulate fluid). This gave rise to the risk that there would be a fluid leak and that the skin on which the plaintiff was lying would become wet.
The plaintiff had a temperature. This would result in the plaintiff sweating and the skin on which he was lying would become moist.

The plaintiff had to be intubated (i.e. a tube had to be inserted down his throat) so that he could be coupled to a respirator. To enable this to be done, the plaintiff had to be sedated - with the consequence that he was unable to move himself naturally.

The plaintiff weighed, on his own evidence, approximately 87 kilograms.

The plaintiff was treated with inotropic drugs and he was hypotensive. Each of these factors would in itself reduce the perfusion of blood in, *inter alia*, the skin.

**Judgment**

Cloete J observed that if the submissions made by the defendant’s counsel were correct, then, accepting the plaintiff’s hypothesis that the infection causing his disability could spread from a sacral bedsore, and if, in addition, such a bedsore is likely to have become a source of such an infection despite proper nursing care, the plaintiff cannot succeed in his claim based in delict as the factual test for causation would not have been satisfied. The court said that it was aware

---

165 The court referred to *Simon & Co (Pty) Ltd v Barclays National Bank Ltd* 1984 (2) SA 888 (A) at 914C–918A and especially at 915E—In fine, where Corbett JA (as he then was) said the following about the application of the test for factual causation: “In many instances, however, the enquiry requires the substitution of a hypothetical course of lawful conduct for the unlawful conduct of the defendant and the posing of the question as to whether in such case the event causing harm to the plaintiff would have occurred or not; a positive answer to this question establishing that the defendant’s unlawful conduct was not a factual cause and a negative one that it was a factual cause. This is so in particular where the unlawful conduct of the defendant takes the form of a negligent omission. In *The Law of South Africa* (ibid para 48) it is suggested that the elimination process must be applied in the case of a positive act and the substitution process in the case of an omission. This should not be regarded as an inflexible rule. It is not always easy to draw the line between a positive act and an omission, but in any event there are cases involving a positive act where the application of the but-for rule requires the hypothetical substitution of a lawful course of conduct (cf Prof A M Honore in 11 *International Encyclopaedia of Comparative Law* c 7 at p 74–6). A straightforward example of this would be where the driver of a vehicle is alleged to have negligently driven at an excessive speed and thereby caused a collision. In order to determine whether there was factually a causal connection between the driving of the vehicle at an excessive speed and the collision it would be necessary to ask the question whether the collision would have been avoided if the driver had been driving at a speed which was reasonable in the circumstances. In other words, in order to apply the but-for test one would have to substitute a hypothetical positive course of conduct for the actual positive course of conduct.” Cloete J said that although the judgment of Corbett JA was a minority judgment, it did, in his view correctly state the law and was an example of the detailed application of the broader test stated by the learned Judge of Appeal at 914F–915B, a passage referred to with approval in *Tuck v Commissioner for Inland Revenue* 1988 (3) SA 819 (A) at 832F—G.
that the plaintiff's claim was founded in contract and, in the alternative, in delict but said that it saw no reason why the *sine qua non* test should not apply equally to the contractual claim. The loss sustained by the plaintiff was said to have been caused by the breach of an implied term of an agreement that the hospital through its staff and employees would exercise due care, skill and diligence in providing nursing care. Precisely the same facts were relied upon as constituting a breach of the implied term as are relied upon as constituting a breach of the duty of care owed to the plaintiff. Thus said the court, it would be anomalous if the same result did not follow irrespective of the cause of action. Furthermore, the court held that although the question of remoteness of damage for breach of contract was approached (in the absence of a contractual stipulation as to the basis on which compensation is to be made) by determining whether the damage flowed naturally and directly from the defendant's breach or was such a loss as the parties contemplated might occur as a result of such breach\textsuperscript{166}, it must follow as a matter of logic that as a general rule, the test for factual causation would first have to be satisfied. Cloete J held that on the evidence, it seemed that if the plaintiff developed pressure sores where the skin was breached, as he did on his occiput and heels, despite adequate care in the ICU, he would, on the probabilities, have developed a bedsore at least as serious in the area which was at greatest risk and where bedsores occur most frequently, namely, the sacrum. Cloete J said he found it probable that the sacral bedsore which the plaintiff was likely to have developed anyway, would not have remained very superficial and that it would not have been fairly easy to manage and recoup the situation. He said that on the probabilities, the polymicrobial invasion would have taken place. The fact that other bedsores (those to the head and ankle) healed without complications, did not derogate from this conclusion, as those other bedsores, because of their location, were much less susceptible to contamination by fecal flora. The court held that assuming that the pressure sore on the plaintiff's sacrum was caused by the negligent omission of the nursing staff in the general surgical ward to give proper pressure part care (a question which it found

\textsuperscript{166} *Victoria Falls & Transvaal Power Co Ltd v Consolidated Langlaagte Mines Ltd* 1915 AD 1 at p 22 and p 54
unnecessary to decide), and assuming further that the plaintiff's disability resulted from a polymicrobial invasion which spread from that bedsore (a question which the court also found it unnecessary to decide), the plaintiff was not entitled to the damages which he claimed - as, on the probabilities, and given that the plaintiff's hypothesis as to how his disabilities occurred was correct, he would have suffered such damages irrespective of any negligence on the part of the nursing staff in the general surgical ward and, for all practical purposes, at the same time.

Discussion

This case involved the question of causation and whether the harm complained of would have arisen whether or not the nursing staff were negligent in caring for the patient. The court said that if the answer to this question was in the affirmative then there was no need even to consider whether or not the nursing staff had in fact been negligent in caring for the patient since the defendant could not be held liable for harm which would have occurred in the absence of his negligent and wrongful acts or omissions. The reason behind this approach is evident from the debates concerning alternative causes and the approach of the South African law of delict to the effect that the defendant is not liable unless his conduct in fact caused the plaintiff's harm\textsuperscript{167}. If there is another factor present which would independently of the defendant have in any event caused the harm then causation cannot be attributed to the acts or omissions of the defendant. It is of significance that the court observed that it saw no reason why the \textit{sine qua non} test for causation should not be applied to the contractual claims as well. The \textit{sine qua non} test is a test for factual as opposed to legal causation\textsuperscript{168}. In \textit{Silver} the court made mention of the problem of alternative causes but was of the opinion that Silver's case was not so exceptional that the

\textsuperscript{167} See Boberg fn 28 supra p 380, Neethling, Poquist and Visser, (fn 28 supra) p 174 fn 6; van der Walt and Midgley, Delict: Principles and Cases fn 28 at p 164

\textsuperscript{168} See also Gibson v Berkowitz And Another 1996 (4) SA 1029 (W)
sine qua non tests for factual causation could not be applied. The court did not go into the question of negligence of the nurses in that case because it found an alternative cause for the patient’s injuries that would have ousted the alternative cause of any negligence acts or omissions on the part of the nurses. Had the nurses in fact been negligent, the sine qua non test would in any event not have been satisfied and the defendant could not have been held liable.

Delictual liability for alternative causes is a subject that occupied the minds of Roman jurists and continues to occupy the minds of South African jurists. The

---

169 At p 575 – 576 of the judgment the court observed as follows with regard to the sine qua non test: “There will, of course, be exceptions, such as that cited by Visser and Potgieter in Law of Damages (1993) paras 6.3.2 at 80–1: ‘[W]here a building contractor X is not able to build because Y, who has to deliver cement, and Z, who has to supply bricks, both fail to honour their contractual obligations on the same day and thus cause damage to X (eg he loses profit). According to the conditio sine qua non “test”, neither Y nor Z has caused damage since, if the breach of contract of each is notionally eliminated, the damage does not fall away!’

The learned authors express the view that common sense must be employed in such cases - an approach emphasised by Corbett JA in Simons’s case at 917 in sine–918A and employed by Lord Wright in Yorkshire Dale Steamship Co Ltd v Minister of War Transport [1942] AC 691 (HL) at 706 (f [1942] 2 All ER 6) and by Beadle CJ in Portwood v Swinburne 1970 (4) SA 8 (RA) at 15F–G. The present is not, however, an exceptional case. In conclusion, on the applicability of the ‘but for’ test for causation, I would refer to the following passage in the unreported judgment (which I feel obliged to say I gave but in which Labuschagne J concurred) in Asaew J Berkenhoud and Another v Willem J Jacobsus Rosanow No Riviera Blomfontein (WLD, case No A301097, delivered on 15 May 1997): ‘gewoonlik waar die agent nooit as oorsaak van die optrede of versuim van een van die partye regtens veroorsaak is, moet daar gekyk word na 'n verskeidenheid van faktore wat 'n waardebepaling deur die Hof verg. Die vraag of die eerste bekendstelling van die eiendom die einde op wichtigheidsnaam veroorsaak het, is geen uitsondering nie. In Aida Real Estate Lid v Lipschitz 1971 (3) SA 871 (W) te 873H–874D het Marais R die volgende gesê: “The law wíth regard to a matter of this kind is usually stated in the following form: The duty of the estate agent, if he is to earn remuneration by way of commission for selling property, is to introduce to his principal (the seller) a purchaser who is willing and financially able to buy the property, and he earns the commission if a sale is concluded with that purchaser at the stipulated price or a price ultimately proved to have been acceptable to the seller. A proviso has been added to the effect that the introduction of the able and willing buyer must have been the effective cause or causa causans of the sale. If a new factor intervenes causing or contributing to the conclusion of the sale and the new factor is not of the making of the agent, the final decision depends on the -result of a further enquiry - viz, did the new factor outweigh the effect of the introduction by being more than or equally conducive to the bringing about of the sale as the introduction was, or was the introduction still overwhelmingly operative? Only in the latter instance is commission said to have been earned. This enquiry is not a metaphysical speculation in the result of cause and effect. It requires, as is said in Webranckx v L K Jacobs and Co Lid 1948 (4) SA 671 (A), a commonsense approach to the question of what really caused the sale to be concluded, or, to put it differently, as it is said in a restatement of the law in America, whether it is ‘just’ that the agent should receive credit and compensation for the work he has done for the seller. In regard to this latter version, it may be said in passing that this question has nothing to do with the amount of work the agent put into it. The more furnishing to the prospective buyer of the principal's address or the location of the property offered may be sufficient to entitle him to claim commission from the seller, provided a line of cause and effect can reasonably be traced from the introduction to the conclusion of the sale.”

Die woorde wat ek gekursiveer het, is belangrik. Dit moet nooit uit die oog verloor word nie dat voordat die gewone vraag (soos in Aida Real Estate v Lipschitz (supra) uitgesig) ontstaan, daar hier - soos in enige ander situasie waar oorsaaklikheid bepaal moet word - eers aan die sine qua non (ofte wel “but for”) toets voldoen moet word. Met ander woorde, as daar nie gesê kan word dat, was dit nie vir die agent se optrede nie, die gevolg (verkoop van die eiendom) nie sou ingetree het nie, kan die optrede van die agent nooit as oorsaak van die verkooptransaksie bestempel word nie. Andersom gestel, as die verkooptransaksie sou plaasgevind het afgekeer van enigiets wat die agent gedaan het, is die agent nie (ingeval die gewone kontrak tussen 'n agent en die eienaar) op kommisie geregist nie.”

---

170 Neethling J, ‘The Case of the Three Hunters, or Delictual Liability For Alternative Causes’ 2003 SALJ 120 at p 263 points out that in Fairchild v Glenhaven Funeral Services Lid; Fox v Spowat (Midlands) Lid; Mathews v Associated Portland Cement Manufacturers (1978) Lid [2002] 3 All ER 305 (HL) (paras 157–60), Lord Rodger
problem of the three hunters is as follows: X, Y and Z are hunters in a forest frequently visited by P. All three of them fire a shot to bring down a bird. One bullet kills P. While there is no doubt that all three acted negligently, it is unknown whether the fatal shot was fired by X, Y or Z. Thus there exists a situation of multiple activities in which each on its own would be sufficient to cause the harm but where it is not know which one in fact cause it. Neethling notes that modern legal systems proffer various solutions to the problem of the three hunters. He observes that South African law will deny delictual liability where the plaintiff cannot, on a balance of probabilities, prove who of X, Y or Z factually caused the harm. According to Neethling the Greek and Italian systems provide a more or less similar solution while German law, on the other hand, holds each hunter liable in full as a joint wrongdoer since persons are regarded as joint wrongdoers even where it is unclear who caused the harm. It is also irrelevant, says Neethling, whether the hunters acted in concert or independently. He states that a similar result is reached in some jurisdictions such as the USA and the Netherlands, by reversing the burden of proof. The via media approach is also followed by quite a few countries according to

of Earlsferry notes that: "D 9 2 51 Julian 86 digesta contains a substantial extract from one of the most important works on Roman law, written in the second century AD, the high classical period of Roman law. In the principium Julian is discussing chap 1 of the Lex Aquilia, which gives the owner of a slave the right to claim damages if someone wrongfully "kills" a slave. Julian considers whether someone "kills" a slave for these purposes if he mortally wounds him and later someone else attacks the slave who dies more quickly as a result. Julian takes the view, which was probably not shared by all jurists that both persons who attacked the slave should be liable for "killing" him. In support of that view he says in D 9 2 51 1 that it follows from the authoritative rulings of the old Republican jurists who held that where a slave was wounded by a number of people in such a way that it was impossible to say whose blow had caused his death, then all of them were liable under the lex Aquilia: "... idque est consequens auctoritati veterum qui, cum a pluribus idem servus suasdam agitaret et mortuus esse perierit..." This passage in Julian's digesta is referred to by the later writer Ulpian in D 9 2 11 2 Ulpian 18 ad edictum: "sed si plures servum percusserint, utrum omnes quasi occiderint tenentur, videamus. Et si quidem appareret, cuius ictu perierit, ille quasi occiderit tenetur: quod si non appareret, omnes quasi occiderit teneri Iulianus sit, et si cum uno agitur, oeteri non liberantur: nam ex lege Aquilia quod alius praestitit, alium non relevant, cum sit poena..." Ulpian considers whether if several people strike a slave, all of them are liable for killing him. He says that if it is clear who struck the blow from which the slave died, that person is liable for killing him. But he reports Julian's view that, if this is not clear, then all of them are liable for killing him. Again the precise factual situation is not spelled out, but it looks as if Ulpian is considering the case of an attack on the slave by several people at once. Since only the actual person whose blow killed the slave is liable if his identity is known, Ulpian must, however, be thinking primarily in terms of the individual liability of the person who does the killing: it is only if you cannot tell whose blow proved fatal that Julian holds that all are liable for killing the slave. A separate rule is adopted for that situation.

I would like to take from these passages the clear implication that classical Roman jurists of the greatest distinction saw the need for the law to deal specifically with the situation where it was impossible to ascertain the identity of the actual killer among the number of wrongdoers. If strict proof of causation were required, the plaintiff would be deprived of his remedy in damages for the death of his slave. In that situation, some jurists at least were prepared, exceptionally, to hold all of the wrongdoers liable and so afford a remedy to the owner whose slave had been killed."
Neethling. Thus under Austrian law, the hunters will be held liable as joint wrongdoers only if the negligent shooting of each was highly dangerous. It does not matter whether they acted in concert. In Belgium the plaintiff will be compensated where every member of the hunting group negligently in concert participates in the damage-causing activity, and thus had collective fault in relation to the damage. In such circumstances, a hunter will be liable even if he can prove that his shot did not kill. Neethling observes that the position is similar in the French system where the theory of ‘faute commune’ normally applies. But, he says, if the hunters were hunting separately, the theory cannot be resorted to and the hunters will not be liable because of the lack of factual causation. All these different solutions, says Neethling, were considered by the European Group on Tort Law. In its *Principles of European Tort Law* the group proposed the following solution to the conundrum of the three hunters:

“In case of multiple activities, where each of them alone would have been sufficient to cause the damage, but it remains uncertain which one in fact caused it, each activity is regarded as a cause to the extent corresponding to the likelihood that it may have caused the victim’s damage.”

Neethling states that in the case of the three hunters this means that each of them would, in principle be liable for one third of the plaintiff’s loss of support since the likelihood that any of the three shots killed P, is similar. He submits that this solution can be justified on grounds of fairness, reasonableness and justice because although only one hunter caused the harm, it is impossible to prove who he or she was. It could thus have been any of them. Neethling notes that the solution is clearly based on policy considerations and not on traditional principles of delictual liability. He points out that the only delictual element that may perhaps be applicable is legal causation where the basic question is whether there is a close enough relationship between a person’s conduct and the victim’s loss that the loss can be imputed or attributed to such person in view of policy considerations based on fairness, reasonableness and justice. He notes further that the solution clearly introduces another form of delictual liability, notably, partial delictual liability for the delict of another person but that this
concept is not new because vicarious liability does more or less the same thing.

Neethling emphasises the importance of the decision of the House of Lords in *Fairchild*\footnote{Fairchild, fn 170 supra} in which the court came to the conclusion that either A or B was liable for the plaintiff's damage and that the one who had paid had a right to claim a contribution from the other (in other words they were joint wrongdoers). The English law has thus started the process of departing from the requirement of factual causation (*conditio sine qua non*) for delictual liability in cases such as that of the three hunters. Neethling notes that this development is, for policy reasons, based on fairness, equity and reasonableness, more satisfying to one's sense of justice and therefore commendable. He submits, however, that it is more honest and dogmatically preferable, to declare outright that liability is based on policy considerations and not on traditional principles of delictual liability. The preference, he states is for partial liability rather than the joint wrongdoer approach adopted by the court in *Fairchild*. In consequence he suggests that the partial liability approach should be accepted and implemented in South African law.

Van Rensburg\footnote{Van Rensburg Juridiese Konsaliteit p 28-30. See Neethling et al (fn 28 supra) at p 174-178 where they summarize all of the criticisms of the *sine qua non* test by Van Rensburg.} criticises the *sine qua non* test. His criticism is *inter alia* that it is based on a clumsy, indirect process of thought that results in circular logic. It requires the elimination of the alleged causal factor from a sequence of events to ascertain whether the end result would have been the same. However, he says, if one has to apply the same test in asking whether the remaining causative factors led to the end result then one ends up eliminating these as well which means that one ends up with a thought experiment in which there are no causative factors at all. It is submitted that this is a perfect example of the dangers of abstraction in law leading to a logical fallacy. The law cannot be divorced from its factual context. The only causal factor that is subject to the *sine qua non* test is the action or omission of the wrongdoer. The *sine qua non* test does not apply to all causal factors of an event — only to those which are attributable to the
actions or omissions of the wrongdoer. The *sine qua non* test is not a test for causation in the abstract. It is seeking to answer the question as to whether factually speaking the actions or omissions of the *wrongdoer* caused the eventual harm. Since such actions or omissions are unlikely in real life to be the only causative factors of the harm, Van Rensburg's attack on the test fails.

### 8.2.13 Korf v Health Professions Council of South Africa

**Facts**

On 19 April 1990 when she was approximately five months pregnant, the applicant consulted a Dr A C Harmse at a clinic in Witbank. He performed a sonar investigation and told her that everything was in order. That same evening she realised that something was wrong and on instructions of Dr Harmse she was admitted to Witbank Hospital, which is a state hospital. After a few minutes Dr Harmse arrived, looked at the sonar report of that morning and again told her that there were no problems as the sonar showed that everything was in order. The next moment he told her that the child would not live and that the foetus had to be removed. This he proceeded to do. He put the foetus on a trolley and, without ascertaining whether it was alive, he then left the room. The applicant’s friend, Anita, after a few minutes noticed movement and told Dr Harmse that the child was alive. He responded by saying that these were merely the final spasms. Thereupon Dr Harmse went to the baby, ascertained that there was life and ordered an incubator. At this stage the baby was already blue. It was alleged that this constituted medical neglect which resulted in the baby becoming a quadriplegic.

---

173 *Korf 2000 (1) SA 1171 (T)*
The applicant lodged a complaint with the South African Medical and Dental Council against Dr Harmse on the basis of medical negligence and a committee of that council, after a preliminary inquiry on 18 March 1997, informed her that the explanation by Dr Harmse was noted and that no steps would be taken. The applicant was dissatisfied. The applicant never received any accounts or correspondence from the Witbank Hospital or Dr Harmse in respect of the birth. Despite numerous requests and personal visits to Witbank Hospital, the applicant could not succeed in obtaining the records of her confinement and treatment. She was informed that all relevant records were in the possession of the respondent (who was the successor in title to the previous South African Medical and Dental Council).

The applicant wanted to institute an action on behalf of her child against Dr Harmse and the Witbank Hospital on the grounds of medical negligence. She alleged that she needed copies of the contents of the file of the respondent on the complaint which she lodged against Dr Harmse for this purpose. The court observed that the application was preceded by 'a strange tug of war' between the applicant's attorneys and the respondent. The attorneys requested copies of the contents of the entire file, whereas the respondent required the attorneys to provide a list of items which they sought in order that this request could properly be considered. This list was not forthcoming as the attorneys’ attitude was that they did not know what was in the file. The hospital records were not specifically requested but, on the other hand, the respondent never denied that it was in possession of the originals or copies of the hospital records which had allegedly gone missing from Witbank Hospital. On the probabilities said the court, the respondent was in possession of the hospital records as no proper inquiry could have been conducted without at least obtaining them. The court further observed that the respondent, strangely enough, was throughout very cagey about the contents of its file. It even refused to furnish the applicant with a copy of Dr Harmse’s explanation or with its own reasons for not taking any steps against him.
The reasons why the respondent refused to give access to the file were as follows:

1. The applicant could not, it averred, engage in a fishing expedition without showing the relevance of the documents sought to the civil proceedings contemplated by her against Dr Harmse and Witbank Hospital. In the absence of such relevant and rational connection the applicant was not entitled to indiscriminate access to the contents of the file.

2. It said that it was obliged to protect the confidentiality of documents or facts which came before it whenever it conducts or has conducted an investigation in respect of a medical practitioner against whom a complaint of misconduct has been lodged.

3. The applicant was told by the respondent as long ago as 26 June 1995 that the documents sought by her were in the possession of Witbank Hospital over whom the respondent had no jurisdiction or control. This statement was incorrect as the annexure to the respondent's answering affidavit, the document referred to, contained no reference to these documents at all.

Judgment

The court observed that the second point relating to the confidentiality of documents or facts was without merit. It said that in as much as the alleged confidentiality was based upon the privilege of a doctor/patient relationship, the applicant herself was the patient. Van Dijkhorst J said he could not understand why the respondent was so evasive. It could have offered insight into all the hospital records, medical reports, sonars and X-rays, etc pertaining to the birth. It could have sent the applicant a copy of Dr Harmse's explanation and of the statement of the applicant's friend Anita. It could have concisely stated the
nature of other documentation it had and the reasons for its refusal to disclose the contents thereof. He stated that it is not the duty of the respondent to shield doctors from complainants, just as it is not the duty of the respondent to persecute them on behalf of complainants; but at least it should not create the impression that it is shielding medical practitioners from the ‘laser beam of the truth’.

The respondent had contended that the applicant had not shown on the facts of the case a basis to procure access to the entire contents of the file. It argued that s 32 of the Constitution should be read together with item 23(2)(a) of Schedule 6 of the Constitution and that the applicant had not shown that the respondent is an organ of state or that the information sought by her was required for the exercise or protection of any of her rights. Van Dijkhorst J noted that section 23 of the Constitution of the Republic of South Africa Act (Act 200 of 1993, the interim Constitution) read:

‘Every person shall have the right of access to all information held by the state or any of its organs at any level of government in so far as such information is required for the exercise or protection of any of his or her rights.’

He observed that in terms of s 233(1) of the interim Constitution, unless the context otherwise indicated, ‘organ of state includes any statutory body or functionary’. The new Constitution of 1996, he noted, contains a different provision. Item 23(2)(a) of Schedule 6 thereof, pending national legislation, preserved the application of section 23 of the interim Constitution with a slightly amended wording:

‘Every person has the right of access to all information held by the state or any of its organs in any sphere of government in so far as that information is required for the exercise or protection of any of their rights.

Van Dijkhorst J observed that there is an extended definition of organ of state. In terms of section 239 of the Constitution an ‘organ of state’ means -
'(a) any department of state or administration in the national, provincial or local sphere of government; or
(b) any other functionary or institution -
   (i) exercising a power or performing a function in terms of the Constitution or a provincial constitution; or
   (ii) exercising a public power or performing a public function in terms of any legislation,
       but does not include a court or judicial officer;...

The court said that it should be noted that the previous ‘level of government’ had become a ‘sphere of government’ but that this did not create a material difference. In Ex parte Chairperson of the Constitutional Assembly: In re Certification of the Constitution of the Republic of South Africa 1996, the constitutional court apparently held the same view. Van Dijkhorst J said that it must further be noted that the ‘statutory body or functionary’ which previously could have been a component of an organ of state had been given a much more precise content. In Directory Advertising Cost Cutters v Minister for Posts, Telecommunications and Broadcasting and Others it was pointed out that an organ of state is not an agent of the state, it is part of government (at any of its levels). Section 233(1) of the interim Constitution included in the term ‘organ of state’ a statutory body or functionary. In that case van Dijkhorst J had applied a narrower definition of the concept organ of state than was applied in Baloro and Others v University of Bophuthatswana and Others. The test laid down was whether the state had control. This approach was followed in Mistry v Interim National Medical and Dental Council of South Africa and Others and Wittmann v Deutscher Schulverein, Pretoria and Others in respect of the

---

174 Ex parte Chairperson of the Constitutional Assembly 1996 (4) SA 744 (CC) (1996 (10) BCLR 1253) at 802E - 803A (SA)
175 Directory Advertising Cost Cutters 1996 (3) SA 800 (T)
176 Baloro 1995 (4) SA 197 (B)
177 Mistry 1997 (7) BCLR 933 (D) at p 947B - 948C
178 Wittmann 1998 (4) SA 423 (T) at p 454B
interim Constitution\textsuperscript{179}. In all these cases, the test applied in order to determine whether a body or functionary was an organ of state was whether that body or functionary was directly or indirectly controlled by the state.

Van Dijkhorst J noted that the 1993 definition of ‘statutory body or institution’ had become ‘any other functionary or institution’. He said he did not think that this was a material difference. He observed that the latter phrase was further limited in the definition, whereas the 1993 definition was limited by the nature of an organ of state. He asked whether the description set out in subpara (b) now extended the meaning of organ of state and noted that subparagraph (i) limits it to a power or function in terms of the national and provincial constitutions. He said that this did not bring about a difference as subsection (ii) limits it to a public power or public function in terms of any legislation. It does not bring about a difference insofar as the reference to public power is concerned. The remaining question for the court to decide was whether the reference to a public function in terms of legislation took the concept of ‘organ of state’ out of the control test. Van Dijkhorst J said that the answer depended on the meaning given to the words ‘public function’. He noted that the three pillars of the state, legislative, executive and judicial, are referred to in section 239 and that the executive one is expressly mentioned in subpara (a) and the legislative one falls under subpara (b)(i) which can also encompass, the auditor-general, public protector, etc. They are all, said van Dijkhorst J, part of the machinery of state as is a functionary (or institution) exercising a public power. He said there is no reason to give the word ‘public’ when used in conjunction with ‘function’ in para (b)(ii) a meaning that would take it outside the context of ‘engaged in the affairs or service of the public’ and give it the meaning of ‘open to or shared by all the people’. (Both these meanings were found in \textit{The Concise Oxford Dictionary} for the word ‘public’.) Van Dijkhorst J found that it followed that the more precise definition of the

\textsuperscript{179} Directory Advertising Costs Cutters (supra) was also followed in respect of the new Constitution in \textit{ABBM Printing and Publishing (Pty) Ltd v Transnet Ltd} 1998 (2) SA 109 (W) at 113A - G and \textit{Goodman Brothers (Pty) Ltd v Transnet Ltd} 1998 (4) SA 989 (W) at p 993G - 994H.
term ‘organ of state’ in section 239 of the Constitution was not intended to
differ materially from the 1993 definition.

The court observed that the issue whether or not the respondent was an organ of
state arose in Mistry v Interim National Medical and Dental Council of South
Africa and Others and that in that case both Booysen J, who dismissed the
applicant’s claim for interim relief, and McLaren J, who dismissed the
applicant’s claim for final relief, applied the control test and concluded that the
respondent’s predecessor was not an organ of state. Van Dijkhorst J observed
that the state is not in control of the respondent and that the respondent was thus
not an organ of state. He noted that there were three requisites for the applicant
to succeed in terms of item 23(2) of Schedule 6 to the Constitution to gain
access to the documents. They were:

(1) the information must be held by the state or an organ of state in a sphere
of government;
(2) the information must be required by the applicant;
(3) for the exercise or protection of any of her rights.

The applicant failed on the first requisite to prove that the respondent was an
organ of state. There was, said the court, a further dimension. Witbank Hospital
is a provincial hospital and therefore an organ of state. The court found on the
probabilities that the respondent held the hospital records and other
documentation (or copies thereof), whereas Witbank Hospital denied that it had
them. It said that the respondent was not entitled to those records in its own
right and could only hold them on behalf of Witbank Hospital. In these
circumstances the first requisite would be met in respect of these particular
documents. The court held that there was no debate about the second requisite.
The applicant had a need for the documentation in order to proceed with the
claim on behalf of her child against the doctor and the hospital.
As far as the third requisite was concerned the court noted that the stance taken by the respondent that the applicant was on a fishing expedition in an attempt to create a claim was invalid. The court said that *prima facie* she had a claim on behalf of her child and that the claim had to be bolstered by expert opinion based on the correct acts. These had to be ascertained from the hospital records and reports. Seen in this light, said van Dijkhorst J there could be no doubt that the information was required for the exercise of the rights of the child. He noted that in terms of the Bill of Rights contained in chapter 2 of the Constitution there were a number of rights some or all of which would have been affected by the alleged negligent conduct of the medical personnel at the birth of the child. There was a shortened life expectation (section 11); the right not to be treated in an inhuman way (section 12(1)(e)); the right to bodily integrity (section 12(2)); the right to health care services and emergency medical treatment (section 27 (i)(a) and (3)); and in particular, as a child, the right to basic health care services and to be protected from maltreatment or neglect (section 28(1)(c) and (d)). Furthermore, said the court, it would be borne in mind that the child’s interests are of paramount importance in every matter concerning the child (section 28(2)). Consequently, the third requisite had been complied with.

The court held that the applicant was partially successful. She was not entitled to the entire contents of the respondent’s file but only to that part thereof which emanated from Witbank Hospital. It said that she had therefore gained substantial success and should be awarded her costs. In as much as the respondent argued that the claim was for the entire file and that she failed to specify these documents, that argument could be countered with the answer that it lay within the power of the respondent to offer to the applicant those documents to which she was entitled and of which the respondent had the full details. The applicant’s complaint was throughout that she could not furnish the respondent with the details thereof.

The court ordered that:
1. The registrar of the respondent must allow the applicant to inspect and make copies of all documentation directly or indirectly emanating from the records of Witbank Hospital pertaining to the birth of the applicant's child and its sequelae. These included but were not limited to bed records, medical records and reports, sonar investigations and X-ray investigations.

2. The respondent must pay the cost of the application.

Discussion

This case is of interest in a number of respects, the medical negligence of the doctor in question being possibly the least of them\(^1\). However it is included in this section because it illustrates a number of points which have been emphasised in this chapter not least of which is the balance of power between the doctor and the patient in terms of accessibility to information and the tendency of medical professionals to protect one another. The court reprimanded the Health Professions Council for apparently interpreting its role as protecting members of the medical profession rather than protecting members of the general public from the medical profession where there is a professional relationship between them\(^1\).

The case also indicates the existence of legal entities which sit somewhere between the purely private sector and the public sector. In this instance, the Health Professions Council is the relevant entity but there are many other such councils established by legislation which falls into the health care arena. The

---

\(^1\) Although the apparent callousness with which he treated the applicant and her baby is shocking.

In Veriava and Others v President, SA Medical and Dental Council, and Others 1985 (2) SA 293 (T) it was held that having regard to the provisions of the Medical, Dental and Supplementary Health Service Professions Act 56 of 1974 and the rules published by the South African Medical and Dental Council in Government Notice R2278 in Government Gazette 5349 of 3 December 1976, the SA Medical Council is truly a statutory custos morum of the medical profession, the guardian of the prestige, status and dignity of the profession and the public interest in so far as members of the public are affected by the conduct of members of the profession to whom they stand in a professional relationship.
Medical Research Council, the Medical Schemes Council, the Medicines Control Council, the Allied Health Professions Council, the Dental Technicians Council, the South African Nursing Council and the Pharmacy Council are examples of such bodies.

In the context of the Constitution as it reads presently, there are essentially two questions in principle that are involved in the situation posed by Korf. The first is whether the courts would still be correct in applying the control test to ascertain whether or not councils such as the Health Professions Council are in organs of state. The second question is whether the fact that they are organs of state or not is material. This question is posed without a consideration of the provisions of the Promotion Of Access to Information Act for the present. This is firstly because although the Constitution itself mandates this legislation, it has to be consistent with the Constitution in terms of section 2 of the latter. Secondly, the nature of these councils is important because there is differentiation between the manner in which both the Constitution and the Promotion of Access to Information Act approach the right of access to records of public as opposed to private bodies.

In terms of section 32 of the Constitution,

(1) Everyone has the right of access to-

(a) any information held by the state; and

(b) any information that is held by another person and that is required for the exercise or protection of any rights.

The definition of “organ of state” in the Constitution reads –

“organ of state” means-

(a) any department of state or administration in the national, provincial or local sphere of government; or

---

182 Act No 20 of 2000
183 Section states: “This Constitution is the supreme law of the Republic; law or conduct inconsistent with it is invalid, and the obligations imposed by it must be fulfilled.”

---
(b) any other functionary or institution—

(i) exercising a power or performing a function in terms of the Constitution or a provincial constitution; or

(ii) exercising a public power or performing a public function in terms of any legislation.”

It is submitted that the Health Professions Council of South Africa and the other statutory professional health councils184 fall squarely into part (b)(ii) of the definition of “organ of state” in the Constitution.

Furthermore, if one considers other legislation governing organs of state e.g. the Public Finance Management Act185 and the question of whether or not they are public entities in terms of such legislation, this submission is further reinforced. Although the statutory professional health councils are currently not listed in Schedules 2 or 3 of the Public Finance Management Act, this is due rather more to a legal technicality than any intention on the part of the Legislature since the Act provides in section 47 (2) that the accounting authority for a public entity that is not listed in either Schedule 2 or 3 must, without delay, notify the National Treasury, in writing, that the public entity is not listed. Section 47 (4) of the Act states that the Minister may not list in Schedule 3 inter alia any public institution which functions outside the sphere of national or provincial government. Schedule 2 of the Act lists “Major Public Entities” while Schedule 3 lists “Other Public Entities” including “National Public Entities”, “National Government Business Enterprises” “Provincial Public Entities and “Provincial Government Business Enterprises” If one considers the definition of “national public entity” in the Act186, it is very clear that the Health Professions Council of

---

184 Others are the Nursing Council, the Dental Technicians Council, the Allied Health Professions Council, the Pharmacy Council and the soon to exist Interim Traditional Health Practitioners Council (in terms of the Traditional Health Practitioners Act that is presently a Bill before Parliament).

185 Public Finance Management Act No 1 of 1999 (PFMA)

186 In the PFMA ‘national public entity’ means—

(a) a national government business enterprise; or

(b) a board, commission, company, corporation, fund or other entity (other than a national government business enterprise) which is—
South Africa and the other statutory health professional councils potentially fall within the purview of this Act although they are not listed in Schedule 3. The objects of the Public Finance Management Act are to regulate the financial affairs and provide for appropriate corporate and financial governance of certain entities which can broadly be described as being of a public nature and so the question of whether or not an entity is an organ of state for this purpose should not necessarily be conflated with the question of whether or not an entity is an organ of state for other purposes. However, it is submitted that if an entity can or does fall within the purview of the Public Finance Management Act, this strengthens the force of the argument that that entity could be an organ of state. It also demonstrates the public nature of that entity which is an important consideration, it is submitted, when deciding questions such as those raised in Korf.

If one looks at the Promotion of Administrative Justice Act187 “administrative action” means any decision taken, or any failure to take a decision, by-

(a) an organ of state, when-

(i) exercising a power in terms of the Constitution or a provincial constitution; or

(ii) exercising a public power or performing a public function in terms of any legislation;

[writer’s italics]

Whilst it is not suggested that only organs of state act in terms of legislation, indeed the Promotion of Administrative Justice Act clearly acknowledges that private entities can also do so, it is submitted that if one looks at the functions of the statutory health professional councils, if one considers that they act only in terms of their founding legislation and that they owe their very existence to such legislation, that their income is based almost entirely upon fees provided for in

---

187 Act No 3 of 2000
legislation and the nature of the functions ascribed to them by that legislation, and the fact that they are very much regulatory bodies\textsuperscript{188}, the argument in favour of their being organs of state is strong. There is a significant difference between such councils and other statutory bodies falling under the auspices of the Minister of Health such as the Medical Research Council and the National Health Laboratory Services which are not regulatory bodies, whose central functions revolve around commercial transactions with both the public and private sectors and which do not fulfil a regulatory role. In fact these bodies perform functions which can be and are performed by private entities for profit every day. Medical research is not a public function and neither is the provision of laboratory services. The fees charged by these entities are fees for services whereas those charged by the statutory health professional councils are fees dictated by regulation and are designed to cover the costs of their administrative and operational functions – a totally different scenario. The incomes of the Medical Research Council\textsuperscript{189} and the National Health Laboratory Services are dependent upon contracts for services concluded with various clients and have a distinctly commercial aspect. The contractual relationships entered into by the statutory health professional councils by contrast, are for services rendered to the councils by third parties in support of the work of those councils eg contracts for auditing, archiving and cleaning services, rental agreements, and employment contracts with staff.

\begin{footnotesize}
\textsuperscript{188} For instance in terms of the Health Professions Act No 56 of 1974 one of the objectives of the Health Professions Council in terms of section 3 (f) is - “subject to the provisions of section 15 of this Act, the Nursing Act, 1978 (Act 50 of 1978), the Chiropractors, Homeopaths and Allied Health Service Professions Act, 1982 (Act 63 of 1982), and the Pharmacy Act, 1974 (Act 53 of 1974), to control and to exercise authority in respect of all matters affecting the training of persons in, and the manner of the exercise of the practices pursued in connection with, the diagnosis, treatment or prevention of physical or mental defects, illnesses or deficiencies in human kind;”

\textsuperscript{189} For instance in terms of section 4 of the Medical Research Council Act No 58 of 1991 the functions powers and duties of the Council include –

\begin{itemize}
  \item undertaking research of its own accord; or
  \item undertaking research on behalf of the state or any other authority, or on behalf of any person or institution, or support such research financially;
  \item developing and utilizing the technological expertise in its possession or making it available to any person or institution in the Republic or elsewhere;
  \item entering into agreements with any person or, subject to the provisions of section 5, with any government or administration, upon such conditions as the MRC and that person, government or administration may agree;
  \item hiring or letting services and immovable property.
\end{itemize}
\end{footnotesize}
Since the decision in *Korf*, the Promotion of Access to Information Act\(^\text{190}\) was passed and has come into operation. Many would argue that since the Act applies not only to organs of state but to private bodies\(^\text{191}\) as well the arguments raised in *Korf* are now largely academic. However, what was demonstrated in *Korf* was a disturbing attitude on the part of the statutory council involved in obstructing a member of the public in enforcing the constitutional rights of herself and her child. The Department of Health is currently busy with amendments to the Health Professions Act to improve the accountability of the council and the professional boards in certain areas. Furthermore, as stated earlier the Promotion of Access to Information Act itself differentiates between rights of access to public and private bodies.

In the case of the former it simply gives a right of access provided that there exists no ground for refusal as provided for in the Act. It gives a right of access to records of the latter where this is required to exercise or protect a right provided that a request for access is made in the prescribed manner and there exists no ground for refusal contemplated in Chapter 4 of Part 3 of that Act\(^\text{192}\). There is thus a primary obstacle to any request for access to the records of a private body in that one must first show that the access is required to exercise or protect a right. The definitions in this Act of "public body" and "private body" are illuminating in the context of the present discussion.

In terms of the Promotion of Access to Information Act-

"public body" means-

\(^\text{190}\) Promotion of Access to Information Act No 2 of 2000
\(^\text{191}\) Section 1 of the Act defines "private body" as-
\(^\text{192}\) Promotion of Access to Information Act No 2 of 2000, section 50.
(a) any department of state or administration in the national or provincial sphere of government or any municipality in the local sphere of government; or
(b) any other functionary or institution when-
   (i) exercising a power or performing a duty in terms of the Constitution or a provincial constitution; or
   (ii) exercising a public power or performing a public function in terms of any legislation;

whereas

"private body" means-
(a) a natural person who carries or has carried on any trade, business or profession, but only in such capacity;
(b) a partnership which carries or has carried on any trade, business or profession; or
(c) any former or existing juristic person, but excludes a public body;

It is clear from the foregoing that for the purposes of the Act, the Health Professions Council would be classified as a ‘public body’ in terms of part (b) of the definition of that term and this is, with respect, as it should be. Any reliance on cases such as Korf to try to avoid the disclosure of the requested record on the basis that the Council is not an organ of state and therefore not a public body would be misdirection and legally incorrect. The emphasis in the Promotion of Access to Information Act, as in the Promotion of Administrative Justice Act, is on the public nature of the functions performed and the powers held by the entity in question. Of assistance in this regard is the fact that the function or power is performed in terms of legislation. It is therefore no longer legally correct to enquire whether or not an entity is an organ of state in deciding whether or not its records may be accessed in terms of section 32 of the Constitution. The Promotion of Access to Information Act makes it clear
that this is not the case. It is submitted, however, that even if it were the case, there is a strong argument for regarding the statutory health professional councils as organs of state on the basis of the current definition of this term in the Constitution itself. What the drafters of the Promotion of Access to Information Act appear to have done is take the wording of the definition of “organ of state” and incorporate it into the definition of “public body” in the Act so that for the purposes of section 32 (1)(a) of the Constitution, the word “state” must be read to include functionaries or institutions “when exercising a public power or performing a public function in terms of any legislation”.

8.3 Summary and Conclusions

The thirteen cases discussed in this chapter indicate a number of important points with regard to the law of delict as it pertains to health service delivery in the public sector.

They illustrate the importance of ensuring the availability of skilled professionals who are capable of adequately performing the tasks entrusted to them. In a practical context this means, for instance, that the state must ensure the community service doctors are adequately and sufficiently supervised whilst performing their community service if it want to avoid being held vicariously liable for culpable homicide in circumstances similar to those in R v van Schoor and S v Mkwatshana. The sometimes critical shortages of nursing and other professional employees in the public health sector in particular creates significant delictual hazards for both the state and the employees who act outside of their scope of practice. Whilst section 38A of the Nursing Act can provide assistance up to a point, as can the approach of the law with regard emergencies, there is still a need to ensure that there are sufficient human resources with the varying levels of skill and expertise required to provide the wide range of health care services offered by the state. There is a high level of risk involved in the delivery of health care services when health professionals
are regularly required to perform activities outside of their normal scopes of practice due not to any emergency, but simply to severe shortages of the appropriate personnel.

The levels of expertise expected of a health professional employed in the public sector cannot be lower than those expected of a health professional in the private sector. The locality rule cannot be used to justify such an argument. Whilst the circumstances in which health professionals in the public sector fulfil their duties may be such that the services they are able to provide are of a lower standard in terms of the level of sophistication of the treatment techniques, or the luxury with which the patient is accommodated, due for instance to a lack of the latest technological equipment and an absence of carpets on the floor of the ward, this should not be conflated with the levels of skill required of such health professionals. The disparities between the public and the private sector in terms of the circumstances in which health care services are provided cannot be used to justify a lesser degree of skill employed by a doctor in the public sector as opposed to one working in the private sector in the same way that the environment of a country doctor cannot justify a lower level of skill than that of a city doctor although it may justify a less satisfactory outcome of the treatment. This point will be explored in more depths in the following chapter in discussing cases such as *Webb v Isaac*¹⁹³. One must distinguish between the level of care and skill which the law requires the health provider to exercise it and the circumstances in which it is exercised. This point neatly demonstrates the importance of construing legal principles in the context of real life situations. The same level of medical care and skill applied in the outbuilding of a farm as in a high tech modern operating theatre is likely to yield very different results in terms of health outcomes. This does not mean that the doctor who treated the patient in the outbuilding has exercised less care and skill than the one in the high tech operating theatre.

¹⁹³ *Webb fn 100 supra*
There are different schools of thought within the science and practice of medicine and other health professions just as there are in any other field of knowledge. The law must make allowances for this. The fact that a particular surgical technique is still practised in the public sector and is still achieving its desired result, despite the fact that it is no longer fashionable in the private sector, does not mean that the public sector practice is unreasonable in terms of the risks posed to the patient. Clinical protocols are some of the most hotly debated issues in the health service delivery environment since, even in medical practice, there is more than one way to skin a cat. In many instances the protocol that is adopted by a particular practitioner will be dictated by his or her own levels of confidence in it and in his or her ability to perform the tasks it requires. One cannot draw an adverse inference simply because a practitioner does not follow a protocol that is within the mainstream of clinical or surgical practice. It is however, important to draw the line between what is an established, although somewhat eclectic, school of thought on the one hand, and pure experimentation on the other. The National Health Act\textsuperscript{194} makes provision for specific criteria involving informed consent by the patient to experimental treatment or treatment for research purposes.

The limitations of the law of delict in its capacity to compensate victims for the wrongs that have been done to them are nowhere more clearly seen that in the case of \textit{Collins v Administrator Cape}\textsuperscript{195}. However this case raises deep philosophical questions about various possible approaches to the value attached by society to human dignity and freedom in relation to the optimal utilisation of resources for the benefit of the greatest number of people. In the public sector in particular, these are often vexed questions as the case of \textit{Soobramoney}\textsuperscript{196} demonstrates. In the case of \textit{Collins} the state could have been ordered to pay an award of damages that in some albeit abstract way equated to the inconceivable loss suffered by the child but those with a utilitarian perspective would ask – to

\footnotesize{\textsuperscript{194} Act No 61 of 2003
\textsuperscript{195} Collins \textit{th 128 supra}
\textsuperscript{196} Soobramoney\textit{v Minister of Health, KwaZulu-Natal 1998 (1) SA 765 (CC)}

1053}
what end? One must weigh up the factors that count in favour of such an approach against those that count against it. Would such an award of damages discourage similar future incidents any more than the guilt and anguish already felt by the health professionals involved? Would it ever make up to the child the life that she has effectively lost? Would it force the state to take other precautionary measures that were not already in place at the time of the incident? Would it 'hurt' the state to lose that amount of money? The chances are that the answers to most of these questions is "No". By contrast, if one did not make such an award in damages how many other patients could be treated with that money in an severely under resourced health system? How many other patients lives could be saved using the amount of that award? Should what is essentially taxpayers money be used to compensate a child who is not capable, effectively, of being compensated or should it be used to benefit other taxpayers who are in desperate need of health care services? These are hard questions involving matters of public policy that are not easy to resolve. It is submitted that the concept of fault makes them harder since there is a vague feeling shared by many that fault equates to blame and blame should attract some kind of adverse consequence for the party at fault. The unemotional purists will argue that this is the role of the criminal law since it amounts to punishment, but as has been discussed earlier, the issue is not that simple.

It is submitted that the right of informed consent has acquired a constitutional dimension. It wholly supports the constitutional rights to human dignity, privacy and bodily and psychological integrity. Although decision of the court in C v Minister of Correctional Services is, it is respectfully submitted, correct, it is a pity that the court did not explore in greater detail the constitutional aspects of the subject of informed consent. Although the conclusion is drawn in this thesis that a separate category of delict — so-called constitutional delicts — is unnecessary, it is submitted that if there is one area of legal debate that clearly illustrates the weight and importance of the constitutional rights mentioned

197 C v Minister fn 153 supra
above, and the delictual consequences of their violation, it is the area of informed consent.

Health professionals cannot be expected to be ‘their brother’s keeper’ in the sense that they can be held responsible for the delicts of their fellows. This topic will be covered in more detail in the following chapter but it is clear from the decision in S v Kramer\(^{198}\) that health professionals who work in a team are entitled to rely on each other to each perform the tasks allotted to them. There is no legal principle that automatically holds them “individually and severally liable” unless of course they are in formal partnership with one another.

Health professionals are not required to exercise the highest possible standard of care but rather a reasonable level of skill and care such as would be expected of a reasonable person in their circumstances and with their background and training. However, this cannot be used as a justification for acting where one does not have the necessary level of care and skill because *imperitia culpaee adnumeratur*. Young doctors, for instance, cannot use their youth and inexperience as an excuse for failing to exercise the necessary degree of care and skill.

The boundaries between the law of contract and the law of delict are thin and getting thinner at least in their application within the context of health service delivery. This is evident *inter alia* from the finding of the court in Silver that the *sine qua non* test of factual causation that is commonly applied to cases founded in delict can also be applied to a claim in terms of the law of contract. After all factual causation is factual causation irrespective of the branch of law that one is dealing with. This illustrates the highly artificial nature of the purist compartmentalisation of different areas of law by some courts and legal academics. Justice is a unitary concept. The Constitution emphasises this as it emphasises the interrelationships between the different rights in the Bill of

\(^{198}\) *Kramer in 99 supra*
Rights. If these rights are interrelated then the law that upholds them cannot be compartmentalised to the extent that different areas of law are required for their enforcement. It is submitted that a contract for health services is no less affected by the constitutional rights to human dignity, equality, life, bodily and psychological integrity and privacy than is a situation in delict involving the provision of health services. The fundamental, underlying principles and values must remain the same because the Constitution is the law upon which all other law in South Africa is based.

Conscious regard must therefore be had, when dealing with cases based on the law of delict with regard to health service delivery, especially in the public sector, to the principles and values of the Constitution because of the number of constitutional rights involved in the delivery of access to health care services and also because access to health care is itself a right in respect of which the state is required to take reasonable legislative and other measures to ensure its realisation.

9.1 Introduction

The principles of the law of delict as they pertain in the private sector are no different to those that are relevant in the public sector. The same elements are relevant and the same obligations, in essence, exist. From a constitutional perspective the responsibility of the state to achieve the progressive realisation of the right of access to health care services is a heavier burden but the right of access to health care services contained in section 27(1) of the Constitution does not restrict the right to the public sector. The horizontal application of the rights in the Bill of Rights is dealt with in section 8 of the Constitution in the sense that it is there stated in subsection (1) that the Bill of Rights applies to “all law”. This includes the law that governs the private sector. Subsection (2) states that a provision of the Bill of Rights binds a natural or juristic person if, and to the extent that, it is applicable, taking into account the nature of the right and the nature of any duty imposed by the right. Obviously the private health sector must be allowed to make a profit in the rendering of health services because this is its *raison d'être*. One cannot expect the private health sector to take
on, at its own expense, the burden of treating the indigent or anyone else without hope or expectation or payment. Consequently, it is submitted that, except under emergency circumstances, the ability of a patient to pay a private provider for services he or she is requesting is a valid and important consideration in a decision of that provider whether or not to provide the required health care services. This said, it is submitted that a refusal by a private provider to give access to health care services to a patient who is able to pay, or who is funded by an insurance company or a medical scheme, would have to be well justified in order to show that there has been no violation of that patient’s right of access to health care services. In the private sector, unlike the public sector, hospitals tend not to employ doctors, physiotherapists, radiographers and pharmacists although they do employ nurses and nursing assistants and may, now that the law relating to pharmacy ownership has changed, increasingly employ pharmacists. In the private sector a significant number of doctors dispense medicines whereas in the public sector, where doctors are employees of the provincial government that owns the hospital, this is not normally the case. Consequently the delictual risks for different kinds of providers in the private sector may differ from those to which the same kinds of providers are exposed in the public sector and issues such as vicarious liability may not be as prominent. However, the basic principles of the law of delict remain the same for both sectors. Indeed many of the issues affecting the private sector have already been discussed in the preceding section on the public sector. The purpose of splitting this section into chapter eight dealing with the public sector and chapter nine dealing with the private sector was to tidily organise the relevant material and make it easier to quickly identify and access the cases relevant to each sector rather than to suggest any significant dichotomy in the law of delict.

A study of the case law involving health service delivery is necessary in order to appreciate the contextual, practical application of the relevant principles of law and to gain an understanding of any differences that may arise as a result of the application of these principles in the private as opposed to the public sector. Although the legal principles themselves do not differ, the real life situation in which they are applied can sometimes, but not necessarily, affect the outcome. This is because of the many different variables at play in differing factual contexts. The point has been made repeatedly in this thesis that law does not exist in a vacuum and it is only through a consideration of its application in practice that it can be properly appreciated.
9.2 Case Law

9.2.1 Mitchell v Dixon

Facts

The facts as they appear from the judgment of Innes ACJ are as follows. On 22 February 1913, the plaintiff consulted Dr Howden of Durban to whom Dr Mitchell was acting as a general assistant at the time. He complained of a pain in the chest, breathlessness and general discomfort. He was given a prescription and told to remain in bed under the care of his mother with whom he was then residing. Thereafter he was once visited by Dr Howden and several times by Dr Mitchell. The diagnosis of both doctors was that he was suffering from pneumo-thorax on the right side – a distention of the pleural cavity due to the presence of liquid or air. It was decided on 03 March to expose the chest cavity and the defendant took with him for that purpose an astra syringe fitted with a steel needle. Dr Mitchell did not employ an anaesthetic. He caused the plaintiff to recline on his left side with his right arm raised, the hand resting on his head and firmly held there by his mother. Then cautioning the patient not to move he inserted the needle between the ribs as a spot in his back. When the instrument was right in and before the defendant had pulled the piston out of the syringe, the needle broke short off at the shoulder. The cause of the breakage was one of the disputed points in the case. The defendant tried to recover the broken portion but failed to do so, it being deeply embedded and out of sight in the flesh and he at once went to call Dr Howden. Together they administered chloroform and made an incision into the cavity with the dual purpose of finding the needle and relieving the patient. According to them there was a marked escape of air but they did not find the needle which still remained in the patient’s body although he recovered in all other respects. The plaintiff claimed damages on the basis of negligence.

Judgment

---

1 Mitchell 1914 AD 525
The court stated that a medical practitioner is not obliged to bring to bear upon the case entrusted to him the highest possible degree of professional skill but is bound to employ reasonable skill and care. The burden of proving that the injury was caused by the defendant’s negligence, said Innes ACJ, rested on the plaintiff throughout and the mere fact that the accident occurred was not *prima facie* proof of negligence. He observed that the needle could have been fractured by causes beyond the control of its operator – for instance by the movements of the patient. Therefore the maxim *res ipsa loquitur* could have no application. Innes ACJ stated that a medical practitioner is not necessarily liable for a wrong diagnosis. No human being is infallible and in the present state of science even the most eminent specialist may be at fault in detecting the true nature of a diseased condition. He noted that a practitioner can only be held liable if his diagnosis is so palpably wrong as to prove negligence, that is to say, if his mistake is of such a nature as to imply an absence of reasonable skill and care on his part, regard being had to the ordinary level of skill in the profession. After examining the evidence the court observed that it could not be said that the defendant had made a negligently wrong diagnosis.

It was also argued that the defendant had used the wrong needle but Innes CJ noted that this argument broke down because he had used the needle that was supplied with the instrument and expert evidence showed that the majority of ‘medical men’ preferred a steel needle to a platinum one for this purpose. The court came to the conclusion on all the evidence that the defendant could not be found guilty of negligence in any of the respects averred by the plaintiff. It set aside the finding of the jury in the court *a quo* in favour of the respondent.

**Discussion**

This case is one of those precedents that have been used to justify the inapplicability of the maxim *res ipsa loquitur* to medical situations. As has already been stated there is no reason in logic why this should be so and it is the view of the writer that a departure from this principle would be in order and would be consistent with public policy considerations in evening out the balance of power between provider and patient. A further important point to note is that a medical practitioner is not necessarily liable for a wrong diagnosis since anyone can make mistakes. Reasonable
mistakes cannot attract delictual liability since reasonable mistakes lack the element of negligence. Claassen and Verschoor point out that it obviously cannot be expected that a doctor who is called out at night to a remote dwelling in the countryside for an unexpected emergency will keep up the same standards as he would have maintained in a fully equipped hospital with adequate numbers of trained staff. The formulation in Mitchell v Dixon that a medical practitioner is not expected to bring to bear upon the case entrusted to him the highest possible degree of professional skill, but he is bound to employ reasonable skill and care; and he is liable for the consequences if he does not has been referred to with approval in Van Wyk v Lewis, Esterhuizen v Administrator Transvaal, Buls and Another v Tsatsarolakis, Coppen v Impey and Pringle v Administrator Transvaal.

9.2.2 Webb v Isaac

Facts

The plaintiff’s right thigh was broken by a falling beam. On the following day the defendant was called in to treat and set the leg. It was alleged that the defendant failed to use reasonable skill and care in his treatment and setting of same; that he negligently set and bandaged it; that he failed to use the proper splints; that he failed and further refused without cause to attend to the plaintiff thereafter or to provide proper treatment with the result that the leg set at an angle instead of in a straight position and became shortened by three inches. It was alleged that by reason of the defendant’s negligence the plaintiff had to undergo an operation for the removal of a piece of bone from his leg and would have to undergo a second operation necessitating the re-breaking and re-setting of his leg in a straight position. The plaintiff claimed that he had suffered in health and in earning capacity and had incurred medical expenses and nursing expenses. He claimed £1000 in damages and costs. The defendant pleaded that on 14 October 1914 he was requested by one B C

6 Coppen 1916 CPD 309
7 Pringle 1990 (2) SA 379 (W)
8 Webb 1915 EDL 273
Torr the owner of the farm Glen Rock to proceed to the farm and to attend to two men of whom the plaintiff was one. Torr said he would pay the fees for such attendance. The state of the roads made it impossible to go out that evening so he went the following morning and treated and set the plaintiff’s leg. The defendant denied that he failed to exercise reasonable care and skill in the setting and bandaging of the leg or that he failed to use splints proper for securing the permanent and proper setting of the leg. The defendant was only requested to pay one visit and he denied that he refused to attend the plaintiff thereafter. He also denied that he was responsible for setting the leg at an angle and thus for the subsequent operations which had become necessary. The defendant asked about the plaintiff’s condition on several occasions and was always informed that he was getting on well. He explained that he did not care to go out again unless asked as he was afraid that it would look as if he was trying to run up his fees in view of the fact that Torr was a wealthy man. Medical evidence on both sides admitted that there was no proof of negligence and that even under the most favourable conditions in the case of about 15 percent of fractures of the thigh there was a shortening of from two to three inches. With one exception the medical witnesses were all of the opinion that under the circumstances the treatment had been right and proper.

**Judgment**

Graham JP in giving judgment stated that the law upon the duties of a medical practitioner and the amount of skill which is expected of him had been discussed in *Mitchell v Dixon*⁹. He referred to the fact that a medical practitioner is not expected to bring to bear upon a case the highest possible degree of professional skill but that if he did not employ reasonable skill he was liable for the consequences. He noted that in *Mitchell* it had been pointed out that the burden of proof that the injury was due to the plaintiff’s negligence rested throughout on the plaintiff and that the maxim *res ipsa loquitur* did not apply. He said that there are ‘excellent reasons’ for this rule of law because if the law required in every case that a practitioner should have the highest degree of skill, it would lead to the result that in remote country districts and even in country districts at no great distance from the large centres it would be impossible to

---

⁹ *Mitchell* fn 1 supra
find a country practitioner who would take the risk of attending a patient if he was always expected to exercise the highest degree of skill obtainable in the medical profession. The law requires of a doctor a reasonable degree of skill which is dependent upon the particular circumstances of the case which he has under treatment. The court considered the facts and the circumstances in which the defendant had to treat the plaintiff and observed that they were not ideal and that it would probably have been better to move the plaintiff to more suitable surrounding but said that there was no evidence to show that it would have been possible to do so. The evidence showed that there was no hospital in Molteno to which the plaintiff could have been removed and that the defendant was not aware that the plaintiff had any friends in Molteno to whose house he could have been taken. Under the circumstances, it was not prepared to say that the defendant acted unreasonably in treating the plaintiff in the house in which he attended him. The defendant stated that in applying the splint he realised it would have been better if it had been a little bit longer but at the same time he said he came to the conclusion that the splint was capable of performing the work for which it was required. The court said it was quite satisfied that the use of the Liston splint and perineal bandage was the best treatment under the circumstances. It said that it was clear from the medical evidence of the experts that the perineal bandage and the weight and pulley is not the highest and most skilful treatment which an injury of this nature could receive but it was equally clear that that treatment was a reasonable treatment for an injury sustained and treated in the particular circumstances of the case. The court observed that it was clear that the removal of the piece of bone from the plaintiff's leg was in no way occasioned by the treatment he had received from the defendant. The bone had been fractured by the falling of the beam and the piece was bound to come away sooner or later. It was impossible for the defendant to remove the bone at the time he set the plaintiff’s leg and it was impossible for him to ascertain that there was a piece of bone which was likely to come away after the fracture. It was only after a radiograph examination that the precise nature of the injury was discovered and a decision on the removal of the bone could be taken.

With regard to the allegation that the defendant had failed to visit the plaintiff when called upon to do so the court stated that it thought it would have been far wiser had the defendant adopted one of three courses of action suggested by one of the expert
witnesses to the effect that he would have recommended the patient’s immediate removal to hospital or on receiving a request for a second visit he would have told the plaintiff that he would pay a visit on a date which he would fix or else he would have stated that he was to be sent for by the plaintiff on a date to be fixed by him. The court said that there was a good deal of force in the argument that it is not a reasonable thing to expect that the patient should fix the date of the doctor’s return visit and that the responsibility should be left upon the patient of sending for the doctor at any particular time he thinks fit for it would be quite impossible for an unskilled patient, on a farm remote from any doctor to know how his injury was progressing and to know the particular time when the doctor should pay his return visit.

The court said it thought that the doctor should have made a date with the plaintiff on which he would visit him in order to ascertain how his injury was progressing. It said it would have been ‘a wiser and kindlier’ thing. At the same time, however, it was impossible from the evidence to find that even if he had visited the plaintiff on a second occasion on the day on which it was alleged he had been sent for, he could have done anything to the leg. The court said it thought the plaintiff had acted unwisely in the matter of not paying a second visit and the question of fees ought not to have entered into his consideration. Knowing that the plaintiff was suffering from a severe injury, it would have been wiser had he made every sacrifice and paid a second visit in order to satisfy himself as to how the case was progressing. At the same time, said the court, had he paid a second visit there was nothing further that he could have done to prevent the patient’s ultimate condition. There was a union of bone but not a proper union. The improper union was the caused by lack of sufficient extension and the lack of extension led to the shortening of the limb. A judgment of absolution from the instance with costs was handed down.

**Discussion**

It is submitted that the court in its reference to country doctors not being able to exercise the highest level of skill and care incorrectly conflated two issues. The test laid down in *Mitchell v Dixon*\(^\text{10}\) that a doctor is required to exercise only reasonable

\(^{10}\) *Mitchell fn 1 supra*
care and skill has not got anything to do with the circumstances in which he must treat his patient. Whether a doctor lives in a small country village or a large and bustling metropolis, it is submitted that the level of skill that he must exercise remains the same. It must be reasonable skill and not skill of the highest professional level. The reason for this, it is submitted, is because not every doctor is capable of exercising the highest levels of professional skill. To suggest otherwise would be to suggest that every physicist should be able to perform to the level of those who have won the Nobel prize for physics or that every lawyer should have the same level of professional skill as the most competent and knowledgeable judge. Reasonable skill sits in the middle of the Bell curve where most practitioners are likely to be found. Exceptional skill is not a common commodity. The reasonable skill must be applied within the circumstances in which the practitioner finds himself. This is the second element of the test. It is discrete from the first in the sense that it does not detract from the level of professional skill required of a practitioner no matter what his circumstances but it acknowledges that the actual level of skill and care that a practitioner is able to devote to his patient may have varying results, depending upon the circumstances. If one conflates these two elements of the test as the court did in *Webb v Isaacs* one starts getting into arguments that country doctors should exercise a lower degree of skill than city doctors when in fact it is not the level of skill that varies but rather the circumstances in which it is exercised 11.

11 Carstens PA in "The locality rule in cases of medical malpractice" 1990 De Rebus 421 states that in view of the inapplicability of the local rule on the uniform South African medical training generally and the rapid advancement of medical learning, the views of Strauss and Strydom, Van der Walt and Gordon and Turner and Price that it makes no difference to the level of skill and care required of a practitioner whether he is attending a patient in Cape Town or a remote village on the edge of the Kalahari desert can be supported in principle. However, there are certain considerations within the South African context which have a definite influence on the question as to whether locality in which a medical practitioner operates should be taken into account when deciding whether his conduct was negligent or not. He submits that a distinction can be drawn between the subjective capabilities of the medical practitioner himself (capabilities such as training, skill and expertise) and the objective circumstances in which the medical practitioner happens to find himself in a particular locality. Carstens says that while it is true that there is uniformity in the training of medical practitioners in South Africa and that the standard of training is in all probability comparable with the best in the world, it cannot be denied that South Africa is a developing country and is in many instances a Third World country. Therefore, although a doctor may be suitably qualified, possessing all the subjective qualities, training and capabilities to be a good doctor, should he be placed in a remote country district where there is a lack of medical facilities and infrastructure to support the effective practice of "First-World" medicine, this must surely be a factor to be taken into consideration when evaluating his conduct in cases of medical malpractice. Carstens stresses, however, that he is not arguing that the medical practitioners in the cities are better than their counterparts in the country; the fact of the matter is that the city practitioner more often than not has access to better medical facilities than his counterpart in the country. The mere fact, says Carstens, that a doctor is practising in the country obviously does not 'license' him to be negligent and then blame his mishaps on the lack of proper medical facilities. The law still requires of a doctor a reasonable degree of skill, which is dependent on the particular circumstances of the case which he has under treatment. Carstens submits that the locality rule is nothing but an 'added particular circumstance' that must be given consideration when deciding whether the doctor's conduct was negligent or not. In his opinion locality where a medical practitioner operates will always be relevant in cases of medical malpractice until such time when it can safely be stated that the medical facilities and equipment in this country are equally available and accessible, irrespective of whether the medical practitioner chooses to practise in the city or in the country.

It is submitted that whether or not the level of medical facilities and equipment is the same throughout the country, the circumstances will still always have to be taken into account since it is the circumstances of each particular case that are relevant. Locality as Carstens correctly points out, is just another of those circumstances. To elevate it to a factor which
As regards the res ipsa loquitur rule, Carstens argues that it should be applied in specific circumstances with regard to the proof of medical negligence. He advances some general principles for the effective application of the maxim.

can increase or reduce the actual level of skill and care required of the doctor (for the purposes of ascertaining negligence) is not correct. One should rather view this issue from the point of view of level of care and skill versus standard and quality of treatment. It is quite clear from the judgment in Webb v Isaac that although the quality and standard of treatment was not what it should have been because of the locality, the level of skill and care required of the doctor remained the same. It was the standard of the treatment that he was able to render that was affected by the locality — not his level of skill and care. Indeed had the court come to the conclusion that another (reasonable) doctor with the same training and qualifications as the defendant, when placed in the same locality and other circumstances as the defendant, would have brought to bear a higher level of care and skill than did the defendant, the latter would have been found guilty of negligence.

Carstens PA "Die Toepassing van Res Ipsa Loquitur in Gevalle van Mediese Nalatigheid" 1999 De Jure 19

12 Carstens states: "Die stelreel kan ong ondubbelsinnig verwerp word nie 'n regvermoede is nie. 'n Hof word ook nie deur die stelreel gebind nie en is vry om elke geval selfstandig in die lig van die beskikbare feite te beoordel...Daar kan wel omstandighede wees wat prima facie toepassing van die stelreel in die mediese praktyk regverdig die anwesigheid van 'n instrument in die pasiënt se liggaam na afloop van die operasie; 'n infeksie wat op 'n impulsing volg, die optrede van aansteeklike siekte in 'n hospitaal, brandwonde teweeggebring deur 'n warm waterbottel in 'n pasiënt se bed; besering van 'n gesonde liggammaad langs die aangetaste liggammaad..."

13..."Dit moet beklemtoon word dat die stelreel nie die onus beinvloed nie en bevestig hy die beginsel dat die onus deurgaans op die eiser rus. Hulle voer aan dat ten einde die hof die geneesheer dan deskundige mediese getuienis sal moet aanbied ten einde aan te toon dat sy optrede medics gesprok...Daar moet nog steeds noukeurig op die algemene bewyslas op die eiser om op 'n oorwig van waarskynlikheid te beslis nie..."
The plaintiff claimed £10 000 in damages for assault. The plaintiff was admitted to hospital for surgical and medical treatment for cancer of the penis. Dr Elliott, who treated the plaintiff was an honorary visiting surgeon who assumed that the administrative procedures, including the obtaining of the patient’s consent, had been
followed. He was doing charitable work at the hospital. The patient’s penis was surgically removed. The patient maintained that he had not given consent to the operation. The jury found for the defendant.

**Judgment**

Watermeyer J advised the jury of the nature of assault. He stated that in the eyes of the law every person has certain absolute rights which the law protects. They are not dependent upon statute or contract but they are rights to be respected and one of them is that of absolute security of the person. He said that nobody can interfere in any way with the person of another, except in certain circumstances. Any bodily interference with or restraint of a man’s person which is not justified in law, or excused in law, or consented to, said Watermeyer J, is wrong and for that wrong, the person whose body has been interfered with has a right to claim such damages as he can prove he has suffered owing to that interference. He explained the term justified as follows: there are certain interferences with the body of another which are justified and perfectly lawful, for instance when a police constable arrests another under a warrant or when an executioner hangs a man. With regard to the term ‘excused’ Watermeyer J said, for instance if one is moving in a crowd and bumps up against another person, that is not an assault; it is an excused interference. If an interference is consented to, said Watermeyer J, then it is not wrong. He used as an example the football matches played at Newlands or a boxing contest.

The declaration in *Stoffberg* alleged an unjustified, unexcused, and unconsented to interference. The plea admitted interference but said that there was consent to the operation albeit not express consent. It said that the consent was implied by the fact that the patient went into hospital and was admitted for treatment and thereby consented to undergo such surgical and medical treatment as was immediately necessary.

In this regard Watermeyer J pointed out that it is a question partly of fact and partly of law whether there was an implied consent to undergo such surgical treatment as was.

---

15 The death penalty has since been abolished in South Africa and there is consequently no longer any justification in law for execution. See *S v Mukwayane and Another* 1995 (3) SA 391 (CC)
considered reasonably necessary by the doctor. He stated that insofar as the legal question is concerned, a man, by entering a hospital, does not submit himself to such surgical treatment as the doctors in attendance upon him may think necessary. By going into hospital, said Watermeyer J, he does not waive or give up his right of absolute security of the person. He cannot be treated in hospital as a mere specimen, or as an inanimate object which can used for the purposes of vivisection. He remains a human being and he retains his rights of control and disposal of his own body. He still has the consent to say what operation he will submit to and unless his consent to an operation is expressly obtained, any operation performed upon him without his consent is an unlawful interference with his right of security and control of his own body and is a wrong entitling him to damages if he suffers any.

Watermeyer J said that it may be that there are many cases in which a doctor could perform surgical operations upon another person without that other person’s consent. He used the example of a man who is picked up unconscious in the street and whose consent cannot be obtained for treatment necessary to save his life. In such a situation, said Watermeyer J, the operation could be performed without consent. Another example given was the case where a man is undergoing one serious abdominal operation and while his body is open the doctor finds there is something else seriously wrong. In order to save his life, it is necessary to remove that. In such a case, said Watermeyer J, the doctor would be justified. He pointed out that in the present case there was no such emergency and that it was admitted that consent ought to have been obtained and was not obtained owing to some oversight in the hospital so that the operation took place without consent and as such was a wrongful act and in infringement of the plaintiff’s rights, not justified by urgency or excused upon any other ground.

Watermeyer J said that although no moral blame attached to Dr Elliott and that he was quite justified in assuming that the consent had been obtained in the ordinary course, this did not change the legal position. In law if a man commits an assault or if he is one of a number who commits an assault then it does not matter whose duty it was to ask for consent to that assault. If he consent is not obtained then all the persons concerned in that assault are liable to the plaintiff if the plaintiff suffers any damages. The judge said that the fact that consent was not obtained in the present case was not
so much Dr Elliot's fault as it was his misfortune and that it did not relieve him of responsibility because he was the man who actually performed the operation of cutting off the plaintiff's penis without his consent. Watermeyer J then went on to explain the principles of compensation and whether damages should be awarded in the present case. He stated that the rule is that unless there is an element of insult or unless the action is brought to establish a right, then the plaintiff cannot recover unless he proves some actual damage, that is, pecuniary loss or pain and suffering. He told the jury that they could not take into account other things such as mental or moral pain and suffering and explained that this action was one to recover damages for actual loss sustained rather than a claim of insult. Watermeyer J told the jury that if they thought that there was cancer and that the operation was necessary to save the plaintiff's life then they should still further consider whether he suffered any damage at all. The jury found for the defendant and judgment was entered for the defendant with costs.

Discussion

Watermeyer J referred in this case to the right of absolute security of the person. He also stated that in the eyes of the law every person has certain 'absolute rights' which the law protects. It is important to note that there is a distinction between a right of absolute security of the person and an absolute right of security of the person. The former relates to the security and the latter to the right. The courts have held that the fundamental rights contained in chapter 3 of the Constitution are not absolute\(^\text{16}\). Since

---

\(^{16}\) Froneman J in Qozeleni v Minister of Law and Order and Another 1994 (3) SA 625 (E) held that: "The fundamental rights protected by the chapter are enumerated (§ 8-32), but they are not absolute rights. Apart from the possibility of these rights conflicting with each other in a given situation, they are all also subject to a general limitation clause (§ 33) and may even in certain closely prescribed circumstances be suspended under a state of emergency (§ 34). Any alleged breach of the fundamental rights set out in chap 3 therefore necessitates a two-pronged enquiry (leaving aside for the moment the possibility of suspension under a state of emergency), viz, firstly, whether there has been an infringement of the right, and, secondly, if so, whether that infringement of the right is justified in terms of the limitation clause (§ 33). It is not necessary to go further than our own case law in this regard to determine the proper incidence of the onus in such cases. The person alleging an infringement of a fundamental right would initially bear the onus of proving such an infringement, but, having done so, the onus of proving the justification for such an infringement in terms of § 33 would be on the person or entity relying on such justification. From the case law it is also quite clear that the latter onus is not merely one of rebuttal ("weerleggingslas") but a fully-fledged onus ("bewyslas") (Mabaso v Felix 1981 (3) SA 865 (A) at 876; Minister of Law and Order and Others v Hurley and Another 1986 (3) SA 568 (A) at 586-589; Minister van Wet en Orde v Matshoba 1990 (1) SA 280 (A) at 284E-4; During NO v Boesak and Another 1990 (3) SA 661 (A) at 673G-H)." In Rudolph and Another v Commissioner for Inland Revenue and Others NND 1994 (3) SA 771 (W), Goldblatt J held that: "Firstly, it must be recognised that the rights and freedoms guaranteed by the Constitution are not absolute. These rights and freedoms may be limited by laws which are not contrary to § 33(1) of the Constitution." In Soobramoney v Minister of Health, KwaZulu-Natal 1998 (1) SA 430 (D), Combrinck J held that: "The case made out by the applicant mirrors what at present seems to be a popular conception that the rights created in the Bill of Rights are absolute and can be exercised and enjoyed without limitation. This is of course not so. The rights are by § 36(1) limited in terms of law of general application to the extent that the limitation is reasonable and justifiable in an open and democratic society. The rights are also limited by the rights of others. A right extends only so far as the point to where it
the constitutional rights have not necessarily replaced those recognised at common law, this would appear to be a fundamental difference between the constitutional right of freedom and security of the person of bodily and psychological integrity as contained in section 12 of the Constitution the common law right to absolute security of the person. The question is whether the Constitution has limited the scope of the right to security of the person so that it is no longer absolute or whether the absolute nature of the common law right remains unaffected by the fact that the constitutional rights are themselves not absolute. It has been held that the common law and constitutional law should not be treated as two distinct and separate branches of law. It is submitted that in view of this, and the fact that constitutional rights are themselves not absolute, it is highly unlikely that the common law rights should continue to be regarded as such. In any event, if one considers the basis upon which the constitutional and other courts have justified their statements that the rights in the Bill of Rights are not absolute, it is that they can be limited by a law of general application and that they must be balanced against other rights. It is submitted that the same is true of common law rights. They can be limited by law and they must also be balanced against other rights, if not other common law rights, then other constitutional

17 Chaskalson P, speaking for the full Constitutional Court in *Pharmaceutical Manufacturers Association of SA and Another: In re Ex parte President of the Republic of South Africa and Others 2000 (2) SA 674 (CC) said: "I take a different view. The control of public power by the Court through judicial review is and always has been a constitutional matter. Prior to the adoption of the interim Constitution this control was exercised by the Courts through the application of common-law constitutional principles. Since the adoption of the interim Constitution such control has been regulated by the Constitution which contains express provisions dealing with these matters. The common-law principles that previously provided the grounds for judicial review of public power have been subsumed under the Constitution and, insofar as they might continue to be relevant to judicial review, they gain their force from the Constitution. In the judicial review of public power, the two are interwined and do not constitute separate concepts."

Fiodes AJ observed in *Pennington v Friedgood And Others 2002 (1) SA 251 (C) that: "At paras [41] of the *Pharmaceutical Manufacturers Association case supra* Chaskalson P stated that powers which were previously regulated by the common law under the prerogative and the principles developed by the Courts to control the exercise of public power are now regulated by the Constitution and, in response to counsel’s submission, relying on the decision in *Container Logistics to the effect that common-law grounds of review can be relied upon by a litigant and, if this is done, the matter must then be treated, not as a constitutional matter, but as a common-law one, Chaskalson P said the following at paras [44] and [45]: "[44] I cannot accept this contention, which treats the common law as a body of law separate and distinct from the Constitution. There are not two systems of law, each dealing with the same subject-matter, each having similar requirements, each operating in its own field with its own highest Court. There is only one system of law. It is shaped by the Constitution which is the supreme law, and all law, including the common law, derives its force from the Constitution and is subject to constitutional control."

---

1071
rights given the existence of the latter. In this sense then common law rights are and were not ‘absolute’ either. In his judgment in Stoffberg, Watermeyer J pointed out that in effect the ‘absolute’ right to security of the person can be modified or limited by a number of different concepts namely justification, excusability and consent. It would seem that the term ‘absolute’ as used with regard to the right of security of a person in Stoffberg v Elliot is thus a relative term. It is submitted therefore that in essence there is little or no difference between the common law right of security of the person and the constitutional right to freedom and security of the person and to bodily and psychological integrity. Even prior to the Constitution the courts were on the whole reluctant to concede the existence of absolute rights. It is submitted that this is because the term ‘absolute’ tends to imply that there are no exceptions to the rule. As any lawyer in practice will confirm, it is usually upon exceptions to the rule, the grey areas between the black and white letter of the law, that legal practice and litigation are founded.

Boberg notes that T W Price rightly points out that Watermeyer J erred when he instructed the jury that, if the plaintiff has not in fact consented, Dr Elliott would have been liable even though he had justifiably believed that the plaintiff’s consent had been obtained.

18 One has a distinct sense of oxymoron here.
19 See for instance Jansen van Vuuren and Another NNO v Kruger 1993 (4) SA 842 (A) and Simonlango and Others v Masinga and Others 1976 (2) SA 732 (W)
20 Boberg PQR The Law of Delict: Aquillian Liability Vol I at p 746
21 Price TW ‘The Role of Casus Fortuitus Vis Major and Mistake in Action for Delict’ 1953 16 THRHR 1 at p 9
22 Boberg (fn 20 supra) at p 746 quotes him thus: This, says Price, was ‘a clear and fatal misdirection on a point of law. On the facts as found Dr Elliott was not guilty of any culpa; the moral position was in fact also the legal position, and the learned judge clearly misconceived the fundamental nature of the Aquillian action...In this case it is plain that the plaintiff sued the wrong person and the learned judge should have directed the jury accordingly’. This argument says Boberg is susceptible of misunderstanding. One may think that culpa was not in issue, since Dr Elliott acted intentionally when he operated. But Price’s point was this: Dr Elliott was without fault because his actual, subjective belief that the plaintiff had consented excluded consciousness of wrongfulness and hence intention, while the reasonableness of that belief excluded culpa. Watermeyer J was therefore in effect instructing a jury that Dr Elliott was strictly liable and that was a misconception of Aquillian liability and a ‘fatal misdirection’. As Boberg says, in the event, justice triumphed when Dr Elliott escaped liability upon the rather quaint ground that the plaintiff had suffered no damage because without the operation he would soon have succumbed to cancer. This, of course assumed that he had no claim for contumelia, as indeed Watermeyer J expressly directed but the assumption is challenged by Amerasinghe CF ‘The Protection of Corpus in Roman Dutch Law’ (1967) 84 SALJ 56 who rightly says that assault is per se contumelious. Van Wyk fn 3 supra
Facts

The facts as they appear from the judgement of Innes CJ are as follows. On 3 February 1922, the respondent, a physician and surgeon practising at Queenstown received a telegram for Dr Louw of Sterkstroom asking him to meet the appellant, who was arriving by train, with a view to an operation. The respondent arranged for her admission to the Frontier Hospital where he examined her the same afternoon. Her condition was so critical that an immediate operation was necessary. This he performed at 8 o'clock the same evening. The anaesthetic was administered by Dr Thomas and a qualified nurse on the hospital staff acted as theatre sister. The matron and another nurse De Wet were also in attendance. The patient's appendix, being inflamed and adherent, was removed. The gall bladder was also in a state of acute inflammation, much distended with necrosis on the surface and he decided to drain it. Having paced the field of the operation with swabs handed to him by the sister her made an incision and inserted a tube. This was attended with difficulty. There was a rush of highly septic matter to be dealt with and owing to the friability of the gall bladder, it was impossible to suture the opening so as to draw it around the tube. He put in more packing to prevent the spread of sepsis. At that stage he was warned by the anaesthetist that the patient should be taken off the operating table as soon as possible. He concluded the operation, removed all the swabs he saw or felt and being satisfied that they had all been accounted for to the satisfaction of the sister, he stitched the patient closed. The appellant, a young woman of 26 made a rapid recovery and was discharged from hospital on 19th February, by which time the wound had healed over. Between that date and January of the following year, the respondent saw the patient on several occasions. Some time after the operation the wound opened slightly, there was an oozing of pus and she informed the respondent that several gall stones had come through the opening. She complained of discomfort but not of pain. The last occasion on which the appellant consulted the respondent was in January 1923 when he found on examination, a slight swelling and tenderness in the region of the gall bladder which pointed, he thought, to a recurrence of the old trouble. Subsequently, on the 15th of February, the appellant claimed that she evacuated a piece of muslin the shape and dimensions of a small, packing swab with tape attachment. Under those circumstances she refused to pay the respondent's
account which had just been rendered but commenced an action for damages. Judgment for the defendant was given by the court *a quo* and the plaintiff appealed.

**Judgment**

The court first considered the question of whether the appellant's evidence could be accepted stating that her story, implying as it did a lesion of the bowel by ulceration or otherwise, and the consequent passage of the swab into the alimentary system was itself remarkable and was rendered more remarkable still by the absence of high temperature and other symptoms which might be expected to accompany this process. However, the medical evidence showed that though in the highest degree improbable, her account of what took place could not be dismissed as impossible. The court *a quo* accepted the appellant's account as being the truth and the Appellate Division then did the same. It then turned to the legal nature of the claim and noted that there was some discussion as to whether the claim had been framed in contract or in delict. One of the appellant's contentions assumed that her claim was contractual. Innes CJ observed that the line of division, where negligence is alleged, is not easy to draw for negligence underlies the field of both contract and delict (tort). He said that cases are conceivable were it may be important to decide on which side of that line the cause of action lies but said that the present was not such a case – that no mere omission was relied on nor was the basis upon which damages should be calculated in dispute. Innes CJ did say that, since the point had been raised, it was his opinion that the claim was based in delict. He observed that the compensation demanded was in respect of injury alleged to have been sustained by reason of the respondent's negligence and lack of skill and that while the duty to take care no doubt arose from the contractual relationship between the parties, it was duty, breach of which was actionable under the Aquilian procedure. Consequently, said the court, the respondent's liability depended on whether it was due to negligence or unskilfulness on his part that the swab was allowed to remain in the wound. He held that this could only be decided on consideration of the facts surrounding the operation but before turning to these he considered the standard of care that the respondent had to observe and the question of where the onus of proof lay. Innes CJ referred to *Mitchell v Dixon* in which it was

---

24 *Mitchell fn 1 supra*
held that a medical practitioner is not expected to bring to bear upon the case entrusted to him the highest possible degree of professional skill but he is bound to employ reasonable skill and care. In deciding what is reasonable, said Innes CJ, the court will have regard to the general level of skill and diligence possessed and exercised at the time by members of the branch of the profession to which the practitioner belongs. He said that the evidence of qualified surgeons is of the greatest assistance in estimating that general level and that their evidence may well be influenced by local experience. Innes CJ said that he intended to guard against assenting to the principle in some American decisions that the standard of skill which should be exacted is that which prevails in the particular locality where the practitioner happens to reside. The ordinary medical practitioner should, he said, exercise the same degree of skill and care whether he carries on work in the town or the country, in one place or another. The fact that several incompetent or careless practitioners happen to settle in the same place should not affect the standard of diligence and skill which local patients have a right to expect.

Innes CJ then turned to the question of onus of proof. He stated that the general rule is that he who asserts must prove. Consequently a plaintiff who relies on negligence must establish it. If, at the conclusion of the case, the evidence is evenly balanced, he cannot claim a verdict for he will not have discharged the onus resting upon him. Innes CJ noted that it was argued that the mere fact that a swab was sewn up inside the appellant's body is prima facie evidence of negligence which shifts the onus so as to throw upon the respondent the burden of rebutting the presumption raised — a difficult task, he said, in view of the lapse of time between the operation and the trial.

The maxim res ipsa loquitur was invoked in support of this argument. The court said that the maxim means simply what it says — that in certain circumstances the occurrence speaks for itself. It noted that the maxim was frequently employed in English cases where there was no direct evidence of negligence and that the question then arises whether the nature of the occurrence is such that the jury or the court would be justified in inferring negligence from the mere fact that the accident happened. It is really, said the court, a question of inference. Innes CJ stated that it was no doubt sometimes said that in cases where the maxim applies the happening of the occurrence is in itself prima facie evidence of negligence and that if by this is meant that the burden of proof is automatically shifted from the plaintiff to the
defendant, then he doubted the accuracy of the statement. He observed that the
general principles on which the onus is transferred from one party to another during
the course of a trial were observed in *Frankel v Ohlsson's Breweries*25 and said that in
the present case there was clearly no shifting of onus. The plaintiff alleged a lack of
reasonable care and skill and the correctness or otherwise of that allegation can only
be determined on a consideration of all the facts. Innes CJ stated that there is no
absolute test – it depends on the circumstances. The nature of the occurrence is an
independent element but it must be considered along with the other evidence in the
case. In his opinion, said Innes CJ, the onus of establishing negligence rested
throughout upon the plaintiff. He noted that the appellant’s contention was not so
much one of incompetence as one of carelessness on the part of the respondent. The
court said that with regard to the removal of swabs at the conclusion of an operation a
surgeon is bound to make such search and take such precautions as are reasonable
under the circumstances. In view of the consequences involved, it said, the search
must be careful and the precautions strict – anything less would not be reasonable. It
said that whilst the testimony of members of the profession is of the greatest value on
questions of this kind, the decision as to what is reasonable under the circumstances is
for the court and whilst the latter will pay high regard to the views of the profession it
is not bound to adopt them. Innes CJ observed that the duty of counting all the swabs
and keeping a tally of those used inside the body and checking them as they come out
is entrusted to the sister. He said there was ample evidence that this is a proper
practice and one largely to be followed in present day surgery and that it was
reasonable. The respondent admitted that he left the counting of the swabs to the
sister. In a general sense the sister is under the orders of the surgeon but she also has
independent duties to discharge and checking of the swabs was one of the most
important. The court said that it could not say that a surgeon who leaves this task to a
competent sister is on that account guilty of negligence. It said that the doctor’s duty
is to do his best for his patient and he should follow the course which his judgment
tells him in his own case is the preferable one. The task of keeping a mental record of
swabs used, a record that is valueless if not accurate, might distract one person more
than another from that level of concentrating upon the problems of the operation
which the interests of the patient demand. The respondent had made as careful a

25 *Frankel 1909 TS 957*
search as the critical condition of the patient permitted and the sister believed that all the swabs were accounted for. The respondent came to the same conclusion and proceeded to sew up the wound. In these circumstances, said the court, it was not prepared to differ from the finding of the court a quo in favour of the defendant that a charge of personal negligence had been established. On the subject of whether the respondent was answerable for the negligence of the sister, said Innes CJ, he did no propose to express any opinion since she was not a party in the present case. However, he did point out that she was not the servant of the respondent and that while she was under his general control during the operation, she was also a collaborator. Innes CJ said that whilst the court was sympathetic to the appellant, to uphold some of the arguments made on her behalf would render it difficult for a surgeon to concentrate all his energies upon the surgical problems of a critical operation and might render practitioners slow to undertake them. This, he said, would hardly be in the interests of the particular patient or the general public.

In a minority judgment Kotzé JA differed from the views of Innes CJ with regard to the question of res ipsa loquitur, saying that the placing of a foreign substance in the patient’s body and leaving it there when sewing up the wound, unless satisfactorily explained, establishes a case of negligence. He quoted from Hillyer v The Governors of St Bartholomew’s Hospital\textsuperscript{26} where Kennedy LJ observed:

\textquote[It appears to me that, subject always to the reservation that I have stated in respect of the nature of the defendant’s legal liability for the negligent acts or omissions of their professional staff, there was apart from the statements which two of the surgeons made subsequently to the plaintiff, and which were admitted in evidence without objection on the part of the defendant’s counsel, a \textit{prima facie} case on the issue of negligence on the facts which I have briefly set forth. I think that so far the plaintiff might, in the circumstances invoke the application of the maxim \textit{res ipsa loquitur}.]\\[26]\textsuperscript{26} \textit{Hillyer} 1909 2 KB at p828

The facts in this case were that a patient, whilst lying on the operating table in St Bartholomew’s Hospital in an insensible state through the administration of the necessary anaesthetics had his left arm burned by contact with a heating apparatus under the table and his right arm was also bruised during the operation. The action was brought against the governors of the hospital, the plaintiff’s case being that they were responsible in law for the negligence of the surgeons employed at the hospital.
The Court of Appeal held that under the circumstances no liability attached to the governors of the hospital for negligence or unskillfulness of the surgeons in attendance at the operation. Kotzé JA said that the actual decision in *Hillyer* had no direct application to the present case but that the quoted observations of Kennedy LJ supported the view that where a plaintiff has proved certain facts from which, if not satisfactorily rebutted or explained, the conclusion may reasonably be drawn that there has been an absence of the necessary care or skill on the part of the medical man, a case of negligence against the defendant has been established, rendering him liable in damages. He noted that it is no doubt true that negligence may be manifested in many and various ways and in complicated instances the difficulties are usually in respect of the *onus probandi*. Not infrequently a plaintiff may produce evidence of certain facts which, unless rebutted, reasonably if not necessarily indicate negligence and in such cases the maxim *res ipsa loquitur* is often held to apply. Kotzé JA said that it seemed to him that the legal view in a case such as the present had been well summed up by Beven in his standard treatise on *Negligence*. According to him, to sew up a sponge or an instrument in a patient after an operation is evidence of negligence. He nonetheless concurred that the appeal should be dismissed but apparently on the basis that the defendant could not upon the evidence be held to be responsible for the sister not having kept a correct count of the number of swabs used and actually removed from the patient's body. Her duty in counting and checking the swabs is quite independent of the operating surgeon, he said.

Wessels JA in a minority concurring judgment stated that though the case was not founded on a breach of contract, it is one of those where the relationship between the parties arose out of a contract but where the act complained of is an injury of delict done in consequence of carrying out the contract. He said the delict grows out of a breach of duty which the law implied from the contract between the parties – the duty of the surgeon who contracts to operate, not to do so negligently. He said that the contract between a patient operated upon in a hospital and the operating surgeon is that the surgeon will perform the operation with such technical skill as the average medical practitioner in South Africa possesses and that he will apply that skill with reasonable care and judgment. Wessels JA said that the locality where the operation is performed is an element in judging whether or not reasonable skill, care and judgment have been exercised. He said that one cannot expect the same level of skill and care of
a practitioner in a country town as you can of one in a large hospital in a large city. In the same way one cannot expect the same skill of surgeons practising in South Africa as of surgeons practising in London, Paris or Berlin. Wessels JA stated that the relation of a hospital sister or nurse in a public hospital to a surgeon operating in that hospital is not that of master and servant not is it analogous to such relationship. The sister or nurse is an independent assistant of the surgeon though under his control in respect of the operation. He noted that the surgeon has no power to appoint her and she receives from him no fees. He also has no right to dismiss her and before and after the operation the doctor has no active control over her. Wessels JA noted that it had been decided in several cases that the doctor is in no way liable for what the nurse does after the operation to a patient in the ordinary course of those duties usually entrusted to a nurse\(^\text{27}\). The judge recognised that in operations some tem work is essential and that the work had become specialized so as to enable the surgeon to devote all his energy and attention “to the highly skilled and difficult work of isolation, dissection and purification”. He said that to what extent the doctor should or should not rely upon the teamwork of the hospital assistances depends entirely on the nature of the particular case. As regards the burden of proof Wessels JA held that the onus of proof must rest upon the plaintiff all of the time. He said that the maxim res ipsa loquitur cannot apply where negligence or no depends on something not absolute but relative and that as soon as all surrounding circumstances are to be taken into consideration there is no room for the maxim. Wessels JA held that it is necessary for the plaintiff who seeks to recover compensation for the damage done to him to show that the defendant was in all the circumstances of the case in the wrong when he left the swab in the abdomen and that in so doing he had failed to use that reasonable skill, care and judgment which it was incumbent upon him to employ. The mere fact, said Wessels JA, that a swab is left in a patient, is not conclusive of negligence. Cases may be conceived where it is better for the patient, in case of doubt, to leave the swab in rather than to waste time in accurately exploring whether it is there or not as for instance where a nurse has some doubt but the doctor after search can find no swab and it becomes patent that if the patient is not instantly sewn up and removed from the operating table he will die. In such a case there is no advantage to the patient, said Wessels JA, to make sure that the swab is not there if during the time expended in

\(^{27}\) *Perionowski v Freeman* A. F. & F. 977
exploration, the patient dies. Hence, he said, it seemed to him that the maxim *res ipsa loquitur* has no application in cases of this kind. Noting that almost all the surgeons called stated that a swab may be overlooked even though a high degree of care is shown and the more difficult the operation, the nearer the patient is to death, the more easily such an accident may happen, Wessels JA held that the appeal must be dismissed. He said that there was no doubt that the plaintiff owed her life to the skill of the defendant and the mere fact that in the exceedingly difficult operation, under the circumstances in which it was performed, he failed to find one of the swabs is not sufficient to justify the conclusion that he did not exhibit reasonable skill, care and judgment as an average surgeon would have displayed in the circumstances.

**Discussion**

This case was recently dealt with extensively in a doctoral thesis on the subject of the applicability of the maxim *res ipsa loquitur* in the health care context\(^\text{28}\). The maxim has already been discussed in detail in chapter seven and will not be further discussed here. The clear sympathy of the court for the doctor in this case (one almost gets the impression from the judgment that the court felt that the patient was ungrateful in that the ‘medical man’ saved her life) harks back to the days when medical paternalism was justified on the basis that ‘medical men’ had an almost mythical, not to mention mystical, knowledge of matters medical and their demi-god status in society was unquestioned by the common herd and may have lead in part to its finding that the maxim *res ipsa loquitur* was inapplicable to medical situations. As has been stated previously whenever the courts have considered the applicability of the maxim in the past they seem to run away from the idea that it shifts the burden of proof to the provider. Apart from the fact that the present writer cannot see why this is such an extremely bad idea in certain instances, the maxim does not shift the onus of proof onto the defendant. It merely transfers, an evidentiary burden that in the course of a trial can many times shift back and forth between the plaintiff and the defendant in much the same way that a tennis ball moves back and forth between players in a tennis match. The total score at the end of the game is what determines the outcome.

\(^{28}\) Van den Heever P "The application of the doctrine of *res ipsa loquitur* to medical negligence actions: A comparative survey" (unpublished doctoral thesis 2002 University of Pretoria). He revisits Van Wyk v Lewis in extensive detail and comes to the conclusion that there was no reason in that case why the maxim should not have been applied and that the court in fact erred in stating that it was not applicable in the medical context.
not one particular volley. Strauss\textsuperscript{29} points out that \textit{Van Wyk v Lewis} has been strongly criticised but ‘after all these years it still reigns supreme’. He notes that in the US the maxim \textit{res ipsa loquitur} has gained a strong foothold and has become a powerful tool in the hands of lawyers acting for dissatisfied patients. There he says, it has been developed into a ‘rule of sympathy’ to combat the so-called ‘conspiracy of silence’ among doctors\textsuperscript{30}.

A further point to note from this landmark case are that the court refused to hold the surgeon liable for the failure of the theatre nurse that was assisting him to correctly count the swabs that were inserted into and removed from the patient’s body and found that he was entitled to rely on her to do her part of the teamwork that was involved in a complicated and delicate surgical operation. The court rejected the idea that because the surgeon was in charge of the process this meant that liability for the negligent acts of others in the team could be laid at his door. This was confirmed more recently in the case of \textit{S v Kramer and Another} in which a court held that a surgeon could not be held liable for the medical negligence of the anaesthetist assisting in the operation. In \textit{Van Wyk} the nurse had not been cited as a party to the proceedings and the court rightly refused to discuss in any detail whether or not she was at fault. It is submitted with respect that the decision of the court in this regard was correct. It would not be conducive to effective teamwork in complicated medical and surgical procedures if the health professionals involved had a legal obligation not to rely on each other to perform their respective roles and fulfil their respective responsibilities in the larger operation. Furthermore, the fact that they should all be properly registered, licensed professionals recognised as such by their respective professional bodies is a factor which should be ignored. Just as a person prescribing a medicine should be able to rely on the fact that it has been registered upon the approval of the Medicines Control Council in circumstances where such approval may not be given without that august body being satisfied as to the safety, quality and efficacy of a medicine, so it is not for individual health professionals to question and mistrust one another’s professional status at a time when the patient should be the main focus of attention. The question of the applicability of \textit{res ipsa loquitur} has already been discussed.

*Dale v Hamilton*31

**Facts**

The facts appear from the judgment of Feetham J. The plaintiff claimed damages for an X-ray burn received by him in the course of an X-ray examination by the defendant. He alleged that the burn was caused by the lack of skill and neglect in treatment of the defendant in conducting the X-ray examination. The defendant admitted that the plaintiff was burned in the course of the X-ray examination he conducted but denied negligence. The plaintiff had been a shaft timberman on a mine and was a member of the Randfontein Estates Sick Benefit Fund Society. The defendant was a medical officer of the society and medical superintendent at the society's hospital. The plaintiff attended the hospital as an outpatient and was subjected to an X-ray examination for the purpose of diagnosing kidney stones. The plaintiff stripped to the waist and lay down on the couch on his stomach. A radiograph was taken and the plate developed. The defendant said it was underexposed and that he would take another. He took a second which was also underexposed and then a third which took a lot longer than the first two – as long as the plaintiff could hold his breath. The third plate, according to the defendant, was over exposed and so he took a fourth. The last plate he said, was the best of them all but still a little over-exposed. Three days after the X-rays, the plaintiff said his inside was painful and he had severe diarrhoea. After ten days he noticed a small red mark which gradually grew larger and became quite painful. He went to the defendant and was treated for it but is steadily became worse and on 24th February he had to take to his bed. On 28th February the defendant called and examined him and certified that he was unfit for work and in the afternoon the plaintiff went to hospital. His condition continued to get worse and in May the defendant advised that he should have an anaesthetic and have the wound scraped. The defendant said that the pain after the scraping nearly drove him mad. In the defendant's absence on leave in July, his locum asked leave to call in an expert radiologist to advise on treatment and thereafter the patient experienced a gradual improvement. All in all, the plaintiff spent more than 18 months in hospital.

---

31 *Dale* 1924 WLD 184
The defendant had only limited training and experience in radiography and the X-ray equipment at the hospital had been old when he first went to work there. Subsequently new X-ray equipment was purchased but some of the parts of the old apparatus were retained in an attempt to save on costs. The defendant had some training on the new equipment which was installed at least partly by the representative of the company from which the X-ray equipment was purchased. It was argued for the plaintiff that the fact that the defendant’s burn was caused in diagnostic work and that it was severe was sufficient to establish a prima facie case of negligence and to shift the onus onto the defendant of proving that there was no negligence. The expert evidence supported this position.

**Judgment**

The court decided that the explanation given by the defendant for the burns was correct. The positioning of the couch relative to the X-ray tube was too close. It referred to the judgment in *Mitchell v Dixon* and the *dicta* of Innes ACJ relating the degree and care and skill expected of a medical practitioner. It also referred to the case of *Lymbery v Jeffries*, heard prior to Mitchell’s case, and the fact that it was there held that work with X-rays was not work ordinarily or specially pertaining to the medical profession. Feetham J stated that if a doctor undertakes to do radiographic work, he must exercise in that work which he undertakes as a medical man, reasonable skill and care. But, he said, he was not sure that it made any difference whether he was a doctor or not. Anybody who undertakes radiographic work is obliged to exercise a reasonable degree of skill and care in doing that work. The question, said Feetham J, is what is the limit of the responsibility of a man undertaking radiographic work. Can it be said that he is entitled to take the factors with which he has to deal for the purpose of providing a suitable setting for carrying out a radiographic examination on trust or must he satisfy himself as to those factors? Feetham J held that in view of the evidence as to what constituted a setting and that the different factors in the setting are all interdependent a radiographer cannot escape liability if, owing to his having given an exposure which in view of the nearness of

32 *Mitchell* fn 1 *supra*
33 *Lymbery v Jeffries* 1925 AD 236
the X-ray tube to the patient is excessive, the patient is burned. In the present case, he noted that the defendant was not in the position of having ascertained from the expert who was employed to install the apparatus, what the tube distance was. The court stated that it was unnecessary to determine whether or not the expert had given the defendant the necessary information because on his own admission the defendant neither asked where the tube was nor looked to see where it was yet on his own admission, the position of the tube was a vital factor in settling the time of exposures. The fact that the tube was as near to the patient as it was, caused the serious burn. The court found the defendant guilty of negligence in that he either did not exercise the care which he should have exercised being a trained man and having undertaken to use reasonable skill and care or he lacked the training necessary to enable him to use the tube which he was using. The court awarded damages for loss of earnings and also the effect of the injury on the plaintiff’s future earning capacity since he could no longer return to his previous job of shaft timberman. It also awarded damages for pain and suffering and loss of general health.

**Discussion**

Claassen and Verschoor note in connection with this case that according to Giesen and Fahrenhorst a physician cannot defend himself by averring that he tried his best in accordance with his abilities and professional knowledge. If he is incompetent to treat a patient’s specific illness he is obliged to refer the patient back to a specialist. A general practitioner will not, however be blamed for his lack of knowledge, training or experience if he undertakes specialist work in an emergency.

This is a clear case of *imperitia culpae adnumeratur* i.e. where lack of skill is reckoned as fault. In this particular situation it would seem that the mine medical scheme (the Sick Benefit Fund Society) was pennywise but pound foolish firstly in not wanting to spend the money to totally re-equip the X-ray unit in the mine hospital and secondly in allowing and possibly even encouraging a doctor who had no formal training or skill on the subject to do X-ray examinations of patients. Nonetheless it

35 Giesen D and Fahrenhorst I ‘Civil Liability Arising From Medical Care – Principles and Trends’ *International Legal Practitioner* 1984 9(3) p 80-85

1084
was apparently he and not the Society that incurred the delictual liability. It is noteworthy that the court said that anybody who undertakes radiographic work is obliged to exercise a reasonable degree of care and skill. The court was not even sure that it made a difference whether the defendant was a doctor or not. This case can thus also be seen from the perspective of someone (whether a layperson or a professional) who is in control of a dangerous thing or is engaged in a dangerous activity. A further point to note about this case is that the court would not allow the defendant to blame anyone else for the manner in which the equipment was set up since part of the duties of a radiographer is to make sure that all of the items of equipment that he uses are correctly positioned. This is because all of the factors are interdependent when taking an X-ray. The court noted that the defendant did not even attempt to make sure that the tube was correctly positioned and so it was unnecessary to consider whether the expert technician who had come out to install the equipment had given the correct information to the defendant. This case is not inconsistent with the decision in Van Wyk v Lewis that the surgeon could not be held responsible for the failure of the theatre nurse to count the number of swabs used in and removed from the patient’s body. It could be asked in relation to Dale why the defendant was not entitled to rely on the expert’s correct positioning of the tube? However, it is submitted that Dale is distinguishable from Van Wyk v Lewis because in the case of the former, it was the task of the radiographer to make sure that the settings were correct in respect of each X-ray and each patient whereas in Van Wyk, it was not the task of the doctor to count the swabs. The work in Van Wyk had consciously been divided up and allocated before the procedure took place. In Dale, the expert technician had set up the equipment simply to show the defendant how it operated and that it was in working order. In Dale, the position of the tube could change depending on the patient’s weight and size and the area of the body to be X-rayed. According the evidence, its position did not necessarily remain the same in respect of every X-ray.

---

36 Schutz JA in Durr v ABSA Bank Ltd and Another 1997 (3) SA 448 (SCA) stated: "I come towards my conclusion on the subject of negligence. The basic rule is stated by Joubert (ed) The Law of South Africa First Reissue vol 8.1 para 94, as follows: 'The reasonable person has no special skills and lack of skill or knowledge is not per se negligence. It is, however, negligent to engage voluntarily in any potentially dangerous activity unless one has the skill and knowledge usually associated with the proper discharge of the duties connected with such an activity.'"

37 Van Wyk fn 3 supra
Facts

The two plaintiffs, who were married to each other in community of property, sued the estate of Dr Hamman, formerly a neuro-surgeon practising in Cape Town, for damages for negligence in connection with a certain operation performed by him on second plaintiff on 12 April 1972. The second plaintiff was born in 1946, matriculated in 1964 and in 1967 obtained a university diploma in the teaching of retarded children. She married the first plaintiff in 1969. When she was a girl aged 14 she fell in a gymnasium on her coccyx and hurt it. She had pain off and on for many years and in 1970 received treatment from a Dr. Bruk in the form of a cortisone injection. In January 1972 she fell on the sharp edge of a chair and again injured her coccyx. She consulted her family doctor, Dr. Levy, who prescribed certain treatment which did not help her. Thereafter she was X-rayed and on 10 March 1972 saw an orthopaedic surgeon, Dr. Butler, who advised against the removal of the coccyx and prescribed conservative treatment in the form of pain pills and the use of a ring cushion. She was apparently not satisfied with this advice and after being told by a friend that Dr. Hammann might be able to help her she approached Dr. Levy and asked him to refer her to Dr. Hammann. This was duly done and the second plaintiff saw him in his rooms on 5 April 1972. Dr Hammann suggested that they first try an epidural block with saline and anaesthetic. On 7 April 1972 two injections of saline and novocaine were administered but they did not help, the coccyx remaining as tender as before. The second plaintiff saw Dr Hammann again on 11 April when he suggested that he should do bilateral phenol blocks of the lower sacral nerves as an outpatient at the Volkshospitaal. The second plaintiff went to the hospital on 12 April for the first of these injections and a right-sided unilateral block was performed, the intention being to inject the other side two days later. The second injection was, however, never administered because the first injection, although it achieved the desired result of relieving the coccygeal pain, had unfortunate consequences, namely, loss of control of

---

38 Richter 1976 (3) SA 226 (C)
the bladder and bowel, loss of sexual feeling and loss of power in the right leg and foot.

Dr. Hammann died in September 1974 and the present proceedings were instituted in April 1975. The grounds of negligence originally relied upon were that Dr Hammann was negligent in advising a phenol block for the second plaintiff's complaint, and he was also negligent in the manner in which it was administered. On 4 February 1976, shortly before the trial commenced, notice was given of intention to apply for an amendment of the particulars of claim so as to include other grounds of negligence. The principal of these were that Dr Hammann failed to warn plaintiff of the dangers inherent in the procedure, and that Hammann failed to enquire into the second plaintiff's prior medical history, more particularly with regard to her bladder. These amendments were duly allowed.

**Judgment**

Watermeyer J noted that Dr. Hammann was a neuro-surgeon of considerable experience. He was the head of the teaching department of Neurosurgery at the University of Cape Town and the head of the clinical department of Neurosurgery at Groote Schuur Hospital. He had been in practice for many years and had the reputation of being an extremely careful and meticulous technician, well informed theoretically and a very competent surgeon. Three experienced neuro-surgeons gave evidence. Professor de Villiers who, apart from his other considerable qualifications, had since 1970 been head of the Department of Neurosurgery at Groote Schuur Hospital gave evidence for the plaintiff. For the defendant, Dr. Rose-Innes, Professor of Neurosurgery at the Stellenbosch Medical School and head of the Department of Neurosurgery at the Tygerberg Hospital, gave evidence and also Dr. Mendelow, practising as a neuro-surgeon, part-time senior neuro-surgeon to the Johannesburg Hospital and the University of the Witwatersrand and past president of the Society of Neurosurgeons of South Africa.

Phenol intrathecal blocks are usually done to relieve pain in cancer patients and for spasticity, and there was much debate in the evidence as to whether it was a permissible treatment for the treatment of coccydynia which, it was generally agreed,
was the condition from which the plaintiff was suffering. Professor de Villiers who examined the plaintiff on one occasion some six to seven weeks after the phenol injection, was fairly firm that he would not have given such an injection for what he described as ‘n mindere kondisie’. He pointed out that since the second fall, a period of only 2 to 2½ months had elapsed, that pain in the coccyx often takes a long time to clear up and that he would have advised conservative treatment for a long time. His reason for saying this was that there are dangers attached to an injection of this nature, particularly to the nerve supply of the bladder and bowel, and he did not think that the taking of such a risk was warranted for the relief of a benign pain such as coccydinia. He said that what had happened in the present case was that, although Dr Hammann was attempting to perform a unilateral block, i.e. on the right side only, the nerves S2, 3, and 4, on both sides had been affected and this resulted in damage to the nerve supply of the bladder, bowel and sexual organs. He readily conceded that this was a very unusual result - to use his own words ‘very uncommon in any man’s experience’ - but nevertheless he would not have attempted it in this particular case. Professor de Villiers’ opinion was based on his assessment of how bad the plaintiff’s pain was but he accepted that in cases of coccydinia where the pain was very severe, disabling or intractable it would be permissible to administer a phenol block. He would not go so far as to say that Dr Hammann was wrong in adopting this procedure. Dr. Rose-Innes, who trained under Dr Hammann and saw him doing phenol blocks, said that Dr Hammann was an expert in this particular field and did phenol blocks well. He himself used phenol blocks and, although he did not do so for coccydinia, he said that it was an acceptable procedure which had been used by published authority of the highest repute. It was widely used for conditions which are not cancer but which produce severe intractable pain. By intractable pain he meant pain that did not respond to other forms of treatment, and he said that, provided one is dealing with a case of intractable pain, he would grant any competent surgeon the right to use it. Dr Mendelow’s attitude was that he did not treat a condition if there was no discernible cause, and he would therefore not have done a block in the present case. He, however, regarded a phenol block as an acceptable, reasonable and a safe procedure and he would not deny any of his colleagues the right to use such a procedure in this condition. In support of his opinion he referred to several published articles on the subject. His view was that in respect of any pain, whether intractable or not, the crux of the matter is the doctor’s assessment of how disabling the pain is to the patient and
whether it requires treatment, and the form of the treatment must then be with the doctor.

Watermeyer J said that in his view, Dr Mendelow’s approach was the correct one, namely, that whether or not it should have been done depended upon Dr. Hammann’s assessment of the degree and severity of the pain which he was being called upon to treat. He noted that it is a well recognised principle of South African law that in cases of this nature, viz. where there is a claim against a deceased estate, although the degree of proof required is no higher than in ordinary cases, the evidence of the plaintiff should be scrutinized with caution. Dr Hamman was not available to testify as to his assessment of the degree and severity of the pain from which Mrs Richter suffered. Watermeyer J observed that none of the expert witnesses went so far as to say that it would be negligent to administer a phenol block for coccygeal pain of a severe nature. The second plaintiff, Mrs Richter, was not prepared to accept Dr Butler’s advice to persevere with conservative treatment and Watermeyer J commented that she was probably insistent that something had to be done about it. She had told Dr Hammann that she had had all sorts of treatment and must have told him that physiotherapy and cortisone injections had not helped. Hammann was an expert in this field and he had never before experienced from a unilateral block the unfortunate results which occurred in the present case. The court noted that all the neuro-surgeons agreed that the results in Mrs Richter’s case were very unusual and most uncommon, and, in Dr. Rose-Innes’ words, “they could not have been expected by any stretch of imagination”.

Watermeyer J noted that the second plaintiff said that if she had been warned that there was any danger she would not have consented to undergo the operation. This was a new ground of negligence introduced for the first time when the particulars of claim were amended. Here, too, the court was entirely dependent upon the plaintiff’s evidence which was subject to the same uncertainties and criticisms as had been mentioned earlier, more particularly because she conceded that there was a discussion between Dr. Hammann and herself about danger to a possible foetus and there was also a discussion about how long the effects of the phenol block would be likely to last. Watermeyer J said that the problem still arose as to whether in the circumstances of the present case Dr. Hammann was under a duty to warn, and if so whether a
failure to warn would constitute actionable negligence on his part. He said that the question of the duty of a medical practitioner to warn a patient of the possible dangers connected with an operation and in what circumstances such failure could constitute negligence, is a vexed question and there are few authorities on the subject. He referred to *dicta* in the cases of *Lymbery v Jefferies* and *Esterhuizen v Administrator, Transvaal* and then continued to observe that the present action was not one for assault. The allegation was that Dr Hammann was negligent in failing to warn the patient. Watermeyer J noted that doctor whose advice is sought about an operation to which certain dangers are attached - and there are dangers attached to most operations - is in a dilemma. If he fails to disclose the risks he may render himself liable to an action for assault, whereas if he discloses them he might well frighten the patient into not having the operation when the doctor knows full well that it would be in the patient's interests to have it. He said that it may well be that in certain circumstances a doctor is negligent if he fails to warn a patient, and, if that is so, it seems in principle that his conduct should be tested by the standard of the reasonable doctor faced with the particular problem. In reaching a conclusion, said Watermeyer J, a court should be guided by medical opinion as to what a reasonable doctor, having regard to all the circumstances of the particular case, should or should not do. The Court must make up its own mind but will be assisted in doing so by medical evidence. After examining the evidence Watermeyer J concluded that if Dr. Hammann did not mention the possibility of complications to the plaintiff he was not negligent in failing to do so. The plaintiff's claim was dismissed with costs on the grounds that she had failed to prove negligence on the part of Dr Hamman.

**Discussion**

The patient in this case seems to have been one of those unfortunate individuals who suffer from chronic pain, travel from one doctor to another trying to find immediate relief and are not happy to accept that at times, the more conservative route, although it may take a bit longer, is ultimately preferable. They require 'active' treatment of their condition. The court in this case had to consider whether the risks that materialised and which, on the basis of the expert evidence before it, was highly
remote, should have been mentioned to the plaintiff before the procedure was carried out. In this sense it was a case about informed consent and the lengths to which a provider is legally required to go in informing the patient before obtaining the required consent. It is of interest that the court in this case applied the standard of the reasonable doctor, a standard that was subsequently rejected by Ackermann J in the judgment in *Castell v de Greef* which put the standard of the reasonable patient decisively on the map. Although Watermeyer J indirectly considered the question of so-called therapeutic privilege it was not directly applicable in the present case because the remoteness of the risk seemed to be the main issue around which the case revolved. The evidence seemed to suggest that the consequences to the patient that had actually materialised were so remote as to be unforeseeable. In this event, it is submitted that even on the reasonable patient test, the doctor in this case would not have been negligent in failing to inform the patient of the risk since it was not a foreseeable one. The question of whether the procedure used by Dr Hamman was the appropriate one also seems to have been answered in the affirmative and the case indicates that there are many ways, in medical terms, of skinning a cat and that just because one doctor does it differently does not necessarily mean that he is wrong.

The question of the failure of a patient to take a provider’s advice and the insistence of the former on less than optimal treatment is interesting in the context of this case. It may well be that Dr Hamman, although an expert at phenol blocks, may not have used them as a routine treatment of coccydynia and that it may have been at the patient’s insistence that he decided to use this particular method of treatment despite the fact that other doctors had advised conservative treatment and Dr Hamman himself seems to have tried a number of options before he used the phenol block. At a broader level the question is to what extent a provider can be held liable for treatment that he knows is not the best option for the patient or that is contrary to his best advice although not necessarily contrary to medical practice generally. The issue of pain management is particularly significant in this context because there is usually no scientific way to measure a patient’s subjective experience of pain. In fact the court recognised in *Hamman* that whether or not the treatment should have been given rested on the doctor’s assessment of the degree of severity of the patient’s pain. If a provider is of the view that a condition can be treated conservatively and that this is the best route for the patient to follow, but the patient insists on other more active treatment, it is
submitted that the maxim volenti non fit injuria comes into play and as long as the patient has given informed consent, the provider should not be held liable for any materialisation of the risks accepted by the patient. The patient’s right to self determination means that he or she is free to make the wrong choices. However, if the patient is requesting treatment which is contrary to recognised medical practice or which the provider knows is likely to do more harm than good in the patient’s circumstances, the provider may not necessarily be able to escape liability if he proceeds with the treatment. It is submitted that there are limits, in terms of public policy considerations, to what a patient can consent to even if it is informed consent\textsuperscript{41}. A patient’s right to self-determination is not absolute and must be balanced against the interests and boni mores of society.

9.2.7 \textit{Blyth v van den Heever}\textsuperscript{42}

\textbf{Facts}

The facts appear from the judgment of Corbett JA as follows. At about 4.30 pm on Sunday 23 May 1971 the appellant (plaintiff below) sustained fractures of the bones of his right forearm (the radius and the ulna) as a result of a fall from his horse while playing polo. After receiving, at the polo field, first-aid in the form of the application of an L-splint to his arm and an injection, appellant was conveyed in a private motor vehicle to the provincial hospital at Ermelo, a distance of some 61 km. He arrived there at about 5.30 pm. The family doctor at the time was the respondent (defendant below). He was called to the hospital and saw the appellant at about 6 pm. Having examined the broken arm, respondent decided to perform a reduction of the fractures under general anaesthetic. Arrangements were made for an operating theatre to be made ready for this purpose at 8 pm that evening and for an anaesthetist to be available. At the appointed time the operation was performed. It ultimately took the form of an open reduction (i.e. a reduction involving a surgical incision in order to expose the fracture site) of both the radius and the ulna. In the case of the ulna the two

bone fragments were aligned and fixed in position by means of a metal plate. Finally the arm was encased - from approximately the middle of the upper arm to the base of the fingers - in a plaster cast.

The appellant remained in the Ermelo hospital from then until the following Saturday (29 May 1971), when he was moved to the Rand Clinic in Johannesburg. By that stage a massive sepsis had destroyed most of the muscle tissue in the extensor and flexor compartments of appellant’s right forearm and also certain of the forearm nerves. On the Sunday (30 May) a specialist orthopaedic surgeon, Dr Boonzaaier, who had treated appellant on Friday 28 May, told the appellant’s mother, Mrs M E Blyth (Mrs Blyth senior), that the appellant ‘would be lucky if he retained 20 per cent use of his arm’. This prognosis proved to be unduly optimistic. Despite a week’s treatment at the Rand Clinic, where appellant was attended by Dr Boonzaaier, the sepsis persisted. At the end of the week (i.e. on Saturday, 5 June) the appellant was allowed to go home. Thereafter he was seen once a fortnight by Dr Boonzaaier. There was, however, no material improvement in the condition of his arm. After he had seen two medical practitioners in Durban, appellant eventually consulted Prof Louis Solomon, Professor of Orthopaedic Surgery and Chief Orthopaedic Surgeon at the University of Witwatersrand. This was on 28 August 1971. Prof Solomon performed an operation on the arm on 2 September 1971 with a view to eliminating the infection. This was successful in that the infection cleared up after two or three weeks. Thereafter, a colleague of Prof Solomon, a Dr Biddulph, who specialises in hand surgery, attempted certain reconstructive surgery aimed at restoring to some extent the nerve function in the forearm and hand. The operation was performed in two stages on 26 October 1971 and 25 January 1972. Prof Solomon assisted at the first operation. These procedures produced very limited, if any, improvement in the condition of appellant’s arm. Eventually the surgical wounds healed and the position became stabilized. At the time of the trial in the Court a quo the forearm had become reduced to what the trial Judge (Eloff J) described as ‘a shrunken clawlike appendage of extremely limited functional value’. On 17 May 1974 appellant instituted action in the Transvaal Provincial Division against respondent, claiming damages in the sum of R70 941 and costs of suit. Shortly before the trial, which commenced on 21 March 1977, this claim was increased to R112 123,56. After a lengthy trial Eloff J granted
absolution from the instance with costs. The present appeal was against the whole of the trial Judge’s judgment and order.

**Judgment**

Corbett JA observed that broadly speaking, the appellant’s case against respondent was that in treating him for the broken arm the respondent acted negligently in that he failed to exercise the professional skill and diligence required of him, as a medical practitioner, in the particular circumstances of the case; that the respondent’s negligence in this regard caused or materially contributed to the functional disability affecting the appellant’s right arm and the pain and suffering which he had endured in regard thereto; and that the respondent was consequently obliged, in delict, to compensate the appellant in damages. In the appeal, the appellant’s counsel confined his case, on the negligence issue, to certain aspects of the post-operative care and treatment of the appellant. In so circumscribing the issues appellant’s counsel, said Corbett JA, exercised a wise discretion since a reading of the evidence showed that the other grounds were either not shown preponderantly to have constituted professional negligence or were not causally connected with the ultimate disaster which overtook appellant’s right arm. According to Corbett JA the case resolved itself into three main questions: (i) what factually was the cause of the ultimate condition of the appellant’s arm; (ii) did negligence on the part of the respondent cause or materially contribute to this condition in the sense that respondent by the exercise of reasonable professional care and skill could have prevented it from developing; and (iii) if liability on the part of respondent be established, what amount should be awarded to appellant by way of damages?

It was common cause that the appellant’s forearm was invaded by a massive sepsis. The general consensus was that the micro-organisms which brought about the sepsis were probably introduced into the arm at the time of the operation on Sunday night and by reason of the surgical incisions then made. It was no part of the appellant’s case that in so introducing the sources of the infection, or in failing to prevent their introduction, the respondent acted negligently. The sepsis must, therefore said Corbett JA, be regarded as a causal factor which is factually relevant but legally neutral. The appellant’s case, however, broadly speaking, was that it was not sepsis alone, but
sepsis operating upon and in conjunction with a very serious ischemic condition in appellant's forearm that caused the eventual catastrophe. In outline, the theory was that the ischemic condition developed shortly after the operation, that it gained in intensity during Monday and Tuesday and that by about 6 pm on Tuesday irreversible damage on a large scale had been caused to muscle and nerve tissue in the appellant's forearm. This dead, or necrosed, tissue, together with damaged tissue at or near the fracture sites, was particularly vulnerable to the invading micro-organisms and formed a ready medium for the rapid and extensive spread of the infection. The respondent's case, on the other hand, was, broadly, that there was no large-scale ischemia, but that sepsis alone or sepsis operating initially upon the limited tissue necrosis at or near the fracture sites (the so-called 'limited tissue necrosis' theory) were the sole causes of the ultimate condition of appellant's arm. The court observed that 'ischemia' means a deficiency of blood in a particular part of the body due to a constriction or occlusion of the blood vessels supplying that part. The most important function of blood is to supply oxygen to the tissues. Tissues cannot survive without oxygen. Consequently a protracted ischemia can cause the death of tissue. There are basically two ways in which an ischemic condition of the muscles and nerves of the forearm can develop. The one is where an artery or major blood vessel serving the forearm becomes injured or constricted or occluded. The other is where a condition, referred to in evidence as a 'compartmental syndrome' develops. With regard to the latter the court observed that it appears from the literature on the subject that a Volkmann's contracture resulting from traumatic injury (such as a bone fracture) is most likely to develop in the lower leg or in the upper arm or upper forearm. Consequently medical practitioners treating, *inter alia*, fractures of the upper forearm must be on their guard against the possible development of an ischemic condition leading to a Volkmann's contracture. They must watch out for the signs and symptoms of an impending ischemia and, if these signs present themselves, take remedial action. The classical symptoms are summed up in what have been described as the 'five p's': pain, pallor, pulselessness, paralysis and para-anaesthesia (loss of sensation over and below the ischemic area). Depending on the type of ischemia involved, these symptoms may vary in their incidence and intensity. Thus, for example, the symptom of pulselessness may not present itself, initially at any rate and there are recorded instances of a Volkmann's contracture having developed without the pain symptom or in a relatively painless manner. The court noted that once the
threat of a Volkmann’s contracture has been diagnosed or is suspected, remedial action must be taken. Since the ischemic condition in the affected limb is, in the case of a compartmental syndrome, the result of a pressure build-up in the forearm, the most important remedial action is to try to achieve a decompression. If the limb is encased in a circumferential plaster cast, then this must be split and, if necessary, removed. There was considerable debate between the experts as to the real extent to which a plaster cast may contribute to a compartmental syndrome, particularly where there is a padding of cottonwool between the plaster and the limb; but, whatever the decompressive effect of the removal may be, it is necessary that this should be done, firstly, in order to make a proper diagnosis and, secondly, as a prelude to more drastic action, if that should prove necessary. If the removal of the plaster, gentle massage and other treatment does not bring the necessary relief, then an operation known as a ‘fasciotomy’ must be performed. This involves, in the case of the forearm, a surgical splitting of the deep fascia down the length of the forearm in order to remove the compressive effect of this inelastic sleeve upon the tissue, blood vessels and interstitial fluids contained in the osteofascial compartments. Corbett JA observed that the evidence indicated that the build-up of an ischemic condition of this nature (i.e. the compartmental syndrome) may be very rapid or it may be a slow, insidious process. It starts with the tiny blood-vessels at the extremities of the vascular system (what one of the experts termed the ‘vascular tree’) and, as more and more blood-vessels become occluded, it works its way towards the larger blood-vessels and eventually spreads throughout the fascial compartment. It was the appellant’s case, and the view of his experts, that the onset of the alleged ischemia was a fairly rapid one and that by 6 pm on Tuesday 25 May it had done its damage.

With regard to causation the court stated that in determining what in fact caused the virtual destruction of the appellant’s arm, the court must make its finding upon a preponderance of probability. Certainty of diagnosis is not necessary. If it were, then, in a field so uncertain and controversial as the present one, a definitive finding would become an impossibility. Corbett JA stated that bearing in mind that in the appellant bore the burden of proof, the question was whether it was more probable than not that large-scale ischemia, coupled with sepsis, caused the damage43. After considering all

43 See Ocean Accident and Guarantee Corporation Ltd v Koch 1963 (4) SA 147 (A) at 157
the evidence, he held that it was more probable than not that the appellant suffered a severe and generalised ischemia in his right forearm, that this ischemia so devitalised the muscle tissues of the forearm that it was possible for the staphylococcal infection to become a massive and invasive one and that as a result thereof there was a large-scale destruction of muscle and nerve tissue and ultimately a fairly typical Volkmann’s contracture. This finding reversed that of the court a quo. The next question considered by the court was whether the eventual result was attributable to negligence on the part of the respondent.

Corbett JA observed that, applying the basic principles relating to delictual negligence which is causally linked to the damage suffered to the situation in the present case, the enquiry resolved itself into the following questions:

(i) Whether the reasonably skilled and careful medical practitioner in the position of the respondent would have realised that a serious ischemic condition was developing or threatening to develop in appellant’s forearm and, if so, when he would reasonably have come to realise this.

(ii) Whether there was remedial action which could reasonably have been taken.

(iii) Whether the same notional practitioner would have known of this remedial action and would have realised that it had to be taken.

(iv) Whether the remedial action, if taken when the need for it ought reasonably to have been realised, would have prevented the damage suffered by appellant.

(v) Whether respondent himself failed to take such remedial action.

With regard to (i) the court held that that the reasonably skilled and careful medical practitioner in the position of respondent would have been aware of the danger of an ischemic condition developing in the appellant’s forearm. He would have known that this danger was a dual one, i.e. it could arise by reason of arterial occlusion or embarrassment or because of the development of a compartmental syndrome. With regard to (ii) and (iii) the court held that the very first step would be to remove the plaster or split it completely and expose the skin. This in itself had two advantages. If the plaster was constricting the arm, removal or splitting would bring relief. Secondly removal or splitting would enable the practitioner to examine the arm and to see what is occurring underneath all the dressings. The doctor would be able to see whether the arm itself appeared swollen or whether from the appearance of the skin there was
swelling and compression within the fascial compartments. Furthermore, the usual tests for ischemia, designed to detect the five p’s and the passive extension test, would then be performed. Thereafter the patient’s condition would be carefully watched and, if the adverse symptoms persisted, then the more drastic step of a fasciotomy would have to be considered, and, if necessary, performed. With regard to (iv) the court found that the evidence as a whole, established as a matter of probability that, had the respondent been alerted by his own observations to the danger of an impending ischemia on Monday morning, either when he saw appellant at 8 am or later in the morning when he was telephoned, and taken the appropriate remedial action then the severe and generalised ischemic condition with concomitant tissue necrosis would have been avoided. This would have prevented the staphylococcus aureus infection from spreading in the way in which it did. It would have been sealed off and localised by the body’s natural defensive responses. The likelihood, therefore, was that there would have been no large-scale muscle destruction and no nerve lesion. The appellant might have had two unpleasant abscesses in the region of the surgical wounds, but there it would have ended. More probably than not the fractures would have healed satisfactorily and appellant would have regained the full use of his arm. With regard to question (v), the court found that it was clear that the requisite remedial action was not taken by respondent. This was partly because he did not diagnose an impending ischemia or suspect the possibility of one developing. In failing to do so, he was, therefore, negligent in that he failed to display the skill and care reasonably to be expected of him. Another reason, said the court, why he failed to make the appropriate diagnosis was because he did not maintain the necessary vigilance (he allowed 24 hours to elapse between visits during this vital period) and when he was telephoned by the sisters and told of their concern he did not go to see things for himself. Corbett JA said that this was the stage par excellence when he should have hurried to the hospital, removed the plaster and commenced the remedial procedures detailed above. In failing to do this and in particular in leaving the splitting of the plaster to the nursing staff he failed in his duty towards his patient and was negligent.

As regards damages Corbett JA observed that the practice of South African courts in assessing damages in a situation such as the present was well stated by Colman J in
Burger v Union National South British Insurance Co. In this connection, observed Corbett JA, Colman J drew a distinction between causation and quantification and observed that it had never been the approach of the court, when faced with uncertainties in regard to the consequences of injury and the quantification of the loss suffered, to resolve these uncertainties by the application of the burden of proof. Although, as Colman J conceded, it is not always possible to distinguish clearly between causation and quantification in this sphere, Corbett JA agreed that this distinction underlies and justifies the general practice of taking into account certain future possibilities, which have not been shown to be probabilities, in computing prospective damages. There was a possibility that the appellant may have to have his arm amputated although he was refusing to acknowledge this possibility at the time of the court case. Corbett JA noted that the appellant was a farmer and that whether he continued with his present disablement (with the possibility of slight improvement as a result of reconstructive surgery) or opted for amputation and an electronic arm, he would be severely handicapped in his day-to-day farming activities. In order to compensate for this he could be provided with a semi-skilled assistant to supplement this deficiency in his working effectiveness. For this aspect he held that an award of R7 500 would provide fair and adequate compensation. With regard to general damages for pain and suffering, permanent disability, disfigurement and loss of amenities, the court awarded R20 000 in damages saying that the pain and suffering attributable to the ischemia, the invasive sepsis, the virtual destruction of his forearm and the various remedial procedures which were attempted must have been very considerable. He noted that having a suppurating, septic arm for about four months must itself have been a very unpleasant experience and that the disability, which was the virtual loss of function of his right arm, was a most serious one. The appellant had faced his misfortune with fortitude and had shown a willing ingenuity in adapting to his handicap. Although right-handed, he had learnt to write with his left hand and also

---

44 Burger 1975 (4) SA 72 (W) at 75D - G where Colman J held that: ‘A related aspect of the technique of assessing damages is this one; it is recognised as proper, in an appropriate case, to have regard to relevant events which may occur, or relevant conditions which may arise in the future. Even when it cannot be said on a preponderance of probability that they will occur or arise, justice may require that what is called a contingency allowance be made for a possibility of that kind. If, for example, there is acceptable evidence that there is a 30 per cent chance that an injury to a leg will lead to amputation, that possibility is not ignored because 30 per cent is less than 50 per cent and there is therefore no proved preponderance of probability that there will be an amputation. The contingency is allowed for by including in the damages a figure representing a percentage of that which would have been included if amputation had been a certainty. That is not a very satisfactory way of dealing with such difficulties, but no better way exists under our procedure. I would refer, in regard to this aspect of the matter, to the remarks of Wessels JA in Van Oudtshoorn v Northern Assurance Co Ltd 1963 (2) SA 642 (A) at 650 - 651.’

45 Corbett JA also referred to Kwelé v Rondalia Assurance Corporation of SA Ltd 1976 (4) SA 149 (W) at 152H - 153A in this regard.
to play tennis left-handed, using the contracted right hand in some ingenious way to throw up the ball when serving. Nevertheless, there remained a disablement which adversely affected the sports and pastimes such as polo, golf, swimming, dancing, rowing, fishing and weight-lifting of which he was fond. It noted that he was also handicapped in his daily activities, eg dressing himself, bathing himself, cutting his food at table, playing with his young children and so on. Corbett J said that the state of the appellant’s arm represented a very considerable disfigurement and noted that the appellant confessed that he was very self-conscious about it. No doubt, in the course of time, said Corbett JA, this feeling of self-consciousness would diminish, but it would probably never disappear entirely.

Discussion

The extensive and detailed factual analysis conducted by Corbett J in his judgment in this case is indicative of just how complex questions of causation in the health care context can become. The important point to note about this case is that it confirms the judgment in Dube v Administrator Transvaal\textsuperscript{46}, which also involved a Volkmann’s contracture following a fractured arm, to the effect that once a provider takes on the treatment of a patient it is his responsibility to ensure that throughout the process the necessary precautions are taken to ensure a successful result. Included in this requirement is an awareness of complications that may foreseeably develop and the measures that must reasonably be taken to avoid them. One cannot fall back on the argument, for instance, that if left untreated the contracture would have developed anyway and that the medical intervention should not be regarded as a kind of novus actus interveniens because it does not interrupt the chain of causation started by the original accident. This kind of argument is only applicable in circumstances where the medical intervention was not negligently conducted and so is of no use to a provider as a defence to claims for medical negligence. If, but for the negligence of a provider, the patient would have received the proper medical care and treatment in the normal course of events, then the final state of the patient’s health is causally attributable to the negligence of the provider in treating him.

\textsuperscript{46} Dube v Administrator Transvaal 1963 (4) SA 260 (W)
Facts

The excipient claimed damages for negligent surgical operation to her right kidney carried out by the respondent, which caused the loss of her right kidney, pain, suffering, loss of amenities of life, anguish and misery, all of which caused her damages in the sum of $25,000 of which she claimed payment and costs of suit.

In her declaration, she stated that, on 26 September 1980, the defendant performed a surgical operation upon her right kidney and that he performed this operation negligently, because:

(a) there were no grounds or there were insufficient grounds for conducting the said surgical operation;

(b) during the course of the said surgical operation, the defendant injured her right kidney; and

(c) the defendant failed to remove, after the said surgical operation, a splint (or catheter) which had during the surgical operation been introduced by the defendant into her right ureter.

She averred that the result of the defendant’s failure to remove the splint from her right ureter until 27 January 1981 was that she suffered a recurrent urinary infection of the bladder, pain and anxiety. She also averred that the negligent operation as a whole occasioned her pain and suffering and the injury to her right kidney resulted in its nephrosclerosis and its atrophy, requiring its surgical removal on 13 March 1984. She concluded that the injury and its consequences occasioned her pain, suffering, chronic illness, anxiety and a reduced expectation of life. Hence, she claimed specific damages in the sum of $2,500 and general damages in the sum of $22,500.

The respondent in response filed a special plea in bar under Rule 137 (1) (a) of the High Court Rules and pleaded that the excipient’s claim had prescribed in terms of section 13 (1) of the Prescription Act 31 of 1975 because:

---

47 Correia 1986 (4) SA 60 (ZI)
(a) the date of the alleged negligence and surgical operation was 26 September 1980;
(b) the further allegation of negligence for failure to remove the splint was until 27 January 1981;
(c) the period of prescription in terms of s 14 (d) of the Prescription Act in respect of such claims is three years;
(d) in terms of s 15 (1) of the Act prescription began to run not later than 27 January 1981; and
(e) summons in this case was only served on 4 March 1985, more than three years after 27 January 1981.

Following the filing of the special plea in bar, the excipient requested further particulars under Rule 137 (1) (d) in the following matters:

(a) The dates on which the claims in the various paragraphs become due, and when did the excipient become aware of the identity of the defendant and the facts in the various paragraphs.

(b) Whether it was alleged that the excipient could have acquired knowledge of the facts from which the claim arises by exercising reasonable care? If so, then this was to be specified.

(c) Whether it was also alleged that the excipient could have acquired knowledge of such identity and of such facts by exercising reasonable care and if so these also were to be specified.

The respondent supplied the particulars regarding when the two claims became due, but with regard to the request on when the excipient became aware of the identity of the defendant and the facts, he stated that since the plaintiff’s claim in this matter was based on a contract between her and the defendant, the particularity sought in respect of s 15 (3) of the Prescription Act was irrelevant. Accordingly the defendant declined to give such particularity.

As a result of this refusal by the respondent to produce the particulars, the excipient filed this exception to the special plea in bar denying that her claim in the declaration arose from contract as contemplated by s 15 (3) of the Prescription Act and that therefore as a matter of law the respondent was obliged in terms of s 15 (3) of the Act
to allege in raising prescription that the excipient became aware of the identity of the defendant and the facts from which the claim arose before 5 March 1982 and/or that the excipient could have acquired knowledge thereof by exercising reasonable care, that this he failed to do, and that the respondent's contention that her claim was based on contract between her and the respondent was argumentative, vague and embarrassing and did not arise from any allegation in the excipient's declaration. In the circumstances, she prayed that the respondent's special plea in bar be set aside with costs, alternatively that paras 1 (b) and (c) and 2 (b) and (c) of the defendant's particulars filed on 30 May 1985 be struck out with costs.

Counsel for the excipient stated that two issues were raised on the papers. First, whether the excipient had sued in tort or in contract and secondly, if the excipient had sued in tort, whether it was open to the defendant to assert by way of a special plea that the claim was founded on contract. He submitted that, the excipient sued in tort, not contract, because the summons was for 'damages for negligent surgical operation' and the declaration cited the respondent as a urologist, alleging that he performed a surgical operation upon the excipient and alleged negligence in performing the operation as there was insufficient grounds for it and the manner in which the respondent performed the operation. Nowhere, he said, did the excipient allege agreement express or implied, nor did she claim refund of any medical fees for breach of contract, pecuniary loss or loss of business income. Her claim was solely for injuries to her body and mental state. With regard to the second point, counsel for the excipient submitted that the defendant had not excepted to the claim as being bad in law on any contention that the plaintiff could not claim against a surgeon or other professional person in delict or tort.

Counsel for the excipient stated that the main issue which arose was whether a surgeon who was sued for physical injuries inflicted in the course of an operation performed by him could be sued only in contract. If he could be sued either in contract or in delict, it followed that the excipient could elect to sue him in tort as she had done in this case because in law a claim always lies in tort against a person who has by want of reasonable care caused another physical injury, i.e. injury to person or property, subject only to certain limits imposed by social considerations.
Counsel for the respondent argued that the excipient’s action was in contract because, in para 3 of her declaration, she alleged that services were rendered to her by the respondent in terms of a contract and that in any case the relationship between a doctor and patient is usually one in contract and that, in order to fix liability in delict, the court would have to be persuaded that the decision in *Lillicrap, Wassenaar & Partners v Pilkington Brothers (SA) (Pty) Ltd* 48 was wrongly decided. He also argued as, a corollary to the first submission, that as the action was founded on contract and under the exception provided by section 15 (3) of the Prescription Act, the respondent was not required to state when the creditor became aware of the identity of the debtor and of the facts from which the debt arose.

**Judgment**

Mfalila J said that the first question to consider was whether the excipient alleged in her declaration that the services were rendered to her by the respondent in terms of a contract. He found that she had not and that the paragraph on which counsel for the respondent had relied was simply an explanation of her claim in the summons for “damages for a negligent operation to her right kidney carried out by the defendant...”.

Secondly, the court looked at whether it was correct to say that a doctor was not liable to his patient outside of a contractual relationship and that therefore there was no liability in delict within the relationship of doctor and patient. Mfalila J said that he did not think one could seriously quarrel with counsel for the respondent’s assertion that “the relationship between a doctor and patient is usually one of contract” without statistics on the relative numbers of patients who enter into contracts with their doctors and those who simply consent to be treated relying on the professional expertise of the doctor. But, said the court, even if it were correct to say that the relationship between a doctor and patient is usually one in contract, this is not the same thing as saying that a contractual relationship is the only one that can subsist between a doctor and patient. Mfalila J noted that Strauss, *Doctor, Patient and the*

---

48 *Lillicrap 1985 (1) SA 475 (A)*
Law"^49 quoted by counsel for the respondent, made no such point on the relevant pages cited. Indeed, said the judge, he would have been very surprised if Strauss had made such a suggestion in Section I of the book dealing with contractual obligations of the doctor when in Part XI of the book he discussed the liability of doctors for medical negligence.

The court noted the words of Lord Nathan^50 to the effect that irrespective of the existence of a contract there is a legal obligation to take due and proper care and that this duty co-exists with any contractual arrangements between the provider and the patient. Mfalila J came to the conclusion that as between a doctor and patient there can exist both contractual and delictual liabilities. The court considered the judgment in Lillicrap and noted the dicta of Grosskopf AJA in that case who recognised that the "present case thus raised fundamental questions relating to delictual liability, and more particularly, its relationship with the liability for breach of contract" and who stated that-

"even if a breach of contract should properly be classified as a form of delict, that would not alter its essential characteristics or eliminate the differences which exist between the action for damages arising ex contractu and liability pursuant to the extended Aquilian action which the respondent has sought to invoke in the present case."^51

---

49 Strauss fn 29 supra

50 In 'Medical Negligence' at p15 where he states: "In the great majority of cases the duty owed by a medical man or a medical institution towards the patient is the same whether there exists a contract between them or not. Where there is no such contract, a duty arises by reason of the assumption of responsibility for the care of the patient; where there is such a contract, this duty in tort exists side by side with a similar duty arising out of the contract. But the implied contractual duty is normally the same as that which exists apart from contract." Mfalila J quoted the following passage from the judgment in Lillicrap at 496D - H, stating that it dispels any notion that there can be no delictual liability where there is a contractual relationship between the parties: "In the present case it is common cause that the damages which the respondent is claiming pursuant to the Aquilian action could, in so far as they arose before the assignment of the contract to Salanc, have been claimed on the basis of breach of contract. The respondent's contention is that in the circumstances of the present case the facts gave rise to both causes of action. In principle there would be no objection in our law to such a situation. Roman law recognised the possibility of a concursus actionum, i.e. the possibility that different actions could arise from the same set of facts. More particularly, the facts giving rise to a claim for damages under the lex Aquilia could overlap with those founding an action under certain types of contract such as deposit, commodatum, lease, partnership, pledge etc. In such a case a plaintiff was in general entitled to elect which actio to employ... In modern South African law, we are of course no longer bound by the formal actiones of Roman law, but our law also acknowledges that the same facts may give rise to a claim for damages ex delicto as well as one ex contractu, and allows the plaintiff to choose which he wishes to pursue... The mere fact that the respondent might have framed his action in contract therefore does not per se debar him from claiming in delict. All that he need show is that the facts pleaded establish a course of action in delict. That the relevant facts may have been pleaded in a different manner so as to raise a claim for contractual damages is in principle irrelevant. The fundamental question for decision is accordingly whether the respondent has alleged sufficient facts to constitute a cause of action for damages in delict. In the present case we are concerned with a delictual claim for pecuniary loss, and, as mentioned above, it is common cause that the claim was founded on the principles of the extended Aquilian action. It is trite law that, to succeed in such a claim, a plaintiff must allege and prove that the defendant has been guilty of conduct which is both wrongful and culpable; and which caused patrimonial loss to the plaintiff... What has been placed in issue by the appellant is whether, on the facts pleaded, the appellant's conduct was wrongful for purposes of delictual liability and whether the damages alleged to have been suffered, are recoverable in a delictual action."
Mfalila J observed that the court in *Lillicrap* was faced with the question whether to extend Aquilian liability to an action for breach of contract. Although the court noted that “in our law Aquilian liability has long outgrown its earlier limitation to damages arising from physical damage or personal injury” and has been extended to cover negligent misstatements which cause pure financial loss, it remarked that there was no authority in Roman or Roman-Dutch law for the proposition that the breach of such a contractual duty is a wrongful act for the purposes of Aquilian liability. However, said Mfalila J the situation is different in the case of a *concursus actionum* because here the actions of the defendant satisfy the independent requirements of both a contractual and an Aquilian action. Such was the position in the case of *Van Wyk v Lewis* because, independently of contract which existed, Dr Lewis would have been liable to his patient for professional negligence. On those considerations the Court held that “our law adopts a conservative approach to the extension of remedies under the lex Aquilia”, and that “it would accordingly be breaking fresh ground if it were to recognise the respondent’s cause of action as valid”.

The court, referring to the dictum in *Lillicrap* to the effect that policy considerations did not require that delictual liability be imposed for negligent breach of contract of professional employment, stated that the pronouncements make it quite clear that if the respondent had satisfied the independent requirements of both a contractual and an Aquilian action, the court would have allowed the action and dismissed the exception as the court *a quo* had done. But the court of appeal found that the respondent had failed to satisfy in its pleadings the requirement for an Aquilian action when it refused to extend further the basis for such an action. The court held that in the present case, even if it were to find that there was a contract between the parties, it would find it no bar, as it was found in the *Van Wyk* case, to the excipient founding her action against the respondent in delict because independently of any contract, he owed her a duty of care when performing the surgical operation upon her, to perform it with such professional skill as to avoid injuring her which she alleged he did. In her summons, she alleged both the duty to take care and a breach of that duty.

---

52 *Van Wyk* fn 3 supra
Commenting on the *obiter dictum* by Innes CJ in the *Van Wyk* case that the delictual duty arose from the contract between the parties, Grosskopf AJA stated as follows at 502E - F:

“This interpretation (which he had just propounded) seems probable if one has regard to the unlikelihood that Innes CJ would have intended to suggest that a medical doctor could not be delictually liable for his negligence unless there was a contractual relationship between him and his patient.”

The court observed that this statement put beyond doubt that the *Lillicrap* case made no decision along the lines suggested by Mr De Bourbon and that by fixing delictual liability on the respondent, far from suggesting that that case was wrongly decided, affirmed its correctness. To put the matter beyond controversy, said the court, Boberg, in his book *The Law of Delict*, opens his first chapter in the “Nature and Basis of Delictual Liability” with the following words based on the decision in the Lillicrap case:

“A delict is a civil wrong. It is an infringement of another’s interests that is wrongful irrespective of any prior contractual undertaking to refrain from it - though there may also be one. It entitles the injured party to claim compensation in civil proceedings - though criminal proceedings aimed at punishing the wrongdoer may also ensue. A single act may arise to give both delictual and contractual, or delictual and criminal liability. The existence of concurrent contractual liability is no bar to an action in delict, provided that the requirements of delictual liability are also satisfied.”

For these reasons said Mfalilala J, he was satisfied that the excipient’s claim against the respondent is properly based on delict or tort, that therefore the provisions of s 15 (3) of the Prescription Act did not apply and that the respondent was bound to furnish the information required by the excipient.

**Discussion**

The courts have shown a notable predilection when faced with a claim which can be adjudicated on the basis of both the law of delict and of contract to deal with it on the basis of the former. This is somewhat surprising given the fact that it is generally easier in terms of the burden of proof to show breach of contract than to show negligence in the delictual context. Perhaps the choice of the courts in giving judgment to reason in terms of the law of delict is because negligence has not in these
cases been that difficult to establish and according to Neethling, Potgieter and Visser\textsuperscript{53} there is no fundamental difference between a delict and a breach of contract. The injured party can choose to act on the one or the other. They also point out that one and the same act can lead to the liability of the perpetrator both \textit{ex contractu} and \textit{ex delicto}. It is submitted that the courts may, for public policy reasons, also choose to focus on the claim based in delict in order to highlight what is in effect a civil wrongdoing and to emphasise the fact that the existence of a contract is unnecessary in such cases. In doing so, the emphasis of the judgment is subtly shifted from a purely business issue to a moral issue. The judgment in \textit{Lillicrap} led to a fair amount of debate and criticism of the court’s failure to allow the claim in delict\textsuperscript{54}. However it still stands and, as the court pointed out in \textit{Correira}, although the same action can 'give rise to claims in both contract and delict, each claim must stand on its own two feet independently of the other.

\textbf{9.2.9 \hspace{1cm} Clarke v Hurst NO And Others \textsuperscript{55}}

\textit{Facts}

On 30 July 1988 and while undergoing epidural treatment, Frederick Cyril Clarke (‘the patient’) suffered a sudden drop in blood pressure and he went into cardiac arrest. His heartbeat and breathing ceased. Resuscitative measures were instituted but by the time that his heartbeat and breathing were restored, he had suffered serious and irreversible brain damage due to prolonged deprivation of oxygen to the brain (cerebral anoxia). He became deeply comatose and remained in that condition ever since. At the time the case was heard, the patient’s swallowing mechanism was not functioning and consequently, even if he had been conscious, he would not have been able to ingest food in the natural way. The patient was fed artificially by means of a naso-gastric tube. Through this tube he was fed a ready made powder diluted with water. The powder provided all the patient’s nutritional needs, while the water provided the hydration necessary for the maintenance of life. Food was digested

\textsuperscript{53} Neethling J, Potgieter JM and Visser PJ \textit{The Law of Delict} at p 265. They note that the action for pain and suffering and the contractual action concur in circumstances where breach of contract also results in a wrongful and culpable infringement of the physical-mental integrity of the wronged contracting party. See also Claassen and Verschoor fn 2 supra at p 118

\textsuperscript{55} Clarke 1992 (4) SA 630 (D)

1108
naturally and the bowels were evacuated by involuntary reflex. There was a tendency to constipation and when this occurred suppositories were administered or manual evacuation was undertaken. The discharge of urine occurred in the normal manner but because it was involuntary, the urinary discharge was administered by a Paul’s tube in order to keep the patient dry.

Because of the patient’s inability to swallow, nasal secretions tended to flow down his trachea into his lungs. In order to maintain respiration unimpeded and to prevent infection, excess secretions were removed by suction several times a day. A plastic tube passed through a tracheotomy opening in the trachea into the patient’s lungs. A suction machine was used to expel the excess fluid from the lungs. The patient was in what is commonly known as a persistent vegetative state. There was no prospect of any improvement in his condition and no possibility of recovery. The applicant, the patient’s wife, applied to be appointed as curatrix to the patient’s person with powers in that capacity to:

1. agree to or withhold agreement to any medical or surgical treatment for the patient;
2. authorise the discontinuance of any treatment to which the patient was subjected, or to which the patient may in future be subjected, including the discontinuance of any naso-gastric or other non-natural feeding regime or like regime for the hydration of the patient;
3. act as set forth in paras (1) and (2) above notwithstanding that the implementation of her decisions may hasten the death of the patient.

In her founding affidavit the applicant had expressed it as her intention, if the application should be granted, to have the tube removed which was introduced into the patient’s stomach to provide for his body’s nutritional requirements. In effect what the applicant intended doing is to put an end to the artificial feeding regime whereby the patient obtained the necessary sustenance for his bodily functions. The applicant expressed herself as follows:

“If the order is granted I will consult with the medical practitioners with whom my husband will be in custody at the time and give such directions as will ensure that any physical distress which accompanies the removal of the tube is minimised; that being necessary, as I understand it, to preserve the dignity of the relationship between the attending medical staff
and my husband and to alleviate the stress on family members. I am of course mindful of the fact that my husband’s death will follow the removal of the tube from his stomach. However, I respectfully submit that the removal of the tube will not cause his death. In my respectful submission what will cause my husband’s death is the cardiac arrest that occurred on 30 July 1988. Notwithstanding their best efforts and intentions, all that the various medical attendants have been able to do is to suspend the process of death. They did not save my husband’s life.”

The applicant made it clear that the effect of stopping the artificial feeding regime would be to terminate the present ‘suspension of the process of death’ of the patient by starving the body of its nutritional needs. The application was supported by the patient’s nearest relatives - his two sisters and his four children - all of whom were majors.

**Judgment**

The court noted the following concerning the patient. He was born on 22 March 1925 and was therefore in his 68th year. He was a qualified medical practitioner and at the time when he suffered the cardiac arrest he was still actively conducting a medical practice. From 1977 to 1986 the patient had been a member of the then Natal Provincial Council and from 1981 to June 1986 he had been a member of the Executive Committee of the Council, responsible for Hospital Services. The patient was a life member of the SA Voluntary Euthanasia Society. He had signed a document headed ‘A Living Will’ directed to his family, his physician and to any hospital and which read:

> ‘If there is no reasonable expectation of my recovery from extreme physical or mental disability . . . I direct that I be allowed to die and not be kept alive by artificial means and heroic measures. I ask that medication be mercifully administered to me for terminal suffering even though this may shorten my remaining life. I hope that you who care for me will feel morally bound to act in accordance with this urgent request.’

During his active life the patient held strong views on the individual’s right to die with dignity when living has ceased to be worthwhile and when there is no hope of improvement or recovery. In a public speech delivered in 1983 he said:

> ‘I feel sure that the general public gets a certain degree of satisfaction in knowing that if they, by a stroke of misfortune, become cabbages or suffer prolonged and intractable pain where a successful outcome is impossible, no valiant and fruitless endeavours will be instituted by the medical team to prolong intense suffering and anguish and to, in fact, prolong death.’
These statements, said the court, undoubtedly stemmed from a settled, informed and firmly held conviction on the patient’s part that should he ever be in the condition in which he has been since the cardiac arrest, no effort should be made to sustain his life by artificial means but that he should be allowed to die. In her application the applicant cited as first and second respondents, the senior medical superintendent and chief nursing services manager at Addington Hospital, where the patient was being cared for. As third respondent she cited the Attorney-General for Natal in his capacity as the prosecuting authority in the province. A curator ad litem was appointed to represent the patient’s interests.

The third respondent, the Attorney-General, opposed the application on a number of grounds. He filed an affidavit in which he said that he was not prepared to undertake in advance not to prosecute should steps be taken to terminate the patient’s life and that he was not prepared to declare in advance what his decision would be in the event of such steps being taken. He said that in view of his opposition to the granting of the order, the court did not have the power to ‘tie his hands in the event of the contemplated termination of the patient’s life’ and that even if the Court did have the power it should refrain from exercising it in this case. Counsel who appeared on behalf of the Attorney-General submitted that despite the form which the applicant’s order prayed for took, she was in effect asking for an order declaring that she would not be acting unlawfully if, in her capacity as curatrix, she were to withhold her agreement to the giving of medical and surgical treatment to the patient or if she were to authorise the discontinuance of artificial life-sustaining measures such as naso-gastric feeding, even though the discontinuance of such measures or the withholding of such treatment would result in the termination of the patient’s life. The court concurred with this submission. It said that admittedly the order which was sought was not couched in the form of a declaratory order but took the form of an order conferring on the applicant, as curatrix to the person of the patient, certain powers (which have been set out at the beginning of the judgment). However, despite the form of the order, it was implicit in it that the applicant was asking the court to declare that she would not be acting unlawfully if she were to exercise those powers. The court said that if, in exercising the powers which she was asking for she would be acting unlawfully, the court would be exceeding its competence if it were to grant to her those powers. No court would be competent to sanction the commission of a
crime or a wrongful act. In essence, therefore, what the applicant was asking for was an order declaring that if she were to take the steps envisaged by her and if as a result of the taking of those steps the life of the patient were to terminate, she would nonetheless not be acting unlawfully.

Building on his submission that what the applicant sought was a declaratory order, counsel submitted that the court should refrain from making a declaratory order which would anticipate facts which have yet to come about which would pre-empt the authority of the Attorney-General to decide in due course whether to prosecute and which would render nugatory the provisions of the Inquests Act56.

Thirion J noted that in *British Chemicals and Biologicals (SA) (Pty) Ltd v South African Pharmacy Board*57 the fact that the applicant’s right to relief depended on the interpretation to be placed on a piece of legislation which defines a crime, was held to be no bar to the making of a declaratory order sought for the express purpose of ensuring the applicant against a successful prosecution, despite the fact that the Attorney-General had not been made a party to the proceedings58. Thirion J said that this decision was authority for saying that the Court may in an appropriate case and despite the opposition of the Attorney-General, exercise its discretion in favour of declaring whether the adoption by an applicant of a certain course of conduct would constitute a crime. He said the Attorney-General’s opposition in the present case to the proposed order was based on the misconception that in granting the order the Court would interfere with the absolute discretion vested in the Attorney-General with regard to criminal prosecutions and would be condoning the commission of a crime. That was not what was envisaged. The Court would only grant the order if on facts which are beyond dispute there was no reasonable possibility that the applicant, in acting on it, would commit a crime against the patient.

---

56 Inquests Act No 58 of 1959
57 British Chemicals 1955 (1) SA 184 (A)
58 Greenberg JA said at p 192: “The main grounds advanced in this Court on behalf of the respondent for the contention that the application was premature were that no substantive application had been made by the appellant to the respondent for any procedural step by the latter, that the appellant was in fact seeking a declaration which would ensure it against successful prosecution under s 76bis and that in any event an order of this kind should not be granted unless the Attorney-General is made a party to the proceedings. In Attorney-General of Natal v Johnstone & Co Ltd 1946 AD 256, the competency of the Court to grant a declaratory order that would have the effect of ensuring an applicant against successful prosecution was recognised; in that case the Attorney-General was a party to the proceedings but what was said (at 260-2) shows that this factor is not an essential one. In civil proceedings to which the Attorney-General is not a party the fact that the claimant’s right to relief depends on the interpretation to be placed on a piece of legislation that defines a crime is no bar to a decision as to whether a certain course of conduct constitutes a contravention of that legislation. As regards the exercise of discretion conferred on the Court by s 102 of Act 46 of 1935, I see no ground for questioning its exercise by the learned Judge a quo in entertaining the application.”
Thirion J said that in his view this is a proper case for the exercise of the Court’s discretion. The applicant, he said, faced an agonising decision. She had a right in the circumstances to know whether in doing what she contemplated she would be transgressing the law. He pointed out that there was no case which could serve as guidance to her. She was emotionally involved. He said it was but right that the decision should be taken by the court, which can view the evidence dispassionately and objectively. In those circumstances the applicant was entitled to have the legal position determined by the Court. The curator ad litem supported the application. His reasoning was expressed thus: An adult of full legal competence has, while of sound mind, an absolute right to the security and integrity of his body. In the exercise of that right he is entitled to refuse to undergo medical treatment, irrespective of whether such refusal would lead to his death. Where, as in the present case, such a person, while he is of sound mind, has directed that if he should lapse into a persistent vegetative state with no prospect of recovery, he should be allowed to die and that he should not be kept alive by artificial means, then if he does lapse into such a state, there is no reason why a curator appointed to his person should not have the power to give effect to his direction. After examining three American cases which were cited in support of the application Thirion J said that he did not think that the approach adopted in these cases could be invoked in South African law to provide an answer to the question whether, were the applicant to discontinue the naso-gastric feeding of the patient, her conduct would be unlawful and whether, were he to die, she would be criminally liable for his death.

He held that the fallacy in counsel’s argument lay in the fact that in South African law the curator personae is not a mere agent to give effect to directions given by the patient while he was competent to do so. The curator personae is at all times under a duty to act in the best interests of the patient and not necessarily in accordance with the wishes of the patient; the well-being of the patient being the paramount consideration. In South African law, the court would not simply weigh the patient’s interest in freedom from non-consensual invasion of his bodily integrity against the interest of the state in preserving life or the belief in the sanctity of human life; nor would it necessarily hold that the individual’s right to self-determination and privacy always outweighs society’s interest in the preservation of life. Furthermore, said
Thirion J in South African law a person who assists another to commit suicide may, depending on the circumstances of the particular case, be guilty of murder or culpable homicide. Referring to the American case of Karen Quinlan, Thirion J pointed out that the conclusion that the killing would not be unlawful was rested in part on the fact that the patient's death would result from the exercise of her constitutional rights to privacy and self-determination and would therefore be protected from criminal prosecution. He said that such an approach would not be open to the court in South African law. The issues in the present application, he said, could only be approached after a thorough evaluation of the patient's physical and neurological deficits and the extent of the biological and intellectual life which still remained to him. The specialist physicians and neurologists who examined the patient were in agreement that he was in a persistent vegetative state because of the extensive damage to the cortex - that part of the brain which is responsible for intellectual function and cognitive awareness. They also agreed that the damage was irreversible and that no improvement was possible.

Thirion J observed that the term ‘persistent vegetative state’ seemed to have been created by Dr Fred Plum, professor and chairman of the Department of Neurology at Cornell University and a world-renowned neurologist. He said it describes a neurological condition where the subject retains the capacity to maintain the vegetative part of neurological function but has no cognitive function. In such a state the body functions entirely in terms of its internal controls. It maintains digestive activity, the reflex activity of muscles and nerves for low level and primitive conditioned responses to stimuli, blood circulation, respiration and certain other biological functions but there is no behavioural evidence of either self-awareness or awareness of the surroundings in a learned manner. He noted that Steadman’s Medical Dictionary defines ‘vegetative’ as functioning involuntarily or unconsciously after the assumed manner of vegetable life. Thirion J said that it seemed that the term ‘persistent vegetative state’ describes not a distinct condition but rather a range of chronically persistent neurological defects which are irreversible; with no cognitive or intellectual function and no self-awareness or awareness of the surroundings and no purposive bodily movement. He reviewed the evidence as to the patient’s state noting

59 Ex parte Minister van Justisie: In re S v Grojohn 1970 (2) SA 355 (A).
60 Quinlan 70 NJ 10; 355 A 2d 647 (NJ 1976)
that, the patient’s biological life was stable, despite the extensive brain damage, because those parts of the brain-stem necessary for the functioning of that part of the autonomic nervous system which controls the essential organs, were operating satisfactorily. The swallowing reflex had, however, been damaged. Although swallowing can be induced or willed by the upper brain, it is a mechanism controlled by the brainstem. The court said that in order to assess what remained of the patient’s human life, i.e. his cognitive or intellectual life, one had to examine the functioning of the upper sections of the brain (cortical function). Thirion J further observed that awareness is the ability of a person to perceive any aspect of the environment. In an unconscious patient this would be tested by applying some external stimulus and observing whether there is a response. He noted that Mr Staub performed several such tests on the patient. In some cases there were responses to the external stimuli. Those were the results of the auditory stimulation test, test of sensation of the face, reactions of pupils, painful stimulation of the limbs and forehead. All these responses, according to Mr Staub, may be mediated through the brain-stem or spinal cord and therefore did not prove that the patient was aware of his external environment at any level. In order to prove clinically that the patient was aware of the stimuli one would have to elicit a response from him that was not possibly mediated at brain-stem level but rather at cortical level. No such response could be obtained from the patient.

Thirion J said that he was impressed by the care and caution with which Mr Staub performed his examination of the patient and with the guarded yet precise manner in which he has expressed and motivated his opinions. He accepted his conclusions and his assessment of the patient’s condition. Thirion J summed up the patient’s physical condition and then went on to examine the effects of the removal of the naso-gastric feeding tube. He noted that the discontinuance of the naso-gastric feeding and any other form of nourishment was bound to lead to the termination of such life as the patient still had. The period which it would take for the patient to die after the administration of nourishment had ceased was somewhat unpredictable. If the potassium levels were to suddenly rise considerably the patient could suffer a cardiac arrest. If this did not happen the patient would simply ‘fade’. He would be totally unaware of what was happening. He would not register anything at all. His blood pressure would drop and his breathing would slow down until cardiac standstill occurred. There would be no dramatic or sudden death. Quiet, shallow breathing would simply turn into no breathing at all and life would be extinguished. This would
occur within two or three weeks after nourishment had ceased to be administered. The court said that there could be no doubt that the discontinuance of feeding would accelerate the patient's death unless some other cause were to intervene to kill him before then.

Counsel who appeared for the Attorney-General submitted that:

(i) any act which hastens a person's death is a cause of it, even though at the time of the commission of the act which results in his death he may already have been mortally injured or may already have been suffering from some terminal condition⁶¹;

(ii) if a killing is intentional it is none the less murder, even though the killer may not have harboured any evil motive⁶²;

(iii) even an omission to act, if the omission results in the victim's death, would attract liability on the part of the non-doer, if he was under a legal duty to act so as to prevent the victim's death;

(iv) consequently in the instant case, if the applicant were to discontinue the nasogastric feeding and the patient's death were to be accelerated or hastened thereby, the applicant's conduct would probably be unlawful.

Counsel's argument, said Thirion J, amounted to this: The discontinuance of the artificial feeding would hasten the patient's death and would thus be a cause of it and, as the applicant foresaw death as a probable result of the discontinuance of the artificial feeding, she would in law be liable for having unlawfully killed the patient.

According to Thirion J, on counsel's argument the wrongfulness of applicant's conduct would prima facie be inferred from the fact that it would prima facie be an invasion of the patient's subjective right to bodily integrity and an assault, and as her conduct would not be justifiable in law on any of the grounds of justification it would be stamped as unlawful. He said that the fallacy in counsel's argument lay in the fact that it assumed that conduct which is prima facie unlawful can in law only be justified under one or other of the stereotyped categories of grounds of justification such as self-defence, consent, necessity, etc. There is, however, no numerus clausus of

---

⁶¹ R v Makali 1950 (1) SA 340 (N)
⁶² S v Hartmann 1975 (3) SA 532 (C); S v De Bellocq 1975 (3) SA 538 (T)
grounds of justification. The stereotyped grounds of justification are specific grounds of justification of otherwise wrongful conduct which with the passage of time have become crystallised, with their own rules limiting the scope of their application. Wrongfulness is, however, a distinct and generally applicable element of delictual as well as criminal liability in the common law. In a case such as the present one has to examine the concept of wrongfulness itself in order to determine whether the conduct complained of falls within its limits. Thirion J pointed out that, writing on the requirements for delictual liability, Van der Walt emphasises that the element of wrongfulness constitutes the fundamental requisite for delictual liability. He defines the criteria for the determination of wrongfulness as follows:

Conduct is wrongful if it either infringes a legally recognised right of the plaintiff or constitutes the breach of a legal duty owed by the defendant to the plaintiff. The inquiry is concerned with whether the infringement of the plaintiff’s interest was in the particular circumstances objectively unjustifiable. In order to determine this, account must be taken of the particular conflicting interests of the parties, the parties’ relation to each other, the particular circumstances of the case, and any appropriate considerations of social policy.

According to Van der Walt, conduct infringes a subjective right if it unjustifiably disturbs or interferes with the holder’s capacities of disposal, use and enjoyment in regard to the object of the right. Whether a particular interference can be regarded as unjustifiable depends on the application of the general criterion of boni mores, the prevailing conceptions in a particular community at a given time, or the legal convictions of the community. The boni mores as a standard looks at the reasonableness of the defendant’s conduct in the particular instance.

---

63 Thirion J observed that "the writers are in agreement that considerations of social policy and the boni mores play a part in determining whether conduct is wrongful. Boberg The Law of Delict at 33 says: 'At the root of each of these crystallised categories of wrongfulness lies a value judgment based on considerations of morality and policy - a balancing of interests followed by the law’s decision to protect one kind of interest against one kind of invasion and not another.' Van der Merwe and Olivier Die Onregmalige Daad in die Suid-Afrikaanse Reg 6th ed at 38 acknowledge the use of the criterion of reasonableness according to society's perception of what is just, for the determination of wrongfulness. Voordurend moet in die privaatreg 'n belange-afweging tussen persone plaasvind aan die hand van die redelikheid. Die redelikheidsmaatstaf, of sosiaaladekwant soos dit soms genoem word, is 'n objektiewe maatstaf. Hier word eenvoudig met die algemene reggeregvoel van die gemeenskap gewerk. Sosiaal adekwant of redelik is 'n handeling gevolglik as dit volgens die reggeregvoel van die gemeenskap regmatig is. Neethling, Potgieter and Visser Deliktereg at 29 also stress the requisite of reasonableness in determining what is wrongful: 'Die algemene norm of maatstaf waarvolgens vasgestel word van 'n belange-aantasting ongeoorloof is al dan nie is die reggeregvoeling van die gemeenskap: die boni mores. Die boni mores toets is 'n objektiewe redelikheidsmaatstaf. Die kernvraag is of die dader die benadeelde se belange in die lig
referred to the observation of Rumpff CJ in *Minister van Polisie v Ewels*66 where, dealing with liability for an omission, the Chief Justice said that it would appear that the stage of development in our law has been reached where an omission is regarded as wrongful conduct also where the circumstances of the particular case are such that the omission not only evokes moral indignation but also that the legal convictions of society ("die regsoortuiging van die gemeenskap") demand that the omission be regarded as wrongful. Thirion J said he thought that the converse would also hold true. If the legal convictions of society do not require that an omission (or for that matter a positive act) be regarded as wrongful, it would not be wrongful in law. Wrongfulness is tested according to society’s legal, as opposed to its moral, convictions but at the same time morality plays a role in shaping society’s legal convictions. He held that if it is accepted, as he thought it should be, that law is but a translation of society’s fundamental values into policies and prescripts for regulating its members’ conduct, then the court, when it determines the limits of such a basic legal concept as wrongfulness, has to have regard to the prevailing values of society. Thirion J said he could see no reason why the concept of wrongfulness in criminal law should have a content different from what it has in delict.

In the court’s view, the decision whether the discontinuance of the artificial nutritioning of the patient and his resultant death would be wrongful, depended on whether, judged by the legal convictions of society, its *boni mores*, it would be reasonable to discontinue the artificial nutritioning of the patient. The decision of that issue, it said, depends on the quality of the life which remains to the patient, i.e. the physical and mental status of that life. The evaluation has to be made in relation to the medical procedures which would have to be instituted or maintained to sustain the patient’s life. Thirion J observed that there were no doubt many whose susceptibilities would be offended at the thought that it could ever be reasonable for those responsible for the care of the disabled patient not to take whatever steps it may be reasonably possible to take to keep the patient alive - regardless of the quality of the life which the patient would have to endure if kept alive. A moment’s reflection would however tell one that it happens regularly, especially in the case of the terminally ill, that

---

66 Ewels 1975 (3) SA 590 (A)
decisions are taken to allow the patient to die rather than to prolong a life of suffering by taking life-support measures. He said he thought society would have regarded as grotesque the thought that the victim in *S v Williams*\(^67\) should have been kept alive on the ventilator after it had been found that her brain had died. He admitted that this was perhaps the extremest of examples but said it nevertheless showed that the decision whether to undertake or to discontinue life-sustaining procedures involves a balancing exercise.

Advances in medical science and technology have made it possible for patients to be resuscitated who have suffered a cardiac arrest and cessation of breathing and who by the ordinary thinking of the community would therefore have been regarded as dead. It is right and proper that these advances in medical knowledge should be employed in the service of mankind but the opening of new frontiers has presented unique situations which require a change in society's attitudes to the process of dying. As it was put in *US Law Week*\(^68\):

‘Medical advances have altered the physiological conditions of death in ways that may be alarming: highly invasive treatment may perpetuate human existence through a merger of body and machine that some might reasonably regard as an insult to life rather than its continuation.’

Patients may be resuscitated and maintained alive when there is not the remotest possibility that they would ever be able to consciously experience life. Within minutes after the supply of oxygenated blood to the brain has stopped the brain cells start dying off - that part of the brain which is responsible for intellectual life being the first to die. Inherent in resuscitation therefore is the very real danger that, by the time that the patient has been resuscitated, his brain may be all but destroyed while the autonomic nervous system and brain stem may nevertheless be able to keep the body biologically alive but securing only a life at the level of a plant or less. In such a situation the doctor or the patient's family has to decide whether it would be justified or reasonable to institute or maintain life-sustaining procedures or treatment which could prolong the life of the patient. In making an evaluation of this kind one must be careful, said Thirion J, to avoid making a judgment according to one's own

---

\(^67\) *S v Williams* 1986 (4) SA 1188 (A)

\(^68\) *58 US Law Week* 4936
predilections or even to facilely give effect to views expressed by the patient when he was still in good health\textsuperscript{69}.

Thirion J agreed that the hastening of a person’s death is ordinarily not justified and is therefore wrongful even when the person is terminally ill and suffering unbearable pain but stated that this is not an absolute rule. It has come to be accepted that the doctor may give a terminally ill patient drugs with the object of relieving his pain, even if, to the doctor’s knowledge, the drugs will certainly shorten the patient’s life\textsuperscript{70}.

Thirion J then posed the question whether, if it would be reasonable for the applicant in the present case to discontinue the artificial nutritioning of the patient knowing that such a step would result in the death of the patient, why would it not be reasonable for someone to simply suffocate the patient to death? The deprivation of food would as assuredly kill the patient as the deprivation of oxygen. He said the distinction is to be found in society’s sense of propriety - its belief that things should happen according to their natural disposition or order. The person who pre-empts the function of the executioner and kills the condemned man while he is taking the last few steps to the gallows, acts wrongfully irrespective of his motive for killing the condemned man. He acts wrongfully because he has no right to meddle in the matter.

In Thirion J’s view, the distinction between the act of the doctor who, while following the precepts and ethics of his profession, prescribes a drug in a quantity merely sufficient to relieve, and with the object of relieving, the pain of his patient, well knowing that it may also shorten the patient’s life, and the act of the doctor who prescribes an overdose of the drug with the object of killing his patient, is that the former acts within the legitimate context and sphere of his professional relationship with his patient while the latter does not act in that context. Consequently, society adjudges the former’s conduct justified in accordance with its criterion of

\textsuperscript{69} Thirion J was of the view that the proper approach is that adopted by McKenzie J in \textit{Re Superintendent of Family and Child Service and Dawson} (1983) 145 DLR (3d) 610 which was quoted with approval by Lord Donaldson MR in \textit{Re J (a minor)} [1990] 3 All ER 930 at 936: “It is not appropriate for an external decision-maker to apply his standards of what constitutes a liveable life and exercise the right to impose death if that standard is not met in his estimation. The decision can only be made in the context of the disabled person viewing the worthwhileness or otherwise of his life in its own context as a disabled person - and in that context he would not compare his life with that of a person enjoying normal advantages.” Thirion J said he did not think that the learned Judge meant to convey in the first sentence of the above passage that an external decision-maker ever has a right to impose death.

\textsuperscript{70} \textit{R v Adams} 1957 Crim LR 365; Smith and Hogan \textit{Criminal Law} 6th ed at 313. Glanville Williams \textit{Textbook on Criminal Law} 2nd ed p 280 gives the following example: “Suppose that a patient with brain damage is on a ventilator (a respirator); he is unconscious, but the machine keeps his heart and lungs going mechanically. The doctor decides that there is no chance of recovery, so he ‘pulls the plug’. There is general agreement that he is entitled to do so. This is not a case where, by commencing to treat the patient, the doctor has put him in some peril to which he would not otherwise have been subject.” (as quoted by the court in \textit{Clarke} fn 55 \textit{supra})
reasonableness and therefore not wrongful, while it condemns the conduct of the latter as wrongful. He stated that the distinction between what is wrong and what is right cannot always be drawn according to logic. Logic does not dictate the formation of society's legal or moral convictions. The distinction, he said, can also be justified on rational grounds. The doctor who brings about the death of his patient by prescribing an overdose of the drug with the object of killing the patient, causes the death of the patient in a manner which is unrelated to his legitimate function as a doctor. He changes not only the course but also the cause of his patient's death. The court held that to allow conduct of this nature would open the door to abuse and subject people to the vagaries of unauthorised and autocratic decision-making. Thirion J found that in determining legal liability for terminating a patient's life there was no justification for drawing a distinction between an omission to institute artificial life-sustaining procedures and the discontinuance of such procedures once they have been instituted; nor was there any virtue in classifying the discontinuance of such procedures as an omission. He observed Van den Heever states that to explain an omission giving rise to an action in the light of previous conduct is pure sophistry. Just as in the case of an omission to institute life-sustaining procedures legal liability would depend on whether there was a duty to institute such procedures, so in the case of the discontinuance of such procedures, liability would depend on whether there was a duty not to discontinue such procedures once they have been instituted. A duty not to discontinue life-sustaining procedures could not arise if the procedures instituted have proved to be unsuccessful. If life-sustaining procedures which have been instituted have proved to be unsuccessful there would be no point in continuing them and consequently they may be discontinued. Thirion J observed that in S v Williams the life-sustaining procedures were held to have been unsuccessful even though they achieved the maintenance of the patient's heartbeat, blood circulation and respiration. He said that the decision must therefore be seen as authority for the view that the mere

---

71 Thirion J quoted J K Mason and R A McCall-Smith Law and Medical Ethics 2nd ed, at p 233: "There are those who say that any distinction between a commission and an omission to act when both have the same effect is no more than an illusion - the responsibility and the intention of the actor are the same. We, by contrast, believe that a morally significant difference between inactivity and action exists and that this rests on a firmer base than a mere intuition. The essence of discrimination lies in the means to obtain the same end, in that the taking of active steps implies an autocratic control over the way in which the event occurs. The doctor who administers a drug intended to end the life of a suffering patient determines the moment and the manner of the patient's death. The action of the drug changes the physical cause of death and this must be a matter of importance. The process is quite different from allowing another agency, eg illness, to cause death. Activity, moreover, directly confronts those views which concede that death is the one hazard of life which is beyond the ambit of legitimate human intervention."

72 Van den Heever FP Aquilian Damages in South African Law at p 38

73 Williams in 67 supra
restoration of certain biological functions cannot be regarded as the saving of the patient's life. The maintenance of life in the form of certain biological functions such as the heartbeat, respiration, digestion and blood circulation but unaccompanied by any cortical and cerebral functioning of the brain, cannot be equated with living in the human or animal context. If, then, the resuscitative measures were successful in restoring only these biological functions then they were in reality unsuccessful and consequently artificial measures of maintaining that level of life, such as naso-gastric feeding, could also be discontinued.

He stated that it would be unreasonable to suggest that if it was known at the time when resuscitation was undertaken that it would only be possible to restore the quality of life which the patient now had, the doctors would then have been under a duty to undertake resuscitation at all. Why then would there now be a duty to maintain this quality of life by artificial means?

Thirion J observed that the patient did not experience his environment at all. There was no social interaction, no registering of sensation. All this was so because the capacity of the brain for a cognitive and cognitive life had been destroyed. The gross damage to the brain which led to the destruction of this capacity was irreparable. In short, the brain had permanently lost the capacity to induce a physical and mental existence at a level which qualifies as human life. In these circumstances he was of the view that, judged by society's legal convictions, the feeding of the patient did not serve the purpose of supporting human life as it is commonly known and the applicant, if appointed as *curatrix*, would act reasonably and would be justified in discontinuing the artificial feeding and would therefore not be acting wrongfully if she were to do so. Thirion J concluded that it could be said that the *curatrix* would

---

74 Thirion J stated that: "This conclusion makes it unnecessary to deal with the argument advanced by counsel for the applicant that the discontinuance of the artificial feeding regime would not in law be the cause of the patient's death if he were to die as a result of such discontinuance. A brief reference to *S v Williams* would however not be out of place. That, was an appeal from a conviction for murder. The victim had been shot and wounded. She suffered severe brain damage which necessitated her being coupled to a ventilator to maintain her breathing. When it was ascertained that her brain was dead the ventilator was uncoupled and her heartbeat and breathing ceased in consequence thereof. On appeal the argument was raised that the uncoupling of the ventilator was the legal cause of the victim's death and not the gunshot wound. The Appellate Division assumed in favour of the appellant that the victim was still alive when the ventilator was uncoupled but, this notwithstanding, rejected the argument that the uncoupling of the ventilator was a cause of the victim's death." He noted that: "On the assumption that the victim was alive when the ventilator was uncoupled, it seemed obvious that the uncoupling of the ventilator accelerated the moment of death and therefore in a sense caused it. It is however clear that a factual causal connection is not enough to entail legal liability. There is no agreement among the writers as to what the additional factor should be. Glanville Williams *Textbook of Criminal Law* 2nd ed at p 381 says that the further test to be applied to the 'but-for' cause (i.e. the *conditio sine qua non*) in order to qualify as legal causation is not a test for causation but a moral reaction. The question is whether the result can fairly be said to be
not be acting in the best interests of the patient if she were to discontinue the artificial nutritional regime of the patient. Consequently he made an order in the following terms:

1. That Shirley Colette Clarke (the applicant) be appointed as curatrix to the person of Frederick Cyril Clarke (the patient).

2. That the powers which the applicant shall have in her capacity as curatrix to the person of the patient shall include the power:
   (i) to agree to or to withhold agreement to medical or surgical treatment for the patient and for that purpose to have the patient admitted to or discharged from any hospital, nursing home or institution for the care of geriatric patients;
   (ii) to authorise or direct the continuance or discontinuance of any treatment to which the patient is at present being subjected, including the continuance or discontinuance of any naso-gastric or other non-natural feeding regime.

3. It is declared that the applicant, in her capacity as curatrix to the person of the patient, would not act wrongfully or unlawfully
   (i) if she authorises or directs the discontinuance of the naso-gastric or any other non-natural feeding regime for the patient;
   (ii) if she withholds agreement to medical or surgical treatment of the patient save such treatment as may seem to her appropriate for the comfort of the patient, notwithstanding that the implementation of her decisions may hasten the death of the patient.

4. That the applicant’s costs of the application, the costs of the curator ad litem appointed in terms of the first order prayed, as well as the costs of the first and second respondents incurred up to 4 December 1991, shall be paid out of the estate of the patient.
Discussion

This case is essentially about wrongfulness. It is a prime example of how the courts use public policy as a determinant of wrongfulness\textsuperscript{75}. This approach has not gone uncriticised and du Bois\textsuperscript{76} observes that Boberg's somewhat cynical description of wrongfulness as but 'a cloak of respectability for judicial gut-reaction' appears to have been vindicated. He notes that while this has not affected the continued pliability of the boundaries of civil liability, nor the capacity of the courts to resolve novel disputes, it does represent an erosion of the most important promise held out by the *boni mores* criterion, namely to render the process and the basis of the judicial development more transparent and certain.

It is worth considering these sentiments more closely in the context of *Clarke* and the cases that preceded it. In *Ex Parte Die Minister Van Justisie: In Re S v Grotjohn*\textsuperscript{77} it was held that whether a person who instigates, assists or puts another in a position to commit suicide commits an offence depends on the facts of the particular case. The mere fact that the last act of the person committing suicide is such person's own, voluntary, non-criminal act does not necessarily mean that the other person cannot be guilty of any offence. Depending upon the factual circumstances the offence can be murder, attempted murder or culpable homicide. The facts were that Grotjohn was absolved of a charge of the murder of his spouse who was partially paralysed and suffered from manic depression. Her marriage to Grotjohn had reached a particularly unhappy and tense stage and was near breaking point. She withheld from him his 'conjugal rights' and he had commenced a relationship with a widow whom he subsequently married after his wife's death. On the day in question, his gun, the butt of which had broken off just behind the trigger, was with a friend but on the urging of the deceased he retrieved it. In her presence he dismantled the gun in order to

\textsuperscript{75} Du Bois F 'Getting Wrongfulness Right: A Ciceroian Attempt' 2000 *Acta Juridica* p1 notes that: "By adopting the notion that the wrongfulness of conduct depends on whether it is contra bonos mores, South African lawyers have endowed the law of delict with a standard for demarcating the scope of civil liability that was inherently flexible and simultaneously made explicit the purpose of judicial development of this part of the law - to ensure that it remains in step with the society it is meant to serve. This splicing of a candid recognition that judges not only apply law, but also develop it, with an insistence that this serves a legitimate function, largely obviated the need to pursue legal evolution behind a screen of questionable interpretations and re-interpretations of 'foreseeability', 'cause', and other conceptual contortions. The development of a concept that at once guides the judicial development of a major branch of the common law deserves to be regarded as one of the foremost achievements of South African lawyers."

\textsuperscript{76} Du Bois fn 75 supra at page 3

\textsuperscript{77} Grotjohn fn 59 supra
ascertain whether the two pieces could be re-attached. To do this he had to remove the triggerguard and as result the trigger was exposed. The deceased blamed him that the gun was broken and wanted to know if it could still shoot in that condition. In order to show her that it could he fired a shot from the balcony into the ground. Thereafter an argument flared up over the widow in the course of which the deceased became angry and said she was going to shoot herself. Grootjohn then fetched a bullet from somewhere in the flat, loaded the gun in her presence and handed it to her telling her to shoot herself if she wanted because she was a burden. She took the gun with one hand, put it on the floor between her feet said “I will”, aligned the barrel with her right eye and pulled the exposed trigger with her foot. She died immediately. The court a quo found Grotjohn not guilty of murder.

In S v Hartmann the accused, a medical practitioner, was charged with the murder of his father, aged 87, who for many years had been suffering form a carcinoma of the prostate. Thereafter secondary cancer had manifested itself in his bones, more particularly his ribs. Until 21 August 1974 the deceased had been living with the accused’s brother in Pretoria where he had received X-ray treatment for the cancer growths in hospital there. The accused had visited him there and on one occasion found him to be bedridden and suffering great pain. The accused was very close to his father and had thereafter induced his father to come to Cape Town by air, whence he was transferred to the Ceres Hospital as a private patient of the accused. There was no longer any question of a cure. The deceased was very emaciated, incontinent and on pain-killing drugs. By 11 September he was in a critical state of ill-health and expert medical evidence described him as being moribund and close to death. The accused had instructed a nursing sister to give the deceased an injection of 1/2 gr. of morphine, which she had reluctantly done. An hour later the accused had himself got a further ampule of 1/2 gr. of morphine from the sister and placed it in the deceased’s drip. The accused had remained with the deceased and about 1 1/2 hr. later, at 11 p.m., obtained 250 mgr. of pentothal from the sister and injected it into the drip. Within seconds of his doing so the deceased died, pentothal not being an analgaesic but of use in anaesthesia and, unless properly controlled, having fatal effects. The Court found that the accused had not desired to end his father’s life: his motive had been

---

78 Hartmann 1975 (3) SA 532 (C)
compassionate, to relieve his father of the further endurance of pain and the continuation of a pitiable condition. He was, however, aware that his act would inevitably terminate his father’s life.

The court held that that the accused clearly entertained that intention which was an essential ingredient of murder and that as to evidence that the deceased had consented to the administration of such a drug, that that would not constitute a defence to the charge. It held accordingly, that the accused’s act of ‘mercy-killing’ made him guilty of murder as charged and that in regard to a suggestion by the state that sentence be postponed until after disciplinary action had been taken by the Medical Council, that it was up to the court to make a decision and that in any event it would be inappropriate to postpone the sentence. It was further held that, regard being had to the mitigating factors, that the accused should be sentenced to one year’s imprisonment, the accused to be detained until the rising of the Court and the balance of the sentence to be suspended for one year.

Van Winsen J referring to the case of *R. v Makali*⁷⁹, observed that the law was clear that it nonetheless constitutes the crime of murder even if all that an accused has done is to hasten the death of a human being who was due to die in any event. He noted that it has more than once been held in the Appellate Division that the fact that the deceased wished to be killed does not exclude the criminal responsibility of him who gratifies the deceased’s wish. See, for instance, *S v Peverett*,⁸⁰ and *S v Robinson and Others*,⁸¹. The court referred to the judgment of Holmes JA in the case of *S v V*⁸², to the effect that:

“Punishment should fit the criminal as well as the crime, be fair to the accused and to society and be blended with a measure of mercy.”

Van Winsen J said that this was a case, if ever there was one, in which, without having to be unfair to society, full measure can be given to the element of mercy.

Strauss\(^3\) refers to a number of unreported cases namely \textit{R v Davidow} (1955), \textit{S v de Belloqc} (1968), \textit{S v McBride} (1979) and \textit{S v Marengo} (1990). In the firstmentioned case the accused’s mother was suffering from an incurable disease on account of which she suffered unbearable pain and was in a constant state of despair. Davidow loved his mother dearly and did whatever was in his power to obtain medical attendance and have her cured if possible. When all his attempts had failed, he requested a friend – in a moment of despair – to kill his mother by means of a fatal injection. His friend flatly refused. At the time of the request Davidow had been in a state of extreme tension. Sometimes in discussions with others about his mother he burst into tears. It was also observed that he sometimes wept in his sleep. His mother often expressed the wish in his presence that she could be dead and said that she could no longer bear the excruciating pain. Finally Davidow decided to relieve her from further pain and suffering. He visited her in hospital and during a severe emotional outburst, shot her in the head with a revolver, killing her. The previous night he had written a note to his brother telling the latter of his intention to relieve their mother of her pain and suffering and that as he did not have the courage to kill himself, he expected to be sentenced to death. Davidow was effectively charged with murder. A psychiatrist testified that the accused had developed an obsession to help his mother and that this obsession induced an irresistible impulse in him to kill her. When he committed the act, the psychiatrist concluded that he acted automatically and involuntarily. The psychiatrist for the prosecution contested the finding of irresistible impulse but agreed with the conclusion at which the defence psychiatrist had arrived. The accused was acquitted by the jury that tried him.

In \textit{S v de Belloqc}, the accused, a young woman and her husband were immigrants from France. Her husband was employed by the Council for Scientific and Industrial Research in connection with the search for oil. He and the accused were newly married and when they had arrived in the country some months earlier, she was pregnant. She gave birth a month later to a premature child. She was very pleased to have this child and for the first three weeks or so nothing was seen to be wrong with it. The child had to be kept at the nursing home although she was discharged because it had to be put in an incubator for a while and treated. After three weeks on a visit to

\(^3\) Strauss fn 29 \textit{supra} at p339 to 341
the nursing home she found that the child had been taken to hospital and a few days later the baby was diagnosed as suffering from toxoplasmosis. The accused had been a medical student in Paris for some four years and knew what this disease was and what its prognosis was – that the child was already in effect an idiot and would have to be fed with a tube through the nose and into the stomach. There was no chance of the child living for any length of time and at her trial a prominent paediatrician said that if it had been his child he would not have treated it medically. The child was kept at the hospital for some weeks and then sent home. While bathing the child the accused decided that it would be best to end its life and drowned it. She was charged with murder. The judge accepted that she had been in a highly emotional state and that she was in a puerperal state when a woman is inclined to be more emotional than the normal person. Nonetheless from her own confession she had intended to kill the child and it could not be said that her emotional state had reduced the intention to anything less than an intention to kill. However on the facts of the case, the judge held that there would be no object in sending the accused to prison, nor would a suspended sentence be appropriate. The sentence was that the accused was discharged and required to enter into recognisances to come up for sentence within six months after the date of sentence if called upon. She was not required to deposit any money in connection with the recognisances. The accused was never called upon to come up for sentence so that in actual fact no sentence was imposed.

In *S v McBride*, the accused killed his wife whom he dearly loved. Over the years her health had deteriorated drastically and this affected him severely. At different times in the past she had nursed her sister and mother, both of whom died in painful circumstances of cancer. Both the accused and his wife believed that she too was dying of cancer. Simultaneously with the deterioration of his wife’s health, the spouses experienced a deterioration of their financial position. After a series of depressing events the accused decided to take his wife’s life and then his own. He shot and killed her, but before he could kill himself he was saved through the intervention of others. Ironically the post mortem examination showed that she did not have cancer. Their fears would probably have been dispelled if she had agreed to submit to a proper and full medical examination but she had refused to do so. The accused was found not guilty by reason of mental illness and declared a state
President’s patient. The judge recommended that the earliest possible consideration be given to the accused’s release.

In S v Marengo, the accused, a 45 year old unmarried woman intentionally killed her father by shooting him in the head with a pistol that he had kept next to his bed for self-protection. He was 81 years of age and suffering from cancer. The accused pleaded guilty to a charge of murder. She told the court that her actions had been motivated by her desire to end her father’s terrible suffering and to end the mental and physical deterioration brought about both to herself and to her father by his constant pain and the hopeless and helpless condition he was in. She was convicted and sentenced to three years in prison suspended in its entirety for five years subject to the usual conditions. The judge found that she was a victim of extreme circumstances which would never be repeated. Imprisonment, he said, was not called for in her case as it could totally destroy her. A factor in the case was that as a young girl she had been totally isolated by her mother from other people. The accused had numerous traits of an obsessive, compulsive personality. She was incapable of making friends and her entire life consisted of going to work as an insurance clerk and going home to her flat where she locked herself in. She had been told by doctors that her condition could continue for many years while she felt that she could not go on for ‘even days, never mind years’.

In S v Williams\textsuperscript{84} the accused in the course of a robbery had shot the deceased in her home and seriously wounded her. She received emergency medical treatment and was subsequently placed on a respirator but the left side of her brain was already dead. The next day there was no evidence of brain activity and the doctor came to the conclusion that her brainstem had died. Her heart and lungs were kept going thereafter for a period of some 48 hours by the respirator whereafter it was disconnected. The accused tried to argue that this was a novus actus interveniens and that his shooting the deceased had not been the cause of her death.

It was held that where a person is wounded so seriously that it would, in the absence of prompt medical intervention, very soon lead to his death, and such person is kept

\textsuperscript{84} Williams fn 67 supra
alive artificially by means of a breathing apparatus (a respirator), the eventual disconnecting of the respirator cannot be seen as the act causing death. It is merely the termination of a fruitless attempt to save the life, i.e. a fruitless attempt to avert the consequences of the wounding. The causal connection between the wounding of the deceased and his eventual death exists from beginning to end and is not interrupted and eliminated by the disconnecting of the respirator. The court said that the fact that it did not decide the issue whether the view held by medical science, viz that the moment of death of a person occurs when there is brainstem death, should also be accepted in law, should not be seen as an indication that the abovementioned view should be accepted by South African courts. The court decided the instant appeal on the traditional view of the community that death occurs when breathing and heartbeat are no longer present.

It is submitted that it is abundantly clear from the circumstances of all of the cases above what the boni mores on the subject of euthanasia is. There is no doubt that the court in Clarke’s case was completely correct in its conclusion that the actions proposed by Mrs Clarke would not be wrongful and that it was not just a question of the judge’s ‘gut feel’ in this particular case although he admittedly did not refer to these unreported cases. Strauss notes that although Hartmann was struck off the roll by the Medical and Dental Council he was subsequently reinstated and the press coverage indicated that his action generally evoked sincere and strong compassion. If the courts in these cases had been obliged to use a less flexible test of wrongfulness, it is submitted that they would have been forced to come to conclusions that were manifestly unjust and that did not accord with the legal convictions of the community.

Clarke is not authority for legal recognition of the so-called Living Will. Taitz states that it is interesting to note the evidence led in Clarke to the effect that the patient (a qualified medical practitioner) was a life member of SAVES (the South African Voluntary Euthanasia Society) He had signed a ‘living will’: a document directing that should he in the future contract a terminal illness with no hope of recovery or become permanently unconscious, he must not be kept alive by artificial means but be allowed to die. Taitz points out that Thirion J stated that these statements undoubtedly

---

stemmed from a settled, informed and firmly held conviction on the patient’s part that should he ever be in the condition in which he has been since the cardiac arrest no effort should be made to sustain his life by artificial means. Nonetheless the judge placed no emphasis on these directions neither did he rule on the validity of the “living will”. The reason for this, says Taitz probably lies in the fact that as yet the “living will” has not yet been recognised in South African law. An examination of the document shows that it is not a will, nor can it be described as a power of attorney. He states that perhaps at best it may be regarded as a written directive having no force of law.

9.2.10 Jansen van Vuuren v Kruger\textsuperscript{86}

\textit{Facts}

The plaintiff, M, lived in a homosexual relationship with one Van Vuuren in Brakpan. It appeared that they were fairly well-known residents of that town and that the nature of their relationship was either generally known or surmised. During the beginning of 1990 they began a business venture in and moved to Nylstroom. They had, however, retained some links with Brakpan. During that period the plaintiff applied for life insurance cover from Liberty Life Insurance Company. The company required a medical report, including a report on the plaintiff’s HIV status (i.e. whether the plaintiff was infected with the human immunodeficiency virus). The first defendant had been the plaintiff’s general medical practitioner since 1983 and the plaintiff nominated him to prepare the medical report. For purposes of an HIV blood test a sample was drawn on 27 March 1990 at the second defendant’s laboratory. The result was positive and the second defendant informed the first defendant accordingly. The first defendant in consequence arranged an appointment with the plaintiff in order to consult with him on the outcome. That took place on 10 April 1990. The plaintiff was extremely upset and distressed. He was also concerned about a possible leak and raised the issue with the first defendant, who promised to respect his wish to keep it confidential. The following day during the course of a game of golf with Dr van Heerden, also a general medical practitioner, and Dr Vos, a dentist, the first defendant

\textsuperscript{86} Jansen van Vuuren fn 19 supra
disclosed the plaintiff's condition to them. The plaintiff and these three doctors moved in the same social circle in Brakpan. The plaintiff was engaged in a business venture with Van Heerden’s wife. Vos had in the past been the plaintiff’s dentist and the first defendant’s ex-wife and her parents were on friendly terms with Van Vuuren. Van Heerden, in due course, informed his wife. Whether Vos informed his was not established in evidence, but all assumed that he had. The news spread and the plaintiff became aware of this fact. He instituted an action for damages in an amount of R50 000 for breach of privacy against his general medical practitioner, the respondent. The plaintiff’s case against the first defendant was pleaded in these terms: the first defendant had been his general medical practitioner; in consequence he owed him a duty of confidentiality regarding any knowledge of the plaintiff’s medical and physical condition which might have come to his notice; he became aware of the plaintiff’s HIV status; it was a term of the agreement which established the doctor-patient relationship that the first defendant and his staff would treat this information in a professional and confidential manner; in breach of the agreement and in breach of his professional duties the first defendant ‘wrongfully and unlawfully’ disclosed the test results to third parties; in consequence the plaintiff had suffered an invasion of, and had been injured in, his rights of personality and his right to privacy. Sentimental (i.e. non-pecuniary) damages of R50 000 were initially claimed, but the amount was increased to R250 000 during the course of the trial. When the plaintiff died, during the course of the trial, of an AIDS-related disease, the appellants were appointed executors of his estate. The Court a quo dismissed the claim but granted leave to appeal. The respondent admitted the existence of the professional relationship, his duty to respect the plaintiff’s confidence and the term of the agreement as alleged, but raised the absence of wrongfulness on three alternative bases: (a) the communication had been made on a privileged occasion, (b) it was the truth and was made in the public interest, and (c) it was objectively reasonable in the public interest in the light of the boni mores. On appeal no reliance was placed on (b). It was argued on behalf of M that two alternative causes of action had in fact been pleaded, namely breach of contract and the actio iniuriarum and that in respect of the former animus iniuriandi was not an element (this was done in order to counter in advance a submission that animus iniuriandi had not been established). The argument was premised on the fact that the term of the contract was common cause and it proceeded on the assumption
that there was no reason why the breach of an agreement not to commit an *iniuriam* ought not to be actionable by a claim for damages.

**Judgment**

Harms AJA stated that as a general rule, and irrespective of the ultimate onus, a plaintiff who relies on the *actio iniuriarum* must allege *animus iniuriandi* (*Moaki v Reckitt & Colman (Africa) Ltd*); cf *Minister of Justice v Hofmeyr* - something the plaintiff had failed to do. However, as was pointed out in *Jackson v SA National Institute for Crime Prevention and Rehabilitation of Offenders* the averment need not be express if “the alleged *injuria* is obviously an infringement of personality, or where the facts pleaded allow of an inference of *animus iniuriandi*."

Harms AJA noted that the *actio iniuriarum* protects a person’s *dignitas* and *dignitas* embraces privacy. He said that although the right to privacy has on occasion been referred to as a real right or ius in rem (see, for example, *S v A and Another*; it is better described as a right of personality. The present case, he said, concerned the alleged invasion of this right by means of a public disclosure of private facts. As far as the public disclosure of private medical facts is concerned, the Hippocratic Oath, formulated by the father of medical science more than 2 370 years ago, is still in use. It requires of the medical practitioner ‘to keep silence’ about information acquired in his professional capacity relating to a patient, ‘counting such things to be as sacred secrets’. But, said Harms AJA, the concept even predates Hippocrates. He referred to *Oosthuizen, Shapiro and Strauss*:

“In a work written in Sanskrit presumed to be from about 800 BC Brahmin priests were advised to carry out their medical practices by concentrating only on the treatment of a patient when they entered a house and not divulging information about the sick person to anyone else. In ancient Egypt also the priestly medical men were under strict oaths to retain the secrets given to them in confidence. They worshipped in the temples of Isis and Serapis, a healer of the sick, and also of their son, Horus, who was usually called Harpocrates by the Greeks and pictured with his finger held to his mouth. The name for medicine, *ars muta* (dumb art), is used in Roman poetry by Virgil in Aeneid XII. The Pythagorean school in Greece, to which medical men especially belonged, considered silence as one of the most important virtues.”

He noted that according to the rules of the SA Medical and Dental Council it amounts to unprofessional conduct to reveal ‘any information which ought not to be divulged regarding the ailments of a patient except with the express consent of the patient’. The reason for the rule is twofold. On the one hand it protects the privacy of the patient. On the other it performs a public interest function. Harms AJA stated that the duty of a physician to respect the confidentiality of his patient is not merely ethical but is also a legal duty recognised by the common law. He stated that one is, as always, weighing up conflicting interests and, as Melius de Villiers indicated, a doctor may be justified in disclosing his knowledge ‘where his obligations to society would be of greater weight than his obligations to the individual’ because ‘(t)he action of injury is one which pro publica utilitate exercetur’. To determine whether a prima facie invasion of the right of privacy is justified, he said, it appears that, in general, the principles formulated in the context of a defence of justification in the law of defamation ought to apply. It was therefore not surprising, said Harms AJA, that the defences pleaded by the first defendant in justification have the ring of defamation defences, namely privilege, truth and public benefit and, in general terms, the boni mores. He noted that on appeal no reliance was placed on the defence of truth and public interest and that nothing more thus needed be said about it.

The court found it convenient to apply the test stated by Burchell Principles of Delict in the context of defamation to the defence of privilege of the sort presently under consideration.

---

92 Harms AJA referred to X v Y and Others [1988] 2 All ER 648 (QB) at 653a-b where Rose J said: “In the long run, preservation of confidentiality is the only way of securing public health; otherwise doctors will be discredited as a source of education, for future individual patients ‘will not come forward if doctors are going to squeal on them’. Consequently, confidentiality is vital to secure public as well as private health, for unless those infected come forward they cannot be counselled and self-treatment does not provide the best care...” He noted that a similar view was expressed by the Supreme Court of New Jersey in Hague v Williams [1962] 181 Atlantic Reporter 2d 345 at p 349: “A patient should be entitled freely to disclose his symptoms and condition to his doctor in order to receive proper treatment without fear that those facts may become public property. Only thus can the purpose of the relationship be fulfilled.”

93 He referred in this regard to de Villiers M The Law of Injuries at p 108. As far as present-day law is concerned, the legal nature of the duty is accepted as axiomatic. See, for example, Sasfin (Pty) Ltd v Beukes 1989 (1) SA 1 (A) at 31F-33G; Neethling Persoonlikheidsreg 3rd ed at 236; McQuoid-Mason The Law of Privacy in South Africa at p 193-4. He noted, however, that the right of the patient and the duty of the doctor are not absolute but relative. See S v Bailey 1981 (4) SA 187 (N) at 189F-G; Sasfin case supra; Sage Holdings Ltd v Financial Mail (Pty) Ltd 1991 (2) SA 117 (W) at 129H-131F; Financial Mail case (AD) supra at 462F-463B.

94 Burchell J Principles of Delict at p 180 states that: “It is lawful to publish ... a statement in the discharge of a duty or the exercise of a right to a person who has a corresponding right or duty to receive the information. Even if a right or duty to publish material and a corresponding duty or right to receive it does not exist, it is sufficient if the publisher had a legitimate interest in publishing the material and the publishee had a legitimate interest in receiving the material.”
Harms AJA observed that the duty or right to communicate and the reciprocal duty or right to receive the communication may be legal, social or moral. He said a legal duty to communicate would, for example, exist in respect of the duty of a medical practitioner to testify in court or to disclose a notifiable disease in terms of section 45 of the Health Act. A social or moral duty, he said, is exemplified in Hague v Williams where it was held that knowledge of a child's pathological heart condition was not of such a confidential nature that it prevented the physician from disclosing it extracurially to an insurer to whom the parents had applied for life insurance on the child.

Harms AJA held that the objective facts that are of relevance in assessing whether the disclosure was justified, were these:

1. The HIV-infection and AIDS-related illnesses are considered by many to be the major health threat of our day. In a paper by the head of the AIDS Centre at the SA Institute for Medical Research, Mrs Christie (who testified for the plaintiff) gave the following graphic description:

   "It is a modern day scourge which has already claimed the lives of thousands of people worldwide. The World Health Organisation estimates that between five to ten million people are infected with the AIDS virus and that there will be an exponential increase in the number of AIDS cases in the next few years. In the absence of a cure or vaccine, the only way to stop the spread of this deadly disease is by prevention of infection in the first place. This is clearly the task of education which is the only current tool available to combat the AIDS epidemic".

Although the concept of "education for prevention" is not new, it takes on special significance in the context of AIDS. For one thing, there is widespread ignorance and subsequent fear of the disease. The public is afraid of AIDS and the media has also helped to reinforce existing fear through sensationalist and sometimes inaccurate coverage on the topic. This is largely detrimental to society because it is a well-documented psychological fact that fear arousal is
not conducive to learning or promoting behavioural change. In fact, fear elicits denial so that people tend to block out what they hear or see. Another difficulty in promoting socially responsible behaviour is that AIDS deals with so many taboo subjects, including: sex, blood, death, promiscuity, prostitution, abortion, homosexuality, drug use, etc. These taboos makes AIDS an uncomfortable subject to deal with and creates impediments in the learning process.

2. Levy AJ described the nature of HIV-infection and the resultant AIDS in these terms:

“A disturbing feature of HIV is that it has the characteristic that it may remain for years in its host without showing any positive symptoms in the carrier. Antibodies in the carrier develop after about three months, but in the interim, that carrier has become and remains a potent source of infection without demonstrating any of the symptoms of HIV and despite the absence of antibodies. AIDS is incurable and fatal and it probably is the greatest public health threat of this century. There is a lack of information concerning the nature of the disease which has led to great fear amongst the public generally that it is easily transmittable and, of course, the fact that the disease has evidenced itself chiefly amongst homosexual and bisexual people has led to a further intolerance by the community of the victims of the disease. The disease is transmitted via body fluids, chiefly blood, semen and mother’s milk, as well as the vaginal fluids. Saliva apparently, although the virus may be found in it, would not carry sufficient of the virus to infect a recipient. It is also found in urine and tears. With blood as a source of infection, there was a great spread of the disease amongst persons requiring blood transfusion, notwithstanding their non-participation in high risk behaviour and, in particular, children have become its victims through infection through blood transfusion, particularly amongst haemophiliacs. The spread of the disease amongst persons practising normal sexual behaviour, presumably originating from homosexuals or bisexuals, or from persons who had become infected through sharing drug injection apparatus with infected persons, has led to a justifiable fear, as indicated earlier, that the spread of the disease will reach enormous proportions in a comparatively short time. At present there seems to be no cure for the disease. Plaintiff had for some time been taking drugs thought to be of assistance in combating or repressing the activity of the virus, but as has been observed, it nevertheless led to the onset of AIDS and his death during the course of the trial. It seems to be generally accepted for the present time that there is no recognised cure for the disease, and any victim of the virus who reaches the AIDS stage, must expect his illness to be fatal. The likelihood of advancing to the AIDS syndrome is, apparently, very high. Some of the writers to which I have been referred speak of a 50 per cent chance, but of greater importance perhaps in casu is the fact that such persons, while demonstrating no overt symptoms of the disease in the absence of blood tests to reveal the presence of antibodies in the blood, nevertheless remain highly infective of any sexual partner or recipient of their blood, whether accidentally or by way of transfusion, or through sharing needles in intravenous drug taking.”

3. Even though the virus is highly infective, it is far less infectious than many other common viruses and can only be transmitted through exchange of certain body fluids, viz semen, vaginal fluids and blood. The mode of spread of the infection generally follows well-defined routes, namely unprotected sexual intercourse,
the injection of infected blood, the infection of an unborn foetus whilst in the womb and, in exceptional cases, the infection of a newborn baby through the medium of breast milk.

4. Not a single case of occupationally acquired HIV has been confirmed in South Africa. Although health care workers are therefore at risk, the risk is small and arises only if through an invasive procedure infected blood enters the worker's blood stream.

5. There are many pathogens that are more infectious than HIV, such as hepatitis B, and a medical practitioner must, in the course of his ordinary practice, take steps to prevent their spread. Some of them are usually sufficient to prevent the spread of HIV in a professional context.

6. There is a reported instance in the USA of a dentist who infected one or more of his patients but that was through the use of instruments which he had used on himself in somewhat extra-ordinary circumstances. But his own HIV-infection was not occupationally acquired.

7. Reference has already been made to the Council’s rule 16 which is of general application. In addition, the Council formulated a guideline in 1989 in connection with HIV in these terms:

“The health care professions are fully aware of the general rules governing confidentiality. Council is confident that if doctors fully discuss with patients the need for other health care professionals to know of their condition, in order to offer them optimal treatment and also to take precautions when dealing with them, the reasonable person of sound mind will not withhold his consent regarding divulgence to other health care workers.”

If having considered the matter carefully in the light of such counselling, the patient still refuses to have other health care workers informed, the patient should be told that the doctor is duty bound to divulge this information to other health care workers concerned with the patient. All persons receiving such information must of course consider themselves under the same general obligation of confidentiality as the doctor principally responsible for the patient’s care. If it were found that an act or omission on the part of a medical
practitioner or dentist had led to the unnecessary exposure to HIV infection of another health care worker, the Council would see this in a very serious light and would consider disciplinary action against the practitioner concerned.

An important aspect of it is that the patient has to be informed of the doctor's obligation to make a disclosure. That gives the patient the opportunity to say why it is in fact not necessary - something that the plaintiff was denied. The first defendant not only did not seek to obtain the plaintiff's consent to a disclosure; to the contrary, he promised not to divulge the information.

8. The prestigious College of Medicine has a similar guideline.

9. There are some medical practitioners who refuse to treat known infected patients out of fear for their safety.

10. There are in the case of HIV and AIDS special circumstances justifying the protection of confidentiality. By the very nature of the disease, it is essential that persons who are at risk should seek medical advice or treatment. Disclosure of the condition has serious personal and social consequences for the patient. He is often isolated or rejected by others, which may lead to increased anxiety, depression and psychological conditions that tend to hasten the onset of so-called full-blown AIDS.

11. Section 45 of the Health Act\(^9\) empowered the Minister of Health to declare any medical condition to be a notifiable medical condition, presumably in order to promote public health. Diseases that have been declared in terms of this provision include cholera, leprosy, malaria, measles, poliomyelitis, tuberculosis and viral hepatitis. HIV-infection or AIDS-related diseases are, on the other hand, not notifiable diseases.

12. Dr Van Heerden had treated the plaintiff once only. That was in January 1990, during the first defendant's absence. He diagnosed, as mentioned, an oral fungal

---

\(^9\) Health Act fn 97 supra
infection. It was a minor problem which, he said, would normally respond promptly to appropriate treatment. There was no evidence of an intrusive procedure having been performed or of any risk having been created.

13. The plaintiff had consulted Dr Vos in his professional capacity prior to and during September 1987 but not since. There is no evidence of the nature of any procedure carried out by Vos on the plaintiff, whether of a risky nature or not.

14. The plaintiff had settled in Nylstroom a few months before the disclosure on the golf course.

According to Harms AJA, although justification is an objective question, Levy AJ considered the first defendant’s motive in making the communication to be of paramount importance but he did not find that the ‘retrospective exposure’ of Vos or Van Heerden justified it. As to Vos, his view was that as far as the first defendant knew the plaintiff was still his dentist and was likely to treat him in the future. It was also likely that he would not on such occasion have informed Vos of his condition in spite of having been advised otherwise by Mrs Christie. As to Van Heerden, it was held (contrary to an earlier finding) that the first defendant had been unaware of the treatment during January. Nevertheless, since Van Heerden was one of a group of 16 doctors in Brakpan who were on call from time to time for all off-duty practitioners in town, it was required that he should be informed for his own sake as well as for the better treatment of the plaintiff, should the occasion arise.

Harms AJA stated that concerning these findings a number of points arise. First, since one is dealing with the issue of wrongfulness, the first defendant’s honesty, bona fides and motive (except, possibly, if malice is in issue) are beside the point100. Second, at the time of the disclosure the plaintiff had moved to Nylstroom and the likelihood of him calling upon the services of either Vos or Van Heerden was remote. If the argument is taken to its logical conclusion, he said, health care workers, at least those in Transvaal, would have to be informed. Third, there was no factual basis for the

100 De Waal v Ziervogel fn 95 supra p 122-3; Delange v Costa 1989 (2) SA 857 (A) at p 862D-E and compare Tsose v Minister of Justice and Others 1991 (3) SA 10 (A) at p 17.
finding that the plaintiff would have failed to inform his future medical attendants of his illness. The evidence was merely that he did not wish to return to Vos for treatment because he did not want to advise him of his condition for fear of local gossip. Lastly, he said the Court was in his view correct in not relying on the 'retrospective exposure' because, as indicated, there was no evidence of it in either instance.

Harms AJA stated that in determining whether the first defendant had a social or moral duty to make the disclosure and whether Van Heerden and Vos had a reciprocal social or moral right to receive it, the standard of the reasonable man applied. With that in mind, he took the view that he had no such duty to transfer, nor did Van Heerden and Vos have the right to receive, the information. He saw the matter in this light: AIDS is a dangerous condition. That on its own does not detract from the right of privacy of the afflicted person, especially if that right is founded in the doctor-patient relationship. A patient has the right to expect due compliance by the practitioner with his professional ethical standards: in the present case the expectation was even more pronounced because of the express undertaking by the first defendant. Vos and Van Heerden had not, objectively speaking, been at risk and there was no reason to assume that they had to fear a prospective exposure. As Levy AJ stated, the real danger to the practitioner lies with the patient whose HIV condition had not been established or (due to the incubation period) cannot yet be determined. In consequence Harms AJA concluded that the communication to Vos and Van Heerden was unreasonable and therefore unjustified and wrongful.

He said that it was extremely difficult to make such an award because there were no obvious signposts. Nevertheless, the right of privacy is a valuable right and the award must reflect that fact. Harms AJA found that aggravating factors included the fact that a professional relationship was abused notwithstanding an express undertaking to the contrary. So, too, the breach created the risk of further dissemination by others. The evidence also established that the publication of a person's HIV condition increases mental stress and that the plaintiff was seriously distressed by the disclosure. And stress hastens the onset of AIDS - something which may have occurred in this instance. On the other hand, the disclosure was limited to two medical men who, it was reasonable to assume, would have dealt with the information with some
The nature of the plaintiff’s condition was in any event such that it would inevitably have become known at some stage. He had, to an extent, already severed his links with Brakpan. There is no evidence that his friends ostracised or avoided him; it was rather a case of his having chosen to withdraw from society, something he would probably in any event have done. In the light of all this the court took the view that R5 000 would be a just award.

Discussion

The question of confidentiality of medical information and the privacy of patients is one of the central issues of debate in the law on health service delivery. Jansen Van Vuuren v Kruger\(^{101}\) predates the Constitution but it is submitted that the decision is not inconsistent with constitutional rights and principles\(^{102}\) and is likely to remain a valid legal precedent on the subject of the unauthorised disclosure by a health professional of confidential information relating to a patient. This case illustrates just how easy it is to breach patient confidentiality. Health workers may talk to one another about a

\(^{101}\) Jansen van Vuuren fn 86 supra

\(^{102}\) Thus for instance in Investigating Directorate: Serious Economic Offences and Others v Hyundai Motor Distributors (Pty) Ltd and Others: In Re Hyundai Motor Distributors (Pty) Ltd and Others v Smuts No and Others 2001 (1) SA 545 (CC) Langa DP stated that: “The right to privacy has previously been discussed in judgments of this Court. In Bernstein and Others v Baxter and Others NNO, [1996 (2) SA 751 (CC)] Ackermann J characterises the right to privacy as lying along a continuum, where the more a person inter-relates with the world, the more the right to privacy becomes attenuated. He stated: ‘A very high level of protection is given to the individual’s intimate personal sphere of life and the maintenance of its basic preconditions and there is a final untouchable sphere of human freedom that is beyond interference from any public authority. So much so that, in regard to this most intimate core of privacy, no justifiable limitation thereof can take place. But this most intimate core is narrowly construed. This inviolable core is left behind once an individual enters into relationships with persons outside this closest intimate sphere; the individual’s activities then acquire a social dimension and the right of privacy in this context becomes subject to limitation.’ (Footnotes omitted.) The right, however, does not relate solely to the individual within his or her intimate space. Ackermann J did not state in the above passage that when we move beyond this established ‘intimate core’, we no longer retain a right to privacy in the social capacities in which we act. Thus, when people are in their offices, in their cars or on mobile telephones, they still retain a right to be left alone by the state unless certain conditions are satisfied. Wherever a person has the ability to decide what he or she wishes to disclose to the public and the expectation that such a decision will be respected is reasonable, the right to privacy will come into play. The protection of the right to privacy may be claimed by any person... As we have seen, privacy is a right which becomes more intense the closer it moves to the intimate personal sphere of the life of human beings, and less intense as it moves away from that core. This understanding of the right flows, as was said in Bernstein, [supra] from the value placed on human dignity by the Constitution.” Similarly Epstein JA observed in De Reuck v Director of Public Prosecutions, Witwatersrand Local Division, and Others 2003 (3) SA 389 (W) that: “The right to privacy includes the right to be freed from intrusions and interference by the State and others in one’s personal life. However, privacy, like other rights, is not absolute. In Bernstein and Others v Baxter and Others NNO [supra] Ackermann J described the right to privacy as ‘an amorphous and elusive’ concept. The learned Justice said: ‘(T)he truism that no right is to be considered absolute implies that from the outset of interpretation each right is always already limited by every other right accruing to another citizen. In the context of privacy this would mean that it is only the inner sanctum of a person, such as his/her family life, sexual preference and home environment, which is shielded from erosion by conflicting rights of the community rights and the rights of fellow members placing a corresponding obligation on a citizen, thereby shaping the abstract notion of individualism towards identifying a concrete member of civil society. Privacy is acknowledged in the truly personal realm, but as a person moves into communal relations and activities such as business and social interaction, the scope of personal space shrinks accordingly.’ In S v Jordan and Others (Sex Workers Education And Advocacy Task Force and Others as Amici Curiae) 2002 (6) SA 642 (CC), O’Regan J and Sachs J stated that “Our Constitution values human dignity which inheres in various aspects of what it means to be a human being. One of these aspects is the fundamental dignity of the human body which is not simply organic. Neither is it something to be commodified. Our Constitution requires that it be respected. ...the constitutional commitment to human dignity invests a significant value in the inviolability and worth of the human body. The right to privacy, therefore, serves to protect and foster that dignity.”
patient not realising that someone else who knows that patient could overhear them, they may go home and speak to a family member about a patient not knowing that the patient is known to that family member. This case indicates that the breach of confidentiality does not have to be an announcement to the entire neighbourhood. It could be a careless remark to one other person who then conveys it to another and a chain of communication is established until, as in the case of Jansen Van Vuuren, just about everyone in town knows. Once such confidentiality is breached it cannot be repaired. It is not as if, once broken, a replacement can be found or the defect can be mended. It is submitted with respect that, whilst the judgment is in principle laudable, the award of damages in this case was rather low given the fact that this case was based on legal rules which although compensation driven, tend to be punitive in nature since no amount of money can make up for the impairment of a person’s dignitas. The court in Jansen Van Vuuren v Kruger canvassed in detail the nature of HIV and AIDS and the social stigma that attaches to it. It also did not escape the court’s attention that the patient was extremely upset at the diagnosis and specifically requested the doctor not to tell anyone else. The fact that the patient relocated, it is submitted, was not sufficient to mitigate the damage to his rights of personality. The disclosure would in all likelihood have lead to a situation where he could not have returned to Brakpan if something went wrong for him in Nelspruit. Furthermore, Nelspruit was another small town not so far from Brakpan that a resident of the latter could not end up there once again spreading the news of M’s illness. Unfortunately, in matters of this nature, the world can often be a lot smaller than it should be. It is further submitted that the casual manner and circumstances in which M’s doctor apparently breached his patient’s right of confidentiality, especially given the fact that health professionals, more than most, are aware of the need for silence and despite his patient’s obvious distress at the news of his illness, was more than a little reprehensible. The court even conceded that the stress to the patient caused by the unauthorised disclosure and the subsequent litigation could have accelerated the onset of AIDS and the patient’s consequent death before the litigation was concluded. The amount awarded in damages was a tenth of the R50 000 that was initially claimed. In the course of proceedings this claim was increased to R250 000. Even in 1993 when the judgment was reported R5000 is not a great deal of money, given the likely impact of the disclosure on M’s life.
Violations of the right to privacy affect the dignitas of a person. The court in S v Jana\textsuperscript{103} analysed the nature of dignitas in some detail\textsuperscript{104}. The right to privacy reinforces and upholds the right to human dignity\textsuperscript{105}. Human dignity is not only a right but a fundamental value of the Constitution. The court in Hermanus v Department of Land Affairs: In Re Erven 3535 and 3536, Goodwood\textsuperscript{106} pointed out that a solutium is symbolic reparation. “It must not be an attempt to provide full redress for the claimant’s emotional suffering. Such an award, albeit symbolic, will serve the all important function of acknowledging the dignity and worth of the claimant.” (writer’s italics) Awards of damages in cases such as that of Jansen van Vuuren v Kruger, therefore fulfil two functions. They offer some form of comfort to the person who has been wronged but they also serve the important function of recognising his or her right to human dignity and worth. It is submitted that in view of this latter function and the importance of human dignity in South African society, the previously conservative approach of the courts in awarding such damages should be revisited in cases involving violations of fundamental constitutional rights if the weight attached by society to such rights is to be reflected in the amounts of the damages awarded.

\textsuperscript{103} Jana 1981 (1) SA 671 (T)  
\textsuperscript{104} Jana \textsuperscript{fn 103 supra}. It stated that “Melius de Villiers’ much quoted definition is: ‘That valued and serene condition in his social or individual life which is violated when a person is, either publicly or privately, subjected by another to offensive and degrading treatment, or when he is exposed to ill-will, ridicule, disesteem or contempt.’ He adds that the rights to an unimpaired person, dignity and reputation are ‘absolute or primordial rights’ ‘which every man has, as a matter of natural right’ and he points out that: ‘The word dignitas must be understood in a wide sense, and not as merely equivalent to the elevated public position of the Roman citizen. Injuries against dignity evidently comprise all those injuries which are not aggressions upon either the person or the reputation; in fact, all such indignities as are violations of the respect due to a free man as such.’ De Wet and Swanepeel define dignitas as ‘waardigheid, zelfspreke en geestelik onveroorloofheid’. Following Joubert, it regards dignitas as one aspect of the wider concept ‘eer’ which Joubert defines as ‘die erkenning van die geestelik-sedelike waarde van die mens as kroon van die skepping, as wese wat uitsteek, bo die bloot fisies-psigiese van die stotlike natuur en die dierellewe’. Van der Merwe and Olivier define dignitas as: ‘Die benadeelde... se eie gevoel van eer en agting van sy persoonlikheid’. As for the Courts, in R v Van Tonder 1932 TPD 90 at 93 Greenberg JP equated dignitas with ‘self-respect, mental tranquillity’. In R v Holiday 1927 CPD 395 at 401 the Court spoke of “a man’s rights of personality, his primordial rights of ‘son état civil’” and said that dignitas “includes a man’s self-respect” and “a woman’s right of privacy in regard to her body”. In R v Ferbrache 1933 OPD 65 at 68 De Villiers JP described dignitas as “the complainant’s own sense of her dignity; in other words her self-respect”, and in R v X and Y 1938 EDL 30 at 32 Pittman JP referred to ‘that ethical interest... to which the Romans gave the name dignitas’. It is submitted that: ‘Dignitas is a somewhat vague and elusive concept which can, however, be broadly described positively in terms of a person’s right to ‘self-respect, mental tranquillity and privacy’. These are the elements which have been constantly stressed by the Courts. It can be described negatively in terms of his right to freedom from insulting, degrading, offensive or humiliating treatment and to freedom from invasions of his privacy...”

Thus in National Coalition for Gay and Lesbian Equality and Another v Minister of Justice and Others 1999 (1) SA 6 (CC), Ackermann J stated: “As we have emphasised on several occasions, 34 the right to dignity is a cornerstone of our Constitution. Its importance is further emphasised by the role accorded to it in s 36 of the Constitution which provides that: ‘The rights in the Bill of Rights may be limited only in terms of law of general application to the extent that the limitation is reasonable and justifiable in an open and democratic society based on human dignity, equality and freedom. ...’ Dignity is a difficult concept to capture in precise terms. At its least, it is clear that the constitutional protection of dignity requires us to acknowledge the value and worth of all individuals as members of our society... The present case illustrates how, in particular circumstances, the rights of equality and dignity are closely related, as are the rights of dignity and privacy.”

In S v Jordan \textsuperscript{fn 102 supra} the constitutional court said that: “As we observed before, the constitutional commitment to human dignity invests a significant value in the inviolability and worth of the human body. The right to privacy, therefore, serves to protect and foster that dignity.”

\textsuperscript{105} Hermanus 2001 (1) SA 1030 (LCC)

\textsuperscript{106}
Damages for *injuria* are not generally in respect of patrimonial loss. In fact, although damages can be claimed for *injuria* where there is patrimonial loss\(^{107}\), the court in *Minister of Finance and Others v EBN Trading (Pty) Ltd*\(^{108}\) stated that in an action based on an *injuria* in which the plaintiff claims special damages the requisites for a claim under the *actio legis Aquiliae* must be alleged and proved. The question of damages in relation to various kinds of delict was discussed in some detail in this case. Magid J stated that in Roman-Dutch law, unlike English law, there are no hard and fast categories of delicts, nor is it necessary to label a cause of action. In our law all delicts give rise to claims based on either the *actio injuriarum* or on the *lex Aquilia*. Provided facts are alleged in a pleading which justify the relief sought in accordance with the principles of our law, the pleading will disclose a cause of action without the delict being named. Similarly, if the evidence led in an action justifies a judgment consistent with our legal principles no label need be attached to the claim on which it is based. He said that in Roman law, of course, the principles of the law developed from various types of actiones; but today we deal essentially in principles rather than actions\(^{109}\).

---

\(^{107}\) For example in *Weeks and Another v Amalgamated Agencies Ltd* 1920 AD 218 damages in a sum which could only have represented special damages were awarded against the messenger of the court and the execution creditors for the wrongful attachment and sale in execution of the plaintiff's goods. The significance of this judgment is that the majority of the Court concluded that the messenger of the court honestly believed he was acting lawfully, which is to say that he was not guilty of *dolus*. Nor was there any specific finding in the majority judgment (though there was in that of the minority) to the effect that he had been guilty of *culpa*. In other words, the majority judgment in *Weeks* is an instance of an award of special damages in an action based on an *injuria* in which one of the defendants at least was acquitted of fault in the widest sense (*dolus* or *culpa*). In fact, it seems clear that the majority judgment held that the messenger was liable as he had not acted strictly in accordance with his duties under the relevant Magistrates' Courts Act 32 of 1917. The same court noted that: 'In *Viviers v Kilian* 1927 AD 449, a case dealing with damages for adultery, special damages were awarded. But by the very nature of things, if the adultery constituted an *injuria* justifying an award of general damages for *consumelita*, the conduct of the defendant must have been intentional and accordingly, for the purpose of an *Aquilian* action, have amounted to *dolus*.'

\(^{108}\) EBN Trading 1998 (2) SA 319 (N)

\(^{109}\) Magid J observed that: 'Voet 47.10.18, in dealing with *injuriae*, said (Gane's translation): 'Action for indemnity for patrimonial loss under Aquilian law. By our customs besides there is this rule that, in addition to this action for honourable and profitable amends, a person who has suffered a wrong has no other right of redress either private or public for the wrong wreaked upon him, but has only a private action for indemnity under the Aquilian law, when perhaps the wrong inflicted has also rebounded in a loss to his household estate.' Roman-Dutch law has been developed in our jurisprudence and the possibility of claiming actual patrimonial loss caused by an *injuria* as, contrary to Voet's view, been expressly approved in the Appellate Division. In *Whittaker v Roos and Bateman; Morant v Roos and Bateman* 1912 AD 92 at 123 Innes J said:

'[(F)or in respect of injuria compensation may be given for the insult, indignity and suffering caused by the wrongful act. It often happens that actual pecuniary loss is caused by an *injuria*; and under such circumstances the modern and convenient practice is not to bring two separate actions, but to claim damage under both heads. In the present case I entertain no doubt that the element of *injuria* is present, and that being so, the plaintiff's claim cannot be restricted to mere patrimonial loss.]' Subsequently, however, in *Matthews and Others v Young* 1922 AD 492 De Villiers JA, after an exhaustive review of the authorities said, at 505: 'We have seen that for the intentional infringement of another's right there were two actions available under the Roman-Dutch law: the *actio injuriarum* or rather the amende honorabel & profitabel - the latter to recover sentimental damages - and the *actio ex lege Aquilia*, where direct patrimonial loss had been sustained. In our practice, however, the necessity for bringing two separate actions has long since disappeared, and there is no objection to the plaintiff in one and the same action now claiming, if so advised, both kinds of redress. The declaration does not betray what kind of damages the plaintiff claims, but from the evidence and the argument, it is clear that the plaintiff is only concerned about compensation. The action is, therefore, an *Aquilian* action for patrimonial loss based upon *dolus*, an intentional violation of plaintiff's legal rights.' In effect the learned Judge said, like Innes J in *Roos & Bateman (supra)* that, if one suffers an *injuria* which causes patrimonial loss, one can claim one's special and general damages in the same action, but he specified that if one claims
The patient’s right to privacy is an important element of the trust factor in the relationship between the patient and the provider of health care services. The duty on the part of health professionals to observe the right of a patient to privacy is clearly not absolute since the right to privacy is not absolute\(^{110}\) and as usual, a balancing act is often necessary in determining whether or not confidential medical information should be disclosed. There is no special privilege accorded to health professionals asked to testify before a court of law with regard to their patients. In *Ex parte James*\(^{111}\) the applicant asked for an order authorising and directing two medical practitioners to swear affidavits to be used in support of a petition relating to the mental condition of the respondent. The two practitioners were prepared to do so but were precluded from doing so by the rules of the Medical Council. The court held that the rules of a professional association cannot confer a power which is neither inherent nor statutory. It saw no difference between the present case and the case of any member of the public who alleges that he is ready to place relevant evidence by way of an affidavit before the court provided the court orders him to do so. The court distinguished the case of *Parkes v Parkes*\(^{112}\) on the basis that it was a trial proceeding saying that “there is all the difference in the world” between the making of such an order and the grant in motion proceedings of an order authorising a named person to make an affidavit. In response to the explanation of counsel that a doctor might be guilty of unprofessional conduct if in breach of the Hippocratic Oath, he divulged information concerning his patient, the court said that they should address themselves to the Medical Council which is the arbiter of professional conduct and it is to this Council that they should address themselves. The application was refused. The applicant was, however, granted leave to apply for a rule nisi on the same papers. In *Parkes* the wife brought an action against her husband for divorce on the ground of his adultery. She alleged that he was suffering from venereal disease which he had not contracted from her. A doctor who had refused to give any information concerning the husband to the wife’s attorney prior to the trial was subpoenaed as a witness by the wife. The doctor was

special damages, the claim is Aquilian and must accord with the requirements of such an action. The enquiry in this case is whether modern developments in South African law law have changed the principles laid down in *Matthews v Young* (supra).

\(^{110}\) *De Reuck v Director Of Public Prosecutions, Witwatersrand Local Division, And Others* fn 102 supra; *Qoxelent* fn 16 supra

\(^{112}\) *Parkes* 1916 CPD 702

1145
asked in court whether he had treated the husband for venereal disease. He claimed professional privilege and refused to reply. The judge ruled that he had to answer the question and he then told the court that he had treated the husband for such disease. In Botha v Botha 113 two doctors from Pietermaritzburg, Dr. Lind, a psychiatrist and Dr. Roper, a general practitioner, had been subpoenaed to give evidence for the defendant. After entering the witness-box and being sworn, and after having thereafter given evidence with respect to their qualifications, they have both refused to give evidence of what the plaintiff and the defendant revealed to them during consultations which they had with the parties. They claimed that their ethical rules prevent them from disclosing confidential information which they had been given by the plaintiff and the defendant in their capacities as medical advisers to the parties. They said that, if they were to reveal such information, they would be in breach of their hippocratic oath which they as doctors were bound to observe. It was clear that the evidence which was sought to be led was relevant to one of the main issues in the case, namely whether the custody of the minor child, Jacobus, should be awarded to the father or to the mother. The evidence of the doctors would have a bearing on the issue as to the fitness or otherwise of the parties to be awarded custody of this child. Leon J stated that in his judgment, a doctor cannot claim privilege for confidential communications from his patients114. He stated that it was of interest to note that in England the Law Reform Committee had recently concluded that the balance of convenience was against professional privilege being extended to a relationship such as that between a doctor and a patient. But in para. 1 of the report it is stated that the Judge has -

"a wide discretion to permit a witness, whether a party to the proceedings or not, to refuse to disclose information where disclosure would be a breach of some ethical or social value and non-disclosure would be unlikely to result in serious injustice in the particular case in which it is claimed".

Leon J was doubtful whether a discretion exists at all in the circumstances with which he was concerned. He was of the view that once the evidence is material and relevant it ought to be admitted without further ado. But, he said, if it is correct to hold that there exists a residual discretion in a court to refuse to allow such evidence to be given, even in circumstances such as those with which he was concerned, he was

113 Botha 1972 (2) SA 559 (N)
114 He referred to Hoffman, SA Law of Evidence, 2nd ed., p. 194; Parke v Parke, fn 112 supra; and also C. v C., (1946) 1 All E.R. 562.
firmly of the opinion that such discretion should in this case be exercised in holding that the evidence must be given. He observed that it is in the public interest that justice must be done. The confidential relationship between doctor and patient must yield to the requirement of public policy that justice must be done and must be seen to be done. This is particularly so, said Leon J, in this sort of case where a minor child is concerned and where the court as Upper Guardian of such child has a duty to ensure, as far as it is within its power to do so, that the future of such child will best be served by that child being placed in the custody of the parent who is most fitted to take care of him.

There are also statutory requirements for the disclosure of medical information. Thus the Compensation for Occupational Injuries and Diseases Act\textsuperscript{115} stipulates that—

(1) A medical practitioner or chiropractor shall within 14 days after having for the first time examined an employee injured in an accident or within 14 days after having diagnosed an occupational disease in an employee, furnish a medical report to the employer concerned in the prescribed manner: Provided that where the employee was at the time of the diagnosis of an occupational disease not employed, the medical report shall be furnished in the prescribed manner to the commissioner.

(2) If the commissioner or the employer individually liable or mutual association concerned, as the case may be, requires further medical reports regarding an employee, the medical practitioner or chiropractor who has treated or is treating the employee shall upon request furnish the desired reports in the manner and at the time and intervals specified or prescribed.

(3) If a medical practitioner or chiropractor fails to furnish a medical report as required in subsection (1) or (2) or in the opinion of the commissioner or the employer individually liable or mutual association concerned, as the case may be, fails to complete it in a satisfactory manner, such party may defer the payment of the cost of the medical aid concerned until the report has been

\textsuperscript{115} COID Act No 130 of 1993 section 74
furnished or completed in a satisfactory manner, and no action for the recovery of the said cost shall be instituted before the report has been so furnished or completed.

(4) No remuneration shall be payable to a medical practitioner or chiropractor for the completion and furnishing of a report referred to in subsection (1) or (2).

(5) A medical practitioner or chiropractor shall at the request of an employee or the dependant of an employee furnish such employee or dependant with a copy of the report referred to in subsection (1).

The Occupational Health and Safety Act\textsuperscript{116} stipulates –

"Any medical practitioner who examines or treats a person for a disease described in the Second Schedule to the Workmen's Compensation Act, 1941 (Act 30 of 1941), or any other disease which he believes arose out of that person’s employment, shall within the prescribed period and in the prescribed manner report the case to the person's employer and to the chief inspector, and inform that person accordingly."

Sometimes prejudice or some form of adverse consequence for the person to whom the record relates is attached to the failure to disclose a medical record. In terms of section 29A (7) the Medical Schemes Act\textsuperscript{117} which deals with the imposition of waiting periods before a person is entitled to benefits from the scheme –

"A medical scheme may require an applicant to provide the medical scheme with a medical report in respect of any proposed beneficiary only in respect of a condition for which medical advice, diagnosis, care or treatment was recommended or received within the 12 month period ending on the date on which an application for membership was made."

The Road Accident Fund Act\textsuperscript{118} stipulates that –

The Fund or an agent shall not be obliged to compensate any person in terms of section 17 for any loss or damage-

e) suffered as a result of bodily injury to any person who-

\textsuperscript{116} OHS Act No 85 of 1993 section 25
\textsuperscript{117} Medical Schemes Act No 131 of 1998
\textsuperscript{118} RAF Act No 56 of 1996 Section 19
(i) unreasonably refuses or fails to subject himself or herself, at the request and cost of the Fund or such agent, to any medical examination or examinations by medical practitioners designated by the Fund or agent;

(ii) refuses or fails to furnish the Fund or such agent, at its or the agent’s request and cost, with copies of all medical reports in his or her possession that relate to the relevant claim for compensation; or

(iii) refuses or fails to allow the Fund or such agent at its or the agent’s request to inspect all records relating to himself or herself that are in the possession of any hospital or his or her medical practitioner.

It is recognised in section 14 of the Constitution which states that everyone has the right to privacy which includes the right not to have –

(a) their person or home searched;
(b) their property searched;
(c) their possessions seized or
(d) the privacy of their communications infringed.

This last is obviously the most relevant to the relationship between patient and provider. It does not expressly cover a situation, however, where for instance the provider acquired information which is deeply personal to the patient and which the patient had not him or herself divulged to the provider. The classic example is, of course, blood test results. The question is whether the right to privacy is infringed when such information is disclosed by the provider to someone other than the patient. The court in *Jansen Van Vuuren* obviously answered this question in the affirmative. However, there is an allied issue relating to the question of ownership of medical records, such as the documentation bearing the test results in *Jansen Van Vuuren* and which states that it is the provider and not the patient who owns those records and the former may therefore dispose of them as he pleases and may, inter alia, refuse to give the patient access to such records. Since the records obviously contain the personal information of the patient, the latter has a very direct and vested interest in how it they are disposed of. This seems to be at odds with the concept of the provider’s ownership
of the records. It is submitted that the patient's right of privacy in fact severely restricts the doctor's right of ownership in the patient records in the sense that he is not free to dispose of them as he sees fit. For instance he may not publish them in a newspaper or even a medical journal in such a manner that the patient can be identified from them. He cannot allow unauthorised persons access to them within his own consulting rooms, neither can he display them to members of the patient's family. All of these actions would constitute a violation of the patient's right to privacy. The statement of Strauss that the rule that a patient will only ordinarily have access to medical records only by way of discovery presents a major obstacle to patients who are still contemplating legal action against a doctor has now largely been addressed by the Promotion of Access to Information Act. At the same time the safeguards of the private law around non-disclosure of medical records have also now been statutorily reinforced by the provisions of this Act. Section 1 of the Act defines

119 Strauss (fn 29 supra at p110) states that the ownership of records made by the doctor for his own purposes cannot be legally in any doubt. He is the exclusive owner of these records... The doctor has a moral obligation to keep the patient informed on his health but he does not have to let the patient read his medical record.

120 Strauss fn 29 supra at p111

121 Promotion of Access to Information Act No 2 of 2000

122 Section 34 provides for mandatory protection of privacy of third party who is natural person in the case of records held by a public body. It states: (1) Subject to subsection (2), the information officer of a public body must refuse a request for access to a record of the body if its disclosure would involve the unreasonable disclosure of personal information about a third party, including a deceased individual.

(2) A record may not be refused in terms of subsection (1) insofar as it consists of information:
   (a) about an individual who has consented in terms of section 48 or otherwise in writing to its disclosure to the requester concerned;
   (b) that was given to the public body by the individual to whom it relates and the individual was informed by or on behalf of the public body, before it is given, that the information belongs to a class of information that would or might be made available to the public;
   (c) already publicly available;
   (d) about an individual's physical or mental health, or well-being, who is under the care of the requester and who is:
      (i) under the age of 18 years;
      (ii) incapable of understanding the nature of the request, and if giving access would be in the individual's best interests;
   (e) about an individual who is deceased and the requester is:
      (i) the individual's next of kin; or
      (ii) making the request with the written consent of the individual's next of kin;
      (iii) about an individual who is or was an official of a public body and which relates to the position or functions of the individual, including, but not limited to:
         (i) the fact that the individual is or was an official of that public body;
         (ii) the title, work address, work phone number and other similar particulars of the individual;
         (iii) the classification, salary scale, remuneration and responsibilities of the position held or services performed by the individual; and
         (iv) the name of the individual on a record prepared by the individual in the course of employment.

Section 63 provides for mandatory protection of privacy of third party who is natural person in the case of records held by a private body. It states:

(1) Subject to subsection (2), the head of a private body must refuse a request for access to a record of the body if its disclosure would involve the unreasonable disclosure of personal information about a third party, including a deceased individual.

(2) A record may not be refused in terms of subsection (1) insofar as it consists of information:
   (a) about an individual who has consented in terms of section 72 or otherwise in writing to its disclosure to the requester concerned;
   (b) already publicly available;
   (c) that was given to the private body by the individual to whom it relates and the individual was informed by or on behalf of the private body, before it is given, that the information belongs to a class of information that would or might be made available to the public;
   (d) about an individual's physical or mental health, or well-being, who is under the care of the requester and who is:
      (i) under the age of 18 years; or
'personal information' as meaning "information about an identifiable individual, including, but not limited to-

(a) information relating to the race, gender, sex, pregnancy, marital status, national, ethnic or social origin, colour, sexual orientation, age, physical or mental health, well-being, disability, religion, conscience, belief, culture, language and birth of the individual;

(b) information relating to the education or the medical, criminal or employment history of the individual or information relating to financial transactions in which the individual has been involved;

(c) any identifying number, symbol or other particular assigned to the individual;

(d) the address, fingerprints or blood type of the individual;

(e) the personal opinions, views or preferences of the individual, except where they are about another individual or about a proposal for a grant, an award or a prize to be made to another individual;

(f) correspondence sent by the individual that is implicitly or explicitly of a private or confidential nature or further correspondence that would reveal the contents of the original correspondence;

(g) the views or opinions of another individual about the individual;

(h) the views or opinions of another individual about a proposal for a grant, an award or a prize to be made to the individual, but excluding the name of the other individual where it appears with the views or opinions of the other individual; and

(i) the name of the individual where it appears with other personal information relating to the individual or where the disclosure of the name itself would reveal information about the individual, but excludes information about an individual who has been dead for more than 20 years".

(ii) incapable of understanding the nature of the request, and if giving access would be in the individual's best interests;

(e) about an individual who is deceased and the requester is-

(i) the individual's next of kin; or

(ii) making the request with the written consent of the individual's next of kin; or

(f) about an individual who is or was an official of a private body and which relates to the position or functions of the individual, including, but not limited to-

(i) the fact that the individual is or was an official of that private body;

(ii) the title, work address, work phone number and other similar particulars of the individual;

(iii) the classification, salary scale or remuneration and responsibilities of the position held or services performed by the individual; and

(iv) the name of the individual on a record prepared by the individual in the course of employment.
Sections 30 and 61 of the Act deal specifically with access to health records held by public and private bodies respectively. The difference between access to records in the public sector and access to records in the private sector is, in the view of the writer somewhat simplistically drawn by the Act. Section 11 gives the right of access to a record held by a public body in the following terms -

1. A requester must be given access to a record of a public body if-
   a. that requester complies with all the procedural requirements in this Act relating to a request for access to that record; and
   b. access to that record is not refused in terms of any ground for refusal contemplated in Chapter 4 of this Part.

2. A request contemplated in subsection (1) includes a request for access to a record containing personal information about the requester.

3. A requester’s right of access contemplated in subsection (1) is, subject to this Act, not affected by-
   a. any reasons the requester gives for requesting access; or
   b. the information officer’s belief as to what the requester’s reasons are for requesting access.

By contrast, the right of access to a record held by a private body is expressed in section 50 of the Act as follows -

1. A requester must be given access to any record of a private body if-
   a. that record is required for the exercise or protection of any rights;
   b. that person complies with the procedural requirements in this Act relating to a request for access to that record; and
   c. access to that record is not refused in terms of any ground for refusal contemplated in Chapter 4 of this Part.

2. In addition to the requirements referred to in subsection (1), when a public body, referred to in paragraph (a) or (b) (i) of the definition of ‘public body’ in section 1, requests access to a record of a private body for the exercise or protection of any rights, other than its rights, it must be acting in the public interest.

3. A request contemplated in subsection (1) includes a request for access to a record containing personal information about the requester or the person on whose behalf the request is made.

A person may only request access to the record of a private body where he or she requires the record for the protection or exercise of any rights. The same qualification
is not present in section 11. Technically speaking a person can request access to a public record out of sheer curiosity and be entitled to that access. Section 45 does state that the information officer of a public body may refuse a request for access to a record of the body if (a) the request is manifestly frivolous or vexatious; or (b) the work involved in processing the request would substantially and unreasonably divert the resources of the public body. However, what is meant by (a) in the light of the provisions of section 11 (3)(b) is far from clear. The validity of the distinction is questionable because in terms of the Act, it is not so much the nature of the record that decides whether or not it falls within the ambit of section 11 or section 50 but rather the identity of the person having custody or possession of the record.

9.2.11

Castell v De Greef

Facts

On 7 August 1989, the plaintiff underwent a surgical operation known as a subcutaneous mastectomy. The operation was performed by the defendant, a plastic surgeon. It was not a success and the plaintiff sued for damages. The plaintiff's mother, and probably also her grandmother, died of breast cancer. In 1982 the plaintiff underwent surgery for the removal of lumps in the breast. In 1989 further lumps were diagnosed. In view of the plaintiff's family history, her gynaecologist recommended a prophylactic mastectomy and referred her for this purpose to the defendant who saw her on 14 June 1989. The plaintiff and her husband discussed the operation with the defendant at some length. A surgical procedure was proposed involving the removal of as much breast tissue as possible with the simultaneous reconstruction of the plaintiff's breasts using silicone implants. Following the discussion, the plaintiff decided to go ahead with the operation. The plaintiff was admitted to the Panorama Medi-Clinic Hospital and the operation was performed the next day. Breast tissue was removed bilaterally, a 280 ml prosthesis was implanted on each side behind the pectoral muscle, and the areolae and nipples were repositioned. The repositioning of the areolae was achieved by the creation on each breast of a

123 Castell 1993 (3) SA 501 (C); 1994 (4) SA 408 (C)
superior pedicle or flap, which was then folded back on itself resulting in the areolae being repositioned some 3 cm above its former position. The reason for repositioning the areolae was to correct a pre-operative mild ptosis (drooping), the aggravation of which is one of the consequences of an implant. This method, known as ‘transposition’ was employed in preference to the ‘free grafting’ method by which the areolae are simply removed and grafted on in a different position. The former method had the advantage that the areolae are not totally detached from the surrounding skin and in this way the risk of necrosis is reduced. The operation had a high risk of complications, the main one being necrosis of the skin and underlying tissue, including the areolae and nipples. The reason was that the removal of the breast tissue and lactiferous ducts in which carcinoma may develop results in the cutting off of the main blood supply to the skin and areolar complex (areola and nipple). The only source of blood that remains is the subdermal plexus or layer of fat beneath the skin. The surgeon’s dilemma is that the more of this tissue he leaves behind the less risk there is of necrosis but also the less effective the procedure is as a prophylaxis for cancer. Even without repositioning the areolae, they are at risk. If they are moved, the risk is increased, but more so if the ‘free grafting’ as opposed to the ‘transposition’ method is employed.

The operation was initially a success in the sense that upon completion all seemed well. Some 36 hours after the operation, however, the defendant observed a discolouration of the left nipple and first became concerned about the blood supply. He expressed this concern to the plaintiff. There was also a ‘wedge shaped’ area below the right areola which appeared pale and ischaemic. Later the same day, when the dressings were being changed, the plaintiff’s husband observed the incision marks around both areolae. The defendant was called to the ward where the plaintiff confronted him with this, saying that he had promised her that he would not ‘remove’ the areolae. He replied that he had not ‘removed’ them but had ‘moved’ them. In the course of the next few days the discolouration of the plaintiff’s left areolar complex worsened and by the time she was discharged from hospital on 13 August it had turned black. By this time, too, the area below the right areola had become discoloured but not to the same extent as the left areolar complex. Upon discharging the plaintiff from hospital, the defendant advised her that she would have to undergo further surgery but that it would first be necessary to wait and see what the extent of
the necrosis would be. On completion of the operation on 7 August the plaintiff was
given a broad spectrum antibiotic intravenously as a prophylaxis against infection.
Thereafter she was put on a related oral antibiotic and other medicines designed to
prevent infection. When the plaintiff's dressings were changed at home on 14 August
1989, both she and a friend, a Mrs Pickering, who assisted her, noticed a discharge
from the area immediately below and bordering on the right areola and also from the
left areolar complex. They also detected an offensive smell. The following day there
was no improvement. On Wednesday 16 August 1989, the plaintiff went to see the
defendant at his rooms in Paarl as previously arranged. He assured her that the
discharge was to be expected and was a consequence of the necrosis. He also
explained that it was necessary to wait before undergoing surgery for the debridement
of the dead tissue. The plaintiff testified that after the 16th the discharge seemed to get
worse, as did the odour. She said she also experienced pain and began to feel feverish.
Although her next appointment with the defendant was on Wednesday, 23 August,
she arranged to come and see him on Monday the 21st as she was not feeling well. On
this occasion he prescribed another antibiotic. On the 21st the plaintiff also began
receiving laser treatment which was administered to the scars by Miss Susan Wessels,
a physiotherapist. On 23 August the plaintiff again saw the defendant. On this
occasion he told her that he would be away the following weekend, but that if there
was a problem she should get in touch with his colleague, Dr Lückhoff. That weekend
the plaintiff continued to suffer pain. She said she felt feverish and emotionally upset.
On Sunday night, 27 August 1989, her husband took her to see Dr Lückhoff at the
Panorama Medi-Clinic. He arranged for her to be admitted and she remained
hospitalised until 11 September 1989. On Monday, 28 August, she was seen in
hospital by the defendant who took swab specimens from both breasts and sent these
off for analysis. Two days later, on Wednesday, 30 August, a debridement of the dead
tissue was performed under a general anaesthetic. The plaintiff had lost the entire
areolar complex on the left side and an area of skin (including a portion of the areola)
below the nipple on the right side. Six days later, namely on 4 September, she
underwent a further surgical procedure involving a skin graft to both breasts, the skin
for this purpose being taken from high up under the left arm. In the meantime, the
analysis of the swabs taken on 28 August revealed the presence of Staphylococcus
aureus. According to the pathologist's reports received on 30 August and 1 September
1989 respectively, Staphylococcus aureus is resistant to both of the antibiotics that
had been prescribed for the plaintiff once she had left the hospital. A different antibiotic was then prescribed.

In May of 1990, she underwent a further operation for the revision of the scars and spent one night in hospital. By this time, however, she had lost confidence in the defendant and the revision was performed by another plastic surgeon. On a subsequent occasion she had the original prosthesis removed and replaced by a smaller, 200 ml prosthesis, spending two nights in hospital for this purpose. Finally, in October of 1991 she underwent a further operation in the course of which the left nipple and areola were recreated. On this occasion she spent one night in hospital.

The plaintiff was satisfied with the final result and no further surgery was envisaged. As a result of the necrosis following the original operation, however, she had to undergo a number of additional surgical procedures which involved her in further expense. She also suffered pain and, for a long period, embarrassment and psychological trauma in consequence of the disfigurement of her breasts. Her claim against the defendant was for damages in the sum of R94 952,12. It was agreed by the parties that the defendant was under a duty of care towards plaintiff to perform the surgery (the subcutaneous mastectomy) with such professional skill, and utilising such procedures and materials as would reasonably be required of a specialist plastic surgeon and further under a duty of care to ensure that all reasonable steps were taken to ensure that plaintiff suffered no harm or damage other than such damage as normally resulted from the surgery in question.

The complaints against the defendant were as follows:
1. He performed the mastectomy and prosthesis implant simultaneously instead of in two stages.
2. He removed and repositioned the areolae unnecessarily, or alternatively without ensuring that the blood supply was sufficient to prevent necrosis.
3. He repositioned the areolae in breach of a specific agreement that he would not do so and that he would ensure that the plaintiff suffered no loss of sensation in the nipples.
4. He implanted a prosthesis which was larger than had been agreed upon.
5. On becoming aware that sloughing of the tissue was beginning to occur (on or about 10 August 1989) he failed to take steps to prevent or curtail this and in particular he failed to remove some of the sutures.

6. He failed to observe by not later than about 16 August 1989 that the plaintiff’s breasts had become infected and failed to take proper steps to treat and prevent the spread of the infection, more particularly he failed to take a pus swab in order to identify the organism causing the infection and to administer an appropriate drug to combat it; and, as a last resort, to remove the prosthesis.

7. He failed to ensure that the breasts were symmetrical.

8. He adopted a suturing technique which made it more difficult to release the sutures should this become necessary to prevent or curtail necrosis.

9. He failed to warn the plaintiff of the risks involved in the operation and of the possible complications, and in particular failed to warn her that:
   (a) transpositioning the areolae would increase the risk;
   (b) it was not essential to transposition the areolae;
   (c) performing the mastectomy and reconstruction simultaneously involved a greater risk than if performed in two stages;
   (d) the risk of complications was as high as 50%;
   (e) in the event of a threatened post-operative necrosis virtually no steps could be taken to avert or curtail it.

The defendant denied that he had breached his obligations and that he had acted wrongfully, unlawfully or negligently. He admitted that there had been scarring of the plaintiff’s breasts but averred that this was an unavoidable consequence of surgery. He averred also that the need for further surgery was a consequence of ‘normal, expected and unavoidable complications’ arising from the initial operation. He admitted that the plaintiff’s breasts had become asymmetrical but averred that this was a normal and expected consequence of the operation.

**Judgment**

In the court *a quo*, Scott J made certain general observations regarding the duty of a medical practitioner towards his patient. He observed that both in performing surgery and in his post-operative treatment, a surgeon is obliged to exercise no more than reasonable diligence, skill and care and that he is not expected to exercise the highest
possible degree of professional skill (*Mitchell v Dixon*). What is expected of him, said Scott J, is the general level of skill and diligence possessed and exercised at the time by members of the branch of the profession to which he belongs. Scott J pointed out that it must also be borne in mind that the mere fact that an operation was unsuccessful or was not as successful as it might have been or that the treatment administered did not have the desired effect does not, on its own, necessarily justify the inference of lack of diligence, skill or care on the part of the practitioner. He said that no surgeon can guard against every eventuality, although readily foreseeable and that most, if not all, surgical operations involve to a greater or lesser extent an element of risk, and from time to time mishaps do occur, and will continue to occur in the future, despite the exercise of proper care and skill by the surgeon. Scott J noted that necrosis is a common complication in operations of the kind undergone by the plaintiff. It can and does frequently arise notwithstanding the utmost care on the part of the surgeon. Indeed, he said, it is one of the inherent risks associated not only with this operation but also with many other operations involving plastic surgery. The mere fact that it occurred in the present case did not, therefore, give rise to an inference of negligence on the part of the defendant.

Concerning the release of the sutures, the court examined the evidence and held that there was no reason to conclude that the decision of the defendant not to release the sutures was such that no reasonable plastic surgeon in his position would have adopted the same approach. It noted that the plaintiff testified that she was satisfied with the final result following reconstructive surgery and that had the sutures been released, there was every likelihood that necrosis would not have been averted and the plaintiff would have been left with additional, and perhaps unacceptable, scarring resulting from an unsuccessful attempt to avert the necrosis. The court then examined the evidence relating to the claim of failure to properly treat the infection and held that the plaintiff had failed to establish that there was an infection. It said that it followed that the defendant cannot be held to be negligent for having failed to detect an infection or to take steps to combat it and this ground of negligence accordingly failed. With regard to the repositioning the areolae without consent and failure to

---

124 *Mitchell* fn 1 supra at p525
125 The court referred to *Van Wyk v Lewis* (fn 3 supra) at 444; *Blyth v Van den Heever* 1980 (1) SA 191 (A) at 221A; *S v Kramer and Another* 1987 (1) SA 887 (W) at p 893E-895C and *Pringle v Administrator, Transvaal* fn 7 supra at p 3841-385E in this regard.
warn of the risks, Scott J held that the probabilities favoured the conclusion that the
defendant explained to the plaintiff that he would reposition the areolae using a
transpositional flap for this purpose, as opposed to the free grafting method, and that
the plaintiff had either misunderstood the position at the time or later became
confused as to what she had been told. The court noted that the plaintiff seemed to be
an intelligent woman and this, according to the defendant, was the impression he also
gained. He spent more than an hour discussing the operation with her and explaining
what he proposed to do. This included answering questions. In the course of his
explanation he drew little sketches on a pad to make things clearer. In these
circumstances, said Scott J, there was no basis, in his view, for holding that any
misunderstanding that may have arisen was the fault of the defendant. This ground of
complaint therefore also failed.

Concerning the question of the warning the defendant was obliged to give with regard
to the risks inherent in the operation the court first made certain general observations.
Scott J, stated that a medical practitioner undoubtedly has a duty in certain
circumstances to warn his patient of the risks involved in surgery or other medical
treatment and, if he fails to do so, may incur liability for negligence. He said that the
difficulty is to determine when that duty arises and what the nature and extent of the
warning must be and noted that in *Richter and Another v Estate Hamman* 126
Watermeyer J adopted the approach of measuring the conduct of the doctor in
question against the standard of the reasonable doctor faced with the same problem 127.
Scott J agreed with this approach. He stated that the ‘reasonable doctor’ test is one
which is well established in South African law and is applied in relation to both
medical diagnosis and treatment and that it affords the necessary flexibility and if
properly applied does not ‘leave the determination of a legal duty to the judgment of
doctors’, as suggested by Lord Scarman in *Sidaway v Governors of Bethlem Royal
Hospital and Others* 128 in relation to the so-called ‘Bolam principle’ 129.

---

126 *Richter* fn 38 *supra*
127 Scott J referred to the following dictum of the court in *Richter* (fn 38 *supra*): “It may well be that in certain
circumstances a doctor is negligent if he fails to warn a patient, and, if that is so, it seems to me in principle that his
conduct should be tested by the standard of the reasonable doctor faced with the particular problem. In reaching a
conclusion a Court should be guided by medical opinion as to what a reasonable doctor, having regard to all the
circumstances of the particular case, should or should not do. The Court must, of course, make up its own mind, but it
will be assisted in doing so by medical evidence.”

129 *Bolam v Friern Hospital Management Committee* [1957] 1 WLR 582 (QB) ([1957] 2 All ER 118
Scott J observed that counsel had invited the court to adopt, if not in its entirety, certain aspects of the doctrine of 'informed consent'. He noted that this doctrine originated in certain jurisdictions of the United States of America and had been accepted in modified form by the Supreme Court of Canada. The doctrine holds that a patient’s consent to medical treatment is vitiated if he is given inadequate information concerning the proposed treatment and that, subject to certain exceptions, what it requires to be disclosed to the patient is determined not by reference to the information a reasonable doctor might disclose, but by reference to the significance a ‘prudent patient’ would be likely to attach to the disclosure in deciding whether or not to undergo the treatment. Scott J noted that the House of Lords in the Sidaway case (Lord Scarman dissenting) declined to adopt the doctrine and instead reaffirmed the ‘Bolam’ test and said that in his view there was no justification for adopting it in South African law. He said that there could be little doubt that a reasonable doctor from whom advice is sought regarding a ‘high risk’ prophylactic operation, such as in the present case, would give his patient a full account of the risks involved and quoted Lord Bridge of Harwick in the Sidaway case. But it does not follow, said Scott J, that the doctor is obliged to point out meticulously each and every complication that may arise. He said that to do so could well result in the risk of complications and their possible further sequelae assuming an undue and even distorted significance in the patient’s assessment of whether to proceed with the operation or not. Scott J held that the doctor is not obliged to educate his patient to the extent of bringing him up to the standard of his own medical knowledge of all the relevant factors involved. What he must do, it is present his patient, in such circumstances, with a fair and balanced...
picture of the material risks involved. Scott J examined the evidence of the various claims involving the failure to inform the patient and found that they were without substance. The plaintiff's claim against the defendant failed and judgment was granted in favour of the defendant.

In the appeal against the judgment of Scott J, Ackerman J observed that it has on occasion been suggested that a 'mere error of judgment' on the part of a medical practitioner does not constitute negligence\textsuperscript{134} and associated himself with the views of the House of Lords in \textit{Whitehouse v Jordan and Another}\textsuperscript{135}. The court pointed out that in \textit{Esterhuizen v Administrator, Transvaal}, Bekker J stated that generally speaking to establish the defence of \textit{volenti non fit injuria} the plaintiff must be shown not only to have perceived the danger, for this alone would not be sufficient, but also that he fully appreciated it and consented to incur it. Indeed if it is to be said that a person consented to bodily harm or to run the risk of such harm, then it presupposes knowledge of that harm or risk. Accordingly, said Bekker J, mere consent to undergo X-ray treatment, in the belief that it is harmless or being unaware of the risks it carries, cannot in my view amount to effective consent to undergo the risk or the consequent harm. Ackermann J also noted that Bekker J was quoted with approval in the judgment of Neser J in \textit{Rompel v Botha}\textsuperscript{136}.

\textsuperscript{134}He referred to the case of \textit{Whitehouse v Jordan and Another} [1981] 1 All ER 267 (HL) in which the House of Lords inter alia considered the correctness of the statement by Denning MR in the Court of Appeal that: 'We must say, and say firmly, that, in a professional man an error of judgment is not negligence' and noted that the House of Lords held this to be an inaccurate statement of the law. At 281a Lord Fraser of Tullybelton expressed the view that: 'I think Lord Denning MR must have meant to say that an error of judgment "is not necessarily negligent".' Lord Fraser further observed as follows (at 281b): 'Merely to describe something as an error of judgment tells us nothing about whether it is negligent or not. The true position is that an error of judgment may, or may not, be negligent; it depends on the nature of the error. If it is one that would not have been made by a reasonably competent professional man professing to have the standard and type of skill that the defendant held himself out as having, and acting with ordinary care, then it is negligent. If, on the other hand, it is an error that a man, acting with ordinary care, might have made, then it is not negligent.'

\textsuperscript{135}\textit{Whitehouse v Jordan and Another} [1981] 1 All ER 267 (HL)

\textsuperscript{136}\textit{Rompel} 1953, Transvaal Provincial Division, unreported) in which it was held that "There is no doubt that a surgeon who intends operating on a patient must obtain the consent of the patient. In such cases where it is frequently a matter of life and death I do not intend to express any opinion as to whether it is the surgeon's duty to point out to the patient all the possible injuries which might result from the operation, but in a case of this nature, which may have serious results to which I have referred, in order to effect a possible cure for a neurotic condition, I have no doubt that a patient should be informed of the serious risks he does run. If such dangers are not pointed out to him then, in my opinion, the consent to the treatment is not in reality consent - it is consent without knowledge of the possible injuries. On the evidence defendant did not notify plaintiff of the possible dangers, and even if plaintiff did consent to shock treatment he consented without knowledge of injuries which might be caused to him. I find accordingly that plaintiff did not consent to the shock treatment."
Referring to the judgment of Watermeyer J in *Richter v Estate Hamman*, Ackerman J stated that in the passage quoted as (a) *supra*, Watermeyer J was alluding to the problems surrounding the so-called ‘therapeutic privilege’ of the medical professional which Giesen in *International Medical Malpractice Law* describes as ‘designed to permit health care providers to withhold disclosure which they judge would be counter-therapeutic and, thus, “detrimental to a particular patient”’. Ackermann J observed that in an obiter dictum in *SA Medical & Dental Council v McLoughlin*, Watermeyer CJ observed that ‘it may sometimes be advisable for a medical man to keep secret from his patient the form of treatment which he is giving him’. He noted that the dangers inherent in the so-called therapeutic privilege, and in particular the inroads that it might make on patient autonomy, have been commented on by Van Oosten in his thesis and by Robertson and by Giesen. Ackermann J felt that it was not necessary to further pursue this issue because this so-called privilege was not invoked by the defendant or relied upon in argument to justify a non-disclosure.

---

137 *Richter* fn 38 *supra* at p 232 where Watermeyer J held: (a) "A doctor whose advice is sought about an operation to which certain dangers are attached - and there are dangers attached to most operations - is in a dilemma. If he fails to disclose the risks he may render himself liable to an action for assault, whereas if he discloses them he might well frighten the patient into not having the operation when the doctor knows full well that it would be in the patient’s interests to have it." and (b) "It may well be that in certain circumstances a doctor is negligent if he fails to warn a patient, and, if that is so, it seems to me in principle that his conduct should be tested by the standard of the reasonable doctor faced with the particular problem. In reaching a conclusion a Court should be guided by medical opinion as to what a reasonable doctor, having regard to all the circumstances of the particular case, should or should not do. The Court must, of course, make up its own mind, but it will be assisted in doing so by medical evidence.”

142 *McC Loughlin* fn 141 *supra*

143 The question of whether informed consent is a contractual issue or not is an interesting one when viewed in the light of the law relating to negligent non-disclosure in the contractual as opposed to the delictual setting. Steyn L ‘Damages for Negligent Non-Disclosure By One Contracting Party to the Other’ (2003) 120 *SAU* 317 - 321. In each case one uses the legal convictions of the community as the touchstone (*Carmichele v Minister of Safety and Security and Another* 2001 (1) SA 489 (SCA) at 494E - F applying *Minister of Law and Order v Kadir* 1995 (1) SA 303 (A) at 317C - 318D). The policy considerations appertaining to the unlawfulness of a failure to speak in a contractual context - a non-disclosure - have been synthesised into a general test for liability. The test takes account of the fact that it is not the norm that one contracting party need tell the other all he knows about anything that may be material (*Spiegh *v Glass and Another* 1961 (1) SA 778 (D) at 781H - 783B). That accords with the general rule that where conduct takes the form of an omission, such conduct is prima facie lawful (*BOE Bank Ltd v Ries* 2002 (2) SA 39 (SCA) at 463 - 464). A party is expected to speak when the information he has to impart falls within his exclusive knowledge (so that in a practical business sense the other party has him as his only source) and the information, moreover, is such that the right to have it communicated to him ‘would be mutually recognised by honest men in the circumstances’ (*Pretorius and Another v Natal South Sea Investment Trust Ltd* (under Judicial Management) 1965 (3) SA 410 (W) at 418E - F). Having established a duty on the defendant to speak, a plaintiff must prove the further elements for an actionable misrepresentation, that is, that the representation was material and induced the defendant to enter into the contract.” Steyn observes that while the majority was prepared, not without some hesitation, to treat the information regarding the lack of an alarm and guards as information lying exclusively within the knowledge of the bank officials, it was not, in the circumstances, prepared to hold that an honest person in the position of the bank officials would have thought that
the risk of loss was such that Ms Fouche should know that certain security measures were not in place. Conradie JA explained that by "honest person" was meant someone embodying the legal convictions of the community, as referred to in McCann v Goodall Group Operations (Pty) Ltd 1995 (2) SA 718 (C) at 726A-G. The majority of the court found that the ABSA officials were not under a duty to disclose information about the absence of an alarm and the lack of guards at night. In a dissenting judgment Schutz JA held that not only was there a duty on the part of the ABSA officials to warn Ms Fouche but also that negligence had been proved and that ABSA was consequently liable to Ms Fouche in delict. He explained that in line with the decision in Bayer South Africa (Pty) Ltd v Frost 1991 (4) SA 559 (A), a person who induces another to enter into a contract by making a negligent misstatement may not only face the avoidance of the contract but may also be liable to that other for the loss which he suffers in consequence. Not only negligence is required to be established but also unlawfulness which, the learned judge of appeal stated, in the context of this case meant that the plaintiff was required to prove that there was such a duty to speak. Schutz JA explained that whether such a duty existed had to be ascertained by reference to what has been called the legal convictions of the community and he quoted with approval, the principles as summarized in McCann v Goodall Group Operations (Pty) Ltd: "From the aforesaid exposition of the law the following principles emerge:

(a) A negligent misrepresentation may give rise to delictual liability and to a claim for damages, provided the prerequisites for such liability are complied with.

(b) A negligent misrepresentation may be constituted by an omission, provided the defendant breaches a legal duty, established by policy considerations, to act positively in order to prevent the plaintiff's suffering loss.

(c) A negligent misrepresentation by way of an omission may occur in the form of a non-disclosure where there is a duty on the defendant to disclose some or other material fact to the plaintiff and he fails to do so.

(d) Silence or inaction as such cannot constitute a misrepresentation of any kind unless there is a duty to speak or act as aforesaid.

Examples of a duty of this nature include the following:

(i) A duty to disclose a material fact arises when the fact in question falls within the exclusive knowledge of the defendant and the plaintiff relies on the frank disclosure thereof in accordance with the legal convictions of the community.

(ii) Such duty likewise arises if the defendant has knowledge of certain unusual characteristics relating to or circumstances surrounding the transaction in question and policy considerations require that the plaintiff be apprised thereof.

(iii) Similarly there is a duty to make a full disclosure if a previous statement or representation of the defendant constitutes an incomplete or vague disclosure which requires to be supplemented or elucidated.

These examples cannot be regarded as a numeros clausulae of the occurrence of a duty to disclose, as may possibly be inferred from the authorities mentioned above. There may be any number of similar factual situations which could give rise to such duty.

In the circumstances Schutz JA decided that each requirement mentioned in the 'check-list' in McCann had been met. Steyn offers a preliminary observation that this case (ABS v Fouche) indicates just how subjective the application of the notion of the 'legal convictions of the community' actually is. In spite of the fact that in each of the reported judgments exactly the same principles or policy considerations were apparently applied to decide whether the bank officials were under a duty to disclose information about the absence of certain security measures, conflicting decisions were reached.

However, analysis and comparison of the judgments, says Steyn, expose more fundamental issues, relating to the requirements for liability for damages in a case of misrepresentation by one contracting party to another, which merit consideration. He points out that in the majority judgment Conradie JA held that to succeed with such a claim, a plaintiff has to prove unlawfulness of the defendant's conduct, in that there was a duty to speak, as well as the further elements for an actionable misrepresentation, that is that the misrepresentation was material and that it induced the defendant to enter into the contract. On the other hand Schutz JA found the bank liable in delict on the basis that its officials' conduct was unlawful as they were under a duty to speak, that their non-disclosure was negligent and that it caused Ms Fouche loss. In other words Schutz JA applied the requirements for Aquilian liability in delict. Steyn asks which of these two approaches is correct? What does the law require to be proved in order to establish liability for damages in such circumstances? He notes that the position was clearly stated by the Appellate Division in Bayer (supra) where Corbett CJ delivering the unanimous judgment of the court stated: "in terms of the case of Administraties: Nautic (v Trust Bank van Afrika Bpk (1979 (3) SA 820 (A)))... a delictual action for damages is available to a plaintiff who can establish (i) that the defendant, or someone for whom the defendant...made a misstatement to the plaintiff; (ii) that in making this misstatement the person concerned acted (a) negligently and (b) unlawfully; (iii) that the misstatement caused the plaintiff to sustain loss; and (iv) that the damages claimed represent proper compensation for such loss...In principle I can see no good reason why in the recognition of such a cause of action based upon a negligent misstatement any distinction should be drawn between a misstatement made which induces a contract and one made outside the contractual sphere....

In principle a negligent misstatement may, depending on the circumstances, give rise to a delictual claim for damages at the suit of the person to whom it was made, even though the misstatement induced such person to enter into a contract with the party who made it. The circumstances will determine the vital issues of unlawfulness and whether there is a causal connection between the making of the misstatement and the loss suffered by the plaintiff."

Steen states that the requirement for delictual liability in terms of the Lex Aquilia – namely (1) unlawful (2) conduct, committed with (3) fault (in the form of intention or negligence) on the part of the defendant, which (4) caused (5) patrimonial loss- must be proved for the plaintiff to succeed in an action for damages in circumstances such as those in ABSA Bank v Fouche. He submits that while proof is required that the misrepresentation caused the plaintiff's loss, it is unnecessary for the plaintiff to show, as stated by Conradie JA, that the misrepresentation induced the contract. He further submits that while it is necessary for a contracting party seeking rescission of a contract in the circumstances under discussion, to prove that the misrepresentation was material, this is not a requirement in order to establish liability for damages for loss caused by such misrepresentation. In a health care context, rescission of the contract is of course, unlikely to be an option for most plaintiffs. Steyn states that another aspect of the decision in ABSA Bank Ltd v Doucette which deserves further consideration is the test to be applied to determine whether the non-disclosure of the information is unlawful. He notes that Conradie JA explained that the 'legal convictions of the community' must be used as the touchstone and that a party is expected to speak when the information he has to impart falls within his 'exclusive knowledge' and the information is 'such that the right to have it communicate to [the other party] "would be
which would otherwise have been actionable. He stated that it does, however, form part of the wider debate concerning consent to medical treatment and whether emphasis should be placed on the autonomy and right of self-determination of the patient in the light of all the facts or on the right of the medical profession to determine the meaning of reasonable disclosure. Ackermann J did not agree with the court a quo in its acceptance of the test formulated by Watermeyer J in Richter v Estate Hamman to the effect that the “reasonable doctor” test is one which is well-established in South African law and is applied in relation to both medical diagnosis and treatment. It affords the necessary flexibility and if properly applied does not “leave the determination of a legal duty to the judgment of doctors”, as suggested by Lord Scarman in Sidaway v Governors of Bethlehem Royal Hospital and Others\(^{144}\) in relation to the so-called “Bolam principle” (Bolam v Friern Hospital Management Committee\(^{145}\)). Ackermann J also did not agree with the conclusion that the ‘reasonable doctor’ test does not ‘leave the determination of a legal duty to the judgment of doctors’. He observed that the ‘reasonable doctor’ test, insofar as it relates to the standard of disclosure, has received little attention in South African case

\(^{144}\) Sidaway fn 128 supra at p 488 (in WLR, and 649e in All ER)

\(^{145}\) Bolam fn 129 supra
law and, apart from the above statement of Watermeyer J in Richter and Watermeyer CJ's obiter dictum in McLoughlin, he knew of no firm judicial pronouncement in South Africa to the effect that disclosure is unnecessary because a reasonable doctor faced with the particular problem would not have warned the patient. Ackerman J pointed out that in Sidaway's case, Lord Diplock held that:

'... To decide what risks the existence of which a patient should be voluntarily warned and the terms in which such warning, if any, should be given, having regard to the effect that the warning may have, is as much an exercise of professional skill and judgment as any other part of the doctor's comprehensive duty of care to the individual patient, and expert medical evidence on this matter should be treated in the same way. The Bolam test should be applied.'

Lord Diplock was therefore of the view that although the law imposed the duty of care, the standard of care to be enforced was a matter of medical judgment. Ackerman J then referred to the comments of Giesen Malpractice Law at p 282 and p 284. He noted that after referring to certain passages from the speech of Lord Templeman in this regard, Giesen ventures the view that:

"The understandable fears of Lord Scarman that the majority decision in Sidaway will result in English law developing out of tune with other important common law jurisdictions may thus prove, in final analysis, to be unfounded."

According to Ackermann J, at least one commentator, Simon Lee 'A Reversible Decision on Consent to Sterilisation' would appear to bear out Lord Scarman's

146 Ackermann J also referred to Giesen D 'From Paternalism to Self-Determination to Shared Decision-making' in (1988) Acta Juridica 107; Van Oosten (fn 140 supra) at 39-53 (in particular, at 50-1) and Strauss (fn 140 supra) at 8-12 and 18-19; See also Dreyer L Redelike Dokter versus Redelike Pasient' 1995 THBHR 532

147 Also reported in Sidaway v Bethlehem Royal Hospital Governors and Others [1985] I All ER 643 (HL), at 658-9

148 Giesen comments as follows: "One has to consider this result carefully. Should the medical profession really be appointed judge in its own cause? Carried to its ultimate logical conclusion, Lord Diplock's opinion would mean that the function of English Courts would be limited to determining whether the defendant physician had acted in accordance with a responsible body of medical opinion, unless the plaintiff was a member of the judiciary (a reference by Giesen to the singular observation at 659a-b that members of the judiciary have the right to be informed as patients apparently because they are aware of their right of self-determination) or had specifically demanded information which the physician then failed to disclose. A standard of disclosure which allows the medical profession to be judge in its own cause and physicians in deciding what is best for the patient to override the patient's right to decide for himself is "medical imperialism" at its worst. We cannot but agree with Lord Scarman's criticism of that stance."

149 "It is further submitted (i) that insofar as Sidaway could be interpreted as sanctioning the view that expert medical evidence is conclusive, it must be regarded as misguided and against the overwhelming international trend to the contrary; (ii) that in this case Lord Scarman's dissenting opinion would have to be considered preferable to Lord Diplock's judicial interpretation of the majority decision of the House; (iii) but that in fact, this decision, in the light of the opinions expressed by a majority of the Law Lords (Lords Bridge, Keith, Templeman and Scarman) does not sanction the view that expert medical evidence has to be treated as conclusive on the assumption that the standard of disclosure is to be determined exclusively by reference to the current state of responsible and competent professional opinion and practice. The implications of such a view would be disturbing in the extreme. But the Courts do not allow medical opinion with regard to what is best for the patient to override the patient's right to decide for himself whether he will submit to the treatment or not."

150 Giesen fn 139 supra at p 284

151 Lee S (1987) 103 LQR at p 513
misgivings. In commenting on the Court of Appeal's decision in Gold v Haringey Health Authority\textsuperscript{152}, Lee states the following:

“So the Court of Appeal's decision ignores the main thrust of the judgments in Sidaway. I observed at the time (101 LQR 316) that Sidaway should not be treated as informed consent (Lord Scarman) 1, uninformed consent 4. There is plenty of material in the speeches of Lord Bridge, with whom Lord Keith agreed, and Lord Templeman to incline a subsequent Court towards the view favoured by Lord Scarman rather than the other extreme favoured by Lord Diplock. In concentrating on Lord Diplock's judgment to the exclusion of the others, the Court of Appeal has threatened to stop the development of a coherent doctrine of consent.”

Ackermann J rejected the view of Scott J in the court \textit{a quo} that there can be no justification for the adoption of the doctrine of informed consent in South African law\textsuperscript{153}. He said he was constrained to disagree, inasmuch as he was of the view that there was not only a justification, but indeed a necessity, for introducing a patient-orientated approach in this connection. In his view it was important to bear in mind that in South African law (which differs in this regard from English law) consent by a patient to medical treatment is regarded as falling under the defence of \textit{volenti non fit injuria}, which would justify an otherwise wrongful delictual act\textsuperscript{154}. Ackermann J held that it is clearly for the patient to decide whether he or she wishes to undergo the operation, in the exercise of the patient's fundamental right to self-determination. A woman may be informed by her physician that the only way of avoiding death by cancer is to undergo a radical mastectomy. This advice may reflect universal medical opinion and may be, in addition, factually correct. Yet, to the knowledge of her physician, the patient is, and has consistently been, implacably opposed to the mutilation of her body and would choose death before the mastectomy. He said he could not conceive how the “best interests of the patient” (as seen through the eyes of her physician or the entire medical profession, for that matter) could justify a mastectomy or any other life-saving procedure which entailed a high risk of the

\textsuperscript{152} Gold [1987] 2 All ER 888 (CA) at p 515

\textsuperscript{153} Scott J stated at p 518 of the judgment in the court \textit{a quo}: “Mr Oosthuizen invited me to adopt, if not in its entirety, certain aspects of the doctrine of “informed consent”. This doctrine originated in certain jurisdictions of the United States of America and has been accepted in modified form by the Supreme Court of Canada (Reihl \textit{v} Hughes (1980) 114 DLR (3d) 1 (Can SC). The doctrine holds that a patient's consent to medical treatment is vitiated if he is given inadequate information concerning the proposed treatment and that, subject to certain exceptions, what it requires to be disclosed to the patient is determined not by reference to the information a reasonable doctor might disclose, but by reference to the significance a “prudent patient” would be likely to attach to the disclosure in deciding whether or not to undergo the treatment (Canterbury \textit{v} Spence (1972) 464 2d 772). The House of Lords in the Sidaway case (Lord Scarman dissenting) declined to adopt the doctrine and instead reaffirmed the “Bolam” test. In my view there can be no justification for adopting it in our law.” It was this specific passage in his judgment to which Ackermann J objected.

In this regard Ackermann J referred to \textit{inter alia}, Stoffberg \textit{v} Elliott (fn 14 supra) at p 149-50; Lymbery \textit{v} Jefferies fn 33 supra at p 240; Lampert \textit{v} Heifer NO 1955 (2) SA 507 (A) at p 508; Esterhuizen's case fn 4 supra at p 718-22; Richter's \textit{Richter} fn 38 supra at 232 and Verhoef \textit{v} Meyer 1975 (TPD) and 1976 (A) (unreported), discussed in Strauss (fn 29 supra at p 35-6).

\textsuperscript{154}
patient losing a breast. Even if the risk of breast-loss were insignificant, a life-saving operation which entailed such risk would be wrongful if the surgeon refrains from drawing the risk to his patient’s attention, well knowing that she would refuse consent if informed of the risk. Ackermann J stated that it is, in principle, wholly irrelevant that her attitude is, in the eyes of the entire medical profession, grossly unreasonable, because her rights of bodily integrity and autonomous moral agency entitle her to refuse medical treatment. It would, in his view, be equally irrelevant that the medical profession was of the unanimous view that, under these circumstances, it was the duty of the surgeon to refrain from bringing the risk to his patient’s attention. In this regard Ackermann J referred extensively to Giesen155 and he also referred to a passage from the thesis of Van Oosten156. Ackermann J then went on to refer to two leading

155 Giesen fn 139 supra, after drawing attention (at p 289) to the fact that ‘an increasing number of both common and civil law jurisdictions’ (as diverse as Canada, the United States, France, Germany and Switzerland) have moved away from ‘professional standards of disclosure’ to more ‘patient-based’ ones, points out (at 297) that there are two patient-based standards that could be applied:

(i) the ‘objective’ or “reasonable” patient standard, posited on the informational requirements of the hypothetical “reasonable” patient in what the physician knows or should know to be the patient’s situation, or

(ii) the individual or ‘subjective’ patient standard, whereby the physician must disclose information which he knows, or ought to know, that his particular patient in his particular situation requires’.

Giesen proposes (at p 303-5) a ‘blending’ of the reasonable patient ‘minimum’ with the individual patient ‘additional needs test’. Giesen (ibid) sees no objection to using the ‘reasonable patient’ test as the point of departure. ‘It will normally lead the physician to a correct assessment of the average patient’s minimum informational needs. His right to self-determination does not require more if in fact the individual patient is a member of that community of reasonable (or “model”) patients with average informational needs.’ Ackermann J noted that this approach must, however, ‘be supplemented by a more subjective patient-based standard, better attuned to the values of each person and his or her inalienable right of self-determination, and better able to manage situations beyond the limitations of the objective test’. Giesen argues (at 304) that the ‘right of the patient to make his own decision about what is to be done with his own body’ must be guaranteed ‘even where the individual patient differs from what the medical profession or anyone else considers to be a “reasonable” patient. The patient has a right to be different. The patient has a right to be wrong.’ He concludes (at p 305) by quoting with approval the following passage from McPherson v Ellis 287 SE 892 (NC 1982), a North Carolina Supreme Court decision in which the subjective test was adopted as a supplement to the prevailing objective test: ‘In determining liability by whether a reasonable person would have submitted to treatment had he known of the risk that the defendant failed to relate, no consideration is given to the peculiar quirks and idiosyncrasies of the individual. His supposedly inviolable right to decide for himself what is to be done with his body is made subject to a standard set by others. The right to base one’s consent on proper information is effectively vitiated for those with fears, apprehensions, religious beliefs, or superstitions outside the mainstream of society.’

156 Van Oosten fn 140 supra where he states at p 414 of his thesis: “When it comes to a straight choice between patient autonomy and medical paternalism, there can be little doubt that the former is decidedly more in conformity with contemporary notions of and emphases on human rights and individual freedoms and a modern professionalised and consumer-orientated society than the latter, which stems largely from a bygone era predominantly marked by presently outmoded patriarchal attitudes. The fundamental principle of self-determination puts the decision to undergo or refuse a medical intervention squarely where it belongs, namely with the patient. It is, after all, the patient’s life or health that is at stake and important though his life and health as such may be, only the patient is in a position to determine where they rank in his order of priorities, in which the medical factor is but one of a number of considerations that influence his decision whether or not to submit to the proposed intervention. But even where medical considerations are the only ones
decisions of the Australian Courts of the standards of disclosure required of a doctor in treating a patient, namely \( F \text{ v } R \)\textsuperscript{157}, a decision of the Full Court of the Supreme Court of South Australia and \( Rogers \text{ v } Whitaker \)\textsuperscript{158}, a decision of the High Court of Australia. In both cases the matter was approached on the basis of the doctor's duty of care to the patient, breach of which would constitute negligence on the doctor's part. Ackermann J pointed out that the matter is approached somewhat differently in South African law, the enquiry being whether the defence of volenti non fit injuria has been established and in particular whether the patient's consent has been a properly informed consent. He observed that on either approach the same, or virtually identical, matters of legal policy are involved\textsuperscript{159}. Ackermann J supported the view of King J in \( F \text{ v } R \)\textsuperscript{160} that the ultimate question is not whether the defendant's conduct accords with the practices of his profession or some part of it, but whether it conforms to the standards of reasonable care demanded by the law. That is a question for the Court and the duty of deciding it cannot be delegated to any profession or group in the community. Ackermann J observed that in \( Rogers \text{ v } Whitaker \) Mason CJ and Brennon J, Dawson J, Toohey J and McHugh J in a joint judgment trenchantly criticised the so-called 'Bolam principle' and its application in \( Sidaway \) and quoted its formulation by Lord Scarman in that case at p 48 to 49\textsuperscript{161}. He noted out that the court in this case
pointed out that in Australia, particularly in the field of non-disclosure of risk and the provision of advice and information, the Bolam principle has been discarded and, instead, the courts have adopted the principle that, while evidence of acceptable medical practice is a useful guide for the courts, it is for the courts to adjudicate on what is the appropriate standard of care after giving weight to “the paramount consideration that a person is entitled to make his own decisions about his life”. Ackermann J considered the criticism by the Australian court in Rogers of the terms ‘the patients right of self-determination’ and ‘informed consent’ as used by the American authorities. Ackermann J held that for consent to operate as a defence the following requirements must inter alia be satisfied:

(a) the consenting party must have had knowledge and been aware of the nature and extent of the harm or risk;
(b) the consenting party must have appreciated and understood the nature and extent of the harm or risk;
(c) the consenting party must have consented to the harm or assumed the risk;
(d) the consent must be comprehensive, that is extend to the entire transaction, inclusive of its consequences.

He held with regard to the criticism in Rogers v Whitaker of the expression “informed consent” that the position in South African law is quite different and the medical judgment. The Court in Rogers v Whitaker (fn 158 supra at p 50) indicated the following shortcoming in the Bolam approach as applied in Sidaway: “One consequence of the application of the Bolam principle to cases involving the provision of advice or information is that, even if a patient asks a direct question about the possible risks or complications, the making of that inquiry would logically be of little or no significance; medical opinion determines whether the risk should or should not be disclosed and the express desire of a particular patient for information or advice does not alter that opinion or the legal significance of that opinion. The fact that the various majority opinions in Sidaway, for example, suggest that, over and above the opinion of a respectable body of medical practitioners, the questions of a patient should truthfully be answered (subject to the therapeutic privilege) indicates a shortcoming in the Bolam approach. The existence of the shortcoming suggests that an acceptable approach in point of principle should recognize and attach significance to the relevance of a patient’s question.”

The criticism of the former expression was on the basis that, while perhaps suitable ‘to cases where the issue is whether a person has agreed to the general surgical procedure or treatment’, it was of little assistance in ‘the balancing process that is involved in the determination of whether there has been a breach of the duty of disclosure’. This criticism struck Ackerman J as being “somewhat paradoxical” when regard is had to the court’s own endorsement of ‘the paramount consideration that a person is entitled to make his own decisions about his life’. In any event, said Ackerman J, it did not seem to be appropriate when applied to the position in South African law, where the issue is treated not as one of negligence, arising from the breach of a duty of care, but as one of consent to the injury involved and the assumption of an unintended risk. He said that in the South African context the doctor’s duty to disclose a material risk must be seen in the contractual setting of an unimpeachable consent to the operation and its sequelae (see Van Wyk v Lewis fn 3 supra at 451; Correira v Berwind [fn 47 supra] at p 63 and Verhoef v Meyer (supra at 32 et seq of the unreported Transvaal Provincial Division judgment and p 26-9 of the unreported Appellate Division judgment)). He referred with approval to the statement of Van Oosten (fn 140 supra) that: “South African law generally classified volenti non fit injuria, irrespective of whether it takes the narrower form of consent to a specific harm or the wider form of assumption of the risk of harm, as a ground of justification (regverdigingsgrond) that excludes the unlawfulness or wrongfulness element of a crime or delict.”

Rogers fn 158 supra. The criticism was to the effect that “... consent is relevant to actions framed in trespass, not in negligence. Anglo-Australian law has rightly taken the view that an allegation that the risks inherent in a medical procedure have not been disclosed to the patient can only found an action in negligence and not in trespass. ...”
expression is an appropriate one. Ackermann J stressed as being of particular importance the conclusion of the court in Rogers that:

"The law should recognise that a doctor has a duty to warn a patient of a material risk inherent in the proposed treatment; a risk is material if, in the circumstances of the particular case, a reasonable person in the patient’s position, if warned of the risk, would be likely to attach significance to it or if the medical practitioner is or should reasonably be aware that the particular patient, if warned of the risk, would be likely to attach significance to it. This duty is subject to the therapeutic privilege."

He said that this test bears a very close resemblance to the blending of the ‘reasonable patient’ minimum with the individual patient ‘additional needs test’ proposed by Giesen and held that the above formulation laid down in Rogers v Whitaker, suitably adapted to the needs of South African jurisprudence, should be adopted in South Africa. In the view of Ackermann J it is “in accord with the fundamental right of individual autonomy and self-determination to which South African law is moving”. He noted that this formulation also sets its face against paternalism, from many other species whereof South Africa “is now turning away” and that it is in accord with developments in common law countries like Canada, the United States of America and Australia, as well as judicial views on the continent of Europe. Ackermann J ruled that the majority view in Sidaway must be regarded as out of harmony with medical malpractice jurisprudence in other common law countries. He concluded that in South African law, for a patient’s consent to constitute a justification that excludes the wrongfulness of medical treatment and its consequences, the doctor is obliged to warn a patient so consenting of a material risk inherent in the proposed treatment; a risk being material if, in the circumstances of the particular case: a reasonable person in the patient’s position, if warned of the risk, would be likely to attach significance to it; or the medical practitioner is or should reasonably be aware that the particular patient, if warned of the risk, would be likely to attach significance to it. This obligation is subject to the therapeutic privilege, whatever the ambit of the so-called ‘privilege’ may today still be.

Ackermann J observed that expert medical evidence would be relevant to determine what risks inhere in or are the result of particular treatment (surgical or otherwise) and
might also have a bearing on their materiality but, in the words of the Supreme Court of Canada in *Reibl v Hughes*164:

"this is not a question that is to be concluded on the basis of expert medical evidence alone". The ultimate question, as King CJ stated in *F v R*, is "whether (the defendant's conduct) conforms to the standard of reasonable care demanded by the law. That is a question for the Court and the duty of deciding it cannot be delegated to any profession or group in the community."

Ackermann J then turned to the facts and found that Scott J was clearly correct in finding that defendant had mentioned to plaintiff the repositioning of the areolae and that she had agreed to it. He said that apart from denying that he gave an undertaking that the plaintiff would not, as a consequence of the operation, suffer any loss of sensation in her areolae or nipples, the defendant's evidence was undisputed that the inevitable consequence of a subcutaneous mastectomy is total loss of sensation in these areas. It was, said Ackermann J, in the highest degree unlikely that defendant would have given an undertaking that was impossible of fulfilment. He noted that according to the defendant, he explained to plaintiff that the operation was not one to be embarked on lightly and that there were many complications involving, inter alia, physical complications in respect of her breasts. He says he specifically mentioned to her that the dominant blood supply, which passes through the breast tissue, would be completely removed and that consequently the risk of complications of damage to the skin was very great. He also mentioned to her that complications of infection and bleeding could occur. It was not suggested by the plaintiff, nor seriously contended on her behalf, that as an intelligent lay person she was ignorant of the fact that a compromised blood supply could lead to permanent damage of skin and tissue (including her areolae). Ackermann J held that in the circumstances, Scott J was fully warranted in his finding that the plaintiff was aware of the risks involved in the transposition of her areolae. Ackerman J found that here was no merit in the complaint that plaintiff was allowed to labour under the misapprehension that the repositioning of her areolae was prophylactically essential and not merely cosmetic. At no stage did plaintiff indicate that she was unaware of the true position in this regard. He said it was difficult to see how she could have been. The purpose of the operation was to remove as much of the breast tissue as possible in order to provide a

---

164 *Reibl* fn 130 *supra*
prophylaxis against cancer in the future. This plaintiff was aware of. The repositioning of the nipples could not be thought to further this end. In his view Scott J was correct in concluding that the evidence was insufficient to establish that the particular type of subcutaneous mastectomy and prosthesis insertion practised by the defendant involved a materially higher risk than if a two-stage procedure was used. Ackermann J also upheld Scott J's conclusions concerning the allegations of post operative negligence on the part of the defendant. He found that the expert evidence plaintiff fell far short of proving, on a balance of probability, that defendant was negligent in not taking the steps indicated. In the view of Ackermann J the plaintiff had proved on a clear balance of probability:

(a) that she developed post-operative sepsis in her breasts which manifested itself no later than 14 August and became systemic and continued to be systemic until at least 24 August;

(b) that defendant became aware of this sepsis on 16 August; and

that the organism, or one of the organisms, causing such sepsis was resistant to the antibiotics which had been prophylactically prescribed by defendant for plaintiff.

He observed that on the facts as found, defendant was therefore negligent in not following such a procedure when he suspected infection on 16 August. A swab was only taken 12 days later. Had the swab been taken on 16 August, the appropriate antibiotic would have been prescribed and the infection effectively treated that much sooner. He said that the final important question is to determine what causal role defendant's negligent failure in this regard played in the sequelae suffered by plaintiff and the consequent damage sustained by her. Ackermann J found that the necrosis suffered by plaintiff in her breast had become irreversible not later than 48 hours after the operation, i.e. by the evening of 9 August, and certainly well before any infection set in or could reasonably be diagnosed. As found, he said, the defendant cannot be held liable in law for the sequelae of the necrosis. It was clear that the necrosis was at least the predominant and major cause of the restorative and reconstructive surgery and medical treatment, for the plaintiff's subsequent periods in hospital and for the pain, discomfort and other trauma suffered by plaintiff in consequence thereof. It was impossible, on the evidence, to establish that defendant’s negligence in failing to treat the infection timeously and properly played any role at all in the harm ultimately suffered by plaintiff. Ackermann J held that it certainly was not sufficiently causally
connected therewith in the sense mentioned in *Blyth v Van den Heever*\(^{165}\). Ackermann J held that the best that could be done, under the circumstances, was to compensate plaintiff for the additional period of pain, suffering, illness, discomfort and anxiety she had to endure because of the defendant’s failure to treat her infection properly and timeously. This period was fairly represented by the period of delay in taking the swab for microbiological testing. This was a period of 12 days. In his view a sum of R7 500 would fairly and adequately compensate plaintiff in this regard.

Ackermann J ruled that the appeal accordingly succeeded with costs.

**Discussion**

Informed consent is about patient autonomy and the right of self-determination. As such, it is submitted that it is a doctrine that is entirely in keeping with the values and principles within the South African Constitution. However long before the decision in *Castell* the maxim *volenti non fit iniuria* has yielded a defence of consent to intended harm in South African law\(^{166}\). Boberg observes that consent freely and lawfully given by a person who has the legal capacity to give it justifies the conduct consented to, making lawful the infliction of the ensuing harm. It is therefore a defence that operates by negating unlawfulness\(^{167}\). Why then was it specifically necessary for the court in *Castell* to recognize a doctrine of informed consent? Is the latter wider than

\(^{165}\) *Blyth fn 42 supra* at p 208A and p 223C-G

\(^{166}\) For example in *Staffberg v Elliott* (fn 14 supra) and *Esterhuizen v Administrator Transvaal* (fn 3 supra).

\(^{167}\) Boberg (fn 20 supra) p 724. He notes, however, that modern law has grafted another limb onto the *volenti* principle which, it is generally agreed has ‘bred a nest of troubles’. Variously called ‘voluntary assumption of risk’ and ‘consent to risk of harm’ this concept, he says, conveys the notion that a person who willingly encounters a known and appreciated danger forfeits any right to compensation if the risk materialises to cause him harm. Precisely why this should be so, says Boberg, is not clear. He says that most writers seem to see it simply as an extension of the *volenti* principle to liability based on negligence. Since Aquilian liability can arise from intention or negligence a sense of symmetry engenders the belief that *volenti non fit injuria* should exclude responsibility on either basis, consent condoning harm caused intentionally, voluntary assumption of risk excusing harm caused negligently. He states that not all the implications of this approach are acceptable. Boberg notes that undeterred by jurisprudential qualms South African courts have repeatedly affirmed the existence of the defence of voluntary assumption of risk and endorsed Innes CJ’s summary of its requirements in *Waring & Gillow v Sherbourne* 1904 TS 340. However, its theoretical foundation received short shrift in earlier decisions and even the Appellate Division in *Lampert v Hejer NO* 1955 (2) SA 507 (A) avoided assigning it a definite juridical niche. Nor says Boberg was it then necessary to separate voluntary assumption of risk from contributory negligence for both were complete defences. Boberg notes that the belief that a person should be entitled to encounter a danger without losing his right against a party negligently responsible for creating it – in other words that factual assumption of risk should not be equated to legal assumption of risk – finds expression in the bargain theory associated with Glanville Williams. The latter requires ‘an express or implied bargain between the parties whereby the plaintiff gave up his right of action for negligence. Boberg notes that Glanville Williams says that to dispense with this ‘is to ignore the chain of cases deciding that knowledge is not tantamount to consent. Consent, in modern law, means agreement, and it would be much better if the latter word replaced the former’. Boberg notes that acceptance of the bargain theory makes consent indistinguishable from waiver. He states that unfortunately this approach seemed to the Appellate Division to place ‘an unduly heavy onus upon the defendant and... not to accord with the general term of our own decisions’. In rejecting it, the court committed our law to the equation of factual with legal acceptance of a foreseen risk. Nor, says Boberg does the court’s criterion of consent give proper effect to the subjective character of the *volenti* defence that the court itself insisted upon. For it is not really a subjective test of consent at all: it is a subjective test of foresight which, once established, is deemed objectively to amount to consent.
the principle volenti non fit injuria? In the judgment of the court in Castell, Ackermann J found that whereas in English (and Australian) law the issue of consent to medical treatment is approached on the basis of the doctor's duty of care to the

168 Van Oosten FFW in 'Castell v De Greef and the Doctrine of Informed Consent: Medical Paternalism ousted in favour of Patient Autonomy' 1995 De Jure 164-179 states: "Ordinarily, lawful consent is out of the question unless the consenting party knows what it is he consents to. Since the patient is usually a layman in medical matters, knowledge and appreciation on his part can only be effected by appropriate information. In this way, adequate information becomes a requisite of knowledge and appreciation and, therefore, also of lawful consent. In the absence of information, real consent will be lacking. In turn this means that the informed consent requisite saddles the doctor, as an expert, with a corresponding legal duty to provide the patient with the necessary information to ensure knowledge and appreciation and hence, real consent on the patient's part." He notes that the informed consent requisite has met with strong resistance in medical quarters. This is particularly borne out by the multitude of paternally inclined objections voiced by the medical profession against the doctor's duty of disclosure. Van Oosten observes that while it may be true that the doctor is medically in the best position to judge the necessity or desirability of an intervention, considerations other than medical ones are often also relevant to the patient's decision to undergo or refuse an intervention. Such considerations, he says, fall outside the doctor's scope of competence. But even, he says, where medical considerations are the only ones, the ultimate decision to undergo or forego a medical intervention should rest with the patient as master of his own body and life and not with the doctor. Moreover the doctor's duty to heal is not absolute but relative. Van Oosten hails Castell as a landmark in South African medical law in general and the law of consent to medical interventions in particular. He says it not only espouses some new principles but also reinforces in sometimes stronger terms than before already existing ones. Firstly, he says, the court clearly opted for patient autonomy over medical paternalism and shifted the emphasis from a medical professional standard of disclosure to a patient autonomy standard of disclosure. He observes that prior to Castell, the courts while accepting and recognising a duty to inform the doctor's part seemed to vacillate between them conflicting notions of the patient's right to self-determination and on the one hand the reasonable doctor test on the other. Secondly, he notes that the court rightly proceeded from the assumption that the decision to undergo or refuse a medical intervention is, in the final analysis, that of the patient and not that of the doctor and that the court's stance is logically consistent insofar as the right to refuse and the right to consent to medical interventions are the reverse sides of the same coin. Thirdly, says van Oosten, in terms of the 'material risk' standard of disclosure espoused by the court, the question is apparently no longer whether the doctor was or could have been aware that the individual patient would regard the risk or danger as serious or typical or unusual or remote or whether or not the reasonable doctor would have disclosed the risk or danger in question. Instead the question is now whether or not the reasonable patient would have regarded the risk or danger as significant, or whether or not the doctor was or could have been aware that the individual patient would regard the risk or danger as significant. He says the shift in emphasis from a professional-oriented test of disclosure to a patient-oriented test of disclosure represents a radical departure from existing law and an important judicial innovation in the sphere of medical law. Fourthly, says van Oosten, although the court is valid and permits exceptions to the so-called 'therapeutic privilege' its approach to the defence is to some extent ambivalent. On the one hand the court appears to accept that therapeutic privilege sets a limit to the doctor's duty of disclosure while on the other it seems to associate the defence with medical paternalism. He observes that it can hardly be denied that the term 'therapeutic privilege' is less than fortunate insofar as it implies a professional discretion to forego disclosure and hence contains an element of assumption of the risk of harm as a justification. He says that not only is necessity as a justification designed to resolve conflicts of interests but it is also one of the recognised and accepted defences to non-consensual medical interventions in emergency situations. Fifthly, says van Oosten, the court's stance is logically consistent insofar as the patient's informed consent, within the framework of the wrongfulness element (with volenti non fit injuria or voluntary assumption of the risk of harm as a justification) rather than the fault element of delict. Sixthly, Van Oosten states that insofar as the court's remarks appear to suggest that the doctor is also under a contractual obligation to furnish the patient with information they raise some points of interest. Does this mean that at least for purposes of contracts between doctors/hospitals and patients, the patient's consensus is synonymous with or equivalent to volenti non fit injuria? If so, must the patient's consensus comply with the requirements of volenti non fit injuria to qualify as valid? If so is the doctor's duty of disclosure one of the naturalia or a tacit term of the contract between the doctor/hospital and patient? If so, are the patient's personality rights of "bodily integrity" and "autonomous agency" by implication also afforded contractual protection? Van Oosten states that if this is what the courts remarks add up to, contractual protection of the patient's personality rights would nevertheless be incompatible with the doctor's part which violates the patient's personality rights would entitle the latter to no more than an award of pecuniary damages. If non-disclosure were to result in a non-consensual medical intervention which violates that patient's personality rights without causing him patrimonial loss, his remedies would be restricted to a delictual action for sentimental damages or a charge of criminal assault or injuria. According to van Oosten, this is not to say that breach of contract may not in specific circumstances constitute an appropriate cause of action. Where a patient specifically contracts with a doctor for disclosure of the diagnosis or for the disclosure of all of the consequences and complications of and alternatives to the proposed intervention, and the doctor fails to keep his side of the bargain, contractual liability for patrimonial loss is quite conceivable. Lastly, he says, the court appears to have introduced the patient's right to self-determination or freedom of choice as a new category of personality rights into South African medical law and wider than the right to bodily integrity. He cites as an example the taking of a doctor of blood or tissue samples without the patient's informed consent and notes that it amounts to a violation of the patient's right to privacy or freedom of choice but not to a violation of his bodily integrity. He notes that since liability for civil and/or criminal assault would be out of the question in these instances the patient's recourse would seem to lie in civil and/or criminal injuria as the most obvious currently existing delict and crime under which such a new category of personality rights can be accommodated.

1174
patient, the breach of which would constitute negligence on the doctor’s part, in South African law it is treated as falling under the defence of *volenti non fit injuria*, the enquiry being whether the said defence has been established and, in particular, whether the patient’s consent has been a properly informed consent. However, on either approach the same, or virtually identical, matters of legal policy are involved. Later on in the judgment Ackermann J states once again that: “It is important, in my view, to bear in mind that in South African law (which would seem to differ in this regard from English law) consent by a patient to medical treatment is regarded as falling under the defence of *volenti non fit injuria*, which would justify an otherwise wrongful delictual act.”

Ackermann J stated that in any event, it did not seem to be appropriate when applied to the position in South African law, where the issue is treated not as one of negligence, arising from the breach of a duty of care, but as one of consent to the injury involved and the assumption of an unintended risk. In the South African context the doctor’s duty to disclose a material risk must be seen in the contractual setting of an unimpeachable consent to the operation and its sequelae (see *Van Wyk v Lewis*[^169^]; *Correira v Berwind*[^70^]). It is submitted that this is simply an endorsement of the principle of *volenti non fit injuria* since these cases were decided long before any debate concerning informed consent. From the passage quoted above, the question of whether the standard of disclosure should be that of the reasonable doctor or the reasonable patient did not seem to be a point of difference between the principles of *volenti non fit injuria* and informed consent either according to Ackermann J. The appeal court therefore disagreed with the court *a quo* essentially on only one point of law[^171^] – the standard of disclosure. Scott J’s refusal to acknowledge aspects of the doctrine of informed consent appears to have been linked directly to his preference for the reasonable standard of disclosure and so this is not a second point of difference between his decision and that of Ackermann J. It is consequently submitted that the doctrine of informed consent in South African law is essentially just another term for the application of the maxim *volenti non fit injuria* and that the main issue that was

[^169^]: *Van Wyk* fn 3 *supra* at p 451

[^170^]: *Correira* fn 47 *supra* at p 630

[^171^]: Ackermann J disagreed with Scott J on only one small factual aspect of the case, namely that there was an undue delay on the part of the defendant in sending a swab for microbiological testing resulting in an additional period of pain, suffering, illness, discomfort and anxiety that she had to endure and for which the court considered R7 500 was adequate compensation.
clarified or settled in Castell was nature of the standard of disclosure to be used in obtaining informed consent.

Strauss, writing before the decision in Castell v de Greef, points out that knowledge and appreciation are the two basic elements of consent. He notes that in our time, patient autonomy – the right to self-determination as opposed to the traditional attitude of medical paternalism- is increasingly emphasised by lawyers and doctors alike. The judgment of Ackermann J in Castell was clearly looking to the provisions in the constitutional Bill of Rights although at the time when the claim arose, the Constitution was still in its infancy. Strauss maintains that legally here would ordinarily be no duty upon the doctor to inform the patient fully of the diagnosis. He says that the diagnosis concerns the question ‘why?’ and may be based on a complexity of symptoms and involve some scientific assessment of the case on the basis of the doctor’s knowledge, skill and experience. Strauss observes that it may be impractical to attempt giving the patient in layman’s language, a general indication of the diagnosis and that the full diagnosis must generally be given only where the patient stipulates this as a condition to giving his consent to an operation or treatment.

It is submitted that the question of disclosure of a diagnosis should rather be approached from the perspective of whether there is a good reason to withhold a diagnosis from a patient. If there is no such reason, the diagnosis should be shared with the patient along with other relevant information. This approach is more

172 Strauss fn 29 supra at p 8
173 Cultural issues can impact significantly upon attitudes to informed consent. Anna, G J and Miller F H 'The Empire of Death: How Culture and Economic Affect Consent in the US, the UK and Japan', *American Journal of Law and Medicine* Vol XX No 4 1994 discuss an interesting theory that the content and style of imparting medical information can profoundly affect a country’s total health expenditure. They explore the cultural role and the economic impact of telling patients about what doctors actually know – or don’t know- about their medical conditions and about therapy that might help (but could also harm) them. They note that initially in the IS, judicial opinions described the requirement of consent to medical treatment as necessary to avoid the intentional tort of battery but by the 1970s courts had begun to reformulate the physician’s duty to inform as a negligence concept, required by the fiduciary nature of the doctor-patient relationship. Doctors had been telling patients relatively little and informed consent became recognised as necessary to promote ‘shared decision-making’. They note that it soon became not only a legal doctrine promoting self-determination but a core ethical principle as well. Informed consent requirements implement the fundamental principle that ‘adults are entitled to accept or reject health care interventions on the basis of their own personal values and in furtherance of their personal goals’. They observe that in the US informed consent is well entrenched in theory but in practice patient autonomy continues to be elusive for many reasons. First, patients (particularly seriously ill ones) remain abjectly dependent on their physicians, who still make choices for them because of the information inequality between doctor and patient. It has been estimated that more than 70 percent of all expenditures for personal health care are the result of decisions of physicians. Moreover, say the authors, the way in which physicians impart information influences patient choice. For example patients tend to go along with therapy their physicians recommend when probably outcomes are discussed in terms of survival percentages, but reject it when those very same outcomes are presented in terms of death statistics. Secondly, state the authors, although the US has a capitalistic, market-driven economy and views medicine as a private good, public expenditure on health care accounts for more than forty percent of the approximately one trillion dollars that Americans will spend on health care in 1995. They note that financial incentives in the system may overwhelm the legal pressure to inform patients adequately. In commenting on his study suggesting that fully half of the coronary angiograms done in the US are unnecessary, Thomas B Graboys explained the difficulties cardiologists have in exploring diagnostic and treatment options with their patient and concluded thus – “It is [just] easier to say we will do
consistent with the patient's rights to human dignity, self-determination and autonomy. The list of complaints by the medical profession against informed consent includes the following:

- It wastes valuable time that could be spent rendering treatment to the ill, in part because patients do not understand what they are told and in part because they do not want to be informed;
- It undermines the trust which patients need to repose in their doctors if they are to be successfully treated;
- It requires disclosure of information about the possibility of risks of induced treatment or failure of the treatment that may lead to a psychologically self-fulfilling prophecy.
- The goal of disclosure of information to patients — that they may make their own choice about treatment — is illusory because disclosure can (and indeed usually will) be made by the physician in such a way as to assure that the patient agrees to the treatment
- For some patients the disclosure of information needlessly frightens them, possibly to the extent that they refuse necessary treatment.
- Some patients have already made up their minds before they acquire the information that the informed consent doctrine requires and the receipt of the information does not change their decision.

The individual's right of self-determination has been referred to elsewhere in South African law, most notably for present purposes in Clark v Hurst No and Others. In

the angiogram and other invasive studies, and we will get paid five times as much". In the UK informed consent doctrine downplays patient choice in comparison with the US. Inter alia, say the authors, this is because in the UK medical care has long been viewed as a publicly provided good, and choices are constrained, by among other things, the total budget government commits to medical services. They point out that consumer advocates in Britain have not been silent in the wake of Sidaway v Bethlehem Royal Hospital Governors 1 All ER 643, 646 (1985) endorsing the Bolam test and are not persuaded that physicians alone should set the disclosure rules. Consumer complaints about continuing medical paternalism had some effect in the UK when the NHS took the reservation expressed by Lord Bridge in Sidaway concerning the Bolam test seriously and issued Patient Consent to Examination or Treatment, and a Guide to Consent for Examination or Treatment to all NHS doctors in September 1990. The NHS intended these documents to govern NHS practice and included the statement "where treatment carries substantial risks the patient must be advised of this by the doctor so that consent may be well-informed".

Palmisano D J 'Informed Consent' Intrepid Resources points out that informed consent is a legal doctrine in America that is defined in all 50 states as a consent to treatment obtained after adequate disclosure. He notes that what is considered to be 'adequate disclosure' varies from state to state. Informed consent is defined in most states as a consent obtained after telling the patient the following: the diagnosis; the nature of the proposed treatment; the name of the procedure; a description in layman's terms; risks associated with that treatment; alternatives and associated risks; and risk of no treatment. (http://www.intrepidresources.com/html/informed_consent.html)

Clarke fn 55 supra
this case the court referred to the American case of *In the matter of Claire Conroy* 177 where it was stated that on balance the right to self-determination ordinarily outweighs any countervailing State interests (in preservation of the individual's life) and competent persons generally are permitted to refuse medical treatment even at the risk of death. Thirion J observed in *Clarke* that in South African law, the Court would not simply weigh the patient's interest in freedom from non-consensual invasion of his bodily integrity against the interest of the state in preserving life or the belief in the sanctity of human life; nor would it necessarily hold that the individual's right to self-determination and privacy always outweighs society's interest in the preservation of life. Furthermore, he said, in South African law a person who assists another to commit suicide may, depending on the circumstances of the particular case, be guilty of murder or culpable homicide178.

In *C v Minister Of Correctional Services*179 Kirk-Cohen J stated that consent is a defence to many acts which would otherwise be a delict. An obvious example is consent to surgery. In recent years the idea that consent must be 'informed consent' has found favour with our Courts (he referred to *Castell v de Greef* in this regard) He noted that in regard to surgery, informed consent postulates full knowledge of the risks involved and, after being made aware thereof by the surgeon, the patient is then entitled to exercise his 'fundamental right to self-determination'180.

It is important to point out, with regard to the future of the doctrine of informed consent in South Africa that the National Health Act, which was passed by Parliament in 2003 makes detailed provision for informed consent in sections 6 and 7. The doctrine of informed consent has therefore become codified in South African law. Section 7 states subject to section 8 a health service may not be provided to a user without the user's informed consent unless –

177 Conroy 98 NJ 321; 486 A 2d 1209 (NJ 1985)
178 Ex parte Minister van Justisie: *In re S v Grootjohn* fn 59 supra
179 C 1996 (4) SA 292 (T)
180 As far as blood tests are concerned, Kirk-Cohen cited *Seetal v Pravittha and Another NO* 1983 (3) SA 827 (D) in which the headnote reads 828A-B: “A blood test on an adult without his consent is unquestionably an invasion of his privacy. On the other hand, the privacy of the individual is not in law absolutely inviolable. The debate about compulsory blood tests amounts to a showdown between the idea that the truth should be discovered whenever possible and the idea that personal privacy should be respected. Both ideas are important but neither is sacrosanct. The resolution of that debate will depend largely upon the store the Court sets by each idea, on its own sense of priority in that regard.”
(a) the user is unable to give informed consent and such consent is given by a person:
   (i) mandated by the user in writing to grant consent on his or her behalf; or
   (ii) authorised to give such consent in terms of any law or court order;
(b) the user is unable to give informed consent and no person is mandated or authorised to give such consent, and the consent is given by the spouse or partner of the user or, in the absence of such spouse or partner, a parent, grandparent, an adult child or a brother or a sister of the user, in the specific order as listed;
(c) the provision of a health service without informed consent is authorised in terms of any law or a court order;
(d) failure to treat the user, or group of people which includes the user, will result in a serious risk to public health; or
(e) any delay in the provision of the health service to the user might result in his or her death or irreversible damage to his or her health and the user has not expressly, impliedly or by conduct refused that service.”

Section 7 (2) insists that: “A health care provider must take all reasonable steps to obtain the user’s informed consent.” While section 7(3) stipulates that: “For the purposes of this section “informed consent” means consent for the provision of a specified health service given by a person with legal capacity to do so and who has been informed as contemplated in section 6.”

Section 7 attempts to address some of the problems experienced by health care providers in obtaining consent for the treatment of persons who do not necessarily have the capacity to make the necessary decisions on their own but whose lack of capacity has not been officially recognised through some legal process. There are many elderly people who wander in and out of senility of various degrees and who often urgently require treatment in situations that fall far short of emergencies. Similarly there is a large number of children in South Africa who have been orphaned due to AIDS and whose legally recognised guardians are no longer available to give the necessary consent to treatment on their behalf. In fact in many cases there is no adult relative or family member available to give such consent. At present the

181 See the discussion on informed consent to research below where section 6 is quoted in full.
provisions of section 39(2)\textsuperscript{182} of the Child Care Act\textsuperscript{183} allow for application to be made to the Minister of Health for authorisation of medical treatment but due to the large numbers of children involved and the fact that each individual case must be considered on its merits, this is not an ideal solution in the case of HIV and AIDS. Application can also be made to a court of law as the High Court in South Africa is the upper guardian of all minors but the process is once again cumbersome due to the fact that application must be made in respect of specifically identified children and each case must be considered on its merits. Section 39(1) of the Child Care Act stipulates that if any medical practitioner is of opinion that it is necessary to perform an operation upon a child or to submit him to any treatment which may not be applied without the consent of the parent or guardian of the child, and the parent or guardian refuses his consent to the operation or treatment, or cannot be found, or is by reason of mental illness unable to give that consent, or is deceased, that practitioner shall report the matter to the Minister, who may, if satisfied that the operation or treatment is necessary, consent thereto in lieu of the parent or guardian of the child.

It is submitted that the right of the user to be informed is significantly extended by the provisions of section 8 of the National Health Act which makes provision for situations in which people have already received treatment in situations in which for one reason or another their prior informed consent could not be obtained. Section 8(3) requires the same standard and level of disclosure as for informed consent as contemplated in section 6. Section 8 also makes provision for the participation of users in decisions affecting their health even where the informed consent itself must be given by another person. This is an attempt to recognise right to human dignity of children and the elderly who, although lacking capacity to a greater or lesser degree, may still be able to understand to some extent what is happening to them. Section 8 therefore imposes obligations upon providers over and above those normally contemplated by the common law doctrine of informed consent when it comes to situations in which it is not the patient him- or herself who is giving the consent.

\textsuperscript{182} According to this subsection: "If the medical superintendent of a hospital or the medical practitioner acting on his or her behalf is of opinion that an operation or medical treatment is necessary to preserve the life of a child or to save him or her from serious and lasting physical injury or disability and that the need for the operation or medical treatment is so urgent that it ought not to be deferred for the purpose of consulting the person who is legally competent to consent to the operation or medical treatment, that superintendent or the medical practitioner acting on his or her behalf may give the necessary consent."

\textsuperscript{183} Child Care Act No 74 of 1983

1180
In an unreported casePop v Revelas in the Witwatersrand Local Division of the High Court of South Africa handed down on 05 August 1999, the plaintiff claimed that he had provided no consent to the doctor for the procedure that was carried out. The doctor raised as proof of consent, the hospital consent document that had been signed by the patient. The doctor said that that document was quite clearly what appears to be a contract between the patient and the hospital. It was not a contract between the patient and the doctor. No evidence was led and it was not pleaded that the document was also a contract between the patient and the doctor.

The patient's evidence was that as far as he was concerned and understood, the document was a contract between him and the hospital. That did not affect the relationship between him and the doctor. The doctor's representatives argued that the document showed that there was consent to the specific operation that was carried out. The doctor wanted to draw the inference from the hospital consent that patient in fact consented to something more than the removal of a callosity, which was expressly consented to between the patient and the doctor. The difficulty for the doctor was that the inference was never put to witnesses. The court found that there was liability by the doctor to the patient on the basis that he carried out an operation which was not consented to. The case stood over for determination of the quantum of damages. The court determined that because there was no consent there was an unlawful invasion of the physical integrity of the patient, even if that was skillfully done.

The subject of informed consent in the context of medical research is a particularly vexed one. The fact that in South African law, informed consent is based upon the maxim volenti non fit injuria offers little protection to persons who consent to be human guinea pigs in clinical trials. In Canada, the 1980 Supreme Court decision inReibl v Hughes185 established the Canadian standard for informed consent to

184 The facts are as relayed by Dinnie D in 'Consent and Therapeutic Privilege' http://www.deneysreitz.co.za/news. He refers to another unreported judgment, Jacobson v Carpenter-Kling, a 1998 decision of the Transvaal Provincial Division of the High Court, in which an Ear Nose and Throat Specialist was sued by the patient for damages arising from lack of informed consent. It was alleged that there was a failure to provide information on the material risks inherent in the operation designed to relieve the patient's chronic sinusitis. Complications set in because of the leakage of cerebrospinal fluid. Further corrective surgery was required. Referring to the Castell decision, the court found that it was sufficient for a doctor to indicate the body parts on which the operation would be performed and to indicate "danger areas" that might be affected together with an indication that the required care would be exercised. The patient's claim failed on the facts. Dinnie states in the article that in his experience, except in cases where there has been lack of informed consent for HIV/AIDS blood testing resulting in an injuria, lack of informed consent as a ground of negligence in a malpractice claim has not successfully been pursued.

185 Reibl fn 150 supra
therapeutic treatment but the leading case in that country for consent in the context of research and experimentation in Canada is *Halushka v University of Saskatchewan et al*<sup>186</sup>. In this case Justice Hall argued that the duty owed by researchers toward prospective subjects is greater than that owed by medical practitioners to their patients. A stricter standard of disclosure in the research context is now generally accepted in law. Canadian legal commentators and researchers continue to cite *Halushka* as the leading case on informed consent to research<sup>187</sup>. It is submitted that the weakness of the Bolam test and the correctness of the approach to informed consent in South African law as evidenced by Ackermann J’s decision in *Castell* as being based on the reasonable patient test is highlighted by discussions on informed consent to medical research. Why should the reasonable doctor test be applicable to situations of medical treatment and the reasonable person test be applicable to situations of medical research? The answer that the latter requires a higher standard of disclosure simply begs the question. If one unpacks the issues inherent in the difference between medical treatment and medical research they are not as obvious as

---

<sup>186</sup> *Halushka* (1965), 53 D.L.R. (2d) 436 (Sask. C.A)

<sup>187</sup> Pullman D ‘Subject Comprehension, Standards of Information Disclosure and Potential Liability in Research’ www.law.ualberta.ca/centres/hilrdfs/hilr/hil/pullmanfrm.pdf. Pullman points out that this is understandable in that it is one of the few cases of this nature that has made its way through the courts. He notes that while it is also the case that established the standard for consent to research is stricter than that applied to therapy, it can in fact be argued that Halushka invoked a weaker standard of informed consent than that which was subsequently applied in *Reibl v Hughes*. The facts of Halushka were that in 1961 the plaintiff, a student at the University of Saskatchewan volunteered to participate in a clinical trial to test a new drug. Although he signed a consent form that authorized the procedure, the physician researchers failed to inform him that the drug was a new anaesthetic about which they had little knowledge and with which they had no prior experience. They did not inform him that he might be exposed to certain unknown risks. Instead they assured him that there was nothing to worry about. Furthermore, while he was informed that the test would require that a catheter be inserted into a vein in his arm, it was not explained that this catheter would push up the vein and through his heart as the experiment proceeded. In fact when the catheter was advanced through the heart chambers and the anaesthetic administered, the plaintiff suffered a complete cardiac arrest. It took approximately one minute and thirty seconds to open his chest and separate his ribs so that manual heart massage could be performed. Although the researchers were able to resuscitate Halushka, he suffered some brain damage with a resulting diminution of mental ability. Justice Hall in ruling on this case acknowledged that ordinarily both medical therapy and medical research require prior informed consent from patients/subjects. He also noted that the difference between the therapeutic situation and the research situation may permit a different standard of informed consent in each context. This is because although therapeutic privilege applies in the treatment context, no such privilege applies in the research context. When the research is for scientific purposes only with no foreseeable therapeutic benefit for the patient or subject, there is clearly no ‘therapeutic privilege’ in view. Thus, Justice Hall argued that the research situation places a stricter duty and higher standard of disclosure on the physician researcher than that required in the therapeutic context. He stated that: “In my opinion the duty imposed upon those engaged in medical research...to those who offer themselves as a subject for experimentation...is at least as, if not greater than, the duty owed by the ordinary physician or surgeon to his patient. There can be no exceptions to the ordinary requirement of disclosure in the case of research as there may well be in ordinary medical practice...The example of risks being properly hidden from a patient where it is important that he should not worry can have no application in the field of research. The subject of medical experimentation is entitled to a full and frank disclosure of all the facts probabilities and opinions which a reasonable man might be expected to consider before giving his consent.” Pullman points out that in stating his position Justice Hall invokes the reasonable person standard of information disclosure. This standard requires that researchers disclose as much information as any reasonable person would expect to have in order to make an informed decision whether or not to participate in a clinical trial. He notes that the reasonable person standard is generally viewed as a compromise between the professional practice standard and the subjective person standard. The former requires researchers to disclose only as much information as other researchers working in the field would normally disclose [the equivalent of the British Bolam test for medical researchers]. Pullman points out that had the court relied upon the professional practice standard in *Halushka*, it would have called for expert witnesses from the research community to testify with regard to standard practice. By invoking the reasonable person standard, Justice Hall implicitly rejected the professional practice standard says Pullman. Furthermore, by requiring “full and frank disclosure” he set aside any appeal to therapeutic privilege as a justification for non-disclosure of information.
might first appear. Medical research and especially clinical trials are usually conducted with regard to a specific illness or health condition which means that those who volunteer for it must be aware of the exact nature of their diagnosis, using the reasonable person test, in order to be able to volunteer as a subject and to understand the associated risks to themselves. Whilst the goal of clinical trials is clearly not therapeutic and those participating in them should be referred to as subjects rather than as patients, those very same people, the subjects of the clinical trial, may be patients in the medical treatment context if the research is designed around a specific health condition. Thus an asthmatic may be a subject in a clinical trial of a new drug for asthma but that same person is likely to be a patient to the doctor who is treating him for his asthma. Why then should the reasonable person test be applicable in the clinical trial context and the reasonable provider test (the Bolam test) be applicable in the treatment context? The paternalism in the latter context is undeniable when one juxtaposes the clinical trial situation and the medical treatment situation. The argument might be raised that the risks associated with clinical trials are greater than those associated with medical treatment. It must be pointed out, however that in practice it is not as easy as it seems to draw a distinction between therapeutic interventions and purely research based interventions. There can be a strongly therapeutic aspect to a research intervention and, although some members of the general public may find it alarming, there is often also a research element in ordinary therapeutic interventions more particularly those involving the utilisation of medicines. Systems for the reporting of adverse drug reactions are premised inter

Noah L in 'Informed Consent and the Elusive Dichotomy Between Standard and Experimental Therapy' American Journal of Law and Medicine Winter 2002 points out that: “To a greater or lesser extent all medical interventions have an experimental quality to them. Physicians try out things on their patients all the time. In many instances, we hope they do so based on well grounded confidence in the likely utility of a particular therapy, though even then the variability of patient response may disappoint our expectations. In far too many instances, unfortunately, physicians select interventions that remain poorly understood. Even for those therapeutic choices subject to federal licensing requirements, particularly pharmaceuticals, product approval does not define the point at which an investigational intervention passes the threshold into standard therapy. Instead the research phase continues after licensure, both in the sense that more safety data accumulates and insofar as physicians may improvise when using a product in ways not originally contemplated. Conversely and investigational product may become the standard of care even before federal regulators bestow their blessing on a particular use. To the extent that we encounter a spectrum rather than a bright-line distinction between standard and experimental interventions, it becomes especially important to understand just what might justify heightened informed consent requirements in the context of clinical trials and then decide whether to extend these to atypical experimental treatments. If for instance, greater uncertainty about risks and benefits, or fears of conflicts of interest, account for demanding and more thorough consent in the experimental context, then perhaps all encounters between physician-investigators and patient-subjects must account for these features of their relationship (in effect, informed consent on a sliding scale). Such an analysis casts serious doubts on the all or nothing approach of federal regulatory agencies and, conversely, it challenges the largely undifferentiated rules applied by the courts when they resolve medical malpractice litigation... For the most part, legal scholars who have addressed informed consent issues have paid scant attention to the special issues that arise in the research setting. In contrast, these issues have attracted a substantial commentary among those in the biomedical research community. This relative disinterest among legal scholars may reflect the fact that courts have not really given the topic separate consideration in the medical malpractice context, and that administrative agencies have done so only in one aspect of complex regulatory regimes for
alia on the fact that not every possible adverse reaction to a drug would have been discovered in the clinical trial phase. Pharmacovigilance programmes are intended to provide early warning signals of previously unknown adverse effects of medicines. The World Health Organization defines a signal as "reported information on a possible causal relationship between an adverse event and a drug, the relationship being unknown or incompletely documented previously." It has been observed that before marketing a new drug many adverse drug reactions (ADRs) may either be suspected from chemical similarity to known drugs or detected in clinical trials. Detection of ADRs in clinical trials is hampered by the fact that rare ADRs and ADRs with a long time to onset are difficult to detect. Since trials are carried out under controlled circumstances, the detection of ADRs in specific populations, such as the elderly, women and children, patients with chronic diseases or patients with multiple drug use are even more difficult to detect. Spontaneous reporting systems are commonly used to detect new or unexpected ADRs after the marketing of drugs. Because of methodological reasons, such as selective under-reporting, spontaneous reporting systems can only be used to signal the possible existence of new or unexpected ADRs. Further pharmacoepidemiological studies are needed to evaluate these ADRs in more detail. It has also been pointed out that clinical trials have become big business. Estimates suggest that as many as twenty million Americans have enrolled in formal biomedical studies. The reasons given for the proliferation of clinical trials in recent years are revealing. They include the fact that patients have become more interested in participating as research subjects either because their conditions have not responded to existing treatments or because they lack insurance coverage and resources to afford standard treatments. It is submitted that the application of the maxim *volenti non fit injuria* in South African law in the context of both the doctrine of informed consent and the ordinary principles of the South African law of delict renders discussions as to the various tests for disclosure of information, and the problem of logical inconsistencies in test dichotomies in the various situations
encountered on the spectrum of health services delivery, largely academic. The standard of care in the law of delict is that of the reasonable person. A person is negligent in terms of the South African law of delict if his actions or omissions do not measure up against those of a reasonable person in his situation. Failure to disclose a risk which is likely, in the judgment of a reasonable person, to materially affect a decision of another reasonable person in consenting to a situation which includes that risk is not, in itself, reasonable. It impairs consent and consent is a factor that vitiates wrongfulness. Since in South Africa, medical interventions are \textit{prima facie} unlawful, a person who ensures that he or she obtains informed consent to the extent necessary to achieve the desired exculpatory effect is therefore unlikely to attract delictual liability should the risk materialise. The risk would have successfully been transferred to the patient/subject. Although the court in \textit{Castell} framed the test as the reasonable patient test, and it is respectfully submitted, correctly so\textsuperscript{193}, one can for the purposes of the law of delict consider this test from the perspective of the provider as well since the test requires that the provider puts him or herself in the position of the reasonable patient in determining the nature and level of disclosure that is required in a particular situation. In other words the provider must ask herself what it is that a reasonable patient in the situation of the patient before her would want to know. In doing so, the provider must herself act reasonably. If a court then subsequently has to consider a claim in delict, it will in applying the same test, be likely to come to the same conclusion as did the provider when informing her patient, concerning the nature and extent of the disclosure that was required in the particular circumstances.

In the United States of America there is a Federal Policy for the Protection of Human Subjects which deals with the subject of informed consent for research purposes.\textsuperscript{194}

\textsuperscript{193} It is submitted that the reasonable patient test is logically the only one that can be applied in a system which operates from the point of view that medical interventions are \textit{prima facie} unlawful. To apply the Bolam test would be to allow the medical profession to be a judge in its own case.

\textsuperscript{194} The disclosure requirements found in the Federal Policy for the Protection of Human Subjects at 45 CFR 46.116(a), under the heading of "basic elements of informed consent," are as follows:
1. a statement that the study involves research, an explanation of the purposes of the research and the expected duration of the subject's participation, a description of the procedures to be followed, and identification of any procedures which are experimental;
2. a description of any reasonably foreseeable risks or discomforts to the subject;
3. a description of any benefits to the subject or to others which may reasonably be expected from the research;
4. a disclosure of appropriate alternative procedures or courses of treatment, if any, that might be advantageous to the subject;
5. a statement describing the extent, if any, to which confidentiality of records identifying the subject will be maintained;
6. for research involving more than minimal risk (as defined in 45 CFR 46.102(i)), an explanation as to whether any compensation and an explanation as to whether any medical treatments are available if injury occurs and, if so, what they consist of, or where further information may be obtained;
There are no South African cases on the subject of informed consent to research. However the National Health Act provides in section 71 that:

(1) Notwithstanding anything to the contrary in any other law, research or experimentation on a living person may only be conducted-

(a) in the prescribed manner; and
(b) with the written consent of the person after he or she has been informed of
the objects of the research or experimentation and any possible positive or
negative consequences on his or her health.

(2) Where research or experimentation is to be conducted on a minor for a therapeutic purpose, the research or experimentation may only be conducted-

(a) if it is in the best interests of the minor;
(b) in such manner and on such conditions as may be prescribed;
(c) with the consent of the parent or guardian of the child; and
(d) if the minor is capable of understanding, with the consent of the minor.

(3) (a) Where research or experimentation is to be conducted on a minor for a non-therapeutic purpose, the research or experimentation may only be conducted-

(i) in such manner and on such conditions as may be prescribed;
(ii) with the consent of the Minister;
(iii) with the consent of the parent or guardian of the minor; and
(iv) if the minor is capable of understanding, the consent of the minor.

(a) The Minister may not give consent in circumstances where—

(h) the objects of the research or experimentation can also be achieved if it is
carried out on an adult;
(ii) the research or experimentation is not likely to significantly improve
scientific
(iii) understanding of the minor’s condition, disease or disorder to such an extent
that it will result in significant benefit to the minor or other minors;

7. an explanation of whom to contact for answers to pertinent questions about the research and research subjects’ rights, and whom to contact in the event of a research-related injury to the subject; and
8. a statement that participation is voluntary, refusal to participate will involve no penalty or loss of benefits to which the subject is otherwise entitled, and the subject may discontinue participation at anytime without penalty or loss of benefits to which the subject is otherwise entitled (45 CFR 46.116(a)).

It should be noted that these requirements could be modified or waived by an Institutional Review Board (IRB) under certain circumstances. In addition to the basic information listed above, the U.S. regulations require that participants be given other information that may affect their participation in research, depending on the nature of the project itself. The U.S. regulations list six such additional disclosures (45 CFR 46.116(b)). (Source: Ethical and Policy Issues in International Research: Clinical Trials in Developing Countries Chapter 3 ‘Voluntary Informed Consent’ www.georgetown.edu/research/ncrel/nbac/clinical/Chapter3.html)
(iv) the reasons for the consent to the research or experimentation by the parent or guardian and, if applicable, the minor are contrary to public policy;
(v) the research or experimentation poses a significant risk to the health of the minor; or
(vi) there is some risk to the health or wellbeing of the minor and the potential benefit of the research or experimentation does not significantly outweigh that risk.

9.2.12 Friedman v Glicksman

Facts

The plaintiff alleged that:
1. When pregnant, she consulted the defendant, a specialist gynaecologist, to advise her apropos of the risk that she might have been pregnant with a potentially abnormal and/or disabled infant.
2. It was understood between the plaintiff and the defendant that the plaintiff wished to terminate her pregnancy if there was any risk greater than the normal risks of the infant being born in an abnormal and/or disabled condition.
3. An agreement was concluded in terms of which the defendant would provide such advice in order that the plaintiff might make an informed decision on her own behalf and on behalf of Alexandra whether to terminate the pregnancy or not.
4. In the alternative the defendant, by virtue of his professional status, was under a duty to provide the advice to the plaintiff both in her personal capacity and on behalf of Alexandra for the purpose set out in 3 above. In this regard he had to act with the skill, knowledge and diligence normally exercised by other members of his profession.
5. The defendant, having carried out certain tests, advised the plaintiff that there was no greater risk than the normal risk of having an abnormal and/or disabled child and that it was quite safe for her to proceed to full term to give birth.
6. The defendant’s advice was erroneous and Alexandra was born disabled on 5 March 1991.

195 Friedman 1996 (1) SA 1134 (W)
7. The defendant in giving his advice had acted negligently in a number of respects. Had he not acted in this negligent manner he would have concluded that there was a greater than normal risk of the child being born disabled and would have advised the plaintiff of this fact.

8. Had she received the correct advice the plaintiff would have terminated her pregnancy forthwith.

9. The defendant’s negligence was a breach of his duty of care as well as a breach of the agreement concluded.

Based on these facts plaintiff has brought two claims - a claim in her personal capacity for the expenses of maintaining and rearing Alexandra as well as all future medical and hospital treatment and other special expenses and claim in her representative capacity on behalf of Alexandra for general damages as well as a claim for future loss of earnings.

Judgment

Goldblatt J noted that claims of this nature have been the subject of many reported judgments in foreign countries and have been the subject of many academic articles both in South Africa and abroad. He examined the terminology used for the various claims that fell into the same category and identified some common terms which he said do contain certain emotional and apparent value judgments which can detract from a proper judicial approach to the issues raised. These are as follows:

‘Wrongful pregnancy’ refers to those cases where the parents of a healthy child bring a claim on their own behalf for damages they themselves have suffered as a result of giving birth to an unwanted child.

‘Wrongful birth’ are those claims brought by parents who claim they would have avoided conception or terminated the pregnancy had they been properly advised of the risk of birth defects to the potential child.

‘Wrongful life’ actions are those brought by the child on the basis that the doctor’s negligence - his failure to adequately inform the parents of the risk - has caused the
birth of the disabled child. The child argues that, but for the inadequate advice, it would not have been born to experience the pain and suffering attributable to the disability.

Goldblatt J stated that different considerations applied to the claims instituted by the plaintiff in that the one claim was a ‘wrongful birth’ claim and the other a ‘wrongful life’ claim. He noted that the defendant argued that it would be against public policy to enforce the contract entered into between the plaintiff and the defendant because it would encourage abortion and thus be inimical to the right to life enshrined in section 9 of the Constitution of the Republic of South Africa Act196 as well as to the generally recognised sanctity accorded by society to life and the process by which it is brought about but said that there was no substance in this submission, which flew directly in the face of the Abortion and Sterilisation Act 2 of 1975. In terms of section 3(c) of that Act an abortion may be procured: ‘where there exists a serious risk that the child to be born will suffer from a physical or mental defect of such a nature that he will be irreparably seriously handicapped’.

Thus, said Goldblatt J, the Legislature had recognised, as do most reasonable people, that cases exist where it is in the interests of the parents, family and possibly society that it is better not to allow a foetus to develop into a seriously defective person causing serious financial and emotional problems to those who are responsible for such person’s maintenance and well being. He stressed that the election to proceed with or terminate the pregnancy in these circumstances rests solely with the mother, who, he said, bears the moral and emotional burden of making such election. It was the view of the court that the contract entered into between the plaintiff and the defendant was sensible, moral and in accordance with modern medical practice. It said that the plaintiff was seeking to enforce a right, which she had, to terminate her pregnancy if there was a serious risk that her child might be seriously disabled. And noted that decision of the Appellate Division in Administrator, Natal v Edouard197, in upholding a ‘wrongful pregnancy’ claim, in which the Appellate Division found such claim not to be contrary to public policy. Consequently said Goldblatt J, a ‘wrongful

---

196 Act No 200 of 1993
197 Edouard 1990 (3) SA 581 (A)
birth’ claim is not contra bonos mores. He did say, however, that different considerations may apply to a ‘wrongful life’ claim.

The court observed that in the present case the defendant was employed to prevent -by way of giving proper medical advice - the birth of a disabled child and that because of his negligence that event had taken place, causing the plaintiff to incur considerable expenses which she would not otherwise have had to incur. Quoting from van Heerden JA in Edouard it stated that -

“(T)he ‘wrong’ consists not of the unwanted birth as such, but of the prior breach of contract (or delict) which led to the birth of the child and the consequent financial loss. Put somewhat differently, . . . although an unwanted birth as such cannot constitute a ‘legal loss’ (i.e. a loss recognised by law), the burden of a parents’ obligation to maintain the child is indeed a legal loss for which damages may be recovered.”

and pointed out that in America a claim for ‘wrongful birth’ is commonly recognised. The court agreed with the reasoning of the American court in Berman v Allan saying that the reasoning of the American Courts is sound and fits comfortably within the Aquilian action. Goldblatt J observed that a doctor acts wrongly if he either fails to inform his patient or incorrectly informs his patient of such information she should reasonably have in order to make an informed choice of whether or not to proceed with her pregnancy or to legally terminate such pregnancy. He pointed out that the fault element of the delict is to be found in the foreseeability of harm which the doctor-patient relationship gives to the doctor and stated that once proper disclosure is not made and the patient is deprived of her option, the damages she suffers by giving birth to a disabled child are clearly caused by the fault of the doctor, provided she would have terminated the pregnancy if the information had been made available to her. Goldblatt J said that he was accordingly satisfied that in regard to her claims in her personal capacity, the plaintiff’s particulars of claim contained

---

198 According to Goldblatt J, this claim was first recognised by the Supreme Court of New Jersey in Berman v Allan 404 A 2d 8 (1979). He quoted from Pashman J who in that case said the following: “The Supreme Court’s ruling in Roe v Wade clearly establishes that a woman possesses a constitutional right to decide whether her foetus should be aborted, at least during the first trimester of pregnancy. Public policy now supports, rather than militates against the proposition that she not be impermissibly denied a meaningful opportunity to make that decision. As in all other cases of tortious injury, a physician whose negligence has deprived a mother of this opportunity should be required to make amends for the damage he has proximately caused. Any other ruling would in effect immunize from liability those in the medical field providing inadequate guidance to persons who would choose to exercise their constitutional right to abort foetuses which, if born, would suffer from genetic defects. (Notes omitted.) Accordingly, we hold that a cause of action founded upon a wrongful birth is a legally cognizable claim.”

199 Berman fn 198 supra
averments sufficient to sustain an action and that this cause of action was a logical extension of the principle enunciated by the Appellate Division in *Edouard*.

With regard to the claim in respect of the child, Alexandra, Goldblatt J noted that the defendant excepted to this claim on the following independent grounds:

1. In so far as the plaintiff's claim was based on a breach of contract, Alexandra was not a party to such contract and cannot be affected by any such breach.
2. The defendant did not owe Alexandra a duty of care which would lead to the termination of her existence.
3. The defendant did not in law act wrongfully against Alexandra.
4. There was no legal basis in South African law for the damages claimed on behalf of Alexandra. A Court is not able to evaluate damages by comparing the value of non-existence and the value of existence in a disabled state.
5. The action was *contra bonos mores* and against public policy.

Goldblatt J agreed that the plaintiff could neither enter into a contract on behalf of Alexandra prior to Alexandra's birth or at such time make any election on Alexandra's behalf. He said it is trite law that an agent cannot act on behalf of a non-existent principal and it is similarly trite that legal personality only commences at birth. In these circumstances, he said, the allegation that the plaintiff acted on Alexandra's behalf whilst she was still *in utero* was legally untenable. He stated that it could also not be argued that this was a contract for the benefit of a third party as such party could only accept the benefit as such at a time when the alleged benefit, i.e. termination of pregnancy, was no longer possible.

According to the court it was thus necessary to consider whether Alexandra had a delictual claim against the defendant for allowing her to be born with her disabilities instead of giving the plaintiff such advice as would have caused her to terminate her pregnancy and cause Alexandra never to have existed in the legal sense. It said that the first question to be answered in relation to the delictual claim was whether a person has an action in respect of injury inflicted on him while he was still a foetus in his mother's womb and referred to *Pinchin and Another NO v Santam Insurance Co*
in which it was answered in the affirmative. Goldblatt J noted that Hiemstra J in
coming this decision, which in the end was obiter, carefully considered all the
authorities and arguments for and against the proposition and that his obiter decision
was greeted with approbation by all the academic writers who dealt with it. He said
that he did not intend repeating Hiemstra J’s arguments, all of which he found
persuasive and with which he agreed.

He was of the opinion that in the present case it was not necessary to invoke the
nasciturus rule because Alexandra’s action did not arise when the pregnancy was not
terminated, but when she was born. The plaintiff argued that, once the mother is
entitled to sue, on the basis that fault and causation are proved, there is no reason in
law or logic why a child should not equally be able to sue for its damages, including
general damages for pain and suffering, disability, loss of amenities and loss of
earnings since these consequence flow directly and foreseeably from the initial delict.
The plaintiff also submitted that the proper measure of damages was the amount
necessary to compensate the child for having to live in a disabled state and not the
difference between non-existence and existence in a disabled state. Goldblatt J noted
that the action for ‘wrongful life’ has been considered in a number of American cases
and has in the main failed. He said in his view that the reasoning of the American

---

200 Pinchin 1963 (2) SA 254 (W)
202 Goldblatt J provided the following useful survey of the legal position on the subject in other countries—
"The view of the majority of the American Courts was expounded by Cercone J in Speck v Finegold Pa 268 Super 342
(1979); 408 A 2d 496 where he said the following at 508 [7]:
‘In the instant case, we deny Francine’s claim to be made whole. When we examine Francine’s claim, we find regardless
of whether her claim is based on ‘wrongful life’ or otherwise, there is a failure to state a legally cognizable cause of
action even though, admittedly, the defendants’ actions of negligence were the proximate cause of her defective birth.
Her claims to be whole have two fatal weaknesses. First, in appellate judicial pronouncements that hold a child has no
fundamental right to be born as a whole, functional human being. Whether it is better to have never been born at all
rather than to have been born with serious mental defects is a mystery more properly left to the philosophers and
theologians, a mystery which would lead us into the realm of metaphysics, beyond the realm of our understanding or
ability to solve. The law cannot assert a knowledge which can resolve this inscrutable and enigmatic issue. Second, it is
not a matter of taking into consideration the various and convoluted degrees of the imperfection of life. It is rather the
improbability of placing the child in a position she would have occupied if the defendants had not been negligent when
to do so would make her non-existent. The remedy afforded an injured party in negligence is intended to place the
injured party in the position he would have occupied but for the negligence of the defendant. Thus, a cause of action
brought on behalf of an infant seeking recovery for a “wrongful life” on grounds she should not have been born demands
calculation of damages dependent on a comparison between Hobson’s choice of life in an impaired state and non­
existence. This the law is incapable of doing.’
In the same case Spaeth J at 512 stated his objection to the cause of action in these words: ‘If it were possible to
approach a being before its conception and ask it whether it would prefer to live in an impaired state, or not to live at all,
one of us can imagine what the answer would be. We can only speculate or refer to various religious or philosophical
beliefs. We cannot give an answer susceptible to reasoned or objective valuation.’
In Philips v United States 508 F Supp 537 (1980) the District Court of South Carolina dismissed a ‘wrongful life’ claim
after considering all the then reported American cases on the basis of the fundamental policy of the preciousness and
sanctity of human life. They accepted it as basic to the beliefs of society that life, with or without a major physical
handicap, is more precious than non-life.
Courts in holding that no cause of action exists in regard to a ‘wrongful life’ claim and the very cogent reasoning of the English Court of Appeal along the same lines were correct and agreed both with the conclusions reached and the reasons therefor. He held that South African law similarly cannot recognise that the facts alleged by the plaintiff on behalf of Alexandra are sufficient to sustain a cause of action and that it would be contrary to public policy for Courts to have to hold that it would be better for a party not to have the unquantifiable blessing of life rather than to have such life albeit in a marred way. He also said that to allow such a cause of action would open the door to a disabled child being entitled to sue its parents because they may have for a variety of reasons allowed such child to be born knowing of the risks inherent in such decision. Goldblatt J took the view that to allow damages to be claimed on the basis alleged by the plaintiff is completely contrary to the measure of damage allowed for in the law of delict. The defendant was in no way responsible for the child’s disabilities and yet he was being asked to compensate the child for such disabilities. This proposition, he said, is illogical and contrary to the South African legal system. The only measure of damages can be the difference in value between non-existence and existence in a disabled state. He found that no criteria, in law, can exist in establishing such difference or even in establishing whether any damage has been sustained. Accordingly, the exception to plaintiff’s claims in her personal capacity was dismissed and the exception to plaintiff’s claims in her capacity as mother and natural guardian of her minor child, Alexandra, was upheld and such claims were dismissed.

Discussion

In California in Curlender v Bio-Science Laboratories App 165 Cal Rptr 477, the Court of Appeal allowed a wrongful life claim for damages on the basis that there should be a remedy for every wrong committed. This approach is in my view illogical and contrary to legal principles in that it ignores the central question of whether a wrong had in fact been committed. In England the question of whether or not a claim for ‘wrongful life’ existed was dealt with by the Court of Appeal in McKay and Another v Essex Area Health Authority and Another [1982] 2 All ER 771 (CA). The Court found that no cause of action existed for a number of reasons. Firstly, the Court held that the defendant was under no duty to the child to give the child’s mother an opportunity to terminate the child’s life. Whilst such a duty may be owed to the mother it could not be owed to the child. To impose such a duty towards the child would, in my opinion, make a further inroad on the sanctity of human life which would be contrary to public policy. It would mean regarding the life of a handicapped child as not only less valuable than the life of a normal child, but so much less valuable that it was not worth preserving. . . .’ (Per Stephenson LJ at 781e.) The Court further held, as had many American Courts, that it was impossible to calculate damages being the difference between an impaired life and no life. ‘But how can a court begin to evaluate non-existence, “The undiscover’d country from whose bourn No traveller returns”? No comparison is possible and therefore no damage can be established which a court could recognise. This goes to the root of the whole cause of action.’ (Per Ackner LJ at 787h.)

1193
Neethling et al note that parents also have a claim for maintenance and medical expenses resulting from the wrongful birth of a disabled child. This claim is based on, eg, a medical doctor's omission to inform parents that their unborn child may be disabled thereby depriving them of the opportunity of deciding to have the child or not. They point out that the disabled child, however, does not have an analogous action for loss of future earnings based on so-called wrongful life. Decisions in this category have proven to be fairly controversial in other jurisdictions with no real consensus. It has been noted that pre-natal torts and birth-related causes of action have become more accepted by courts and legislatures but that there is still controversy as to the kinds of damages that are recoverable. Although a complete international comparison of the law of other jurisdictions is beyond the scope of this thesis it would be illustrative to look at the position in the United Kingdom and Australia which both use common law systems that are similar to that of South Africa. The American cases other than those to which the South African courts have already made reference differ too widely on this subject to be of much assistance.

In the UK, prior to MacFarlane v Tayside Health Board the law for recovery of damages in wrongful conception cases was as set down by the Court of Appeal in Emeh v Kensington and Chelsea and Westminster Area Health Authority and Thake v Maurice. In Emeh a disabled child was born to a healthy mother following a failed sterilisation operation. The Court of Appeal allowed recovery of damages for pain, suffering and loss of amenity and special damages consequent on pregnancy and

205 Alvarez I J 'A Critique of the Motivational Analysis In Wrongful Conception Cases'. The author states that on wrongful conception cases, courts attempt to balance plaintiffs' injuries with public policy concerns involving the valuation of infant's lives. In balancing these interests the courts have used different rules and sometimes have deviated from traditional tort law principles. http://infoeagle.bc.edu/bc_org/eng/law/wawsh/journals/bclaw/41_303/03_TXT.htm
206 Thomas CM 'Claims for Wrongful Pregnancy and Child Rearing Expenses' observes that "Wrongful birth claims relate to the birth of a child as a consequence of medical negligence. There has been general acceptance by courts in various jurisdictions that costs relating to the pregnancy and birth may be recovered. However the more contentious issue is whether there is liability for the costs of rearing such a child. The English courts have held there is no such liability with respect to a healthy child, while in Australia, the Queensland Court of Appeal has taken the opposite view. In New Zealand the issue has yet to be decided. The Accident Compensation scheme has limited the development of the law relating to personal injury in general, but the High Court has found that the scheme does not prevent claims for wrongful birth. It is argued that the New Zealand courts should follow the Australian decisions, as the English approach is based on the views of ordinary people on this moral question as perceived by judges. This requires the individual judge's sense of the moral answer to a question to prevail, albeit in light of the judge's view of the opinions of ordinary people. It is argued that this is a subjective approach in that, in such a complex and emotionally difficult area of the law, there is unlikely to be uniformity of opinion among the public, or even among judges. As such, this is arguably a matter better resolved by legislation than by the courts." http://www-accountancy.massev.ac.nz (30 September 2002)
207 MacFarlane [2002] 2 AC 59; HL (Sc)

209 Thake [1986] 1 QB 644
birth. It also allowed recovery of the costs of maintaining the child to adulthood. This decision was followed in *Thake* (supra). In the case of *MacFarlane* (supra) the parents decided that their family was complete and therefore MacFarlane had a vasectomy. Following the operation his sperm count was measured and he was told by the surgeon that it was negative. A few months later Mrs MacFarlane became pregnant. All five of the law Lords took the view that the claim for maintenance and upbringing of their child was a claim for pure economic loss. With the exception of Lord Millet they all held that damages for pain, suffering and loss of amenity caused by the pregnancy and birth of the child were recoverable. Special damages consequent on the pregnancy and birth of the child were also recoverable. However the costs of maintenance and education of the child were not. It has been observed that the opinions of their Lordships in MacFarlane illustrate the differing approaches to identifying situations in cases of economic loss outside the normal run of cases involving physical injury or damage\(^{209}\). In Australia on 16 July 2003 the High Court in

\(^{209}\) Author not stated: "Wrongful conception"- economic loss, damages and ethical dilemmas. The author notes that "In Brooke LJ's judgment in Parkinson [Parkinson v St James and Seacroft University Hospital NHS Trust [2001] All ER (d) 125 (Apr)] (pp 381B–383B) provides an interesting commentary on the development of claims for economic loss in the tort of negligence since Ann's v Merion London Borough [1978] AC 728.

He identified five approaches to the question in the judgments of the House of Lords in *MacFarlane*: whether there had been an assumption of responsibility; what the purpose of the operation was; whether there were analogous established categories of negligence; what the result of the three stage test in *Caparo Industries v Dickman* [1990] 2 AC 605 was; and whether considerations of distributive justice provided a more just solution than considerations of corrective justice. Brooke LJ applied each of these approaches separately in Parkinson.

One of the above approaches of the Lords in *MacFarlane* is worth commenting on as it seems to have become particularly fashionable in the higher echelons of the judiciary. 'Distributive justice' requires reference to the way in which burdens and losses are distributed throughout society. The reasonable man is invoked to consider fairness between one class of claimants and another. In contrast, 'corrective justice' requires someone who has harmed another without justification to indemnify the other for the consequences of that harm. The concept of distributive justice was applied by Lord Hoffman in *White v Chief Constable of the South Yorkshire Police* [1999] 2 AC 455. He held in that case that the ordinary man would consider it unfair for the police officers in *White* to recover damages for psychiatric injury following the Hillsborough disaster when relatives had not been allowed to recover for the same injury in *Anns v Chief Constable of the South Yorkshire Police* [1992] 1 AC 310. Lord Steyn applied the concept of distributive justice and concluded that if the hypothetical commuter on the Underground were asked the question whether the parents of an unwanted but healthy child should be able to sue the doctor for compensation equivalent to the cost of bringing up the child to adulthood the overwhelming number of commuters would say no on the basis of a premise as to what is morally acceptable and what is not (p 83B). It was emphasised in the opinions of Lords Slynn and Clyde that *MacFarlane* was concerned with a healthy child: the conclusions might be different if the child were to be born disabled. Cases since *MacFarlane* have focused on the following issues:

- Whether the parent(s) of a disabled child are able to recover damages for the costs of maintaining him or her and whether or not the parent(s) are able to recover the additional costs associated with having a disability (Parkinson v St James and Seacroft University Hospital NHS Trust [2001] ECWA Civ 530; [2001] 3 All ER 97).
- Whether a disabled parent is able to claim the additional costs associated with the disabled parent's disability in bringing up a healthy child (Rees v Darlington Memorial Hospital [2002] WLR 1483).
- Whether a brain-damaged parent of a healthy child is able to recover the grandparents' costs of maintaining the child until majority (AD v East Kent Community NHS Trust [2003] 3 All ER 1167).

The author summarises the position in the UK as follows:

- "In the case of a healthy mother and child damages for wrongful conception are only recoverable for pain, suffering and loss of amenity caused by the pregnancy and birth as well special damages consequent thereon. The costs of educating, upbringing and maintaining the child to adulthood are not recoverable (MacFarlane).
- Where the child is born disabled the additional costs of maintenance due to the disability are not recoverable but not the ordinary costs of bringing up the child (Parkinson).
- Where the mother is disabled the additional costs of maintaining the healthy child which are due to the disability are recoverable but not the ordinary costs of bringing up the child (this decision is shortly to be looked at by the House of Lords) (Rees).
Cattanach v Melchior\textsuperscript{210} upheld an award of more than $105,000 compensation for the costs of maintenance to the parents of a child born as a result of negligent gynaecological advice. This was the first time the High Court had made a ruling on the issue. Mr and Mrs Melchior are the parents of a son born in 1997 despite the performance of a sterilisation procedure by Dr Cattanach in 1992. Prior to the sterilisation procedure, Dr Cattanach had accepted at face value the mother’s history that her right ovary and fallopian tube had been removed at the age of 15 following an appendectomy. He applied a Filshie clip to the plaintiff’s left fallopian tube only. Mrs Melchior subsequently conceived by transmigration of an ovum from her left ovary to her right fallopian tube. The Supreme Court of Queensland held that the doctor was negligent in failing to advise the plaintiff that the absence of her right fallopian tube had not been clinically confirmed, that there was a procedure which would confirm the patency of the right fallopian tube and that in the absence of the performance of this procedure, the plaintiff faced a considerably increased risk of pregnancy following sterilisation. The court awarded damages for pain and suffering involved in the unexpected pregnancy together with the cost of past and future medical care and assistance involved in bringing up her son. The father was awarded a nominal amount in damage for the loss of consortium and both parents were awarded just over $105,000 for the past and future costs of raising their son. In June 2001 the majority of the Queensland Court of Appeal upheld the trial judge’s findings on liability and the awards of compensation to the parents. Special leave was granted to appeal to the High Court solely in relation to the issue of whether the parents were entitled to claim the costs of raising their child. The appellant’s main ground of contention was that the Court of Appeal had erred in not applying the decision of the House of Lords in MacFarlane (supra).

Interestingly, the Attorneys General of South Australia and Western Australia intervened in the appeal in Cattanach and made submissions on the increased financial burden that would fall on the public health system if the appeal was not

\textbullet{} Where the mother is disabled and the grandparents bring up the healthy child the costs of maintenance are not recoverable (this decision is also being appealed) (\textit{AD}).

\textbullet{} In considering whether or not damages are recoverable in case of pure economic loss, the courts have begun to use a range of approaches. In addition to the three-stage \textit{Caparo} test and whether or not there has been an assumption of responsibility they have begun to consider distributive justice (ie whether or not a decision is fair between one class of claimants and another) and other approaches (see judgment of Brooke LJ in \textit{Parkinson}).

\texttt{http://www.butterworths.co.uk/pipeline/journal/archive/2003/wrongul_conception.htm}

\textit{Cattanach} [2003] HCA 38

1196
upheld. In a 4:3 majority, the High Court dismissed the appeal and upheld the decision of the Court of Appeal. The judges held that as a matter of law, the question of whether the respondents should be allowed to recover compensation for the cost of raising their child was a straightforward one to answer – the accepted common law principles for recovery of damages for negligent advice clearly entitled the respondents to claim for the costs of child maintenance as reasonably foreseeable consequences of the appellant’s breach of duty. They made it clear that the appellant’s submissions did not explain why the law should shield him from what were otherwise recoverable damages. The majority stated that MacFarlane is not persuasive authority in Australia and noted that the House of Lords expressly rejected the notion of public policy as a ground upon which to deny the recovery of the costs of child maintenance and that they saw no compelling reason why public policy should be invoked in the appeal, a fact which the dissenting judges also acknowledged. Hayne J doubted whether there was any accepted public policy against recovery which the community as whole recognised and believed in. The court rejected the secondary argument that damages awarded should be offset by the benefits of having the child as being inconsistent with Australian law and unjustifiable as a matter of legal principle. The majority also criticised the unconvincing argument that the birth of a child should be regarded as a benefit and a blessing, an argument that ignored the fact that millions of people use contraception daily to avoid this result. They also said that it was highly speculative to bar recovery on the basis that a child who was the subject of litigation could be harmed by this knowledge in later life.

It is submitted that the decision of the Australian court is thus consistent with the decisions of the South African courts in Friedman and in Edouard. The Australian decision also has the effect of demystifying, along with the South African judgments, such cases as being anything more than ordinary claims for pure economic loss and for non-patrimonial 'loss', such as pain and suffering and loss of amenities, that are usually recognised in terms of the law of delict. The court saw public policy issues as being used if anything to preclude the claim for maintenance rather than to support it. This indicates that the normal and usual position in Australian law would be that

212 Edouard fn 197 supra
maintenance would be payable in the circumstances of Cattanach. Raising a child is an expensive business. A child that did not form a part of its parents’ future plans may have a limited and not too bright future of its own if its parents can ill afford to raise it. Furthermore, the need to support and maintain another child may adversely prejudice the interests and opportunities of older siblings that were planned and conceived in accordance with their parents’ financial and other resources. Even taking into account public policy considerations, it is submitted that there are at least as many policy reasons that support an award in damages for the maintenance and upbringing of a child as there are those that do not and, it is submitted, the former may be a great deal more rational and practical than the latter in many instances. It is submitted with respect that the decisions of both the South African courts and the Australian courts demonstrate an eminently sensible and pragmatic approach to the problem of wrongful conception. It takes into account the imbalance of power between the provider and the patient who has no possible way of knowing whether or not he or she has been sterilised or that the child in utero is disabled, except to conceive a child or give birth to that child respectively – a result that in either case is the very situation that is sought to be avoided. In both instances the patient is utterly dependent upon the expertise and professional advice of the provider. It is submitted that in the case of South Africa, the judgments are also in keeping with the Constitution which grants a right of access to reproductive care in section 27(1). As stated previously, access does not mean access to medical negligence and substandard medical advice or treatment. Furthermore, section 28 of the Constitution clearly sets out the rights of children as being inclusive of basic nutrition, shelter, basic health care services and social services and that a child’s best interests are of paramount importance in matters concerning the child. It is submitted that in order for the rights of the child to be adequately recognised and the constitutional principle of the paramountcy of the child’s best interests to be observed it is difficult to see how a court could not decide in the manner in which it did in Friedman. There are likely to be very few cases indeed where the child would not benefit from an award to its parents in respect of its maintenance and upbringing especially in the uncertainties that plague modern life such as unemployment and violent crime. If one accepts the idea in principle that a child can be born in consequence of the delict of a provider of health services then it is submitted that whether the child is healthy or disabled becomes simply a question of the quantum of damages payable to the parents since, if
the provider had done his or her job properly, the child would not have been born, disabled or not. If the child is disabled as the result of negligent medical treatment then it may have a claim for damages in South Africa law on the basis of the *nasciturus* rule. This would not be a claim for wrongful birth so much as a claim for an injury to the child while it was still a foetus in its mother’s womb.

9.2.13  

*Gibson v Berkowitz*²¹³

**Facts**

The facts as they appear from the judgment of Claasen J are as follows. On 19 June 1992 the plaintiff complained to her general practitioner, Dr Reyneke, of lower abdominal pain and she presented with a vaginal discharge and a burning sensation. Dr Reyneke referred her to the first defendant. She consulted him during July 1992 on a number of occasions. Several tests were done which eventually led to the first defendant advising her that precancerous cells existed in her vagina and that they had to be cauterised by way of a Lletz procedure. On 8 September 1992 she was admitted to the second defendant’s hospital and under general anaesthetic the pre-cancerous cells were negligently swabbed with 100% instead of 3% glacial acetic acid, causing burns to the plaintiff’s vulva, perineum, peroneal region and vagina. The acid was washed down from her vagina with water, ran down her natal cleft and soaked into the towelling under the small of her back, causing extensive full thickness third degree burns to her sacrum and buttocks, in size approximately 200 mm long in the transverse plain and 100 mm in the vertical dimension. When the plaintiff came to in the ward she screamed with pain, claiming that she was on fire. Her mother Mrs Zackie looked at the injuries on her back. According to her they looked horrific. The plaintiff had blisters from the acid burn and these had ‘popped’. The plaintiff was immediately treated with the necessary creams and heavily sedated due to her excruciating pain. Although she was sedated she was still conscious and therefore must have experienced extreme pain during the periods when the sedation receded. She spent approximately eleven days in hospital. Eventually it was decided to take her

---

²¹³ *Gibson* 1996(4) SA 129 (W)
home as it was thought that her mother could take better care of her at home than in hospital. During the initial stages of her recovery Mrs Zackie attended to the plaintiff almost round the clock. She had to change the dressings on the plaintiff's back three times daily. The plaintiff had to be helped with her ablutions and bathing. Her vagina had to be douched while sitting in the bath and on a number of occasions her mother and the plaintiff noticed dead skin being washed from the vagina. The plaintiff had to be anaesthetised whenever she wanted to pass motions and had to urinate while sitting in a bath. She was catheterised in order to keep the area as free from contamination as possible and to monitor the urine output. Throughout this period she lay prone most of the time. Her burns covered 15% of her body, taking into account the inside of the vagina and the vulva, perineum, peroneal region, and the sacrum and buttock area. A month after her admission to the second defendant's hospital on 8 October 1992 the plaintiff was admitted to the Park Lane Clinic where, under general anaesthetic, she underwent a sloughectomy of the wound on her back as well as skin grafts harvested from her buttock. She was instructed to lie prone for ten days after the operation. She was very uncomfortable in this position. The skin graft staples were removed on 13 October and two days later, on 15 October, she was discharged from the Park Lane Clinic. She was given broad-spectrum antibiotics. The scar had to be massaged with aqueous cream. By 12 November the scar was still painful and it required vigorous massaging. Silicone sheeting was applied to the scar and a corset was used over it to apply pressure on the lower back. By 3 December 1992, i.e. approximately two months after the skin-graft, the scar was still painful. On 28 January 1993 the plaintiff saw Dr Ritz again and reported that the pain had improved. She was told that further plastic surgery would be required to improve the scar. At this stage she complained of an area of breakdown in the posterior fourchette of the vagina which caused problems during intercourse. She was advised to see a gynaecologist in this regard. By 18 March 1993 Dr Ritz reported that the scar had markedly improved. It was soft and pliable but darker than the surrounding area and obvious to the observer. Dr Ritz felt essentially it was a good result. The plaintiff still had periods of pain for which she used Voltaren gel and massages. The gynaecological problem involving the posterior part of the vagina still remained unresolved, and she was again advised to see a gynaecologist. Other than that, according to Dr Ritz's report, she had healed well. Most of the perineum and the area around the vagina and the natal cleft had healed without surgical intervention. The injury left pigmentation in the skin but there was no
contour deformity. The donor site of the skin graft had also healed very well and was minimally noticeable. The plaintiff's mother testified that the plaintiff experienced considerable discomfort and humiliation when, during the period she had to lie prone, she was forced to pass motions in Kimbies, i.e., babies' nappies. In fact the plaintiff was prone for approximately two months after the original incident. Part of the plaintiff's suffering was the fact that she was unable to attend to and care for her four-year-old daughter Jen-Ai. Mrs Zackie had to take over most of the plaintiff's maternal duties in looking after Jen-Ai and her household chores. Mrs Zackie testified that, subsequent to the injury, plaintiff's personality had changed substantially from an outgoing 'little tiger' and go-getter to someone who is withdrawn and depressed. The plaintiff had become like a hermit. She lost her interest in socialising, her work and her home. Where previously (as the photographs handed in as exhibits show) she wore sexy tight-fitting clothes and revealing bathing suits, she lost interest in her physical appearance. She began overeating and was forced to wear loose and unflattering clothes partly as a result of her obesity and partly due to the injuries to her back. Before returning to her work she slept three to four hours per day and did nothing but sit around, mostly at her mother's home. The plaintiff developed headaches and often complained of vaginal infections. She developed suicidal tendencies and on one occasion her ex-husband Paul cleared her home of all drugs and sleeping tablets to prevent her from taking an overdose. The plaintiff testified that she suffered extreme humiliation and indignity due to the doctors frequently examining her private parts. She felt her womanhood had been taken away. She thought that she had become infertile as a result of the injury. Sexual intercourse had become painful and troublesome. She could not be a mother to her child. She felt useless, suicidal and had nothing to live for. The only reason why she did not commit suicide was for the sake of her daughter. After the initial healing period and by December 1992 she returned to her work, doing half-day stints. Eventually she was able to do a full day's work again. She was employed at Sage Life. Prior to the injury she worked as a secretary to Mr Colin Jamieson. However, on returning to her employment she was placed in a position of what is known as a 'conservation officer,' a position of lesser responsibility than that of a secretary. It appears that at Sage Life employees were subject to an annual appraisal. In the plaintiff's case her post-traumatic appraisal during April 1993 showed that she performed as 'standard' in most respects. By April 1994 her work appraisal had improved to 'good' in most respects. And by April 1995
her appraisal indicated ‘outstanding’ performances in seven out of twenty-two categories. Part of the plaintiff’s post-traumatic suffering was actually experienced at work. She had to treat and medicate herself while at work. She was forced to take cotton wool and creams to work. Whenever she went to the toilet she had to stand over the toilet and pass motions and then clean herself with cotton wool and treat herself with the necessary creams. She also had to sit on a special chair to accommodate the pain in her back. A large portion of the plaintiff's residual physical complaints related to her alleged sexual dysfunction and recurring vaginal infections.

The court took the view that the plaintiff overstated the detrimental effects of the burning incident on her sex life. According to the plaintiff she had had an active sex life of four to five episodes of sexual intercourse per week prior to the incident. Although divorced from her husband Paul during April 1992, they were staying in the same home at the time of the injury. This cohabitation was agreed to for the sake of Jen-Ai. After the injury they once again commenced sexual intercourse during or about December 1992. She in fact complained to Dr Hurwitz, a gynaecologist, on 17 December 1992 of feeling pain on penetration. Her complaint about pain to her fourchette to Dr Ritz in January 1993 is also indicative that she had recommenced having regular sexual intercourse. In February 1993 she complained to Dr Hurwitz of ‘feeling raw’. However, by then her vagina had completely healed. Dr Hurwitz also found on 25 February 1993 that any discomfort she experienced was due to muscle tension in the expectation of pain and must therefore have been psychological in origin rather than physical. In October 1993 the complaint to Dr Israelstam was only of ‘limited pain on introitus whereafter sex was satisfactory’. By June 1994 the plaintiff was questioned by Dr Kruger, the gynaecologist who performed an unrelated gynaecological operation on her, concerning any sexual dysfunction and she reported that there was no sexual dysfunction whatsoever. In July 1995 Dr Gordon-Grant, a gynaecologist, approached by the plaintiff, opined that any discomfort which she was suffering during intercourse was as a result of her episiotomy, ie a surgical incision of her perineum which was performed to facilitate the birth of her child, Jen-Ai.

Claasen J concluded that any sexual dysfunction she experienced as a result of the burning incident terminated approximately a year after the incident. He also concluded that although there were 11 documented complaints of vaginal infections, the plaintiff was under a misapprehension as to what caused the symptoms. It was,
however, her evidence that she at all times thought that these ‘vaginal infections’ were the result of the burning incident, and she was strengthened in this perception by her general practitioner’s clinical findings. The objective medical evidence produced in Court, however, positively disproved the correctness of her and her doctor’s conclusions in this regard. Claasen J observed that her perception that these recurring vaginal discharges resulted from the burning incident had a distinct effect on her psychological make-up subsequent to the burning incident. It strengthened her in her, albeit mistaken, perception that her womanhood was taken away from her, that she would not be able to bear children again and therefore that her marriage prospects were nil. These wrong perceptions did not help in lessening the mental anguish which was occasioned by the burning incident. He said that she could not be faulted for having entertained these wrong perceptions. Not only was she reinforced in some of them by her doctor, but no one, not one medical expert, until the trial, rid her of these wrong perceptions. Despite this unfortunate concurrence of events, said Claasen J, the defendants could not be held liable for the costs associated with the so-called ‘recurring vaginal infections’ because they were in truth not recurring vaginal infections at all.

**Judgment**

Claasen J observed that it is trite law that psychological sequelae can form the subject of a damages claim under the *lex Aquilia*. He noted that it was common cause that the plaintiff was suffering from a nervous and psychological disorder known as a major depressive disorder coupled with anxiety. In this state she was unable to return to work. It became common cause that the evidence had shown that this condition is curable. A proper programme of psychotherapy and electroconvulsive therapy (ECT) commonly known as ‘shock treatment’, administered over a period of approximately 18 months, would restore the plaintiff to her pre-morbid level of functioning both at

---

214 He referred in this regard to *Bester v Commercial Union Versekeringsmaatskappy van SA Bpk* 1973 (1) SA 769 (A) at 776H-777A where Botha JA said the following: “Die betoog veronderstel dat ‘n psigiatriese besering geen fisiese besering is nie, en beteken dat, ofskoon geneege doenig op senusook of psigiatriese besering wat tot, bv. ‘n hartaanval aanleiding gee, verhaalbaar is, dit nie verhaalbaar is waar die senuskok of psigiatriese besering op, bv, kranosinnigheid uitoop nie. Voorts kom die betoog daarop neer dat ‘n onregmatige dader nie aansprakelik is vir skade veroorsaak deur op-skuldige-opskuldige-vervuilning, deur die op-skuldige-opskuldige-vervuilning van eenig skade wat op onregmatige en skuldige wyse veroorsaak is. (Mathews and Others v Young 1922 AD 492 op 504.)”
home and at work. As a result of this evidence, the plaintiff's enormous claim for future loss of earnings had, to all intents and purposes, fallen away. Her claim for loss of future earnings was limited to the period of 18 months during which she would be temporarily and partially disabled from being employed. Also, her future medical expenditure was limited to the cost of undergoing the required psychotherapy and ECT which would restore her to her former level of functioning. The plaintiff contended that the defendants were liable in delict for her present depressed condition and all the costs associated therewith. The defendants contended that her present condition is not legally connected to the injury suffered in September 1992.

Claasen J observed that the defendants' negligence had been admitted. On the first trial date set for this matter, ie 16 August 1995, the defendants consented jointly and severally to judgment in respect of the allegations of negligence set out in paras 1 - 10 of plaintiff's particulars of claim. He said it was not necessary for purposes of the judgment to repeat these allegations of negligence. The nature of the injuries suffered by the plaintiff and the quantum of damages associated therewith were, however, very much in dispute. The thrust of the defendants' defence was related to the question of causation. Their defence boiled down to the contention that there was a break in the causal chain of events linking the plaintiff's present psychological state and the damages associated therewith to the original negligent acts of the defendants. Claasen J observed that it is trite law that a causal nexus between a defendant's negligent conduct and the plaintiff's damages is an essential element of delictual liability. He said that the determination whether or not certain sequelae are causally linked to the defendant's conduct requires a two-stage enquiry: Firstly, whether a factual relation exists between the defendant's conduct and the harm sustained by the plaintiff ('factual causation') and, if so, secondly, whether the defendant should be legally responsible for the harm factually caused by his conduct ('legal causation'). Claasen J noted that this process of causal determination was described by Corbett JA (as he then was) in Minister of Police v Stosana 1977 (1) SA 31 (A) at 34E-F in the following terms: "Causation in the law of delict gives rise to two rather distinct problems. The first is a factual one and relates to the question as to whether the negligent act or omission in question caused or materially contributed to ... the harm giving rise to the claim. If it did not, then no legal liability can arise and cadit questio. If it did, then the second problem becomes relevant, viz whether the negligent act or omission is linked to the harm sufficiently closely or directly for legal liability to ensue or whether, as it is said, the harm is too remote. This is basically a juridical problem in which considerations of legal policy may play a part." He also referred to S v Daniels en 'n Ander 1983 (3) SA 275 (A) at 331B-C, where Jansen JA stated the following: "Daar kan weinig twyfel bestaan dat in ons regspraak die bepaling van "feitelike" oorsaklike verband op die grondslag van die conditio sine qua non geskied. ... Sonder sodanige verband tussen die dader se handeling en die beweerde, gewraakte gevolg is daar in die algemeen geen aanspreeklikheid nie. Aan die ander kant is dit ook duidelik dat 'n dader nie aanspreeklik gestel behoort te word vir alle gevolge waarvan sy handeling 'n conditio sine qua non is nie - sy
J stated that the test for factual causation is usually not too difficult to apply to any given circumstances. The *sine qua non* test normally results in an easy answer as to whether or not the harm would have resulted ‘but for’ the negligent conduct. What often poses a greater test for jurists, he observed, is the second leg of the enquiry, i.e. legal causation. He noted that various theories have been advanced in the past such as ‘proximate cause’, ‘direct cause’, ‘foreseeability’, ‘absence of a *novus actus interveniens*’ and ‘sufficient causation’. In South Africa, he said, the matter has become settled in that the Appellate Division has laid down a ‘flexible norm’ (‘soepel maatstaf’) whereby considerations of policy, reasonableness, equity and justice are applied to the facts of the case216. After considering the evidence Claassen J said he was convinced that the plaintiff would not have been healed by August 1995. He said he would find it extremely strange if a young woman such as the plaintiff would not have had uninterrupted and continuous mental anguish following upon such a horrendous intrusion into her femininity. The breast and vagina have always been a symbol of womanhood and ultimate utility. It is well known that both disease and surgery of the breast and vagina evoke a fear of mutilation and loss of femininity. Injury to these organs would therefore tend to have the same consequences. It is also

aanspreeklikheid sou dan te wyd strek en die grense van redelikheid, billikheid en regverdigheid oorskry. Beleidsoorwegings verg dat lewers 'n grens gestel moet word.” Claasen J further noted that Corbett CJ once again had occasion to deal with the matter of causation in *International Shipping Co (Pty) Ltd v Bentley* 1990 (1) SA 680 (A) at 700E-I where the learned Chief Justice said: “As has previously been pointed out by this Court, in the law of delict causation involves two distinct enquiries. The first is a factual one and relates to the question as to whether the defendant’s wrongful act was a cause of the plaintiff’s loss. This has been referred to as ‘factual causation’. The enquiry as to factual causation is generally conducted by applying the so-called ‘but-for’ test, which is designed to determine whether a postulated cause can be identified as a *causa sine qua non* of the loss in question. In order to apply this test one must make a hypothetical enquiry as to what probably would have happened but for the wrongful conduct of the defendant. This enquiry may involve the mental elimination of the wrongful conduct and the substitution of a hypothetical course of lawful conduct and the posing of the question as to whether upon such an hypothesis plaintiff’s loss would have ensued or not. If it would in any event have ensued, then the wrongful conduct was not a cause of the plaintiff’s loss; *aliter*, if it would not so have ensued. If the wrongful act is shown in this way not to be a *causa sine qua non* of the loss suffered, then no legal liability can arise. On the other hand, demonstration that the wrongful act was a *causa sine qua non* of the loss does not necessarily result in legal liability. The second enquiry then arises, viz whether the wrongful act is linked sufficiently closely or directly to the loss for legal liability to ensue or whether, as it is said, the loss is too remote. This is basically a juridical problem in the solution of which considerations of policy may play a part. This is sometimes called “legal causation”.

Claassen J pointed out that van Heerden JA in *S v Mokgethi en Andere* fn 74 supra at p 401-41B described the test for legal causation thus: “Wat die onderskeie kriteria betref, kom dit my ook nie voor dat hulle veel meer okaas as is ‘n maatstaf (die soepel maatstaf) waarvolgens aan die hand van beleidsoorwegings beoordeel word of ‘n genoegsame nou verband tussen handeling en gevolg bestaan nie. Daarmee gee ek nie te kene nie dat een of selfs meer van die kriteria nie by die toepassing van die soepel maatstaf op ‘n bepaalde soort feitkomplekses subsidies nuttig aangewend kan word nie; maar slegs dat geen van die kriteria by alle soorte feitkomplekses, en vir die doeleindes van die koppeling van enige vorm van regeansaanspreeklikheid, as ‘n meer konkrete algemene maatstaf gebruik kan word nie.” He noted that this proposition was reenacted in *S v Abrahams* 1994 (4) SA 1 (A) where Botha JA said at 18E-H: “Ter aanvang van die bespreking van die voorgaande betoog, ag ek dit noodsaaklik om ‘n paar opmerkings van ‘n algemene aard voorop te stel. Die belangrikheid en die krag van die oorheersende maatstaf om vrae van juridiese kousaliteit op te los, wat in *Mokgethi* (supra) en *International Shipping Co* (supra) aanvaar is, té juis in die soepelheid daarvan. Dit is my oortuiging dat enige poging om aan die buigsaamheid daarvan afbreuk te doen, weerstaan moet word. Vergelykings tussen die feite van die geval wat opgelos moet word en die feite van ander gevalle waarin daar alredely ‘n oplossing gevind is, of wat hipotesies kan ontstaan, kan vanaf verskeiden perspektiewe en waardevol, en soms miskien zelfs deurklankende wees, maar ‘n mens moet oppas om nie uit die vergelykings-proses vaste of algemeengelyke redes of beginsels te probeer distilleer nie. Die argument dat die eiser se eis ‘in beginsel’ verwerp moet word, is misplaas. Daar is net een ‘beginsel’: om te bepaal of die eiser se skade te ver verwyderd is van die verweerder se handeling om laasgenoemde dit toe te reken, moet oorwegings van beleid, redelikheid, billikheid en regverdigheid toespeel word om die betondere feite van hierdie sake.”

216
well known in cases of rape that women suffer ruminatory thoughts for extended periods of time after the incident. In his view the plaintiff’s injuries far exceed the injuries normally associated with rape. The burning of her back, the skin-grafting operation, the humiliation of her inability to do her ablutions in a normal manner, her fear of being infertile and the continued medical examinations which she was subjected to, constitute, in his opinion, added suffering which was not normally associated with the trauma of rape. It is therefore more than probable that the plaintiff, given her immature personality traits, would have taken a long time to overcome the psychological trauma associated with the violation of her genitals. Claasen J said that if he was correct in drawing this analogy with the trauma normally associated with rape, then it was probable that she would have suffered continuous mental anguish throughout the period leading up to the court case in August 1995. He found that even though plaintiff’s condition may have been influenced by ‘compensation neurosis’, this in itself would not break the chain of causality, absolving the defendants[^217].

Claasen J said that trial stress in itself cannot therefore break the causal chain between the defendants’ negligence and the plaintiff’s present major depressive disorder. He stated that taking into account reasonableness and equity, he was of the view that the present condition was justifiably linked to the defendant’s negligence. Her present worsened depressive disorder, he said, was not harm of an altogether different kind from that which one would normally expect after an injury of the kind suffered by the plaintiff. A more severe form of depression, ie a major depressive disorder plus anxiety, following upon a burning of a woman’s genitals is not an unexpected phenomenon. Claasen J stated that it was not a result of ‘a different kind from that which would otherwise have resulted from the actor’s negligence’ (per Hiemstra J in

[^217]: He referred in this regard to *Moehlen v National Employers' Mutual General Insurance Association Ltd* 1959 (2) SA 317 (SR) where Morton J said at 319H-320C: “If, then, anxiety neurosis is the sole cause of her present condition, this litigation and the plaintiff’s desire for compensation are not its only causes, though they may have intensified it. It was initially caused by her physical injuries and was a direct and reasonably foreseeable consequence of the deceased driver’s negligence. This puts the present case in a very different class from such cases as *Hay (or Bournhill) v Young* [1942] 2 All ER 396, and *King v Phillips* [1953] 1 All ER 617, which Dr Palley has cited in support of his submission. Whether I apply the test of foreseeability to the negligence only, as in the *Polemis* case, [1921] 3 KB 560, or extend it to the consequential damage, the result is the same, and I find the defendant liable for that damage. Similar anxiety neuroses have been held to be ground for damage in such cases as *Latimer v Orient Steam Navigation Company Ltd* (1952) and *MacKenna v Smiths Dock Company and Others* (1947), the reports of which are only available to me in Kemp and Kemp's *The Quantum of Damages* at 367-70. In *Slipman v London Transport Executive* (1951) ibid at 361, in which the plaintiff had suffered no physical injury at all in the collision and in which there was a similar conflict of medical opinion, Mr Justice Hilbery, although he preferred the diagnosis of the medical witness for the defendant that the plaintiff would recover and that settlement of his claim would have enabled him to recover very much quicker, nevertheless awarded substantial general damages.”
It was a normal response to the stimuli created by the negligent injury to the plaintiff, particularly so because of her neurotic state of learned helplessness and her inherent personality traits. This was merely a case of a young woman who was incapable of facing the results of her injuries with ‘normal’ fortitude and courage. In essence her vulnerability stemmed from the weakening effect which her pre-existing personality traits had on her ability to withstand trauma. Hers was a ‘thin skull’ case in the emotional and psychological sense. That being so, it seemed to Claasen J that her emotional over-reaction to the stimuli emanating from these additional stressors could not be regarded as a supervening cause and the defendants must be held liable. The court said that it must be remembered that her sequelae stemmed from actual physical injury to herself. It was not a case of merely witnessing a traumatic event which induced shock causing subsequent psychological sequelae. In cases where psychological sequelae follow after actual physical injury, there is less likelihood of ‘limitless’ liability and therefore greater scope for a flexible approach to include liability for psychological sequelae which are further removed from the original negligent conduct.

Claasen J held that even if it could be said that there was a lesser connection between the nervous collapse during August 1995 and the original injury, the fact that she was physically injured would be sufficient in these circumstances to hold the defendants liable. Because the plaintiff suffered physical injury, she was to be regarded as a ‘primary victim’. He noted that in Page v Smith Lord Keith held that the thin skull rule applies where the plaintiff is a primary victim (as was Mrs Gibson in the present matter). He held that hindsight has no part to play where the plaintiff is a primary victim and proof of proximity will therefore present no problem, i.e. remoteness of damages will not be a problem where psychological sequelae occur consequent upon a physical injury. Claasen J said that the principle expressed by Lord Keith is in line with the dictum of Botha JA in Bester’s case. He was of the opinion that the clarity and perspective which hindsight brings in regard to the respective influences of all the stressors which played a part leading up to the August 1995 psychological collapse, was not that relevant where the defendants’ negligence caused the plaintiff to suffer a direct physical injury. He held that the thin skull rule applied. The defendants

---

218 Alston 1964 (4) SA 112 (W) at 116F-G
219 Page [1993] 2 All ER 736 (HL) at 767 in fine
therefore found their victim as she was with all her personality traits which played an important although unquantifiable role in causing the collapse. The defendants also found the plaintiff with all her built-in stresses and strains arising out of her family-related problems. Claasen J said that it was not possible to quantify the influence of these stressors and thus the fact that the collapse occurred later rather than sooner was with hindsight of little consequence. Applying these principles to the present case Claasen J was of the opinion that the defendants were liable for all forms of nervous shock and psychological trauma, the lesser as well as the more serious, following after the injury because it is irrelevant whether the precise nature and extent of plaintiff’s psychological trauma could have been foreseen.

It was submitted for the defendants that had the plaintiff submitted to timeous psychotherapy she would have received timeous cognitive restructuring which would have returned her to her pre-morbid emotional level of functioning. This would then have enabled her to withstand the trial stress and its associated disappointments. Claasen J responded to this by saying that it must be remembered that the onus to prove that the plaintiff acted unreasonably in failing to submit herself for psychotherapy, rests on the defendants. Claasen J observed that it was never the defendants’ case at the commencement of proceedings that the plaintiff’s alleged failure in this regard constituted a novus actus interveniens which broke the causal chain between the defendants’ negligence and the ultimate psychological breakdown in August 1995. Nor was this defence pleaded. He said he was about the true nature of this defence asking if he was to hold that the plaintiff negligently failed to submit to psychotherapy, should her negligence be regarded as contributory negligence or should her negligence be taken into account when legal causation is evaluated? He asked whether it was truly a defence of a novus actus interveniens interrupting legal causation or was it a defence of contributory negligence by the plaintiff which caused her damages to be reduced by apportionment? If the latter, then the plaintiff’s

Claasen J associated himself with what Berman AJ said in Masiba and Another v Constantia Insurance Co Ltd and Another 1982 (4) SA 333 (C) at 342D-F: “Regard being had to the physical condition of the deceased and his long history of hypertension the present case affords an almost classic instance of the so-called ‘thin skull case’, the rule being that a negligent defendant is bound to take his victim as he finds him, see Wilson v Birt (Pty) Ltd 1963 (2) SA 508 (D) at 516. It being a sine qua non of liability where non-physical injury is inflicted that this harm should have been foreseeable, the application of the ‘thin skull rule’ to cases involving injury of this nature is that once a psychiatric injury of gravity sufficient to render it actionable is foreseeable, then the injured party can recover for more extensive psychiatric damage which is attributable to his pre-existing weakness, see Bester’s case supra at 779.” He also referred to the Australian cases referred to by Navsa J in Clinton-Parker v Administrator, Transvaal, Dawkins v Administrator, Transvaal 1996 (2) SA 37 (W) at 65H-66F.

Butler v Durban Corporation 1936 NPD 139 at p 148
damages may be reduced due to her contributory negligence only if the pleadings placed her fault in issue\(^\text{222}\) which, in this case, the pleadings did not.

Claasen J noted that on the pleadings it was common cause that the defendants were 100% to blame for the plaintiff’s injuries. What was in issue, on the pleadings, was the nature, extent and quantum of her damages consequent upon her injuries. But, he observed, it has been held that ‘fault’ as used in section 1 of the Apportionment of Damages Act\(^\text{223}\) is wide enough to bear the extensive meaning of negligent conduct which causally contributed to both the occurrence of the ‘harmful event’ as well as negligence which affects the ‘nature, extent and quantum of damages’ suffered. He observed that this was held to be so even in cases where the defendant’s negligence is the sole cause of the harmful event. The plaintiff’s ‘fault’ which may help to cause both the harmful event and the subsequent nature and extent of his damages, said Claasen J, is restricted to ‘pre-accident’ or ‘pre-tortious’ fault. Put differently: it is the plaintiff’s negligent conduct prior to the commission of the defendants’ delict which is judged as being relevant for purposes of apportioning the plaintiff’s damages, and not his negligent conduct after the commission of the delict. Thus a plaintiff’s negligent conduct subsequent to the harmful event which caused his damages cannot be the subject of apportionment in terms of the Apportionment of Damages Act\(^\text{224}\).

Claasen J found that a distinction should be drawn between the parties’ negligence prior to the harmful event and any relevant negligence after the harmful event. In the case of a plaintiff, his pre-delictual negligence will trigger the application of contributory negligence to reduce his damages. The plaintiff’s post-delictual negligence will, however, affect the principles of legal causation (or remoteness) which may reduce his damages. Post delicto, the plaintiff’s negligent conduct may be regarded as an *actus novus interveniens* which breaks the chain of causality.

\(^{222}\) *AA Mutual Insurance Association Ltd v Nomeka 1976 (3) SA 45 (A) at 55-6*  
\(^{223}\) Apportionment Act 34 of 1956  
\(^{224}\) The court referred to Neethling J and Potgieter JM ‘Aspekte van die Deliks Elemente Nalatigheid, Feitelike en Juridiese Koualiteit (insluitend die sogenaamde eierskedelgevalle) – Smit v Abrahams’ (1993) *THRHR* 157 at p 159: “Die wesentlike verskil tussen die vraag na nalatigheid (juridiese verwytybaarheid van die dader) aan die een kant, en kousaliteit (aanspreeklikheidsbegrensing of toerekenbaarheid van skade) aan die ander kant, moet nie uit die oog verloor word nie. Dit is onlogies om, nadat eenmaal bevind is dat die dader nalatig was (omdat hy in die lig van die voorziensbaarheid van of specifieke gevolge, of skade in die algemeen, anders moes opgetree het), met verwysing na verdere (‘remote’) gevolge weer te vra of die dader anders moes opgetree het. Daar is immers by die ondersoek na nalatigheid reeds besluit dat hy anders moes opgetree het. By verdere gevolge gaan dit dus nie meer om die dader se verwytybaarheid (skuld) nie (dit staan in hierdie stadium reeds vas), maar of hy vir die verdere gevolge van sy verwytybare optrede aanspreeklik gehou moet word.”
sufficiently to absolve the defendants from liability for the plaintiff’s damages. It is therefore in terms of the doctrine of legal causation (and not contributory negligence) that he chose to construe the defence of the plaintiff’s alleged refusal to submit to psychotherapy. Also, said Classen J, the fact that this defence was not pleaded by the defendants would be no bar to it being considered. Any defence which attacks the legal connection between the harmful event and the plaintiff’s damages can be raised once the nature, extent and quantum of the plaintiff’s damages have been put in issue. On the evidence, Claasen J found that this defence must fail. It was never explained to the plaintiff in detail what a full-blown psychotherapeutic programme could mean to her. The cost and time implications were never discussed with her, nor the expected prognosis if she were to submit to such a course. It was only after the full analysis contained in Dr Sugarman’s medico-legal report came to hand for purposes of the trial that these facts were made available to the plaintiff. It was therefore not correct to say that she ‘refused’ psychotherapy. Nor did she ‘unreasonably’ refuse to undergo psychotherapy said Claasen J.

As far as damages were concerned, Clasasen J held that taking into account the plaintiff’s pain and suffering, disfigurement and loss of amenities of as well as the comparable cases to which counsel had referred and allowing for some inflationary escalation, a proper award for plaintiff’s general damages for pain, suffering, disfigurement, and loss of amenities of life, past and future, should be an amount of R70 000.

Discussion

This case is an example of the thin skull rule applied in the psychological rather than the physical context. Since, as the court has pointed out, the nervous system is in any event a physical component of a person’s psychological state, there is no reason in principle why the thin skull rule should not be applied to psychological harm. The court acknowledged the ‘thin skull rule’ in psychological as opposed to physical harm in Clinton-Parker v Administrator, Transvaal Dawkins v Administrator, Transvaal225

---

225 Clinton-Parker 1996 (2) SA 37 (W)
It is submitted that this view is consistent with the constitutionally acknowledged right to psychological integrity. It is important to note in this regard that where a mishap occurs due to an underlying and undetected condition, for example an allergy to anaesthetics, this will not necessarily mean that the provider is liable for that mishap. All of the elements of delict, including negligence are still a requirement. If the provider should have anticipated the underlying condition and, for example, asked the patient if he or she suffered from any allergies or if there are certain recognised pretests to be conducted where there is a reasonable likelihood that a patient could have an underlying condition then it is likely to be evidence of negligence where such precautions were not taken.

9.2.14 Broude v McIntosh And Others

Facts

The appellant was a medical doctor who has spent most of his professional life practising medicine either privately or as an employee of a hospital. He was born on 30 March 1931 and was 60 years of age at the time of the operation. In 1969 his left ear began to trouble him. He experienced deafness and tinnitus and protracted bouts of giddiness. In the same year he underwent an operation in Germany. It left him permanently deaf in the left ear but alleviated the tinnitus and the vertigo to such an extent that for 20 years he had no need of further intervention. In 1989 there was a recurrence of vertigo and tinnitus with accompanying nausea. He was referred in 1990 to the first respondent, Professor McIntosh, who was an ear, nose and throat surgeon. He was head of the relevant department at the Johannesburg hospital and a professor in the faculty of medicine of the University of the Witwatersrand. Conservative treatment followed but brought little relief. In March 1991 a decision was made to operate. The operation was performed by the first respondent at the Johannesburg General Hospital on 4 September 1991. The operation which the first respondent set out to perform was a cochlear vestibular neurectomy. It was a designedly destructive operation and had as its object the severance of both the cochlear and the vestibular nerves. The vestibular nerve is severed and excised to counteract vertigo. The cochlear nerve is severed but not necessarily removed to counteract tinnitus.

Broude 1998 (3) SA 60 (SCA)
Inasmuch as the cochlear nerve plays a role in the hearing function, its severance would not have been appropriate if the plaintiff had still been able to hear in his left ear. The operation entails gaining access to the inner ear structures by making appropriate incisions, sculpting away with a rotary burr part of the mastoid bone behind the ear, passing through the labyrinth and of the cochlea (and *en passant* destroying them *pro tanto*) and arriving at the internal auditory canal. This is a bony structure with an internal lining of dura which is a very thick tough tissue. The bone of the canal is shaped down until it is so translucent that one can see through it to the structures behind it. The underlying dura is exposed by lifting the remaining film of bone. The dura is then opened and the nerves which are to be severed are exposed to view. They are visualised microscopically at a very large magnification by the surgeon. Absent any anatomical abnormalities the nerves are easily seen and distinguished from one another both by reason of their colouration and by reason of their physical location and the courses which they take. In close proximity to the vestibular and cochlear nerves is the facial nerve - indeed these three nerves make contact with one another for some of their respective lengths. The vestibular nerve has two branches both of which are severed and a segment of each removed. The cochlear nerve is incised and may or may not be removed. To close the opening through which entry was gained, a sheet of fascia (fibrous tissue which holds structures together and envelops muscles) taken from the patient’s body is placed in such a way as to cover the opening in the internal auditory canal. To hold it in place and provide a soft tissue seal so that cerebrospinal fluid which fills the canal does not exude or leak out, an appropriate quantity of body fat harvested from the patient is eased into the cavity before the incision in the patient’s skin is sutured. That is how the first respondent said the operation should be done and there was no disagreement amongst the medical witnesses about that.

The operation was done and after spending some time in the recovery room appellant was taken to the ward in the latter part of the morning. His wife was waiting to see him. According to first respondent, the appearance and function of the appellant’s face after he awoke from the anaesthetic in the recovery room was normal. Later that day when he saw the appellant in the ward there were no clear signs of even a partial palsy. All that he observed was ‘a possible sluggishness of movement in places’. According to the appellant’s wife, Mrs Broude, she noticed when appellant was
wheeled into the ward that 'his face looked strange' in that his mouth looked 'skew'. She said that the appellant passed his hand across his face and asked her whether his face was skew and she replied in the affirmative. Later on in the afternoon she met the first respondent in the ward which was a general ward. The appellant asked the first respondent whether his face was skew and first respondent affirmed that it was. The first respondent allegedly patted her on the shoulder and laughingly said: 'Mrs Broude, if you were in America you would already be at the lawyer's offices.' According to first respondent he said no such thing. Appellant and his wife also said that first respondent told them that appellant's face would return to normality within three to four weeks. First respondent's version was that when he did discuss the palsy (and it was not on that occasion) he said it would resolve itself in three to four months but that he could have said that it might resolve itself earlier within a matter of weeks.

The first respondent did not dispute that by the next day some clinical signs of a left facial palsy were visible. On that day the appellant was tested by means of electroneuronography to establish the status of his facial nerve. The test (ENOG) showed a 60% degeneration of the nerve. On 19 September (by which time appellant had been re-admitted to hospital another ENOG was carried out and it showed a 100% degeneration of the nerve.

During the appellant's first stay in hospital there was a leakage of cerebrospinal fluid through the surgical wound and through the nose. The occurrence of such a leak is not uncommon and is not necessarily or even probably indicative of negligence. The appellant was anxious to go home and after discussion with the first respondent during which appellant was told to stay in bed he was discharged. There was still an occasional leak of cerebro-spinal fluid at this time. While at home appellant suffered from a stuffy and irritating nose. He blew his nose and experienced an excruciating headache. He rushed back to hospital and remained there for several days. When he was subsequently discharged, the appellant was to be strictly confined to his bed, take antibiotic cover, and report back regularly to the department. The leakage of cerebrospinal fluid continued. The first respondent's attitude was that it would stop of its own accord. The appellant decided to take a second opinion and consulted Dr Davidge-Pitts on 7 October. The appellant was advised to wait for a few more weeks. He also communicated with Dr Hamersma during October. The latter was reluctant to
be involved but advised him to keep in contact with the first respondent, to be
conservative and to follow the first respondent’s advice. By 23 October the leak had
stopped and appellant returned to work on 28 October.

On 29 October the appellant consulted an ophthalmologist, Dr Kuming, about
problems he was experiencing as a consequence of not being able to open and close
his left eye because of the palsy. As time went by and no improvement in his facial
condition appeared to be taking place, appellant’s anxiety increased. He experienced
difficulty in making contact with the first respondent and eventually appellant wrote
to him. The letter was mainly reproachful. It was said that the facial palsy was still
present and the question was posed whether the facial nerve had been either partially
or completely severed. Surprise and disappointment was expressed that neither first
respondent nor his department had made contact with the appellant. However, first
respondent was thanked for everything and the operation was said to be ‘in a final
analysis’ a ‘success’ and ‘the nursing, medical and hospital’ were said to have been
‘superb’.

The first respondent claimed not to have received this letter until long after it was
written, citing his lengthy absence from South Africa as one of the reasons why he did
not receive it sooner. He admitted that he did not reply to it but said that he was due to
see appellant soon after he had seen the letter and intended to discuss it with him then.
As a fact they did not see one another again. On 30 January 1992 appellant consulted
a neurologist, Dr Levy, who was well known to him. Clinical examination failed to
disclose any observable functioning of the left facial nerve. An electromyographical
(EMG) test was performed to assess whether any function was present. According to
Dr Levy mild volitional activity in certain of the facial muscles was noted. No
stimulation of the facial nerve was possible. Dr Levy concluded that there did appear
to be some return of function and suggested that a further EMG test in six weeks’ time
might be of some value. He said in evidence that the volitional activity reflected when
the EMG test was done was inconsistent with total severance of the nerve and that for
the message to have reached the muscle from the brain stem via the facial nerve
meant ‘that there must have been some continuity’ and that whatever lesion there
might be was a ‘partial’ one. He said that clinical recovery of a facial nerve can be
very delayed and that electrical recovery often precedes clinical recovery. However,
there is sometimes no functional recovery. A further test was carried out on 1 July 1992 but the findings were not recorded and Dr Levy was quite unable to recall what they showed. Appellant claimed that he had been told by Dr Levy that the result of the first test was equivocal and that nothing could be deduced from it. Dr Levy’s response to that was that the result of the test may have been equivocal as an indicator of returning function but that it was not equivocal as an indicator of continuity of the nerve.

Before returning to Dr Levy on 1 July 1992 the appellant consulted Dr Hamersma during February 1992 after an arranged meeting with first respondent did not take place on 4 February. Dr Hamersma examined appellant and subjected him to electrical testing. He told the appellant that the facial nerve was dead and that there was no response. He questioned the appellant about his interaction with the first respondent and, having learnt that the first respondent had told appellant to await developments, he advised him to ‘err on the conservative (side) and give it its best shot’ seeing that the first respondent had ‘never ever indicated any kind of concern' and that ‘we should wait up till nine months’. He also told him that he might need an operation and that he should consult another ear, nose and throat surgeon, Dr Le Roux, and a neurologist, Dr De Klerk. On 5 March 1992 Dr Kuming performed a tarsorrhaphy operation on appellant. It entails suturing the corners of the eyelids together in order to protect the eye without depriving the patient of the use of the eye. Had appellant been able to open and close his left eye this operation would not have been required.

On 19 May 1992 appellant consulted Dr Le Roux who sent him to a physiotherapy practice conducted by Ms Melanie Jacobs in the same building in order to undergo a nerve excitability test (NET). The test was conducted by one of her assistants, Ms Van der Merwe. According to Ms Van der Merwe, she had no difficulty in performing the test. The apparatus was not out of order and appellant was not told to come back on another day. According to Dr Le Roux, the result indicated that the nerve was alive and had a chance of recovery and that it had not been severed. Marais JA observed that a strange feature was that Dr Le Roux testified initially that he had not asked for the test to be done but conceded when confronted with a note written to Ms Jacobs that he had done so. However, he said he had received no report on the result of the
test. When asked why he had not asked for the report when it was not forthcoming, he was quite unable to explain why he had not done so. He claimed to have seen it for the first time in court. Equally strange, said Marais JA, was the appellant’s evidence that the apparatus was not functioning, that he returned on another day to be tested, and that the person conducting the test was still ‘not very impressed with their apparatus’ but said ‘they have got some result and that they would report to Dr Le Roux’.

The latter advised appellant that he should consider going to see Dr Fisch, a renowned surgeon in Zurich, with a view to surgical exploration of the nerve and a primary nerve repair. Dr De Klerk shared that view. In the result the appellant was operated upon by Dr Fisch in Zurich on 19 September 1992. Dr Fisch was unable to repair the nerve and instead performed a facial nerve hypoglossal anastomosis. The operation entails severing the nerve to the tongue in the neck and then connecting it to the facial nerve where it exits from the brain stem at the base of the skull. The muscles of the face are thereby enervated and the patient is trained to use the tongue to create facial movement. However, it does not restore emotional expression and while it is possible to close the eye, secretion of the eye does not return and the eye remains dry. The operation was successful.

The appellant underwent yet further operations in South Africa in 1993 to improve his facial appearance. What was found during the operation in Zurich and what inferences could be drawn from what was found was the subject of much debate. Dr Hamersma was present at the operation and described what was found. Dr Fisch did not testify but his note of the operation was translated from German into English and placed before the trial Judge by consent of all the parties as being a correct exposition of what he did and what he found. The parts of it around which debate centred were these:

5. Behind the foramen meatal, a huge neuroma bulged out of the opened internal auditory canal. This neuroma was removed by tympanoplasty scissors, without escaping of fluid.

6. Removal of bone over jugular bulbus in the area of porus acusticus internus. This had not been reached by previous operation. Exposure of back, upper and lower surfaces of the internal auditory canal. The facial nerve was traced
inside the scarred auditory canal. A few millimetres before the foramen meatal, the nerve loses itself inside scar tissue. The scar extends over the entire internal auditory canal.

7. Opening of the meatal dura in the area of porus acusticus internus. Here too an atrophied facial nerve was to be found. Even after removal of dense scar tissue from the internal auditory canal, it was still impossible to identify a proximal stump of the facial nerve, with any certainty. It would appear that, after the previous operation, dense scar tissue in the internal auditory canal compressed the facial nerve and led to development of a scar-neuroma.

8. In view of the fact that facial paralysis had persisted for one year and the patient’s facial muscles had a very flaccid appearance, we decided to proceed with a hypoglosso-facial-anastomosis.

Review: The cause of the facial-nerve-lesion during the previous operation remains unclear. It is possible that the internal auditory canal was, to a large extent closed by tissue which, as a result of post-operative swelling of facial nerve graft within the inner auditory canal was compressed and, as a result, regenerated nerve-fibres were unable to establish contact with the meatal foramen. Whether the six weeks of liquorrrhea also were (also) responsible, remains an open question.”

Marais JA noted that what was thought to be a neuroma was shown on histological examination to be ‘scar tissue with parts of a peripheral nerve’. A neuroma is the new growth of tissue which usually follows upon the severance of a nerve and it is something quite distinct from scar tissue. The reference to ‘liquorrhea’ was a reference was to the leakage of cerebrospinal fluid which occurred in September 1991.

Judgment

The claim for damages was founded upon first respondent’s conduct before, during, and after the operation. Marais JA found that the omission to inform appellant of the risk of leakage of cerebrospinal fluid was of no significance. The leakage was not proved to be causally related to the onset of the facial palsy and the appellant did not claim that if the risk of leakage had been mentioned to him, he would have refused to
consent to the operation. Marais JA observed that the court a quo drew attention to the fact that when the appellant's letter of demand was sent it made no mention of any failure by first respondent to inform appellant of the risk to the facial nerve and the availability of an alternative operation. The judge in the court a quo also considered it to be improbable that first respondent would have failed to inform appellant of these matters. Marais JA added that it was also somewhat improbable that the appellant would have been disinterested in such matters given the fact that he was a medical practitioner with some knowledge of the anatomy of the area in which the operation would be performed. He held that no good reason existed to differ from the trial judge's view that this cause of action was not made out and that the same applied to the alternative cause of action based upon an alleged negligent failure to inform appellant.

The negligent conduct during the operation was pleaded originally as consisting of, firstly, the severance of the facial nerve, and, secondly, the failure properly to close the operation site and the aditus (entrance) to the antrum (cavity). The latter allegation was not persisted in at the trial and no more need be said about it. During the trial appellant amended his pleadings to include an allegation that, if the facial nerve was not severed, it was negligently damaged in some other unspecified way. The trial judge concluded that the evidence did not establish on a balance of probabilities that the facial nerve was severed during the operation. Marais JA after considering the basis for the trial judge's conclusion held that there was no preponderance of probability that the facial nerve was severed during the operation. Counsel for the appellant contended that, whatever the precise cause of the palsy was, the onset of the palsy was so immediate and complete that it had to be inferred, as a matter of probability, that it could only have been caused by some unspecified negligent act on the part of the surgeon which caused damage so severe that the act must have been closely akin to severance in its traumatic impact. In considering this contention Marais JA noted that the evidence of Dr Hamersma was of pivotal importance in the appellant's case and that the trial judge's mainly unfavourable assessment of him as a witness was fully borne out by the evidence. He was found to be deserving of credit for his readiness to champion the cause of the appellant but lacking in objectivity because of his professional animosity towards the first respondent which predated the operation which the first respondent performed upon the appellant. Marais JA said
that a disturbing aspect of his evidence was the zeal with which he sought to persuade Dr Fisch to include in his report an unequivocal statement to the effect that the cochlear nerve had not been cut despite the fact that the factual foundation for such a statement was slender. His motive for doing so was to enable it to be argued that the facial nerve had been mistaken by first respondent for the cochlear nerve and mistakenly severed. A perusal of his evidence, said Marais JA, showed him to be a forceful and at times excitable personality who was intent upon dredging up anything he could think of which might reflect adversely upon the first respondent’s performance of the operation, his conduct after the operation, and his credibility. Anything which appeared to militate against his own thesis of severance of the facial nerve or damage so serious as to be akin to severance was dogmatically derided as being of no consequence. Marais JA concluded that while Dr Hamersma was a very knowledgeable and experienced surgeon and there was much in his evidence which made good sense and accorded with the evidence of other medical witnesses and medical literature, there were too many manifestations of a lack of objectivity to enable one to repose any real confidence in him as a witness. His dogged persistence in advancing the contention that first respondent had negligently severed the facial nerve during the operation, knew that he had done so, yet failed to lift a finger to make amends, was, in the face of the countervailing indicia and the inherent improbability of such behaviour, illustrative of unjustifiable obstinacy and cast a pall of doubt over the value of his evidence on other contested issues. Marais JA noted that counsel for the appellant had frankly conceded that, if the finding that it had not been proved that an immediate and total left facial palsy had set in after the operation could not be successfully assailed, he would find it very difficult, if not impossible, to convince the court that it was more probable than not that first respondent must have been negligent in some or other respect in performing the operation. Marais JA said that this concession was correctly made and that even if the immediate onset of a total facial palsy had been proved, it would have been questionable whether the inference that first respondent had negligently seriously traumatised the facial nerve during the carrying out of the operation would have been justified. Marais JA stated that in cases of this kind, when a patient has suffered greatly because of something that has occurred during an operation a court must guard against its understandable sympathy for the blameless patient tempting it to infer negligence more readily than the evidence objectively justifies, and more readily than it would have done in a case not
involving personal injury. He said that any such approach to the matter would be subversive of the undoubted incidence of the onus of proof of negligence in South African law in an action such as this. The judge observed that when reviewing the total picture emerging from the evidence, counsel for appellant sought to invest with some significance what the trial Judge found to be untrue denials by the first respondent of what at first blush might seem to be compromising statements made by him after the operation (the reference to medical malpractice litigation in the United States of America and the long wait for recovery of facial function which would be appellant’s lot). It was argued that, when read with the difficulty which the appellant said he experienced in getting to see or elicit any response from first respondent after his discharge from hospital, it was indicative of a guilty conscience and a realisation that the operation had not been performed with the necessary care. Some significance was also sought to be attached to the finding that first respondent’s description of the appearance of appellant’s face soon after the operation was unjustifiably euphemistic. Marais JA further observed that the trial Judge weighed these contentions and discounted the probative value of the findings on which they were based. He pointed out that the remark about lawyers and the United States of America was equally consistent with a genuine sense of confidence that at worst a transient facial palsy which would soon resolve itself was present. The overheard remark, made on a later occasion, that it would take longer to recover than appellant had initially been led to believe, when objectively regarded, is not indicative of any sense of personal guilt. The difficulties experienced by appellant in making contact with first respondent were not regarded as sinister. The evidence on that issue was rightly held to be inconclusive. The euphemistic description by first respondent of appellant’s face was not attributed by the trial Judge to a wilful perversion of the truth; instead he attributed it to reconstruction based upon available but incomplete hospital records and assumptions about what would have been done. He pointed to the inherent improbability of first respondent having known all along that he had severely damaged the facial nerve but having refrained from informing appellant and, more importantly, from having taken any remedial operative action. Recriminations and unpleasant repercussions would be inevitable. Although he did not explicitly say so, Marais JA said he thought that it was implicit in the trial Judge’s judgment that, whatever reason first respondent may have had for denying making the remarks which he did, the inference that it was because he had a guilty conscience was not justified.
It was argued that the learned trial Judge’s assessment of first respondent’s credibility was unduly charitable and that reconstruction and inadequate hospital records could not explain his excessively euphemistic description of appellant’s facial appearance soon after the operation. Nor, so it was submitted, could a subconscious repression of any recollection of the statements which he made after the operation satisfactorily account for his denial that he made them. Marais JA said whilst this may be so he did not think that it contributed greatly to the resolution of the question of whether first respondent was indeed negligent in his performance of the operation. Marais JA found that he was unable to say that the trial Judge was wrong in his overall assessment of this aspect of the case.

Marais JA stated that the post-operative negligence alleged could be disposed of shortly. An allegation that the appellant was prematurely discharged from hospital on the fifth day after the operation ‘in a debilitated and ill condition’ was said by the appellant himself to be incorrect. An alleged negligent failure to institute any or proper treatment for a ‘dry eye’ condition which often accompanies facial palsy had to be jettisoned when it became quite obvious from contemporaneous hospital records, the authenticity of which was undisputed, that appellant’s evidence in support of that allegation was quite wrong. An allegation that there was a negligent failure to close the cerebrospinal fluid leak was simply not shown by the evidence. It stopped of its own accord as both the first respondent and Dr Davidge-Pitts had predicted it would. An allegedly negligent failure to properly monitor the appellant’s condition by regular check-ups or examinations was not established. As the trial Judge correctly observed, the preponderance of evidence was that it was expected of a public hospital patient to report back after his discharge. A report back date had been mentioned upon appellant’s first discharge. It was anticipated by his second re-admission to hospital when the cerebrospinal leak worsened. Upon appellant’s second discharge there was nothing to be done except to wait. Indeed, said Marais J, despite the appellant’s later resort to other medical practitioners for advice (including Drs Le Roux and Hamersma), no immediate surgical intervention was advised and they too advised appellant to wait and see what developed. By the time surgical intervention was recommended, the appellant had long since ceased to look to the first respondent for treatment and advice. An allegedly negligent failure to inform appellant that he had severed the facial nerve and to determine the site of the damage to the nerve and
repair it was not proved because a severance of the facial nerve during the operation was not proved. The appeal was dismissed with costs.

**Discussion**

It is submitted that this case serves to illustrate the point that not all adverse outcomes following a medical intervention attract liability. It also could be cited in evidence of the lack of truth behind the idea of a conspiracy of silence between health professionals since the expert witness for the plaintiff seemed so determined to expose the defendant’s lack of professional skill that he even went almost so far as to try to construct evidence to this effect himself. Fortunately the court was not deceived on this score. The question of expert medical evidence and how the courts approach it is covered in some detail in the discussion of *Michael v Linksfield Park Clinic infra*. In *Broude* the question was primarily around causation although of course negligence was also alleged but not proven. There was no evidence that the facial nerve of the plaintiff had been severed in the operation neither was there sufficient evidence of negligence on the part of the defendant. It would seem that the overly emotional and vindictive responses of the expert witness for the plaintiff did not assist the latter’s case because the court acknowledged the pivotal importance of this expert witness but also recognised his lack of neutrality.

**9.2.15 Mukheiber v Raath**

**Facts**

Mr and Mrs Raath were married out of community of property and both were estate agents. Mrs Raath had given birth to four children: a son, Zane, who was born in 1986 and who died when he was five years old; a son, Timothy, born in 1988; a daughter, Taryn, born in 1993; and a son, Jonathan, born in 1994. The birth of Jonathan gave rise to the claim. Dr Mukheiber was a gynaecologist who had been practising as such for more than 30 years. A doctor-patient relationship existed between him and Mrs

---

Raath from before Timothy’s birth, attended to by Dr Mukheiber and done by way of caesarian section in 1988. In 1992 Mrs Raath became pregnant with Taryn. Dr Mukheiber once again was chosen by the prospective parents to attend to the pre-natal treatment of Mrs Raath. She visited him a number of times in the ordinary course of her confinement. On 28 January 1993 Mrs Raath again visited Dr Mukheiber on a routine ante-natal gynaecological visit. During the course of that visit it was decided that she would give birth to the child she was then carrying by elective caesarian section on 8 February 1993, which was to be done by Dr Mukheiber. During the course of the same consultation, she informed him that she did not wish to fall pregnant again and the question of sterilisation was raised. Dr Mukheiber informed her that he required her to discuss the matter with her husband and to tell him at their next consultation what they had decided. Mr and Mrs Raath had previously discussed the prospect of her sterilisation but not in depth. They did not, on the evening of 28 January 1993, discuss the issue of sterilisation. However, during the early hours of 29 January 1993 Mrs Raath went into spontaneous labour and, at approximately 6.30 am, Dr Mukheiber delivered her of a healthy daughter (Taryn) by emergency caesarian section. The following day Dr Mukheiber visited Mrs Raath in hospital and on Monday, 1 February 1993, she was discharged from hospital. At no stage was it agreed that Dr Mukheiber would perform a sterilisation procedure. The prescribed forms required by the hospital where Mrs Raath gave birth to Taryn that permit a doctor to perform a sterilisation had not been completed. The pathological examination which Dr Mukheiber always insisted upon after he had done a tubal ligation had not been requested or done. He had, in fact, not performed a sterilisation on Mrs Raath and his patient’s card and records did not reflect such an operation at all, although meticulously correct in all other respects.

The cause of action arose on 4 February 1993, when Mrs Raath, accompanied by her husband, visited Dr Mukheiber’s consulting rooms and surgery at approximately 13:00 to have the sutures, inserted during the caesarian section, removed. The plaintiffs’ version was that, having removed the sutures, Dr Mukheiber called Mr Raath, who was in the waiting room, into the surgery to show to him how neatly the operation had been done. According to them, Dr Mukheiber then told them that he had performed a sterilisation on Mrs Raath, that she was now a ‘sports model’, and that they did not need to worry about contraception. Dr Mukheiber disputes this.
version. He cannot remember having removed Mrs Raath’s sutures, but concedes that he must have done so. However, he denies that he ever made the alleged misstatement. He said he did not think he had made a mistake [ie the alleged misrepresentation] for the following reasons: it was very soon after the caesarian section, six days, and he remembered the procedure very, very clearly. The second thing that was uppermost in his mind would have been the fact that when he phoned the Libertas Hospital [just before the emergency caesarian] he asked the sister to please inquire from Mrs Raath if she wanted to be sterilised. If she wanted to be sterilised she should get consent from her and her husband. And the third thing is that he would have had my clinical notes in front of him as well as a pathological report, and if he had seen a pathological report then he would have known that she had had a sterilisation. But if there was no pathological report he could not possibly see how he could have made that mistake.

During August 1993 Mrs Raath telephoned Dr Mukheiber and informed him that she was not feeling well and that her menstrual periods had stopped. She asked him whether it was possible to fall pregnant after a sterilisation, and that he replied that it was highly unlikely and that, in more than 30 years of practice, he had never had a sterilisation that had gone wrong because he cuts, ties and cauterises the Fallopian tubes. According to her he said that she was probably overworked and that it was more likely that her hormones had not yet settled down after the sterilisation. Dr Mukheiber admitted in evidence to a telephonic conversation with Mrs Raath in August 1993. According to him she asked him whether a person who had been sterilised could possibly fall pregnant, to which he replied that it was highly unlikely but that anything was possible. He denied that she accused him of doing a sterilisation on her and denied having told her that, in performing a sterilisation, he also cauterises the Fallopian tubes - that is not his practice. He also denied having told her that he had never had a failed sterilisation, because, in fact, he had had two such failures. He also denied telling her that it was likely that her hormones had not yet settled down, because a tubal ligation would not affect the hormonal balance at all. On 21 September 1993 Mrs Raath visited a general practitioner, Dr Andrea Steinberg, who diagnosed that she was 12 weeks pregnant. Mrs Raath testified that she was devastated and burst into tears, because they did not want to have more children. Dr Steinberg (who was not available to testify) telephoned Dr Mukheiber and the latter
then spoke to Mrs Raath over the telephone. According to her, he said that he was ‘... absolutely flabbergasted ...’ to learn that she was pregnant, because he cuts, ties and cauterises the tubes and that there must be some technical problem. He requested her to come and see him the following day in his surgery. Dr Mukheiber recalled the telephonic conversation with Dr Steinberg. He testified that it was put to him that he had sterilised Mrs Raath and that she was now three months pregnant. He testified that this was the first time that he had been accused of having performed a sterilisation on Mrs Raath. His evidence is that he said to Dr Steinberg that he did not have his clinical notes with him, but that he would check his notes the following morning, which he did. He also telephoned the records department of the Libertas Hospital and ascertained that only a caesarian section had been performed and no sterilisation.

Mrs Raath testified that she visited Dr Mukheiber the next day, ie 22 September 1993. Her evidence is that he called her into his surgery and told her that he had not done a sterilisation on her. She replied that he had told her that he had done a sterilisation, whereupon, in her words, he said:

“... he knows he told me, he was mistaken but he was too lazy to check his records at that time. He said that he felt morally responsible about what had happened, and asked me what I wanted him to do about it.”

After Mrs Raath, according to her evidence, explained to him that they had no medical aid assistance, Dr Mukheiber undertook not to charge her for the future antenatal care and caesarian section itself, but stated that she would have to pay the hospital fees. Dr Mukheiber recalled this consultation with Mrs Raath. He flatly denied that he told her that he had made the alleged misrepresentation or that he had made a mistake and had been too lazy to consult his notes. He admitted not having charged Mrs Raath for the consultation, but denied that it indicated guilt. According to him he did so for compassionate reasons. He conceded that it is possible that for compassionate reasons he also undertook to attend to the prenatal care and the delivery free of charge. Mrs Raath did not use Dr Mukheiber’s professional services
after this date. They commenced litigation shortly thereafter. The trial Court absolved the defendant, Dr Mukheiber, from the instance with costs.228

The Full Court of the Cape High Court reversed the trial Court’s judgment. Accepting that Mrs Raath bona fide believed that a sterilisation had been performed on her by Dr Mukheiber (which belief was never questioned during the trial), the Full Court found it inconceivable that such belief might have been due to some delusion or confusion of which no suggestion whatsoever was made during her cross-examination. The Court found it ‘highly improbable’ that anyone other than Dr Mukheiber, or any actual or imaginary incident or circumstance not suggested or referred to in evidence, might have conjured up the firm belief in her mind that she had been sterilised. The probabilities rather favour the inference that Dr Mukheiber must have sown the seed in the minds of the Raaths that they could discontinue contraceptive practices.

_Judgment_

Olivier JA observed in giving judgment that since the middle of the 1960s actions for ‘wrongful conception’ (an action for damages brought by the parents of a normal, healthy child born as a result of a failed sterilisation or abortion performed by a medical doctor), ‘wrongful birth’ (an action brought by the parents on similar grounds but where the child is born handicapped) and ‘wrongful life’ (an action brought by a deformed child, who was born as a result of a negligent diagnosis or other act by a doctor) have troubled Courts in England, the USA, Canada and Germany. In South Africa it was for the first time given judicial attention in the High Court in _Edouard v Administrator, Natal_229 and by this Court in _Administrator, Natal v Edouard_230. The _Edouard_ case was a claim for ‘wrongful conception’ and was based on breach of contract.

---

228 Olivier JA noted that the crux of the decision was formulated as follows: “It follows from the aforesaid that I find myself in the unenviable position of not being able to decide the probabilities on either side. I cannot find that the general probabilities favour plaintiffs' case more than defendant’s, or vice versa. As far as the credibility of the witnesses is concerned, I cannot fault the evidence of either side to the extent that I would reject their evidence as being untrue. In the result, I am unable to find that plaintiffs have discharged the onus upon them of establishing that defendant made the alleged misrepresentation that he had sterilised first plaintiff.”

229 _Edouard_ 1989 (2) SA 368 (D)

230 _Administrator Natal v Edouard_ fn 197 supra
Olivier JA observed that the legal matrix in which the plaintiffs’ claim was to be placed and judged is that of negligent misrepresentation which cause pure economic loss, ie as opposed to physical injury to person or property, and not made in a contractual context. Such a claim, he noted, is recognised in South African law as one of the instances of the application of the extended *actio legis Aquiliae*231. He stated that the action is available to a plaintiff who can establish:

(i) that the defendant, or someone for whom the defendant is vicariously liable, made a misstatement (whether by commissio or omissio) to the plaintiff;

(ii) that in making the misstatement the person concerned acted unlawfully;

(iii) that such person acted negligently;

(iv) that the plaintiff suffered loss;

(v) that the said damage was caused by the misstatement; and

(vi) that the damages claimed represent proper compensation for such loss.

Olivier J noted that the court had in the past cautioned against the danger of limitless liability produced by the application of the extended Aquilian action. That danger, he said, is ever present, particularly where a medical practitioner runs the risk of having in effect to maintain the child of his patient without having any real control over the vicissitudes that attend the child’s upbringing. In order to keep the cause of action within reasonable bounds, each and every element of the delict should be properly tested and applied232. Olivier J noted that the danger of limitless liability in particular as far as negligent misrepresentation as a cause of action is concerned can be averted if careful consideration is given to the dictates of public policy, keeping in mind that public policy can easily become ‘an unruly horse’.

Olivier JA said that he was not inclined to reject the doubt or to reject the trial Court’s finding as to the credibility of the three dramatis personae. He agreed, however, that on the evidence the probabilities favoured the case of the Raaths and that that, on a balance of probabilities, it had been proved that Dr Mukheiber did make the alleged

---

231 This principle was first recognised in *Administrateur, Natal v Trust Bank van Afrika Bpk* 1979 (3) SA 824 (A) at p 831B-833C. The action was again affirmed in *Siman and Co (Pty) Ltd v Barclays National Bank Ltd* 1984 (2) SA 888 (A) at p 904D-G, again in *Lillietrop, Wassenaar and Partners v Pilkington Brothers (SA) (Pty) Ltd* 1985 (1) SA 475 (A) at p 498D-in *Bayer South Africa (Pty) Ltd v Frost* 1991 (4) SA 559 (A) at 568B-D.

232 This includes, according to Corbett CJ in *Bayer* [fn 193 supra] at 568D “... the duty of the Court (a) to decide whether on the particular facts of the case there rested on the defendant a legal duty not to make a misstatement to the plaintiff (or, to put it the other way, whether the making of the statement was in breach of this duty and, therefore, unlawful) and whether the defendant in the light of all the circumstances exercised reasonable care to ascertain the correctness of his statement; and (b) to give proper attention to the nature of the misstatement and the interpretation thereof, and to the question of causation".
representation. He pointed out that Mrs Raath was not sterilised by Dr Mukheiber when he performed the caesarian section on her on 29 January 1993. The representation by him that he had done so was therefore false. On the subject of unlawfulness, Olivier JA stated that there are different ways in which the unlawfulness of a misrepresentation can be approached. Common to all approaches is the fundamental principle that tortious liability is founded not upon the act performed by the defendant, but upon the consequences of that act. He noted further that common to all approaches is that unlawfulness, in the relevant sense, is to be found in the violation of the rights of the person suffering damage as a consequence of the act complained of, and that whether or not there was a violation of a right of the claimant (or the converse, a dereliction of a duty by the defendant) depends on a number of considerations, including in the final instance, public policy. Olivier JA observed that the South African legal position relating to the unlawfulness of a misrepresentation was admirably encapsulated by Corbett CJ in an article entitled ‘Aspects of the Role of Policy in the Evaluation of our Common Law’. Olivier JA stated that the question of whether there is a duty not to make a misrepresentation, depends on the circumstances of each case. He said that in the context of misrepresentation one must ask the question: was there in the particular circumstances an invasion of the rights of the claimant as a consequence of the misrepresentation? Conversely, was there a legal duty upon the defendant before making the

---

233 He quoted Viscount Simonds in Overseas Tankship (UK) Ltd v Morton Dock and Engineering Co Ltd [1961] 1 All ER 404 (PC) (Wagon Mound No 1) at 415A: “But there can be no liability until the damage has been done. It is not the act but the consequences on which tortious liability is founded. Just as (as it has been said) that there is no such thing as negligence in the air, so there is no such thing as liability in the air.” He also referred to Boberg (fn 86 supra) at 31.

234 Suid-Afrikaanse Uitsaakorporasie v O'Malley 1977 (3) SA 394 (A) at 403A; Schultz v Butts 1986 (3) SA 667 (A) at 679A-F; Regal v African Superlative (Pty) Ltd 1963 (1) SA 102 (A) at 121G-122F; Minister van Polisie v Ewels (fn 66 supra) at 596G-597H.

235 Corbett CJ (1987) 104 SALJ 52 at 59. He said it bears full quotation: “Thus the key to liability is the existence of a legal duty on the part of the defendant, that is the person making the statement, not to make a misstatement to the plaintiff, that is the person claiming to have been damnified by the statement. For without this legal duty there can be no unlawfulness. And unlawfulness is a sine qua non of Aquilian liability. The legal duty is, however, not an absolute one. It simply requires the defendant to take reasonable care to ensure the correctness of his statement before making it. This requirement of a legal duty, together with the nature of the misstatement and its interpretation, and the question of causation, enables the Court to keep within bounds the potentially unruly concept of liability for economic loss caused by a negligent misstatement. In deciding to give its imprimatur to this cause of action, the Appellate Division unquestionably took a policy decision of paramount importance in the law of delict. Moreover, as in the case of liability for an omission, the general test adopted for determining wrongfulness or unlawfulness poses the question whether in all the circumstances of the case there was a legal duty to act reasonably. The application of this test in each individual case, where there is no clear precedent, entails the making of a further policy decision, or value judgment. Here the law must keep in step with the attitudes of society and consider whether on the particular facts society would require the imposition of liability. Factors which would no doubt influence the Court in coming to a conclusion would be whether the extent of the potential loss incurred is finite and identifiable with a particular claimant or claimants; whether the misstatement relates to a field of knowledge in which the defendant possesses or professes skill; whether the misstatement was made in a business or professional context or merely casually or in a social context, whether the loss suffered was a reasonably foreseeable consequence of the misstatement; and so on.”

236 King v Dykes 1971 (3) SA 540 (RA) at 546A-E.
representation, to take reasonable steps to ensure that it was correct? He found that the following circumstances indicated that there was such a duty:

(i) The relationship between Mrs Raath (and her husband) and Dr Mukheiber and the nature of his duties towards them amounted to a special duty on his part to be careful and accurate in everything that he did and said pertaining to such relationship.

(ii) The representation was not only objectively material, carrying the real, objective risk of the conception and birth of an unwanted child; the representation was also subjectively material: the dangers of a false representation of the kind under discussion should have been obvious to the mind of a gynaecologist in the position of Dr Mukheiber.

(iii) It was plain that the misrepresentation induced the Raaths not to take contraceptive care.

(iv) It must have been obvious to a person in Dr Mukheiber’s position that the Raaths would place reliance on what he told them, that the correctness of the representation was of vital importance to them, and that if it were incorrect they could suffer serious damage.

(v) The representation related to technical matters concerning a surgical procedure about which the Raaths as lay people would necessarily be ignorant and Dr Mukheiber would, or should be, knowledgeable.

A failure on a doctor’s part to take reasonable steps to desist from making the sort of representations now under discussion unless and until he has taken all reasonable steps to ensure the accuracy of the representation would, said Olivier JA, render the misrepresentation unlawful.

He then turned to the question of negligence and noted that in South African law, the standard of conduct expected from all members of society is that of the bonus paterfamilias, ie the reasonable man or woman in the position of the defendant. An act which falls short of this standard and which causes damage unlawfully is described as negligent, ie it is tainted with culpa. Olivier JA stated that the test for culpa can, in the light of the development of the law since Kruger v Coetzee237 be stated as follows:

---

237 Kruger 1966 (2) SA 428 (A)
For the purposes of liability *culpa* arises if -

(a) a reasonable person in the position of the defendant -

(i) would have foreseen harm of the general kind that actually occurred;

(ii) would have foreseen the general kind of causal sequence by which that harm occurred;

(iii) would have taken steps to guard against it, and

(b) the defendant failed to take those steps.

He observed that in the case of an expert, such as a surgeon, the standard is higher than that of the ordinary layperson and the Court must consider the general level of skill and diligence possessed and exercised at the time by the members of the branch of the profession to which the practitioner belongs238. Dr Mukheiber did not dispute that, if it was found that he had made the representation under discussion, his action was negligent. Applying the tests set out above, it was clear, said Olivier JA, that Dr Mukheiber should reasonably have foreseen the possibility of his representation causing damage to the Raaths and should have taken reasonable steps to guard against such occurrence, and that he failed to take such steps.

On the subject of causation, Olivier JA made the following observations. As far as factual causation is concerned, the court follows the *conditio sine qua non* - or ‘but for’- test239. Once factual causation has been established, however, the question of limiting the defendant’s liability for the factual consequences of his or her conduct arises. It is here that views differ radically. There are two main schools of approach amongst South African academic writers and in the case law.

The ‘relative view’240 proposes that one should -

“... see both wrongfulness and culpability, not in abstracto, but as relative to the actual consequences in issue. The question is not whether the defendant’s conduct was wrongful and culpable, but whether the harm for which the plaintiff sues was caused wrongfully and culpably by the defendant. Wrongfulness is determined by applying the criterion of objective reasonableness *ex post facto* to the actual harm and the manner of its occurrence; culpability is satisfied only where the defendant intended or ought reasonably to have foreseen and guarded against harm of the kind that actually occurred. Having thus accorded the requirements of wrongfulness and fault an active role in the limitation of liability, those who adopt this approach have no need to postulate a further requirement that the plaintiff's damage be not ‘too remote’. Their finding that the defendant acted wrongfully and culpably in causing the harm actually complained of inherently also confines his liability within acceptable limits. And the policy considerations that must ultimately determine what limits of liability are

---

238 *Van Wyk v Lewis* (fn 3 supra) at 444.
239 *Minister of Police v Skosana* fn 215 supra at 34F-35G
240 *Boberg* (fn 20 supra) at p 381
acceptable receive due judicial recognition when the discretionary ‘objective reasonableness’ test of wrongfulness and the flexible ‘foreseeable kind of harm’ test of negligence are applied."

The other view

"... is that limitation is best achieved by postulating a further requirement for liability, namely that the plaintiff’s damage must not be ‘too remote’. Also called ‘legal causation’, remoteness may be determined in various ways. Some favour the ‘direct consequences’ test, some the ‘foreseeability’ test, some the ‘adequate cause’ test and some a composite solution. Common to all, however, is the premiss that culpability is an ‘abstract’ attribute of conduct unrelated to its actual consequences, and so having no function in limiting liability for those consequences, which is the province of ‘legal causation’. The traditionalists therefore approach the issue of remoteness already armed with a wrongful and negligent act that has in fact caused harm, and proceed to enquire whether the causal connection is sufficient - according to the test that each favours - to found legal liability."

In general, said Olivier JA, the courts have in the past on occasions followed the relative approach. Among others, Boberg241 has pleaded for a rejection of the second approach on the grounds that-

"the need to have recourse to remoteness is a self-imposed burden of those who refuse to see that negligence, being a failure to act as a reasonable man would have done in particular circumstances, cannot be divorced from those circumstances and therefore contains all the ingredients for the effective limitation of liability."

Nevertheless, he said, the court of appeal has applied the test of so-called legal causation in recent times on more than one occasion, and counsel for Dr Mukheiber had relied on these cases242 for his argument that the damages claimed by the Raaths, or part of it, are too remote and should either be refused in toto or limited. Olivier J stated that what appears from the ‘legal causation’ cases is that public policy plays a role, even a decisive role, in limiting liability. On the other hand, in the relative approach, public policy plays the very same role in establishing which consequences of an act are to be regarded as wrongful, thus creating and at the same time limiting liability. The two approaches differ in methodology and approach, but not in substance. If properly applied, they would generally give the same legal result in each case. What is clear in the present case is that the element of factual causation, the ‘but

241 Boberg The Law of Delict at p 382
242 The cases are Minister of Police v Skosana (fn 215 supra at p 34) (Corbett JA, majority judgment); International Shipping Co (Pty) Ltd v Bentley fn 215 supra at p 702 et seq (Corbett CJ); Smit v Abrahams fn 216 supra at p 14A et seq (Botha JA); Standard Chartered Bank of Canada v Nedperm Bank Ltd 1994 (4) SA 747 (A) at 764A et seq (Corbett CJ); Groenevald v Groenevald 1998 (2) SA 1106 (A) at P 1113C-J.
for test, is not in issue: but for Dr Mukheiber’s misrepresentation, the Raaths would have taken contraceptive measures, and the child, Jonathan, would probably not have been conceived and born. What remained in dispute is whether public policy excludes or limits the liability of Dr Mukheiber in the present case. The role and ambit of public policy in a claim by the father of a normal and healthy child conceived and born after an unsuccessful tubal ligation performed on his wife, the mother of the child, against the doctor was considered by this Court in *Edouard*. The action was based on breach of contract. Damages were claimed for (a) the cost of supporting and maintaining the child up to the age of 18 years and (b) for the discomfort, pain, suffering and loss of amenities of life suffered by the mother. This Court disallowed claim (b) on the basis that in our law general damages of the type claimed under this head are not recoverable in a breach of contract action. Claim (a) was upheld. In upholding claim (a), the court undertook an extensive review of overseas cases and legal literature dealing with claims for ‘wrongful conception’, ‘wrongful birth’ and ‘wrongful life’ in the context of public policy. Van Heerden JA, with whose judgment the other four Judges concurred, found (at 589F-G) that the majority of the objections against the said type of claims are based on no more than two basic themes pertaining to public policy, viz-

“(i) that the birth of a normal and healthy child cannot be treated as a wrong against his parents, and (ii) that as a matter of law the birth of such a child is such a blessed event that the benefits flowing from parenthood as a matter of law cancel or outweigh the financial burden brought about by the obligation to maintain the child. Thus it has been suggested in somewhat florid language that the birth of a healthy child is an occasion for the popping of champagne corks rather than for the preferring of a claim for damages.”

As far as objection (ii) is concerned, Van Heerden JA held that it is simply not the position in South African law that benefits of a non-pecuniary nature can be subtracted from patrimonial loss. Van Heerden JA dismissed objection (i) with equal decisiveness. But, asked Olivier JA, are the policy considerations underlying the decision of the court in *Edouard* also applicable to the present dispute? He stated there are differences which cannot simply be glossed over. The first and obvious is

---

243 Van Heerden JA said “… the ‘wrong’ consists not of the unwanted birth as such, but of the prior breach of contract (or delict) which led to the birth of the child and the consequent financial loss. Put somewhat differently, the Bundesgerichtshof has succinctly said that, although an unwanted birth cannot as such constitute a ‘legal loss’ (i.e. a loss recognised by law), the burden of the parents’ obligation to maintain the child is indeed a legal loss for which damages may be recovered.” Van Heerden JA quoted, with approval, dicta from the dissenting opinion of Clark J in *Cockrum v Baumgardner* 447 NE 2d 385 (1983) at 392-3; the dissenting opinion of Cadena J in *Terrell v Garcia* 496 SW 2d 124 (1973) at p 131 and the judgment in *Jones v Malinowski* 473 A 2d 429 (1984) at p 435.
that while *Edouard* dealt with contractual liability, the present case involved a delictual claim. In *Edouard*\(^2\) van Heerden JA, in dealing with the nature of the wrong complained of, indicated that the wrong consists of the prior breach of contract or delict which led to the birth of the child and the consequent financial loss. Olivier JA said he considered this approach of the law to be correct. There can be but one test for wrongfulness, based as it is ultimately on considerations of public policy, and whether the claim is brought in contract or delict. He noted that it is well recognised today that a contract between a patient and a doctor imposes on the latter a duty to exercise due care and skill; but even in the absence of a contract between them there is a duty of care on the doctor. The duty of care in either case seems inevitably to be measurable by the same yardstick and Olivier JA was of the view that the same policy considerations that underlie the *Edouard* judgment are applicable in the appeal under consideration. These considerations, he said, did not stand in the way of allowing the Raaths’s action.

Secondly, there is the question of the underlying motive of the mother (and the father) for not wanting a child to be conceived and born. After discussing the dicta of Thirion J in *Edouard*\(^2\), Olivier JA stated that he could see no reason for limiting claims such as those under discussion to requests made only by married couples (what of the spinster or widow who needs the operation for preventative medical reasons?) or where the husband has given his consent (is a woman not in control of her own body?) or where the request is made for socio-economic reasons only (which may be the worst reason: what if it is requested for reasons of health - the father or mother is HIV positive - or there is a genetic defect in the family, etc?). In the present case the Raaths did not wish to have any more children for socio-economic and other family reasons. He found that these were socially acceptable reasons, and that it did not lie in

\(^2\) *Edouard* fn 197 supra at p 590F

\(^3\) In *Edouard* in the Court a quo (fn 229 supra), where the claim was of contractual nature, Thirion J at 3751 came to the conclusion that “...an agreement for a sterilisation operation to be performed on a married woman with her husband’s consent where the reason for the operation is the prevention of the birth of a child whom they would be unable to support, is valid”. In dealing with the arguments pro and contra the recognition of an action for damages based on breach of contract in respect of wrongful birth, Thirion J limited himself to claims of parents in a wrongful birth action for damages in respect of the expense which the parents will have to incur in connection with the maintenance of the child born, as a result of the breach of contract to perform the sterilisation operation “...and where the reason for their seeking sterilisation was the couple’s inability to maintain the child. Different considerations might well apply where the consideration influencing the decision to have the operation was not an economic one.” When the appeal in *Edouard* was adjudicated in the SCA, Van Heerden JA also concluded his remarks by stating that his finding (that the claim was admissible) was intended to pertain “... only to a case where, as here, a sterilisation procedure was performed for socio-economic reasons. As pointed out by Thirion J [in the court a quo] different considerations may apply where sterilisation was sought for some other reason”. 

1233
the mouth of Dr Mukheiber to say that he is not liable because the Raath’s reasons for not wanting a child were not legitimate or contra bonos mores.

Olivier JA pointed out that a third problem in the present type of case was the fear of imposing too heavy a burden on the doctor. In contract, the doctor can contract out of liability. While generally it is not impossible or contra bonos mores to contract out of delictual liability, it is difficult to see how it could realistically have been done in the present case. He held that the response to the fear expressed above must rather be that professional people must not act negligently. In casu, they should not make unsolicited misrepresentations. A fourth problem was: how far was Dr Mukheiber’s liability to go? As far as the confinement cost was concerned, there could be no defence: such costs were reasonably foreseeable and there was no reason to limit them. The problem arose, said Olivier JA, in connection with the maintenance claim. The cost of maintaining the child, Jonathan, was a direct consequence of the misrepresentation. It was foreseeable by a gynaecologist in Dr Mukheiber's position. In principle he was by virtue of considerations of public policy, not protected against such a claim, as pointed out above. But the claim cannot be unlimited. His liability could be no greater than that which rests on the parents to maintain the child according to their means and station in life, and lapses when the child is reasonably able to support itself.

In the result, he was of the view that considerations of public policy did not militate against holding Dr Mukheiber liable for compensating the Raaths for the damages claimed by them. The appeal was dismissed with costs.

Discussion

Roederer criticises the Supreme Court of Appeal’s characterization of this case as being one of ‘pure economic loss’. He points out that the actual harm entails an infringement of the right to choose, resulting in a combination of potential patrimonial and non-patrimonial harms and benefits. He states that one may say here that the harm

---

246 In this regard Olivier JA referred to Bruce Cleaver ‘Wrongful Birth’ - Dawning of a New Action’ (1991) 108 SALJ 47 at p 66.
has been mislabelled and the result of the mislabelling is that the courts could not fashion a remedy to repair the harm. Further, he says that they were at least precluded from thinking how a potential remedy could deter the future creation of the harm. He also questions whether or not the facts actually establish a negligent misrepresentation on the basis of the extent to and manner in which it is justifiable for a court on appeal to take a trial court’s findings of fact and reinterpret them, set them aside and further exclude facts from being entered into evidence. Roederer asserts that the full bench and the Supreme Court of Appeal did not develop the law by boldly fashioning a new rule or creating a new legal action and that while they did rule favourably on an extension of Aquilian liability to a new factual situation, the facts as found by the trier of facts do not fit the rule. He argues, nonetheless, that considerations of distributive justice mandated some form of relief in this case and notes that such considerations are not easily at home in the law of delict which is much more hospitable to notions of corrective justice. He says that Aquilian liability with its underlying logic of corrective justice does not allow easily for a remedy on the facts as found by the trial court. While there is a simple straightforward remedy for negligent misstatements or misrepresentations causing pure economic loss, there is no simple, uncomplicated remedy for negligent miscommunications or misunderstandings causing loss of the right to choose whether or not to conceive.

It has been stated that in Mukheiber v Raath the appeal court, through the mouth of Olivier JA, reopened the old debate on the limitation of liability in the law of delict. Potgieter notes that over the last ten years or so, especially since the judgment of Van Heerden JA in S v Mokgethi a degree of consensus has developed that legal causation should serve as a measure of liability, Mukheiber, with reference to Boberg, once again revives the so-called relative approach as an alternative method to legal causation of limiting legal liability. He notes that according to the strict application of the relative approach, the question as to the boundaries of liability must be resolved during the investigation into unlawfulness and negligence and a separate investigation of legal causation is therefore unnecessary. He notes that this discussion is further

---

249 Mokgethi in 74 supra
developed in *Sea Harvest Corporation (Pty Ltd v Duncan Dock Cold Storage (Pty) Ltd*\textsuperscript{250}. He points out that in *Mokgethi*, the appeal court advocated that use of the so-called supple approach to the question of legal causation. According to this approach, the critical question is whether there is a sufficiently close connection between the acts of the doer and the consequence with respect to policy considerations on the grounds of reasonableness, fairness and justice. Potgieter notes that the traditional tests for legal causation such as the 'direct consequences', foreseeability and adequate cause tests can play a subsidiary role in the determination of legal causation in terms of the flexible approach. He points out that this approach has been followed and developed in numerous authoritative appellate division and high court decisions and, contrary to the impression given in *Mukheiber*, there is little doubt as to the content thereof. He says that according to *Mukheiber* there are in principle two approaches to the limitation of a tortfeasor's liability, namely the so-called relative approach according to which legal causation is unnecessarily taken into account because unlawfulness and negligence are established with reference to each head of damages, and legal causation which, as a separate element of a delict, determines the attribution of damages to a tortfeasor independently of unlawfulness and negligence. He notes that in both approaches, public policy plays, according to the court the exact same role – namely to limit liability (and, in the context of unlawfulness, to simultaneously create liability) – and will in general in any event yield the same result.

In order to ascertain whether the defendant in *Mukheiber* should be held responsible for the particular consequences, the court did not expressly select one of the two approaches but addressed itself directly to 'public policy' without indicating whether this was with regard to unlawfulness or legal causation. Potgieter complains that this had the result of blurring to some extent the distinction between unlawfulness, negligence and legal causation. On top of this, he says, legal causation as an independent element of the law of delict is shifted to the background because the court did not follow the comprehensive appellate division judgement on the subject but apparently relied solely on Boberg's outdated position that legal causation should be abandoned in favour of the relative approach. Nonetheless says Potgieter, it seems

\textsuperscript{250} *Sea Harvest* [2000] All SA 128 (SCA)
as though the court in the end took into account policy factors which fall within the
ambit of legal causation.

Potgieter comments that the decision of the appeal court in *Mukheiber* can put a
question mark on the value and importance of legal causation as an independent
element of a delict and can promote legal uncertainty. He says that this is already
partially evident in *Sea Harvest* where, with reference to *Mukheiber*, the majority of
the court through the judgment of Scott JA dealt with the question of the limitation of
liability by means of the relative approach to negligence while Streicher JA in a
minority judgment applied legal causation as it was developed in *Mokgethi*. He notes
that certain aspects of *Mukheiber* have attracted criticism elsewhere\(^{251}\) and briefly
repeats some of this criticism in order to provide accompanying commentary. He
states that firstly it seems as if the court erroneously found that negligence was
present before unlawfulness was established. The court postponed the final verdict as
to unlawfulness to the point where finality as to the role of certain policy
considerations was obtained, a question which the court only answered after the
question of negligence had been resolved. In actual fact, fault - the legal blame
attributed to the defendant – is only determined if it is certain that he acted unlawfully
– a position which judge Olivier himself stated on occasion expressly\(^{252}\) Potgieter
observes that any question there might have been that in *Mukheiber* that the appeal
court wrongly found that there was negligence before it was clear that unlawfulness
was present, was dispelled in *Sea Harvest*. There the court found unabashedly that
unlawfulness only arises once negligence has been established. Scott JA in giving the
majority judgment stated: “In the absence of negligence the issue of wrongfulness
does not arise.” Potgieter observes that it requires no argument that this viewpoint, in
the words of Olivier JA in *Administrateur Transvaal*, is based on a legal impossibility
and is therefore unacceptable.

Boberg’s position, as reflected in *Mukheiber* – that the relative approach that
unlawfulness and negligence are determined simultaneously with liability – is a

nalatigheid kan naamlik beantwoord word as presies vasstaan welke regsplig op 'n verweerder gerus het en dat daardie
regsplig verbreek is"
typical example, says Potgieter of the faulty use of particularly negligence instead of legal causation, as a means of limiting liability. It is clearly nonsensical to apply the reasonable foreseeability and avoidance test for negligence to the question of liability of the defendant for the wider consequences. He says that it is illogical after it has already been found that a person has acted negligently (because in the light of reasonably foreseeable consequences he should have acted differently) to ask again with reference to further consequences whether the person should have acted differently. It has already been decided that he should have acted differently. From this it follows, says Potgieter, that the test for negligence is not suited to determine liability for the wider consequences and that a purpose built, independent criterium is necessary to achieve this objective. That legal causation is concerned with a completely different question to fault is underlined by the need to apply legal causation to cases of strict liability where no fault is present. The apparent conclusion of the court in *Mukheiber* that both the defendant’s liability and the boundaries thereof can be determined purely by way of public policy without indicating which delictual element is under discussion is open to criticism because it causes confusion between amongst others unlawfulness and legal causation. Potgieter comments that certain policy considerations are more appropriate to certain delictual elements than others. He states that this can be illustrated particularly with reference to one policy consideration namely that the defendant’s liability should not be unbounded so that the fear of possibly unlimited liability can be avoided. Usually the judgment – apparently under the influence of the English duty of care approach – weighs the possibility of limitless liability against the question of whether there was a legal obligation on the defendant to avoid the relevant pure economic loss (or to supply the correct information in the case of a negligent misrepresentation), in other words, the question of unlawfulness. Potgieter observes that this method of approach is however questionable on solid grounds. According to van Aswegen it would be a better

253 He refers inter alia to Hart H and Honore AM *Causation in the Law* (1959) p 239-40 in which the authors state: “There is a logical absurdity in asking whether the risk of further harm, arising from a harmful situation which a reasonable man would not have created, would itself have deterred a reasonable man from acting.”

254 Van Aswegen A ‘Die Sameloop van Eise on Skadevergoeding uit Kontrakbreuk en Delik’ (LLD thesis, UNISA) (1991) p 177-8; ‘Policy considerations in the law of delict’ 1993 *THRHR* 192-3. Van Aswegen, as quoted by Potgieter, states: “Ten aansien van die bepaling van die regspig, dit wil sê onregmatigheid [by suiwier ekonomiese verlies] speel veral twee beleidsfakte: ‘n belangrike rol, naamlik die moomlikheid van oewerlose antwoordlikheid en die subjektiewe wete of kennis van die dader. Op die oog of tyd dit of die twee faktoe albei aanvaarbare beleidsfakte is wat by vernas van onregmatigheid ter sprake kan kom. Nietemin kom dit my voor of die feit dat te wye skade of skade van onbeperkte omvang deur bepaalde optrede veroorsaak word, nie sodanige optrede sonder meer regmatig behoort te maak nie. Ek twyfel of dit stroom met die gemeenskapsgeronde funksie van die privaatreg. Eén van die onwendelike konsekwensies van so’n houding is dat geen interdik verkry sou kon word teen dreigende veroorsaking van oewerlose suiwier ekonomiese verlies nie. Myns insiens sou ‘n beter oplossing wees om so ‘n oorweging by die juridiese kousaliteitsvraag in
solution to take such a consideration into account when looking at the question of legal causation by finding that there is an insufficiently close connection between the action and the ultimate result, namely unlimited liability. Then such loss causing behaviour would still be unlawful while the doer’s liability would be kept within reasonable bounds. Potgieter states that according to Boberg, adherents to the legal causation approach believe that legal causation takes over completely the limiting function and that negligence has no function in limiting liability. Potgieter points out that in the first place, recognition of legal causation as a delictual element is not inextricably bound to the purely abstract approach to negligence in accordance with which negligence is established solely by means of the question whether loss in general was foreseeable. Even where a more concrete approach to negligence is chosen above the abstract approach, legal causation in specific cases has a role to play. Secondly, he says, it is not correct to describe legal causation as the only means of limiting liability. The boundless liability which factual causation in itself would contribute is in a sense already bounded by the liability determining elements of a delict. In this way the liability of a person who causes loss factually but who does not act unlawfully, or who acts unlawfully but is not negligent is bounded by the absence of the elements of unlawfulness and fault. Legal causation comes expressly to the fore when it appears that a person’s actions with reference to at least certain consequences are unlawful and at fault but there are further consequences that arise and the question is whether he must be held responsible for those further consequences. Because the application of legal causation as a means of limiting liability is not necessarily based on the purely abstract approach to negligence, says Potgieter, it is more correct to refer to the two approaches as the relative (or concrete) approach and the legal causation approach. Put this way, it is not completely clear in Mukheiber to which of these two approaches the court leans. He notes that the court refers to both but then declares that these approaches in effect are the same and if correctly applied, yield the same results in view of the fact that public policy plays the same role in both. Oliver JA then proceeds to adjudicate liability purely on the basis of public policy without expressly indicating the delictual element to which it relates. As previously indicated, it looks as if the court is still busy with the question of unlawfulness. On the other hand, a person could say that the court nevertheless dealt with the question of liability

aanmerking te neem deur te bevind dat daar nie 'n nou genoeg verband tussen die handeling en die uiteindelike gevolg, naamlik onbegrende aanspreeklikheid, is nie. Dan sal sodanige skadeveroorstekende optrede steeds onregmatig wees, maar die dader se aanspreeklikheid sal binne redelike perke gehou word". 

1239
under the banner of legal causation because 'direct consequences' and foreseeability, which are typical legal causation considerations, were also taken into account. A third but unlikely possibility, says Potgieter, is that the court did not want to commit itself to either one of the two approaches but considered liability purely on the basis of public policy, irrespective of whether or not it could have been brought within one of the existing elements of delict.  

Midgley observes that the conduct and harm
only equitable, fair and just to hold one responsible for the consequences which one intended. However, in *Groenewald [supra]* the Court noted that a defendant would be at fault where there was intention to cause (some) harm, "even if he did not intend that the consequences of such conduct would be to cause the kind of harm actually suffered by the plaintiff or harm of that general nature." This statement appears to view the intention in the abstract, contrary to principle and, if accepted, would cause one to rethink whether or not it is true in all instances to say that intended consequences cannot be too remote. Take the following example: X punches Y on the chest, Y, who unbeknown to X has a weak heart, is highly traumatized by the incident and suffers a stroke. It is clear that X intended to cause Y harm but did not intend to cause the harm actually suffered, nor harm of that general nature, i.e., psychiatric injury. He did not intend the consequences that resulted so surely, in respect of the harm that resulted, there is no fault in the form of intention. If I am wrong in this view, then surely one's sense of fairness, equity and justice would lean in favour of no liability. In such a case intention cannot serve as a limiting criterion in the same way as it did in the past.

When it comes to the relationship between wrongfulness and fault, Midgley points out that *Sea Harvest* made it clear that wrongfulness is distinct from the fault element; in *Cape Town Municipality v Bakkerud 2000 (3) SA 1049 (SCA)*, the court following *Administrateur, Transvaal v van der Merwe 1994 (4) SA 347 (A)* 364G-H said that wrongfulness is the anterior question, with fault becoming relevant only after a situation is identified in which the law of delict requires action. In *Sea Harvest* and in *Mkhatswa v Minister of Defence 2000 (1) SA 1004 (SCA)* the opposite view was taken — that in the absence of negligence, wrongfulness does not arise. The view expressed in *Mukheiber* however, says Midgley, is that conduct which falls short of the standard set by the reasonable person and which causes harm unlawfully is negligent. Midgley states that at the heart of this conundrum lies a sense that one can be at fault only if one's conduct is unlawful: lawful behaviour cannot be termed 'negligent'. When courts look at the fault criterion, the element of wrongfulness has already been found to exist or is inherent in the type of conduct in question or has been presumed for the purposes of the negligence enquiry. However, in *Bakkerud*, the court said that a reasonable person should not be found to bear responsibility and a proportionate sense of ethical moral responsibility according to such a sense. One wonders, says Midgley if this statement is correct. Surely a reasonable person knows what is right or wrong and acts accordingly? Knowledge of the lawful nature of the conduct is implicit in a reasonable person's behaviour; and a reasonable person will not act unlawfully. Nonetheless, wrongfulness and negligence are separate enquiries and it appears that the comment was made in an attempt to show that the reasonable person test is inappropriate for determining wrongfulness, in the same way as public policy plays no role in determining whether harm was foreseeable.

This is a different way of saying that wrongfulness considerations are inappropriate for determining negligence. In *Mukheiber*, Midgley notes that despite the apparently clear demarcation of boundaries between the wrongfulness and legal causation elements, these concepts and their roles have now become fuzzy. The reason he gives for this state of affairs is that legal causation is being used more often than determining whether or not a factual causation connection is also legally relevant. To call it an inquiry into remoteness might soon be a misnomer for it has become a vehicle for deciding issues which traditionally fall within the domain of wrongfulness. While the direct consequences and foreseeability test focus clearly on the causal link between the conduct and the harm, the flexible criterion emphasizing reasonableness, fairness and justice which has not supplanted them, extends beyond mere matters of causation. He notes that in *Mukheiber* the court apparently as part of an inquiry into legal causation, noted that the contractual and delictual duty of care should be measured by the same yardstick, which is very different form considering remoteness of harm.

Midgley states that at the heart of this conundrum lies a sense that one can be at fault only if one's conduct is unlawful: lawful behaviour cannot be termed 'negligent'. When courts look at the fault criterion, the element of wrongfulness has already been found to exist or is inherent in the type of conduct in question or has been presumed for the purposes of the negligence enquiry. However, in *Bakkerud*, the court said that a reasonable person should not be found to bear responsibility and a proportionate sense of ethical moral responsibility according to such a sense. One wonders, says Midgley if this statement is correct. Surely a reasonable person knows what is right or wrong and acts accordingly? Knowledge of the lawful nature of the conduct is implicit in a reasonable person's behaviour; and a reasonable person will not act unlawfully. Nonetheless, wrongfulness and negligence are separate enquiries and it appears that the comment was made in an attempt to show that the reasonable person test is inappropriate for determining wrongfulness, in the same way as public policy plays no role in determining whether harm was foreseeable.

This is a different way of saying that wrongfulness considerations are inappropriate for determining negligence. In *Mukheiber*, Midgley notes that despite the apparently clear demarcation of boundaries between the wrongfulness and legal causation elements, these concepts and their roles have now become fuzzy. The reason he gives for this state of affairs is that legal causation is being used more often than determining whether or not a factual causation connection is also legally relevant. To call it an inquiry into remoteness might soon be a misnomer for it has become a vehicle for deciding issues which traditionally fall within the domain of wrongfulness. While the direct consequences and foreseeability test focus clearly on the causal link between the conduct and the harm, the flexible criterion emphasizing reasonableness, fairness and justice which has not supplanted them, extends beyond mere matters of causation. He notes that in *Mukheiber* the court apparently as part of an inquiry into legal causation, noted that the contractual and delictual duty of care should be measured by the same yardstick, which is very different form considering remoteness of harm.

Although the court did enquire into the wrongfulness, it too, considered policy factors normally found in that inquiry — socially acceptable reasons for the operation; no indeterminate liability — as part of legal causation, together with the fact that the result was a direct consequence of the representation and foreseeable. He remarks that the court also used a phrase normally found in the wrongfulness enquiry: that there were no considerations of public policy which militate against liability. It seems, says Midgley, as if the wrongfulness element is no longer intended to play as important a role in judicial decision making as it did previously. In instances of positive physical conduct causing physical injury, including psychiatric injury, wrongfulness is presumed. The element serves as a means of fixing liability, with the focus shifting to fault and causation for determining the extent to which liability should be limited. In instances of wrongfulness involving statements and omissions, the wrongfulness element serves to determine whether or not the circumstances of the case dictated the existence of a legal duty to speak carefully or to act positively. Such decisions would involve policy considerations, like determining the legal convictions of the community in omission cases, which in turn involve the exercise of a judicial value judgment. The application of such policy focuses on the existence of legal duty, not on limiting liability. The latter aspect, which appeared to be integral to the wrongfulness inquiry a few years ago seems now to find its home in the legal causation inquiry and would include determining whether considerations of policy would militate against liability and would thus deny a claim or a remedy. Midgley says that the shift in focus in principle to using wrongfulness as part of legal causation to limit liability on the grounds of policy. But care should be taken to delineate the scope of each inquiry. Wrongfulness should focus on the extent of the duty or whether a right out
elements have not been affected by series of recent decisions involving the law of delict and neither was the concept of factual causation. He notes with regard to the latter that the sine qua non test prevails but it has long been accepted that common sense standards will be used where the but-for test is inadequate — and logic might even be discarded in some instances. Midgley observes that while the test in Kruger v Coetzee\(^{257}\) is open to an abstract interpretation such as that applied by the court in Groenewald v Groenewald in terms of which one could be at fault even if a reasonable person would not have foreseen the causal sequence between the conduct and the harm, or the general nature of the harm which resulted, courts have tended to use a more focused approach, requiring that the general nature of the harm and the general manner in which it occurs must have been reasonably foreseeable. He says that the Mukheiber formulation reflects this development and in his view, is entirely accurate. Midgley states that it is a pity that the court backtracked from this approach in subsequent cases. He comments that the accumulative effect of the cases he discusses is that the test for negligence is now in some disarray. A similar uncertainty has been created regarding the wrongfulness and legal causation elements. It seems, he says, that the court is curtailing the once prominent use of the wrongfulness criterion to determine policy issues, hence the concomitant expansion of the legal causation element. Midgley highlights a further trend. In Barnard v Santam Bpk\(^{258}\) the court found no need to set out general principles of liability and focused on the special features of the facts before it, yet in deciding the matter it resorted to established principles. The court in Mukheiber, he points out, also followed a principled approach, as did Streicher JA in Sea Harvest. On the other hand the majority in the latter case opted for flexibility, preferring the view that the courts should not rigidly adhere to formulae when resolving issues before them, a view supported in Mkhatshwa v Minister of Defence\(^{259}\). He notes that Bakkerud completed the thought processes when it confirmed that when assessing wrongfulness the legal convictions of the community test is merely a means of reaching particular ad hoc value judgments. Midgley states that one can discern a clear view from these cases that the court does

\footnotesize{\textit{to exist in the circumstances, while legal causation should be used to determine the quality of the causal link or the remoteness of the harm. In his view, issues of indeterminate liability and multiplicity of actions belong to the former enquiry not the latter.}}

\footnotetext[255]{Midgley JR fn 255 supra}

not consider itself bound by established principles of law drawn from previous
decisions. That collective wisdom might be useful and might direct the decision-
making process to some extent; but the court will not allow principles to interfere with
or to constrain what it believes to be just outcome for a particular case.

Midgley observes that some light on the trend to emphasize flexibility,
reasonableness, fairness, justice and to focus on value judgments and policy decisions
based on the facts of the case before the court is shed in recent article written by
Nienaber JA\textsuperscript{260}. Having canvassed opinions of a number of Supreme Court of Appeal
judges, Nienaber JA compares the roles of judges and legal scholars in South African
society and highlights their different approaches to issues of law. He notes that a
judge’s principle task is to resolve the dispute, not to synthesize the law and a judge’s
legal intuition as to the correct norm to be applied, based on an understanding of the
facts, plays a decisive role in the decision-making process. A judge’s legal conviction
is geared towards the norm, which ought to produce the desired result, but is not a
substitute for the appropriate legal rule. Yet, where judges collectively believe that a
dispute should be resolved in a particular way, situations may arise where the only
way in which to achieve that result is to amend the existing rule or to render it more
flexible. According to Midgley, what appears to be happening in the cases under
discussion is the finalization of a framework in terms of which Nienaber J’s candid
explanation of the judicial decision-making process can take effect. In all instances, a
just resolution of the dispute between the parties is paramount and although principles
of law are still relevant in reaching this objective, no single principle is to be regarded
as a holy cow\textsuperscript{261}. Flexibility is the keyword and the facts of a case will determine
which method of reasoning suits the circumstance.

In his concluding remarks, Midgley states that while the cases have not jettisoned any
of the established principles of liability, gone are the days when one could confidently
assert that every element must be used to determine liability in particular cases. He
notes that in Mukheiber it was said that every element must be used to determine

\textsuperscript{260} Nienaber PM 'Regters en Juriste' (2000) 1 7SAR 190
\textsuperscript{261} This sentiment is not new although it is fascinating to see it making a conscious comeback if Nienaber’s research is
correct and there is a calculated movement within the judiciary in this direction. A little over two thousand years ago a
remarkable teacher once admonished the priest/lawyers of his time that: “The Sabbath was made for man; and not man
for the Sabbath” (St Mark chapter 2 verse 27 The Bible (King James Version))
liability but the court was quite happy not to do so in Barnard. He says that the cases indicate that a value judgement as to what is fair and reasonable in the circumstances, based on a judicial assessment of current social policy has not become the overriding factor. He points out that it has always permeated the traditional elements of liability, particularly the wrongfulness and causation elements, but now we see all the standard criteria for liability being reformulated to place public policy - the notorious unruly horse – at the forefront. Midgley observes that judge Nienaber has also pointed out that a scholar’s concern is the ordering and systematisation of law, that concepts and systems take precedence and the resolution of a factual dispute is often of less importance than the impact of a judgment on the legal system as a whole. To a judge, says Nienaber, this is also important but of secondary concern. Midgley says that although he does not wish to render the need for justice subservient to principles and concepts, and that the judgments under discussion correctly point out that principles are to serve as guides for achieving just results the principles remain important. They constitute a collective sense of what is just – the boni mores of society- and provide clarity, certainty and also flexibility to accommodate new situations. But as important: principles form the platform for organized thinking and guard against erratic decisions, fuzzy logic and intellectual laziness as well as any temptation for judges, consciously or subconsciously to follow a line of least resistance. They also, he says, provide certainty and allow society to regulate its affairs according to known legal standards. There will always be hard cases and it is to be accepted that conclusions may differ on occasions but such different conclusions, based on accepted principles instead of a judge’s inherent feel for a case, will not necessarily render a decision unjust inter partes or otherwise. Midgley says he is also somewhat concerned about the role of the Supreme Court of Appeal in establishing norms and standards and in providing guidance. Society cannot afford to litigate every dispute to obtain an ad hoc decision on the facts and the practice of law should not become a lottery in which lawyers try to second guess a judge’s judicial intuition. He states that society and lawyers in particular look to the Supreme Court of Appeal for intellectual leadership and to provide well-reasoned judgments setting out the law which can serve as leading cases for determining future disputes. Midgley concedes that some of the judgments under discussion do just that but there are also some concerns. He asks whether one should be content for example, with the statement in Groenewald that once can have intention if one intends some harm, even if one subjectively did not
foresee the actual consequences? Or when assessing negligence, with the clear contradiction in *Groenewald* on the one hand and *Mukheiber* and *Sea Harvest* on the other, as to whether or not a reasonable person would foresee the nature and cause of the harm? Does a reasonable person obey the law? Should we accept that it does not matter that the Supreme Court of Appeal gives mixed messages concerning which of the wrongfulness or negligence inquiries comes first, because that will be dependent upon the facts of the case? Or that the facts determine whether multiplicity of actions is a wrongfulness issue or one of causation? Or, he asks, should a judge be able to change conventional judicial wisdom as encapsulated in a principle, concept or formula, to suit the outcome which he or she desires? Should judges be able to disregard age-old principles, without any consideration of their rationale, on the basis that their ad hoc ‘gut-feel’ regarding the outcome of a particular dispute does not conform with established principle? Midgley observes that while such flexibility might give judges greater freedom to resolve disputes there is also greater scope for error, for which there is little accountability. The fact remains, he says, as judge Nienaber recognizes that facts and legal principles are in the public domain, open to scrutiny but a judge’s intuition remains un-articulated. Yet value judgments based on such intuition would never be wrong – for only the judge in the first instance can truly be said to have a full sense of the ‘atmosphere’ of the dispute. The value judgement could become a convenient disguise and there is a real danger that judges might become a law unto themselves. A judge’s intuition, says Midgley, ought not to be the supreme law.

At the outset it must be stated that the writer is in total agreement with and echoes the concerns of Midgley as stated in the foregoing pages. It is respectfully submitted that in a flexible system such as the one apparently desired by the judiciary and which, according to Nienaber, it is currently working towards, a far greater degree of legal learning and analytical skill would be required of a judge than is the case under the present (should one say previous?) system of legal principle. Furthermore, although a system such as that postulated by judge Nienaber as being the nirvana of a number of members of the judiciary is in the mind of the writer technically, logically and legally conceivable\(^{262}\) (without necessarily reducing litigation to the level of a lottery) it may

\(^{262}\) *An attempt is made at an outline of such a system in the pages that follow.*
also require a capacity on the part of legal academics and the judiciary not only to analyse but also to synthesize to a greater degree legal concepts and principles. In short it would be a far more complex system than the one that is still largely in place. Obviously this is not an insuperable obstacle but in order to be successful in the long term such a system might well require an overhaul of the legal educational system not to mention the judiciary. On the other hand in the short term it would be possible for such a system to accommodate the most narrow-minded and inflexible of judges who still insist on outdated and rigidly purist approaches to the application of law simply on the basis that such a system is sufficiently flexible to accommodate a wide variety of doctrinal approaches provided that there is sufficient legal precedent to accommodate the alternative views. It would be the role of the legal scholars to identify the larger patterns of order emerging from the chaos at the lower level of the courts. In order to effectively do so, however, the former would need a complete set of mental tools that included the ability both to analyse and synthesize law.

It is submitted that the processes of synthesis and analysis are simply two opposite ends of a spectrum of mental processes that can be equally employed for the positive and beneficial development of law but that there has been a marked tendency in the past to employ only one end of this spectrum – and more extreme end at that – notably analytical thought, in considering legal principles and procedures. This tendency is in keeping with larger globally predominating trends emphasising the value of, and promoting and encouraging, human analytical thought almost to the total exclusion, in some fields of knowledge and learning, of other kinds of mental processes. It is a particular characteristic of the western world and is associated with the left side of the brain.

The arguments of Potgieter and Midgley, when contrasted, nicely illustrate this point and this is why they have been cited such detail. It is only in the detail that one gets a proper feel for the differences in their views which is somewhat ironic because, it is submitted, it is at the wider, systemic level that they differ most fundamentally. From a systems point of view, Potgieter is working squarely within a particular, well-defined and fairly narrow system of thought in arguing that the legal analysis in *Mukheiber* is logically unsound, regressive and therefore regrettable. His complaint in a nutshell, is that it does not follow the long established and well-recognised (for a
period of some ten years) rules or principles that have been developed within the law of delict with the result that one ends up with the (in his view) logical anomaly that the court is putting the cart before the horse in finding a person negligent before the unlawfulness of his actions has been established. Potgieter’s analytical approach also reflects the manner in which doctoral theses in the legal field are written in South Africa, the manner in which their subject matter is chosen and the mode of much academic exegesis of the law in textbooks and legal journals 263. It is located firmly at the analytical end of the spectrum where each statement is reduced to its most elemental and unitary form and then subjected to microscopic scrutiny. If it does not fit with the predefined framework which is usually long accepted and well established, then points of difference are highlighted and more often than not, rejected by the analyst as being unsound. Potgieter’s approach allows for no deviation from the rules, the basic tools of the logical system with which he is dealing, or the manner of their application. Midgley, by contrast, is located much further along the spectrum of analysis-synthesis. Firstly, and significantly, he adopts a much broader view than does Potgieter. Apart from the fact that he considers in some detail six recent decisions by the Supreme Court of Appeal as to the two discussed by Potgieter, Midgley is prepared to entertain the possibility of systems within systems – in other words that the narrow system within which Potgieter operates in contained within a potentially wider, more comprehensive one that allows for legal development and evolution. For instance, when it comes to the detail, while Midgley does not disagree with Potgieter that when courts “look at the fault criterion, the element of wrongfulness has already been found to exist...”, unlike Potgieter he acknowledges the possibility that both the relative approach to the question of limitation of liability and the legal causation approach are valid in certain contexts and that the difference between them is not such that it is irreconcilable. From a systems point of view, Midgley deliberately considers the relationship of each element in the logical system that comprises a delict to that of each other element, albeit in a somewhat linear fashion. His focus is as much on the content of the rules, the conceptual tools used by lawyers and courts alike, to ascertain whether there is delictual liability and if so, the extent of it, as on their application. Midgley is open to the possibility that there may be different ways to skin a cat and that there are few man-made systems whether in

263 The frequency with which the Russian dolls of microcosm within macrocosm manifest when one starts to look through a wide-angle lens instead of a microscope is intriguing to say the least.
the abstract or physical worlds, that cannot stand improvement. By contrast, Potgieter’s focus, because it is too narrow to accept the possibility of the validity of different approaches, tends to be on the manner of the application of the rules, rather than the content and structure of the rules themselves and the complexities of their application which is why he comes up with a logical anomaly as a result. Although he does consider the relative approach, it is from a critical and unaccepting point of view. In his mind, its fate was decided before he put pen to paper. It has no valid existence in his ‘world view’ except as a means of demonstrating the correctness of his favoured approach to the limitation of liability - legal causation. A further example of this type of thinking, this time within the hallowed halls of academia in South Africa, is the unwillingness of some universities to recognise health law as a particular legal discipline or subject. The view is apparently that health law is no more than the sum of its parts, most notably the law of contract, delict, constitutional and administrative law, and that since these are already taught as subjects at these universities, a course in health law is unnecessary. This is a typically reductionist approach that maintains that the way to understand the whole is to understand its constituent parts. It is tantamount to saying that if one understands the atoms that go into the formation of a molecule of wood, one has everything necessary to comprehend the nature of a tree or a table. Midgley acknowledges that some of the elemental concepts in the law of delict have now become somewhat fuzzy and so is essentially not in disagreement with Potgieter on this particular point either. Midgley takes the view that ‘there is no objection in principle to using both wrongfulness and legal causation to limit liability on the grounds of public policy but that care should be taken to delineate the scope of each inquiry’ and he goes on to make some helpful suggestions as to how to do this.

In total contrast to Potgieter, Midgley’s approach recognizes the possibility of legal development, acknowledges the formulation of that legal development in *Mukheiber* and laments the fact that the court has backtracked from this approach in subsequent cases. Midgley does not move so far down the analysis-synthesis spectrum that he is comfortable with the apparent view of the court that it does not consider itself bound by established principles of law drawn from previous decisions. As stated earlier, he

264 At p 94–95 Midgley fn 255 supra states that: “In Groenewald the Court repeated established rules in respect of legal causation, but with regard to negligence, it interpreted the standard test in a manner different from previous interpretations. The Court held that one could be at fault even if a reasonable person would not have foreseen the causal sequence between the conduct and the harm, or the general nature of the harm which resulted. While the test in *Kruger v Coetsee* is open to such an ‘abstract’ interpretation, courts have tended to use a more focused approach, requiring that the manner in which it occurs must have been reasonably foreseeable. The *Mukheiber* formulation reflects this development and, in my view, is entirely accurate. It is a pity that the court backtracked from this approach in subsequent cases.”
voices a number of very valid and grave concerns about the results of judge Nienaber’s survey of the opinions of a number of Supreme Court of Appeal judges. Although there is scope in his ‘world view’ of the law for the concept that justice should not be subservient to principles and concepts he is extremely cautious about the manner in which the South African judiciary approaches this concept and the present writer respectfully concurs. There is the potential to plunge the legal system into chaos if this concept is not properly approached. It is with good reason that Midgley, at the start of his article states that the South African law of delict consists, not of a random, collection of miscellaneous, unrelated wrongs, but a set of principles, rules and concepts founded on historically-developed broad bases of liability, which provide elastic and adaptable principles for application in novel situations.  

The obvious question is whether the “gut feel” approach the judges seem to favour can in any way be accommodated alongside the more traditionally accepted tools of legal exegesis. Is there a logical system that would avoid the evils validly feared by Midgley whilst at the same time accommodating the need for judges to be able to primarily ‘resolve disputes’. It must, of course, be stated at the outset of this discussion that if anyone is likely to conceptualise these different elements of legal reasoning into a meaningful and internally consistent system, it will not be the judiciary. The writer begs the indulgence of those readers who are predominantly left-brained for the brief, somewhat metaphysical journey that follows.

It is submitted that, given the fact that judges will do what judges will do, it is up to legal scholars and academics to find other ways of systematizing the case-by-case approach. In the words of Baviaan - the dog-headed barking Baboon, who is ‘Quite the Wisest Animal in All South Africa’ in response to the question of Leopard as to where all the game had gone –

"The game has gone into other spots; and my advice to you… is to go into other spots as soon as you can."

265 In making the statement he refers to Van der Walt JC and Midgley JR, Delict, Principles and Cases vol 1 ‘Principles’ (1997) para 18 and Perlman v Zoutendyk 1934 CPD 151 at p 155 as sources.
It is submitted that the game for present purposes is not the Zebra, the Eland and the ‘Koodoo’ featured in this Rudyard Kipling story266 but rather the ‘game’ in the sense of a game that is played in accordance with a set of rules – in other words a system. What ‘other spots’ are available for legal scholars and academics to go to in order to get on top of the ‘game’?

At the outset it must be stated that the proposal that follows as a method of accommodating alternate but equally valid systems of legal principle is premised on the validity and continued application of the principle of stare decisis in South African law and is not intended in any way to mean that this principle should be ignored by the courts or undermined. The principle of stare decisis has been acknowledged by both the constitutional court267 and others268 as being of critical importance to the development of the South African legal system and it is fervently hoped that the judges of the Supreme Court of Appeal in their pursuit of flexibility are not so zealous that they forget the finding of one of their number in the recent case of

266 Kipling R, ‘How the Leopard Got His Spots’ Just So Stories 1902

267 Kriegler J in Ex Parte Minister Of Safety and Security And Others: In Re S v Walters and Another 2002 (4) SA 613 (CC): “The words are an abbreviation of a Latin maxim, stare decisis et non quieta movere, which means that one stands by decisions and does not disturb settled points. It is widely recognised in developed legal systems. 71 Haith and Kahn 72 describe this deference of the law for precedent as a manifestation of the general human tendency to have respect for experience. They explain why the doctrine of stare decisis is so important, saying: ‘In the legal system the calls of justice are paramount. The maintenance of the certainty of the law and of equality before it, the satisfaction of legitimate expectations, entail a general duty of Judges to follow the legal rulings in previous judicial decisions. The individual litigant would feel himself unjustly treated if a past ruling applicable to his case were not followed where the material facts were the same. This authority given to past judgments is called the doctrine of precedent. It enables the citizen, if necessary with the aid of practising lawyers, to plan his private and professional activities with some degree of assurance as to their legal effects; it prevents the dislocation of rights, particularly contractual and proprietary ones, created in the belief of an existing rule of law; it cuts down the prospect of litigation; it keeps the weaker Judge along right and rational paths, drastically limiting the play allowed to partiality, caprice or prejudice, thereby not only securing justice in the instance but also retaining public confidence in the judicial machine through like being dealt with alike .... Certainty, predictability, reliability, equality, uniformity, convenience: these are the principal advantages to be gained by a legal system from the principle of stare decisis.”

In Mistry v Interim Medical and Dental Council of South Africa and Others 1998 (4) SA 1127 (CC) the court stated that: “Whilst it may not be easy ‘to avoid the influence of one’s personal intellectual and moral preconceptions’, this Court has from its very inception stressed the fact that “the Constitution does not mean whatever we might wish it to mean”.

Cases fall to be decided on a principled basis. Each case that is decided adds to the body of South African constitutional law, and establishes principles relevant to the decision of cases which may arise in the future.” See also National Director of Public Prosecutions and Another v Mohamed NO and Others 2003 (4) SA 1 (CC); Van Der Walt v Metcash Trading Ltd 2002 (4) SA 317 (CC)

268 Shabalala v Attorney-General, Transvaal, and Another Gumede and Others v Attorney-General, Transvaal 1995 (1) SA 608 (T); Wagener v Pharmacare Ltd; Cuttings v Pharmacare Ltd 2003 (4) SA 285 (SCA). In Ngcusa And Others v Permanent Secretary, Department Of Welfare, Eastern Cape, And Another 2001 (2) SA 609 (E) Froneman J: “This principle lies at the heart of our system of legal precedent. Again, in MacCormick’s words, at 75 - 6: ‘that I must treat like cases alike implies that I must decide today’s case on grounds which I am willing to adopt for the decision of future similar cases, just as much as it implies that I must today have regard to my earlier decisions in past similar cases. . . What is more, I should argue that its forward-looking requirement is yet more stringent than its backward-looking, just because - as we saw - there can genuinely be a conflict between the formal justice of following the precedent and the perceived substantive justice of today’s case. That conflict cannot in the nature of the case arise when, unconstrained by an unambiguous statute or directly binding precedent, I decide today’s case in the knowledge that I must thereby commit myself to settling grounds for decision for today’s and future similar cases. There is no conflict today, though there will be in the future if today I articulate grounds of decision which turn out to embody some substantive injustice or to be on other grounds inexpedient or undesirable. That is certainly a strong reason for being careful about how I decide today’s case.”
Afrox Healthcare Bpk v Strydom\textsuperscript{269} that the opinion of the court \textit{a quo} that the principles of \textit{stare decisis} as a general rule did not apply to the application of s 39(2) of the Constitution was, as far as post-constitutional decisions were concerned, clearly incorrect. It is submitted that the South African legal system is quite capable of development to the most satisfactory levels and standards without the sacrifice of this critical and central concept.

The tension in the South African law of delict between the theory and practice of law, as highlighted by Midgley, is not a purely South African phenomenon. Frankel in a paper written in 2001\textsuperscript{270} notes in her introduction that

"Much has been written about theory and practice in the law, and the tension between practitioners and theorists. Judges do not cite theoretical articles often; they rarely ‘apply’ theories to particular cases."

She notes that “theory, practice, experience and “gut” help us think, remember, decide and create. They complement each other like the two sides of the same coin: distinct but separable”. Frankel observes that the dictionary definition of a theory includes words like “analysis”, “speculation”, “principle”, “belief”, “hypothesis”, and

\textsuperscript{269} Afrox Healthcare Bpk 2002 (6) SA 21 (SCA). Brandt JA observed that: “Is die Hooggeregshof in hierdie geval by magte om uitting te gee aan sy oortuigings of is hy steeds deur die beginsels van stare decisis gebonde om die gemenerg toe te pas soos pre-konstitusioneel deur hierdie Hof neergelê? Die antwoord is dat die beginsels van stare decisis steeds geld en dat die Hooggeregshof nie deur art 39(2) gemagtig word om van die beslissings van hierdie Hof, hetsy pre- hetsy post-konstitusioneel, af te wyk nie. Artikel 39(2) moet saam- geëens word met art 173 van die Grondwet. Kragtens laasgenoemde artikel word ekkenning verleen aan die inherente bevoegdheid van ‘n Hooggeregshof om - saam met die Konstitusionele Hof en hierdie Hof - die gemenerg te ontwikkel. Dit is by die uitoefening van hierdie inherente bevoegdheid wat die bepalings van art 39(2) ter sprake kom. Voor die Grondwet het die Hooggeregshof uiteraard ook, netsoos hierdie Hof, die inherente bevoegdheid gehad om die gemenerg te ontwikkel. Hierdie inherente bevoegdheid was egter onderworp aan die reeds wat in die leerstuk van stare decisis uitdrukking vind. Na my mening word hierdie reel nog uitdruklik nog by noodwendige implikasie deur die Grondwet verdring. Kortom, onderliggend aan die opdrag vervat in art 39(2), is die veronderstelling dat die betrokke Hof die bevogdheid het om die gemenerg te wysig. Of die betrokke Hof inderdaad daardie bevogdheid het, word onder meer deur die stare decisis-reel bepaal. Hierbenewens is die oorwegings wat die leerstuk van stare decisis ten grondslag lê steeds van toepassing, ook wat die pre-konstitusionele beslissing van hierdie Hof betref. Hierdie oorwegings blyk uit die volgende verklaring deur Hablo en Kahn \textit{The South African Legal System and Its Background} op 214, wat ook met instemming aangehaal word deur Kriegler R in para [57] van die Walters-saak: ‘The advantages of a principle of stare decisis are many. It enables the citizen, if necessary with the aid of practising lawyers, to plan his private and professional activities with some degree of assurance as to their legal effects; it prevents the dislocation of rights, particularly contractual and proprietary ones, created in the belief of an existing rule of law; it cuts down the prospect of litigation; it keeps the weaker Judge along right and rational paths, drastically limiting the play allowed to partiality, caprice or prejudice, thereby not only securing justice in the instance but also retaining public confidence in the judicial machine through like being dealt with alike... Certainty, predictability, reliability, equality, uniformity, convenience: these are the principal advantages to be gained by a legal system from the principle of stare decisis.’"
“assumption”. The thread that connects all of these words, she says, is critical thinking and generalization — a general view of parts of the world. The two components of theory are thinking in its various aspects and generalization — the recognition of observed or imagined patterns\(^\text{272}\) covering numerous related details. She notes that the dictionary definition of practice includes “exercise”, “custom”, “habit”, “repeat” and “perfect” and that the thread that connects all of these words is repetition whether of acting or thinking. Frankel observes that many of the words defining practice suggest acting on automatic pilot, so to speak, with no independent or critical thinking or attention. She sys that these words may denote acting or doing with little mindfulness or attention but that this is not, however, necessarily so. An artist practices the piano with great attention and concentration. The practice of the law and medicine in most cases is far from routine. Therefore, says Frankel, practice is not necessarily mindless, but it could be. She notes that practice produces experience, both for practitioners and for theorists. Experience is gained by repeated activities, including thinking. Practice is generally not mere repetition of identical actions, especially if the actions are complex, Each repeated action changes the actors and their product, adding to their experience, which refines their performance and enriches their memory.

\(^{272}\) R.C.L. ‘Law and Disorder: The New Science of Chaos’ observes that “the outer world can often seem as chaotic as our inner world — our stream of consciousness. Coherence can all too easily elude us... The fragmented, fractal nature of everyday reality, and people, is one of our basic problems. To use thinking to sort things out...we must first find the basic structure to reality. The structure reveals the order underneath the chaos.” The writer goes on to discuss the hidden order in the physical world that has relatively recently come to light in terms of chaos theory and the mathematics of fractals which involves the study of logical systems with no immediately apparent order but in which there is nevertheless a distinct and recognizable pattern when viewed macroscopically. There is a very clear and, it is submitted, apposite analogy between fractals, such as the famous Mandelbrot set, and the common law.

R.C.L. draws an analogy between the common law in effect in the US and in Britain, quotes Judge Aldisert as saying “The heart of the common law tradition is adjudication of specific cases” and states that for this reason, the common law is inherently flexible and changes with time and circumstance. The writer points to the statement of the American jurist Roscoe Pound that “Law must be stable, and yet it cannot stand still” stating that: “The common law flows from the facts of particular cases. From the cases come narrow rules of law, then slowly over time, broader principles of law are fashioned from the rules of many cases. In the often-quoted words of law professor, Munroe Smith in Jurisprudence (1909) “The rules and principles of case law have never been treated as final truths, but as working hypotheses, continually retasted in those great laboratories of the law, the courts of justice. Every case is an experiment: and if the accepted rule which seems applicable yields a result which is felt to be unjust, the rule is reconsidered. It may not be modified at once, for to attempt to do justice in every single case would make the development and maintenance of general rules impossible; but if a rule continues to work injustice, it will eventually be reformulated. The principles themselves are continually retasted; for if the rules derived from a principle do not work well, the principle itself must ultimately be re-examined.” Common law is not etched in stone. it is continually created anew. In fact, above the entrance to Yale Law School is the engraving: “The law is a living growth, not a changeless code”. The particular hornbook laws may vary and be modified as facts mold the law, demand exceptions or even the creation of new laws. The “Law” is a subtle, flexible thing which defies certainty and absolute predictions. AS the great jurist Cardoza put it in his essay, Growth of the Law (1924), ‘When uniformities are sufficiently constant to be the subject of prediction with reasonable certainty, we say that law exists’. Cardoza recognised that certainty of prediction was never absolute, that in any one case, the rule of law could err. For Cardoza, as for today’s modern physicist, Law is a matter of probabilities, not certainties.”

http://www.lawofwisdom.com/LawofWisdom/chapter6.html
It is submitted that what Frankel is saying in effect is that in real life, in chaotic systems, the patterns of thought that frame the concepts and conceptual elements of the system are iterative in the same way that fractals are iterative – that although the patterns of thought, for the purposes of the present discussion these would be represented by the legal rules and principles of the law of delict, are similarly or consistently applied, each iteration brings new perspectives and new insights into the pattern as a whole in ways that are not necessarily obvious. In fractals there is a vast difference between iteration and bland repetition. The blandly repetitive approach does not allow for change. It is not chaotic in the mathematical sense. It represents the more traditional rule that the rules themselves don’t change although the contexts in which they operate do. In terms of complexity theory, which has some characteristics in common with chaos theory\textsuperscript{273}, the rules themselves can change but do so in terms of recognisable patterns that lend internal consistency to the system as a whole. It has been observed that although chaos and complexity are at times used interchangeably, they are not identical and need to be distinguished as their application to social systems may differ. Chaos theory or non-linear dynamics is based on the iteration either of a mathematical algorithm or a set of simple rules of interaction. It provides some powerful analogies associated with the edge of chaos, the emergence of order, and the co-existence of stability and instability\textsuperscript{274}. However, complex social systems do not necessarily function through iteration, unless iteration is defined so broadly to accommodate cycles of learning and adaptation that it practically becomes meaningless. Chaos theory and complexity may share certain characteristics but differ in so far as a complex adaptive system is able to evolve and change\textsuperscript{275}.

\textsuperscript{273} Mitleton-Kelly E ‘Organisations As Co-evolving Complex Adaptive Systems’ http://bpc.warwick.ac.uk/eve.html She observes that "The notions of stability and instability provide another way of looking at complexity. This view is closely associated with chaos theory and sees complexity in terms of emergent order co-existing with disorder at the edge of chaos. When a system moves from a state of order towards increasing disorder, it goes through a transition phase called the edge of chaos. In that transition phase, new patterns of order emerge among the disorder and this gives rise to the paradox of order co-existing with disorder. Complexity in this view is seen in terms of the order which emerges from disorder"

\textsuperscript{274} S Mitleton-Kelly (fn 273 supra) states that: “Iteration was defined by Brain Goodwin [at an LSE Strategy & Complexity Seminar, on 32/4/97] as the "emergent order (which) arises through cycles of iteration in which a pattern of activity, defined by rules or regularities, is repeated over and over again, giving rise to coherent order." According to Mitleton-Kelly the distinction between chaos and complexity is particularly important when considering the application of the principles or characteristics of chaotic or complex systems to social systems. Her article starts from the viewpoint that social systems are fundamentally different from all other complex systems but she emphasises that this does not mean that all the valuable work achieved by the sciences of complexity is disregarded. On the contrary, she says, such work needs to be studied as it can provide a significant starting point for the study of complex social systems. What must be avoided is the mapping of principles from the natural sciences onto social systems. Mitleton-Kelly points out that such an attempt would be inappropriate, as the subject matter of different disciplines is constituted in a different way and is based on different units of analysis (eg molecules, species, individual humans, societies, etc.). Mapping would also assume similarities between those systems studied by the natural and social sciences which may not exist, and which could lead to an ontological category mistake.

\textsuperscript{275} Mitleton-Kelly fn 273 supra
It is submitted that both chaos theory and complexity theory presents an extremely useful way of considering and organising the issues represented in the problems posed by Midgley, especially with regard to ‘fuzziness’, by the latest developments in the law of delict and the apparent approach of the judges of the Supreme Court of Appeal as presented by judge Nienaber. Complexity theory suggests that in order to understand law as a complex system there should be a paradigm shift characterised in terms of a shift in the understanding of law from the:

276 Webb J in ‘Why learning the law really is a complex business’ http://www.ukcle.ac.uk/lli/2004/papers/webb.html points out that: ‘Complexity theory is a new way of looking at systems. It has emerged over the last 20 years or so (see Kauffman, 1990, 1992) from an almost primordial transdisciplinary soup of studies of self-organisation within genetic and other biological systems, and in parallel developments in the natural and (latterly) social sciences. These studies have encompassed fields as apparently diverse as cybernetics and artificial intelligence, quantum physics, the neurosciences, organisation management and economic and social theory. Even in law, a theory of legal autopoiesis has developed from the work, chiefly, of two German scholars, the sociologist Niklas Luhmann and the jurist Gunther Teubner. Since its emergence in the 1980s this has become an increasingly influential, but still primarily Euro-centric branch of legal theory, which draws heavily on concepts developed first in the study of living systems... The idea of a simple definition of complexity theory teeters on the brink of the oxymoronic, but most complexity theorists seem to agree that there are a number of relatively simple concepts fundamental to our understanding of complex systems. The particular formulation of complexity theory I intend to use today draws heavily, though not exhaustively, on work on neural networks and the so-called ‘connectionist’ principles derived from network theory. This isn’t, as I have said, the only source of complexity theory but it is a branch which has obvious and strong links to issues of learning and cognition; it has been an important part of my own way-in to complexity theory and so I will use it primarily as my exemplar today... ’Connectionism’, ‘neural networks’ and ‘parallel distributed processing’ (PDP) are all names for a method of computation that attempts to model the neural processes of the human brain. Connectionism claims to be able to approximate the kind of spontaneous creative and somewhat unpredictable behaviour of human agents in a way that conventional methods used by AI researchers relying on classical ‘representational’ theory, cannot. (Davis 1992; Churchland 1995). The classical model treats all cognitive processes as the result of an enormous number of syntactically driven operations – i.e. in simple terms, it treats ‘intelligent behaviour’ as a species of rule following. Connectionist models rely on the neurally inspired approach of PDP. A PDP network involves a collection of simply processing units (we can think of them as neurons) which are linked through a series of levels. The connections lines are critical, since it is they, not the neurons, which incorporate modifiable values (called weights) which determine the strength of the connection between neurons – this models the synaptic connections in the brain. The system functions by each neuron continuously calculating its input in parallel with all the others with patterns of activity developing depending on the modulating effect of the weights. Over time these patterns gradually relax into a stable pattern of activation in response to inputs received. The values of the weights are determined by a learning rule. In many experimental models, the rule is one called back-propagation – the system is put through a training phase in which it is presented with a set of inputs and a set of outputs, and the weights are adjusted through the intermediate levels of neurons. Through multiple iterations the system learns to generate the patterns which enables it to match the inputs to the outputs... What I am more interested in are the systemic features of neural networks, because it is at the systemic level that connectionism tells us some useful things about complexity more generally. Indeed it is tempting to see the developed neural network as a paradigm complex system. We can illustrate this by identifying those features of PDPs which appear increasingly to be treated by complexity theorists as generic features of complex systems:

1. ‘Memory’ or ‘knowledge’ does not reside in any single neuron, but only in the relationship between neurons – it is, in the jargon, distributed.
2. The network uses many essentially simply components which are richly interconnected and thus able to undertake quite complex activities (i.e. it is their interconnectedness or relationality that enables them to deal with complexity) (But this feature also limits both the comprehensibility of the system to any individual agent, and the ability to predict the influence that any individual agent has at the classical order at the edge of chaos arguments - Kauffman, 1990).
3. These interactions are in the form of complex patterns that are generated by the system itself – the system is to a degree, self-organising and its patterns are emergent properties of the interactions. This idea of emergence is of singular importance to complexity theory. Emergent properties are different from what we conventionally think of as properties: they are dynamic, often more than the sum of the parts (think about ‘love’ (and even more appositely, the present writer submits, ‘justice’) as an emergent property – it cannot be analysed by conventional means (though some of its manifestation can be), it does not readily yield to conventional causal explanation... and often fundamentally unpredictable.
4. The relationality of complex systems also raises one other critical point for learning theory: the PDP research shows that learning in such systems is not rule-based in any explicit sense: the learning rule is merely a description of a relationship between inputs and outputs, it is not prescriptive in the representational sense. The model of the mind (and of language) can be approximately described by rules, but that is not the same thing; these rules are post hoc descriptions rather than true representations of how the mind works – the mind, this suggests, works in ways that are relational rather than representational, a notion which, if taken seriously could have significant implications for our understanding of things like the learning of associations.”

---

• linear to the non-linear, recursive process;
• convergent to divergent;
• atomistic to the relational;
• uni-dimensional to the multi-dimensional; and
• intentional to the ‘messy’, random and unpredictable.\textsuperscript{277}

Ontological modelling is another, related approach that could be useful to legal academics in systematising judicial pronouncements\textsuperscript{278}. It has been stated that one of the main attractions of ontologies is their promise of simplicity and certainty in an ever more complex and ambiguous world\textsuperscript{279}. The role of ontologies is to facilitate communication across different classificatory schema and in its most basic form ontology is an agreed upon concept of domain specific knowledge. Breuker and Winkels discuss the views and results related to the development of a core ontology that identifies the main concepts that are typical, and preferably exclusive for law. These are only a few, those related to normative knowledge (deontic terms) and to notions about legal responsibility. They observe that the vast majority of terms or concepts found in legal sources refers to common sense, albeit a special and often more restricted version of common sense knowledge. They point out that they can never represent all common sense knowledge, so must have to resort to foundational ontologies. According to Breuker and Winkels\textsuperscript{280} an ontology describes how some domain is ‘committed’ to a particular view: not so much by the collection of the terms involved but in particular by the way these terms are structured and defined. This structure tells us “what a domain is about”. It does not come as a surprise that for

\textsuperscript{277} See Webb fn 276 supra who makes these suggestions in relation to legal education. It is submitted that they are equally applicable to the law itself and the problems presently under discussion with regret to the latest developments in the law of delict. 

\textsuperscript{278} Schafer, B, Vandenberge W and Kingston J in ‘Ontological modelling and commitment to comparative legal theory. A case study’ (www.juridicas.unam.mx/inst/cyacad/events/2004/0902/meets9/236s.pdf) observe that ontology based approaches have become increasingly widespread in the computer science community in general ad legal information systems design in particular. They state that: “Their importance has been recognized in fields as diverse as knowledge engineering, knowledge representation, qualitative modelling, language engineering, database design, object-oriented programming, information retrieval and agent based system design. Applications span from enterprise integration, natural language translation, medicine, e-commerce, geographical information systems and of course law.

\textsuperscript{279} Schafer et al fn 278 supra. They state that: “Global markets and the ubiquitous interconnectivity of systems and information processes in cyberspace that they bring with them have dramatically increased out awareness of the problems created by conceptual mismatches and failing system interoperability. The idea to agree on explicit and unambiguous subject taxonomies resonates particularly well with lawyers. Much of European Union legislation can be understood as the legal equivalent to ontology integration. most problems of private international law as partial responses to the problem of ontology mismatch where such higher level of agreement can be reached. Ontology based solutions have therefore unsurprisingly attracted the attention of lawyers working in multi-jurisdictional contexts. In the absence of supranational harmonization, these contexts are also particularly knowledge intensive, making the use of AI solutions even more plausible” [Note: AI in this article is an abbreviation for the term ‘artificial intelligence].

\textsuperscript{280} Breuker JA and Winkels RGF ‘Use and Reuse of Legal Ontologies in Knowledge Engineering and Information Management’ (http://www.lrijur.uya.uy/~winkels/LecOnt2003/Breuker.pdf)
instance, medical domains are about malfunctions. These malfunctions are often diseases, i.e. processes; they are classified in (multiple) taxonomies, and associated with sets of typical symptoms, and with treatments.

They explain that an ontology makes explicit the views one is committed to in modeling a domain. Modeling is taken here in the broad sense that includes the notion of understanding. A major and typical problem from jurisprudence (legal theory) occurs already in the use of the term “law”... Indeed, the problem of what counts as the unit of law is already one of the fundamental ones questions in jurisprudence and is called the individuation problem: “Classifying laws in logically distinct categories has always been one of the major tasks of legal philosophy... The classification of laws presupposes a solution to the more fundamental problem of the individuation of laws, i.e., an answer to the question ‘What is to count as one complete law?’ [281]

To come to the end of the metaphysical journey and apply (not map) the ‘other spots’ encountered to the law of delict, one must engage in the following mental exercise.

---

281 (Raz, 1972, page 825). Breuker and Winkels (fn 280 supra) note that: “There are two extreme views. The first one takes all legally valid statements in legal sources (legislation, precedence law, etc) as a whole: the law. The assumption is that in principle the individual statements in this whole are or should be coherently organized. This is the predominant view in jurisprudence and legal philosophy... Whether this coherence is an actual concern for the legal system (i.e., the law should be the object of proper knowledge management), or whether it is ‘genetically’ built-in by the constraints provided by fundamental, ‘natural’ legal principles, is a long and classical debate in legal theory. As [Van Der Velden, 1992] points out, the latter view takes the notion of coherence beyond what he sees as ‘linguistic’ or semantic coherence. It is this kind of coherence we are concerned with here. However, the other extreme takes all legally valid statements as being individual laws. In extremo this view is incorrect, if only because it presupposes some legally valid statement that covers the legal validity of an individual statement. This view is not a view that is shared with jurisprudence. Jurisprudence is in the first place concerned with justifying law, so legal scholars will not easily take validity statements in law as a side issue (see e.g. [Kelsen, 1991]). However, in legal knowledge engineering this alternative perspective is a far more fruitful one. The validity problem is presumed and the emphasis is on the coherent modeling of actual law. The coherence is not to be found in the collection of legal sources themselves but in the worlds (domains) where the statements in these sources refer to. These statements are normative statements about behaviour. They qualify some kinds of situations as disallowed. The collection of normative statements is not aimed at describing all possible situations in a domain, but only those that have normative relevance. What is possible is assumed to be known (or to be found out) by the agents to which the law is addressed. This means that the collection of individual statements about some legal domain does not provide a full description of the domain, neither that coherence is to be found in the legal statements. The coherence has to be found in modelling the possible behaviours in the domain by ‘reconstructing’ what is assumed by the legal statements.” [Footnotes omitted]

They refer by way of example to the ontological views contained in the works of some of the major legal theorists and philosophers as follows: “The Hartian distinction between primary and secondary rules (norms) has become a quasistandard in legal theory. Hart’s distinction, carefully detailed in his ‘Concept of Law’ [Hart, 1961], draws a line between a first level which refers to human behaviour and a second, meta-level of the first, which contains knowledge about primary norms. These secondary rules may belong to three types: (i) rules of adjudication, that can be used to determine authoritatively whether a certain primary rule has been violated or not; (ii) rules of recognition which define, directly or indirectly, which rules are the valid ones, and can therefore be applied; (iii) rules of change, which define how rules are to be made, removed or changed. These distinctions point out three functions of secondary norms: to provide support for solving conflicts (adjudication), to specify the limits of the legal system (recognition) and to specify how the legal system can change in time (change)... Hofstad’s theory is considered a landmark in American jurisprudence [Hofstad, 1919]. An interesting (and unusual) aspect of Hofstad’s theory is that rights and other positional concepts that represent legal relations are considered primitives. There are two groups of interrelated legal relations or positions. The first group is composed by right, duty, no-right, privilege and has a strong normative flavour. These concepts are closely related to Bentham’s concept of right, obligation and liberty. The second group consists of power, liability, disability immunity. These concepts are more closely related to legal competences and legal responsibilities.”
Assume a simple system in which the law of delict is a Black Box from which a certain output called justice is required. There is no indication at this stage of how the output is derived but the system is capable of an output and moreover the desired one. If this were not so, the system would ultimately self-destruct since it serves no useful purpose. This is one step up from Midgley's fears of a lottery since there is an expected outcome which most people can identify and one which the Supreme Court of Appeal judges would be unable to deny is valuable and necessary output of the system. In fact, according to judge Nienaber, the output of justice is the reason on which they base their requirement of flexibility. Of course that outcome in itself is relatively difficult to define in concrete terms because justice is an abstract concept, but for the moment there is an identifiable outcome which will distinguish a bad or undesirable decision in terms of the law of delict, from a good, or desirable one. A legal system that does not serve the interests of justice is ultimately self-defeating. An objective for the system as a whole is thus set. Even within the flexible system desired by the Supreme Court of Appeal judges, it is submitted, however, that there is room for a further level of complexity. Assuming that within the Black Box, called the law of delict, there are one or more sets of conceptual elements that will yield the desirable result, each set (or system) of elements must be internally logically consistent in its own right. In other words one cannot 'mix up' the elements of one set with the elements of the other and achieve justice as an output. This is because the definition of one element, ultimately must influence the definitions of the other elements in the set in order for the system to be able to achieve the desired output. Although there is flexibility in the choice of sets, and even in the definition of an individual element within that set, if the desired outcome is to be achieved then certain basic rules apply. A yet further level of complexity is still possible without compromising the flexibility required by the judges of the Supreme Court of Appeal. This is the level at which the individual elements in the various conceptual sets within the Black Box represented by the law of delict interact with each other. Bearing in mind that they must all interact with each other to produce the desired result in order for the law of delict to be a valid and useful system of law, this implies some rules as to the manner in which they are interconnected or interact, without necessarily reducing the flexibility desired by the judges. These rules may well be dependent on the nature of the factual system that is 'fed into' the Black Box since, if the system is dynamic and adaptive, which it has already been argued, the common law is, then
there is the potential for these rules to vary depending upon the facts of each case. In a system such as the one described above, stability and instability, uncertainty and certainty operate side by side to achieve a desired result. The system is flexible yet contained since in law there is an outer limit to the number of factors that is considered the minimum necessary to achieve the desired result. If a judge chooses a particular element from a particular set in order to decide the case, then from a legal academic point of view, his legal analysis must be consistent with the ‘rules’ of that particular set within the system. For example, if the judge in deciding the limits of liability in a particular case seizes on legal causation as the element he wishes to use, then his reasoning must be consistent with the logical system (set of elements) in which that rule operates namely that unlawfulness should be decided before negligence. However, it may be argued that if the judge chooses the set of elements in which liability is limited by considerations of negligence and unlawfulness then he is not necessarily bound to resolve the issue of unlawfulness before determining negligence. Internal consistency is the key. It may even be that in certain circumstances it is internally consistent to use elements that are common to both sets in order to arrive at a conclusion.

If a judge imbues the conceptual tool fondly referred to as the ‘reasonable man’ with a knowledge of the law, and with a sense of ethical and moral responsibility sufficient to act in accordance therewith, then there is no need for that judge to enter into a discrete and independent consideration as to whether negligence can exist in the absence of unlawfulness. However, if for the purpose of clarity, the court chooses to narrow the ‘reasonable man’ conceptual tool so as to exclude the question of whether or not a ‘reasonable man’ would act in accordance with the law, then negligence and unlawfulness become two discrete concepts which that court must then deal with accordingly. Either way, there is no need for absolutes. Those who enter into heated debates about whether the reasonable man test should include the possibility that a reasonable man would act within the limits of the law or not are missing the point entirely. The reasonable man test is one tool in a toolbox of conceptual tools that is designed to achieve an outcome called justice. The manner in which one conceives of his particular ‘reasonable man’ simply determines the manner in which the remaining functions are taken up by the other conceptual tools in his toolbox. The conceptual tool that bears the description, “a reasonable man who acts in accordance with the
principles of law", has the capacity to perform an extra function that, in the toolbox containing the conceptual tool called "the reasonable man who does not have a tendency to act in accordance with the principles of law", will be performed by some other conceptual tool. This is because if the role of the tools within the toolbox, or the function of the toolbox in which they are contained, is such that it contains the minimum number of functions or factors necessary to achieve justice, then any number of actual formulations of these tools is likely to achieve the desired result. Obviously it is up to legal scholars and the judges between them to (a) identify those tools and the sets into which they fall and (b) to make sure that the toolboxes do contain the minimum necessary to ensure that the outcome of their application is justice. This is where the increased levels of legal knowledge and learning referred to earlier, may in practice be required. Obviously a judge working with a single toolbox would have a much simpler life than those judges who want the flexibility to be able to use many different toolboxes. However the risk for the judge who uses only one toolbox is that it may not have inside it all that is necessary to achieve justice out of every set of facts that comes before him. Assuming that he can identify what is lacking, and instead of simply making a bad decision which does not produce the desired result, i.e. justice, he attempts to find a way around this problem, he would then be faced with a choice of modifying some of his existing tools (which can sometimes be a difficult and somewhat artificial exercise) or he can add new tools to his toolbox. Such new tools will in all likelihood already have been developed by those judges using more than one toolbox to begin with since the sets of tools in each toolbox are different. It is the difference between the ‘serial’ and ‘in parallel’ approaches to legal development. The advantage of such judges over the judge who uses only one toolbox would be that not only are they already aware of the alternatives open to them, but they know how to use them and which toolbox is the most useful in various factual situations. If one toolbox turns out to be unsuitable to achieve the desired result on a particular set of facts, then they can switch to another one. A judge who uses only one toolbox is obviously unlikely to follow precedents in which other toolboxes have been used unless he wants himself to become a multi-toolbox judge but there is still room for the observation of precedent to the extent that there are other decisions in which his preferred set of conceptual tools have been applied.
For a legal scholar or a legal practitioner trying to predict the outcome of a particular case, such a system would require the application of all of the likely toolboxes to the facts of the case in order to see firstly whether the results of each test are the likely to be the same or whether they are likely to differ and if so, on what basis. Since there has to be a measure of internal consistency in the manner in which the individual toolboxes are applied to a particular legal problem there will still be a level of certainty. Similarly as time goes on and the problems themselves are categorized in terms of the system of precedent into those most conducive to resolution by a particular identified toolbox, yet more certainty will enter the system. In the case of the legal practitioner, the basis for the difference would give a good idea in which direction the legal argument before the court should be conducted in order to achieve a result most favourable to the client and in the case of the legal scholar i.e it would give a good idea of a possible direction of legal development, gaps in one toolbox in relation to another and how best to close them, and the most suitable applications of a particular toolbox to specific types of factual settings.

It is submitted that the value of the role and work of legal academics within a system of law in which chaos theory, complexity theory and ontology are valid and applicable conceptual tools is inescapable and inestimable. An approach to legal exegesis which includes the identification of the various possible elemental sets within various fields of law, the scope and manner of the interaction between the individual elements of those sets, the influence of one set upon another, the development of new sets and subsets, and the suitability of certain sets over others for the resolution of particular factual paradigms is a playground of cosmic proportions for legal scholars. The judges may have their flexibility and their gut feel. It is the legal academics to whom litigants will turn for an explanation of what just happened. In the process, it may be that the judges will get what they want too. The ability to play with the rules in such a way as to achieve that elusive but highly prized ideal of all rational societies – justice.

9.2.16 Michael and Another v Linksfleld Park Clinic (Pty) Ltd and Another²⁸²

²⁸² Michael 2001 (3) SA 1188 (SCA)
Facts

The plaintiffs' son, Minas ('the patient') sustained an injury to his nose in a sports accident. He consulted a plastic and reconstructive surgeon, Dr Fayman, who recommended a rhinoplasty in order to remove a hump on the dorsal aspect of the nose and to correct a deviated septum. The operation was arranged for 10:00 on 7 December 1994 at the first defendant's clinic. Dr Fayman was assisted by Dr Rubin and the second defendant, a specialist in anaesthesiology, was the anaesthetist. All three doctors were in private practice. The first defendant's employees who were involved in the events of that morning were Sister Montgomery, the sister in general charge of anaesthetics and recovery, and Sister Glaeser who was the anaesthetic sister assigned to this particular operation. They were both registered nurses. A Lohmeier defibrillator was included in the clinic's emergency equipment on a resuscitation trolley. This was a portable electronic apparatus designed to restore normal rhythm to a fibrillating heart by way of electric shocks applied to the chest wall. It was Sister Glaeser's duty to make sure that this defibrillator was in working order and to use it when called upon by the second defendant to do so. As anaesthetist, he was in overall charge of all necessary resuscitation measures. At about 9:40 the pre-operative process started. The initial stages included the insertion into the patient's left hand of an intravenous tube connected to a drip-line and the attachment to his person of leads from items of equipment reflecting, blood pressure, heart rate and electrocardiographic (ECG) tracings of heart rhythm. Anaesthetic induction commenced at about 9:45 employing a combination of inhalants and intravenous drugs. Among the drugs administered intravenously was one milligram of propranolol hydrochloride (propranolol) given to prevent an untoward increase in heart rate during the operation. Propranolol is a beta blocker which lowers excessive heart rates by blocking the beta adrenergic receptors in the heart which govern heart rate stimulation. It is manufactured in tablet form and also in one milligram (one millilitre) ampoules for intravenous administration. In South Africa it is sold, inter alia, under the trade name 'Inderal'. The package insert published in November 1993 by the South African distributors of Inderal stated that intravenous administration was for the emergency treatment of cardiac dysrhythmias especially including supra-ventricular tachydysrhythmias. The recommended dose was one milligram injected over one
minute which could be repeated at two-minute intervals until a response was observed or to a maximum, in the case of anaesthetised patients, of five milligrams. At about 9:50, with the patient now fully generally anaesthetised, Dr Fayman injected a local anaesthetic (lignocaine and adrenaline) into the nose and inserted at the back of each nostril a plug of ribbon gauze soaked in a cocaine solution. The use of cocaine had a two-fold purpose. It is a local anaesthetic and a vasoconstrictor. The blood vessels of the nasal lining bleed very readily and it was necessary to constrict them to ensure a clear field for the surgeon. Cocaine is widely used for this purpose in ear, nose and throat surgery. The mass of cocaine in the solution was approximately 150 milligrams (being 1.76 milligrams per kilogram of the patient’s weight, which was eighty-five kilograms). The limits of a safe dose are from 1.5 milligrams to 2 milligrams per kilogram. Because not all of the solution was in contact with the inner nasal surfaces only about eighty per cent of the cocaine would have been absorbed. Cocaine, either in overdose or in patient over-reaction, has cardio-toxic effects which can lead to cardiac arrest. One of these is its local anaesthetic effect, which impairs electrical conduction within the heart and diminishes the contractility of the myocardium - the heart muscle. Another is its propensity to result in coronary vasospasm which leads to myocardial ischemia. Cocaine toxicity exhibits a well-known pattern of heart reaction, first hypertension and tachycardia, then ventricular arrhythmias, then falling blood pressure and heart rate, then ventricular fibrillation and finally cardiac arrest. At 10:00 the operation began. This kind of operation usually took Dr Fayman about one hour and involved, after an incision in each nostril to enable lifting the soft tissue off the ridge of the nose, operating first in one nostril and then in the other. The surgery encompassed lowering the bony ridge to the desired degree by rasping it from both sides and then trimming the cartilaginous portion of the nose with a scalpel. Dr Fayman completed the rasping process on the left side and went on to operate on the right.

Between 10:15 and 10:28, while surgery was in progress, bleeding in the nose suddenly occurred in the right nostril which obscured the surgical field and brought the operation to a stop. With the bleeding there was a dramatic and alarming increase in the patient’s heart rate and blood pressure. In the evidence this high level of heart rate (tachycardia) and high blood pressure (hypertension) was called ‘the hypertensive crisis’ and the tachycardia itself was identified as a supra-ventricular
tachydysrhythmia. The second defendant diagnosed too light anaesthesia as the cause of the crisis. This did not mean inadequate anaesthesia. The difference is that adequate anaesthesia can during surgery become too light by reason, not of reduction in anaesthetic, but of excessive surgical stimulus. He deepened the degree of anaesthesia, and to bring down the heart rate and blood pressure, which presented the risk of cerebral haemorrhage, he injected a further one milligram of propranolol into the drip-line. The heart rate and blood pressure came down as intended but thereafter they continued to decline. At below 60 beats per minute the heart rate became what is called bradycardia. Early in the bradycardia the ECG monitor displayed features of a normal tracing, including the characteristic peak and lows referred to as the QRS complex. This complex then soon broadened, indicating a symptomatic bradycardia.

At about this time the second defendant instructed Dr Fayman to undertake cardiopulmonary resuscitation (CPR) by way of external heart massage. The second defendant considered that there had been an over-action by the propranolol and to counter it he started administering, in conjunction with the CPR, a sequence of different drugs (ephedrine, isoprenaline and adrenaline) to try to raise the heart rate and blood pressure by removing the beta blockade. All these measures failed and the patient’s heart went into cardiac arrest at 10:28. Shortly before the arrest the second defendant noted that the ECG tracing had become a flat line. In other words there was no discernible wave. This led him to conclude that the patient’s heart was in a state known as asystole, in which there is no electrical activity in the heart at all. Because shocking by defibrillator damages an asystolic heart he considered he was confined in his resuscitation efforts to CPR and drug therapy, those being the only measures by which rhythm can be restored if the heart is in that state. When, after about four minutes, these efforts failed to yield any apparent result, the second defendant’s options were to leave the patient for dead or to employ the defibrillator in the hope that if the heart was not in asystole but in ventricular fibrillation a heart beat could be restored by defibrillation. A fibrillating heart is one in which there are electrical impulses but no rhythm and no output. Its energy goes into rapid, random, uncoordinated contractions, all in complete disorder. What defibrillation does is to shock a fibrillating heart into momentary asystole and afford it the opportunity for a normal beat to resume spontaneously. The Lohmeier defibrillator (‘the Lohmeier’) was therefore brought into action. On the second defendant’s instructions Sister Glaeser set the device to deliver a charge of 200 joules. When she did so she noticed that the
number of joules digitally displayed as reflecting the strength of the required charge did not stay at 200 but started decreasing while she was busy preparing to activate the defibrillator. She nevertheless proceeded to cause delivery of a shock. The patient's body responded but not his heart. For some minutes after that, CPR and adrenaline were repeated. A second shock at 200 joules was ordered. The outcome was the same. Again the number of joules on the display fell before the shock could be given. After renewed CPR and further adrenaline a third shock was ordered, this time at 360 joules. The heart remained in arrest. Once more the digital display decreased. Because Sister Glaeser and the second defendant thought that the diminishing display indicated that the apparatus was failing to hold its charge and was therefore defective, Sister Montgomery was sent to fetch another defibrillator. CPR and adrenaline were repeated. In addition, bretylium tosylate, sodium bicarbonate and calcium gluconate were injected into the drip-line.

From the intensive care unit Sister Montgomery returned in due course with another make of defibrillator. When programmed to deliver a charge of 360 joules, its digital display remained constant. With the new defibrillator a fourth and fifth shock were given. Both elicited a body reaction and, in addition, a heart beat. The fourth resulted in ventricular tachycardia and the fifth, sinus tachycardia - a fast but normal rhythm. By the time heart action was restored it was 10:44. Further resuscitation was required in the intensive care unit and so the operation was not completed. The nasal wounds were simply closed and the patient's nose was plugged and splinted. Prior to the cardiac arrest, and more or less contemporaneously, the second defendant recorded certain data regarding the operation. He used both sides of a stereotyped form which he himself designed and which he had had printed. One side was referred to as his 'chart'. His recordings were interrupted entirely by the arrest and resuscitation but later that morning he made further entries on the reverse side of the form under the heading 'Additional notes'. Later during the day he spoke to the plaintiffs and, in expressing his regret for what had happened, said of the operation that everything had been done correctly and that he did not know what had gone wrong.

During the afternoon the first defendant's general manager, Dr Malkin, spoke to Sister Glaeser. In recounting the morning's events, she indicated that in comparison with the second defibrillator the Lohmeier had seemed to be defective. In consequence Dr
Malkin wrote to the suppliers of the Lohmeier alleging that the resuscitation had failed because the defibrillator was unable to maintain the required charge and expressing concern that there had been a delay in the resuscitation. This prompted a number of independent tests of the apparatus concerned during the following year, the result of all of which was that it was reported to be in working order. It was also established that in all defibrillators the programmed charge diminishes between the time it is set and the delivery of a shock. This is due to electrical resistance within the apparatus. Lohmeiers constitute the only make whose digital display reflects that reduction and Sister Glaeser and the second defendant did not know this. At 19:00 on the day of the operation the patient was examined by a cardiologist, Dr J L Salitan, who performed an echocardiogram. He later reported that the patient’s heart was enlarged and its left ventricular contractility significantly reduced. His conclusion was that there was ‘marked global myocardial dysfunction, probably acute’, possibly the result of prolonged hypoxia. Obviously prolonged hypoxia did occur and although it is in dispute precisely by what mechanism the myocardial damage came to be caused, what is not in issue is that hypoxia caused injury to the brain. Brain injury was sustained after the heart went into cardiac arrest and was ongoing for as long as the resuscitation period advanced without restoration of a heartbeat.

As regards the first defendant it was alleged that it failed to have a functional defibrillator immediately available when required alternatively, if the Lohmeier was functional, first defendant failed (at a time prior to the date in question) to inform Sister Glaeser about, and to train her in, the workings and manner of operation of the Lohmeier, thereby causing delay in the resuscitation process when the Lohmeier appeared to her to be defective and to require replacement by a substitute defibrillator.

As regards the second defendant it was alleged in relation to the cardiac arrest that:

1. He failed to take adequate account of the effect which the cocaine would have in conjunction with what he himself administered and to guide Dr Fayman as to the upper dose limits of cocaine.

2. He failed to dilute the propranolol which was given to combat the hypertensive crisis or to administer it in doses of between 100 micrograms and 500 micrograms at a time.
3. The use of propranolol in conjunction with cocaine created the risk of sudden heart failure.

4. He failed to recognise the risk of, or to prevent, life-threatening bradycardia and cardiac arrest.

In relation to the resuscitation it was alleged that:

5. He failed to ensure beforehand that a functional defibrillator was available and that he was reasonably acquainted with its workings. This caused a delay in the resuscitation process when a second defibrillator was sent for.

6. When the patient’s heart was in fibrillation he failed to order defibrillation at the earliest opportunity. Alternatively, he attempted defibrillation on an asystolic heart thereby worsening the outcome. In the further alternative he failed to deliver three quick shocks in a ‘stacked sequence’ in accordance with certain published algorithms approved for emergency cardiac resuscitation.

**Judgment**

The court had to decide what was the cause of the cardiac arrest. The plaintiffs contended that it was propranolol and that the hypertensive crisis was occasioned by too light anaesthesia. For the second defendant it was maintained that the cause of both the hypertensive crisis and the arrest was cocaine toxicity. The question was whether the arrest was foreseeable as a reasonable possibility, meaning a possibility which a reasonable anaesthetist would foresee and guard against. If the cause of the arrest was cocaine toxicity and the arrest was indeed foreseeable in that sense, the question would then be whether the arrest was reasonably avoidable. The main subsidiary question allied to the first issue concerned the length of time between the hypertensive crisis and the cardiac arrest and that, in turn, depended on the credibility and reliability of the witnesses who were centrally involved in the operating theatre at the time. For the plaintiffs they were Doctor Fayman, Doctor Rubin and Sister Glaeser. On the opposite side, the second defendant stood alone. Other subsidiary questions were whether, irrespective of the cause of the arrest and irrespective of the correctness of his conclusions, the second defendant was reasonable in diagnosing too light anaesthesia as the cause of the hypertensive crisis and in giving propranolol as the counter and whether he was at fault in relation to either the size of the dose or the
manner of its administration and whether it was reasonable to diagnose a propranolol over-action as the cause of the bradycardia.

The second essential issue is whether the Lohmeier defibrillator was defective and, if not, whether the ignorance of the second defendant and Sister Glaeser as to the manner of its workings was culpable and whether their ignorance occasioned an unreasonable delay in the resuscitative process. Allied questions were whether the heart arrested in asystole or fibrillation; when fibrillation occurred if initially there was asystole; whether fibrillation was immediately amenable to defibrillation and, if not, when it first became amenable. Finally, on the matter of delay, the crucial enquiry is whether the fourth shock (and the fifth if required) would have been given materially earlier had the Lohmeier been in proper working order and had Sister Glaeser and the second defendant known that. The court held that the answer to that enquiry entailed examination of what resuscitation measures were in progress between the third and fourth shocks and whether the picture would have been different in the absence of their ignorance.

The Supreme Court of Appeal noted in its judgment that in the trial court, none of the experts was asked, or purported to express a collective or representative view of, what was or was not accepted as reasonable in South African specialist anaesthetist practice in 1994. It stated that although it has often been said in South African cases that the governing test for professional negligence is the standard of conduct of the reasonable practitioner in the particular professional field, that criterion is not always itself a helpful guide to finding the answer. The present case, it said, showed why. Apart from the absence of evidence of what practice prevailed it was not a question of simply the standard, for example of the reasonable attorney or advocate, where the court would be able to decide for itself what was reasonable conduct. The court asked how the conduct and views of the notional reasonable anaesthetist could be established without a collective or representative opinion especially in view of the fact that the primary function of the experts called was to teach, with the opportunity only for part-time practice. In these circumstances, said the court, counsel were probably left with little option but to elicit individual views of what the respective witnesses considered reasonable.
The court said that what is required in the evaluation of such evidence is to determine whether and to what extent the expert opinions advanced in Michael’s case were founded on logical reasoning. It referred with approval to *Bolitho v City and Hackney Health Authority*\(^{283}\) and the dicta of Lord Browne-Wilkinson summarising them as follows:

The Court is not bound to absolve a defendant from liability for allegedly negligent medical treatment or diagnosis just because evidence of expert opinion, albeit genuinely held, is that the treatment or diagnosis in issue accorded with sound medical practice. The Court must be satisfied that such opinion has a logical basis, in other words that the expert has considered comparative risks and benefits and has reached ‘a defensible conclusion’

If a body of professional opinion overlooks an obvious risk which could have been guarded against it will not be reasonable, even if almost universally held

The defendant, said the court, can properly be held liable, despite the support of a body of professional opinion sanctioning the conduct in issue, if that body of opinion is not capable of withstanding logical analysis and is therefore not reasonable. However, it will very seldom be right to conclude that views genuinely held by a competent expert are unreasonable. The assessment of medical risks and benefits is a matter of clinical judgment which the court would not normally be able to make without expert evidence and it would be wrong to decide a case by simple preference where there are conflicting views on either side, both capable of logical support: Only where expert opinion cannot be logically supported at all will it fail to provide ‘the benchmark by reference to which the defendant’s conduct falls to be assessed’.

After analysing the evidence, the court held that much as the plaintiffs deserved the sympathy of all for the awful fate that had befallen their son and the profound grief this must have caused them, the trial judge was right to dismiss the claim. It held that the appeal could not succeed.

**Discussion**

\(^{283}\) *Bolitho* [1998] AC 232 (HL)
Carstens discusses this case in some detail. He points out that it should be noted that the court emphasised the fact that in this case none of the experts was asked, or purported to express, a collective or representative view of what was or was not accepted as reasonable in South African specialist anaesthetist practice in 1994. The court evaluated the standard to establish the conduct and views of the notional reasonable anaesthetist without a collective or representative opinion. The court observed that the difficulty of determining this standard was exacerbated by the fact that the primary function of the experts who testified was to teach with only limited opportunity for part time practice, leaving counsel with little option but to elicit individual views of what the respective expert witnesses considered to be reasonable. He observes that in setting a standard to be applied to the expert evidence, the court relied on the decision of the House of Lords in the medical negligence case of *Bolitho v City and Hackney Health Authority* in which it was held that a court is not bound to absolve a defendant from legal liability for allegedly negligent medical treatment or diagnosis just because evidence of an expert opinion, albeit genuinely held, is that the treatment or diagnosis in issue accorded with sound medical practice. The court must be satisfied that such opinion has a logical basis, in other words that the expert has considered comparative risks and benefits and has reached a ‘defensible conclusion’.

Carstens also observes that the court highlighted the essential difference between the

284 Carstens P *Setting the Boundaries for Expert Evidence In Support Or Defence of Medical Negligence: Michael v Linksfield Park Clinic (Pty) Ltd 2001 (3) SA 1188 (SCA) 2002 THRHR p430. He neatly summarises the approach to expert evidence in followed by the Supreme Court of Appeal in this case as follows:

- In delictual claims the issue of reasonableness or negligence of a defendant’s conduct is one for the court itself to determine on the basis of the various and often conflicting expert opinions presented;
- As a rule, that determination will not involve considerations of credibility but rather the examination of the opinions and the analysis of their essential reasoning, preparatory to the court reaching its own conclusion on the issues raised;
- In the case of professional negligence, the governing test is the standard of conduct of the reasonable practitioner in the particular professional field, but that criterion is not always a helpful guide to finding the answer;
- What is required in the evaluation of expert evidence bearing on the conduct of such persons is to determine whether and to what extent the opinions advanced are founded on logical reasoning;
- The court is not bound to absolve a defendant from liability for allegedly negligent professional conduct (such as medical treatment or diagnosis) just because evidence of expert opinion, albeit genuinely held, is that the conduct in issue accorded with sound practice;
- The court must be satisfied that such opinion had a logical basis, in other words, that the expert has considered comparative risks and benefits and has reached a defensible conclusion. If a body of professional opinion overlooks an obvious risk which could have been guarded against, it will not be reasonable, even if almost universally held;
- A defendant can be held liable despite the support of a body of professional opinion sanctioning the conduct in issue if that body of opinion is not capable of withstanding logical analysis and is therefore not reasonable. However, it will very seldom be correct to conclude that views genuinely held by a competent expert are unreasonable;
- The assessment of medical risks and benefits is a matter of clinical judgment which the court would not normally be able to make without expert evidence, and it would be wrong to decide a case by simple preference where there are conflicting views on either side, both capable of logical support;
- Only where expert opinion cannot be logically supported at will it fail to provide the benchmark by reference to which the defendant’s conduct fails to be assessed.

Finally it must be borne in mind that expert scientific witnesses tend to assess likelihood in terms of scientific certainty and not in terms of where the balance of probabilities lies on a review of the whole of the evidence.

*Bolitho* fn 283 supra

---

285
scientific and judicial measure of proof with reliance on another decision of the House of Lords in the Scottish case of \textit{Dingley v The Chief Constable, Strathclyde Police}\textsuperscript{286}. 

In his comments on the case, Carstens points out that in essence the court in this case affirmed the general applicable principles already enunciated in the cases of \textit{Van Wyk v Lewis}, \textit{Webb v Isaac}, \textit{Coppen v Impey}, \textit{Pringle v Administrator Transvaal} and \textit{Castell v de Greef} that the proof of medical negligence has to be determined with reference to expert evidence of members of the medical profession but that such determination in the final instance is for the court who is not bound to adopt the opinion of such testimony. He finds the analysis of the nature of the expert evidence in relation to the test for medical negligence problematic in the sense that the context in which it is applied by the court is ‘somewhat clouded’. Carstens submits that this also rings true with regard to the court’s assessment of conflicting schools of thought in medical practice. He says that the court correctly ruled that it must be satisfied that the tendered medical opinion must have a logical basis, in other words that the expert has considered comparative risks and benefits and has reached a defensible conclusion. However, the court added the rider to this ruling that a defendant can be held liable if the supporting body of expert opinion is not capable of withstanding \textit{logical analysis} and is therefore \textit{not reasonable}. Carstens submits that this statement whereby logic is indicative of reasonableness (conversely the absence of logic is indicative of unreasonableness) is problematic. He notes that it is conceivable that expert medical opinion based on logic is not necessarily indicative of reasonableness or unreasonableness within the realm of accepted medical practice. Logic refers to a process of reasoning/rationality based on scientific or deductive cause and effect. Therefore a given result or inference is either logical or illogical. Reasonableness on the other hand, says Carstens, is a value judgment indicative of or based on an accepted or standard norm. While it is true that logic more often than not is an integral part of reasonableness, it does not necessarily follow that logic can be equated to reasonableness. The distinction is illustrated with reference to the concepts of ‘medical misadventure’ and ‘professional errors of judgment’ within medical practice, where even ‘illogical’ medical mishaps/errors of judgment have been held to be

\textsuperscript{286} \textit{Dingley} 200 SC 77 (HL) where it was said that: “One cannot entirely discount the risk that by immersing himself in every detail and by looking deeply into the minds of the experts, a judge may be seduced into a position where he applies to the expert evidence the standards which the expert himself will apply to the question whether a particular thesis has been proved or disproved...instead of assessing as a judge must do, where the balance of probabilities lies on a review of the whole of the evidence.”
reasonable in terms of accepted medical practice. Carstens notes that it should also be emphasized that medical negligence should not be determined 'in the air' but with regard to the particular circumstances of each case. It is also highly improbable that any party to a medical negligence action would call an expert medical witness whose opinion is based on an illogical foundation – hence the ruling by the court that it will seldom be correct to conclude that views genuinely held by a competent expert are reasonable. He submits that the true test for expert medical opinion in medical negligence actions, is that the opinion should objectively and clinically reflect the standard or norms of accepted medical practice in the particular circumstances; that is to say whether the plaintiff’s claim can succeed with reference to the standard of the reasonable competent anaesthetist in the same circumstances, alternatively whether the defendant-anaesthetist’s actions or omissions are defensible with reference to the same yardstick. Carstens states that in the event of conflicting expert opinion or different schools of thought in medical practice, it appears that even a conflicting and minority school of thought or opinion will be acceptable, provided that such opinion accords with what is considered to be reasonable by that branch of the medical profession. He points out that the court’s concern that it would be wrong to decide a case by simply preference where there are conflicting views on either side, both being capable of logical support could be overcome by strictly applying the ordinary rules of evidence. If both conflicting views on either side are capable of logical support (or rather are indicative of accepted or reasonable medical practice) the question arises whether the plaintiff has proven his or her case against the defendant medical practitioner on a preponderance of probabilities. The judgment then depends on the credibility and reliability of expert witnesses. If the scales are evenly tipped on a review of the whole of the evidence, then absolution from the instance should be ordered.

Carstens notes that although counsel referred the court to a plethora of relevant South African case law, in its judgment it referred to two judgments of the House of Lords, omitting any reference to or discussion of relevant South African case law. He states that this omission is regrettable as the Supreme Court of Appeal had the opportunity to extensively review leading cases on medical negligence in which the approach to expert medical evidence was paramount. He observes that it is not often that cases on medical negligence serve before the Supreme Court of Appeal and although principles
pertaining to the approach to expert medical evidence have generally been reaffirmed, it is specifically the approach to conflicting opinions representing different but acceptable schools of thought in medical practice that still remains open-ended.

It is submitted that the paucity of reference to South Africa legal precedent is further evidence of the trend identified by judge Nienaber as referred to in the article by Midgley discussed earlier in the section on *Mukheiber*. There is presently a disturbing lack of legal scholarship, or, to put it differently, a disturbing unwillingness to engage with the law on a more than superficial level, within South African courts and the Supreme Court of Appeal in particular that does not further the spirit or the letter of the Constitution requiring the development of the common law. It is further submitted that the attitude of the judges of the Supreme Court of Appeal surveyed by judge Nienaber that their main role is to resolve disputes is indicative of a narrow, unproductive and miserly approach to law in a country

- in which litigation is so expensive that it is more often than not inaccessible to the ordinary person;
- with a long history of human rights abuse that was sanctioned and condoned by the previous legal system; and
- which is only ten years into the development of a constitutionally based system of law and government that represents a radical departure from the system previously in place.

One might expect such an attitude from a judiciary operating in an environment in which the legal system was well developed, well established and in which there was no great need for judges to fulfil a leadership role in implementing the principles and values of a relatively new legal order. It is more than a little disheartening to see the quality and standard of some of the judgments that emanate from both the High Court and the Supreme Court of Appeal. Even more disturbing is the apparently increasing difficulty in obtaining the written judgments of the High Court within reasonable time periods and the fact that many judges mark judgments that they have given on issues of constitutional importance as unreportable. In this context it is highly unlikely that

---

287 Botha J for instance, of his judgment in the case of the *Treatment Action Campaign and Others v Minister of Health and Others* in the Pretoria High Court were it not for the significant degree of public interest in the case and the fact that the *Treatment Action Campaign* is sufficiently well funded to have its own website upon which it can itself publicise judgments like this such judgments would not be generally or easily accessible to the public. Another case that was not reported is the decision of the Transvaal High Court in *Harris v Minister of Education*, another judgment that involved
a more complicated approaches to legal analysis will be adopted by South African courts and the exercise conducted in the discussion under Mukkheiber is likely to be little more than “pie in the sky”. Instead it seems that one may be faced with body of decisions that are increasingly internally inconsistent to the point where there is no cohesive or higher vision present in South African case law. The decision of the court a quo in the case of VRM below is a good example.

9.2.17 VRM v The Health Professions Council of South Africa and Others\textsuperscript{288}

Facts

The facts as they appear from the plaintiff’s heads of argument are as follows:

The plaintiff, VRM, lodged with the first defendant, the Health Professions Council of South Africa, a complaint of improper or disgraceful conduct on the part of the third defendant, a Dr Labuschagne. The first defendant ruled that there has not been conduct on behalf of the third defendant which could be said to have been improper or disgraceful and resolved that no further action should be taken. The plaintiff sought the review and setting aside of this decision.

On 29 January 1999 VRM, consulted Dr Labuschagne. She was 6 month’s pregnancy and wanted him to deliver her baby. He examined her to see whether she and the unborn baby were healthy and he took a blood sample. He did not inform her of the purpose of the test or that the blood was to be tested to determine the applicant’s HIV status. In his response to her complaint, Dr Labuschagne stated that he had ‘informed’ VRM that the routine blood tests would include a test for HIV. There was no prior counselling before the test was taken. At the time of the consultation, although Dr Labuschagne informed VRM that ‘routine blood tests’ would be conducted he did not obtain her informed consent in terms of the guidelines on “The management of patients with HIV infection or AIDS” (the guidelines) which were in place since 1992 and which bind all doctors and other health professionals. The guidelines are explicit.

\textsuperscript{288} As yet unreported. Case No 2612912001 heard in the Transvaal Provincial Division of the High Court of South Africa Date 27 May 2002.
They state *inter alia* that:

2.4.1 Although infection with HIV and of Aids is incurable at present, Aids is considered a manageable life-threatening disease.

2.4.2 ...Routine or universal testing of patients in the healthcare setting is unjustifiable and undesirable.

2.4.3 A good patient-doctor relationship and mutual trust are essential pre-requisites for the implementation of reasonable and equitable guidelines that will ensure that the requirement both of healthcare workers and patients are satisfied.

2.4.4 It is accepted that a healthcare worker will examine or treat a patient only with the informed consent of the patient. Similarly, taking a blood sample to test for HIV antibodies should be done only with the consent of the patient, in accordance with the guidelines set out below.

2.4.5 The requirements for informed consent are stated as follows:

Informed Consent

A patient should be tested for HIV infection only if he gives informed consent. Such informed consent should incorporate the following minimum standards:

If posters are displayed in an attempt to inform patients that testing for HIV may be undertaken, these must be supplemented by a verbal discussion between the doctor and the patient in order to appropriately obtain the patient's informed consent.

The patient should clearly understand what the purpose of the laboratory test is; what advantages or disadvantages testing may hold for him as patient; why the surgeon or physician wants this information; what influence the results of such a test will have on his treatment; and how his medical protocol will be altered by this information. The psychosocial impact of a positive test result should also be addressed.

The principle of informed consent entails that the healthcare worker accepts that if the patient were HIV positive, appropriate counselling will follow. The
healthcare worker must therefore ensure that the patient is directed to appropriate facilities that will oversee his further care and, if possible, counsel his family and/or sexual partners. The healthcare worker clearly also ethically has the right to inform identifiable sexual partners of the HIV positive status of a patient.

2.4.6 The results of HIV positive patients should be treated at the highest possible level of confidentiality”.

During March 1999 VRM received an account from a pathology laboratory which mentioned ‘HIV Elisa’. At a subsequent consultation with Dr Labuschagne, VRM and her husband enquired of Dr Labuschagne whether this reference had anything to do with AIDS. Dr Labuschagne told VRM and her husband that the account and its contents had nothing to do with AIDS and that the reason for the medical aid being charged with such test was a mistake. On 01 April 1999 VRM was admitted to hospital with labour pains. On 03 April Dr Labuschagne delivered the baby by caesarean section. It was stillborn. On 04 April Dr Labuschagne attended on VRM at the hospital and without preamble informed her that she was HIV positive. Dr Labuschagne issued a death certificate for the baby which records the cause of death as “stillborn”, “HIV+”. Dr Labuschagne advised VRM’s husband of her HIV status. VRM’s husband subsequently tested negative for HIV. At no stage did VRM receive any counselling as required by the guidelines from Dr Labuschagne or anyone else. On 9 July 1999 VRM, through her attorneys, lodged a complaint of professional misconduct against Dr Labuschagne and requiring the HPCSA to immediately start investigations into his unethical and illegal conduct.

On 4 October 1999 the first respondent, the HPCSA, resolved to make available to VRM Dr Labuschagne’s explanation, contained in a letter to the HPCSA dated 27 August 1999. The gist of his reply as summarised by the appeal court came to the following:

(a) That he asked and obtained her consent to take a blood sample and to have it tested also to determine her HIV status.
(b) That he was aware thereof that she was HIV positive when her husband and she enquired, during March 1999, about the meaning of “HIV Elisa” but that as she was one month away from delivery he thought it in her best interests, from a psychological point of view, not to inform her of her status then. He states that he attempted “to sidestep” the question by explaining to them in medical terms that “HIV Elisa” indicated an infection and that Aids may be a result thereof.

(c) He denied that he stated that the account had nothing to do with Aids and that he would follow it up with Drs Buisson and Partners.

(d) He denied that her water broke on 2 April but stated that he caused it to break in an attempt to get the patient to go into normal labour. He refers to the hospital report which indicates that the membrane was intact. He states that when he broke the water there was a very offensive discharge. It seems as if, after the Caesarian Section, he formed the opinion that it was the result of an intra uterine infection which may have caused the stillbirth.

(e) He denied that he asked to see her husband and says that after he had informed her of her status he asked her whether she would tell her husband or whether he was to do it. He says that she asked him to do it and that he subsequently did so.

(f) He denied that he had told the complainant that the baby was also HIV positive. He denied that he performed any HIV testing on the baby. What he told her was that its death was probably caused by its mother’s HIV status and intra uterine infection. He explained that the reference to HIV on the death certificate was a reference to the mother’s HIV status.

(g) He explained that he considered it to be heartless and cruel to inform a woman pregnant with her first child one month before its birth that she was HIV positive. At that stage such information could not change anything. In any event statistics show that only one half of children born HIV negative convert to HIV positive.

(h) He pointed out that there were no facilities for pre- or post natal test counselling at the Louis Trichardt hospital. Nor did there exist protocols regarding measures to reduce the risk of mother to child transmission.

(i) He also denied that there was any risk of mother to child transmission.
In a letter dated 14 April 2000 the appellant’s attorney was informed that the Committee of Preliminary Inquiry of the first respondent had found that there had been no improper or disgraceful conduct on the part of the third respondent. At the request of the appellant’s attorney the reasons for the finding were supplied in a letter dated 21 February 2001. The reasons read as follows:

“I refer to your letter dated 28 November 2000 and wish to advise that the Committee (sic) to accept the respondent’s explanation was based on the following facts:

1. The acceptance that the patient was informed of the HIV testing and that she consented to it.
2. That there is a lack of facilities for proper pre- and post HIV testing in the hospital.
3. Noted that the patient’s husband was only informed at the request of his wife (the patient).

It was on the strength of these facts and other factors as outlined in Dr Labuschagne’s letter to Council dated 27 August 2000 that his explanation to the allegations against him was accepted.

In the application, which was launched on 31 October 2001, the appellant reiterated the facts stated in her letter of complaint with the exception that she conceded that her husband had been informed of her HIV status with her consent. Her husband was subsequently tested for HIV and the test was negative. These circumstances led to a separation between her and her husband. She denied that there were no facilities for pre and postnatal counselling at Louis Trichardt. Such facilities were available at the government primary health clinic.

It was contended for the plaintiff in the heads of argument that-

1.1.1. the HPC is under a statutory duty to act on complaints of improper or disgraceful conduct if a prima facie case of such conduct is established;
1.1.2. the common cause facts point overwhelmingly to a serious transgression of the ethical obligations by which Dr Labuschagne was bound;
1.1.3. the HPC failed to appreciate the nature of its obligations and accordingly did not exercise a proper discretion;

1.1.4. Daniels J [in the court a quo] wrongly concluded that the difference between consent and informed consent was marginal. Moreover, in finding that Dr Labuschagne acted in what he believed to be the best interests of his patient, Daniels J confused the inquiry into improper conduct with the inquiry into mitigation. Finally, while Daniels J implicitly found that Dr Labuschagne had breached the guidelines for the management of patients with HIV, he relegated the breach to a matter of no consequence, holding that the guidelines were not cast in stone. In so holding, he constructed a defence not even advanced by Dr Labuschagne himself, nor one even alluded to by the Committee or the HPC. On the contrary, both the HPC and the Committee considered the guidelines as binding on all doctors. It was accordingly submitted that Daniels J erred in dismissing the application.

The main grounds on which the appellant relied were-

(a) that the second respondent misdirected itself in accepting the version of the third respondent regarding the question of whether she had consented to HIV testing in spite of the existence of a dispute of fact.

(b) that the second respondent ignored the fact that on the version of the third respondent he had not obtained her informed consent.

(c) that the second respondent erroneously accepted that there “was a lack of facilities for proper pre- and post-HIV testing in the hospital”.

The Committee of Preliminary Enquiry of the HPCSA had declined to refer the complaint to a disciplinary committee and found that the doctor had not acted improperly or disgracefully despite the fact that there was a dispute of fact between the doctor and the patient which could only be resolved by means of an inquiry.

In its judgment, the appeal court observed that the court a quo pointed out that there was a dispute about the existence of counselling facilities at the hospital which the appellant did nothing to dispel in spite of being afforded the opportunity to do so. It found that the respondent’s version in this regard was more probable. In respect of the first and second respondents’ acceptance of the third respondent’s explanation, it
posed the question whether it was so unreasonable as to warrant interference by the court. It made the observation that the consent obtained by the third respondent from the appellant probably did not qualify as informed consent in terms of the guidelines. It remarked that the difference between consent and informed consent is marginal and that it was of no real moment that the appellant was only informed of the outcome of the HIV test at a later stage. It described the approach of the third respondent as one that displayed compassion and concern. Nothing would have changed if the appellant had been told of the test result earlier. It came to the conclusion that the conduct of the third respondent did not amount to improper or disgraceful conduct. To the extent that the third respondent had deviated from the guidelines, the court accepted a submission that the guidelines were not cast in stone. With reference to a submission based on *Veriava and others v President, South African Medical and Dental Council and others* that there was a *prima facie* complaint that called for an inquiry, it found that the complaint was a mere allegation and had not been substantiated.

Counsel for the appellant argued that the first respondent was under a statutory duty to act on complaints of improper or disgraceful conduct if a *prima facie* case of such conduct had been disclosed. He contended that in this regard the first respondent failed to appreciate its statutory duties. He referred to section 15 A(g) and (h) and section 41 of the Health Professions Act (the Act) and to the case of *Veriava supra*. He submitted that the finding in *Korf v Health Professions Council of South Africa* that the first respondent was not an organ of State must be considered to have been wrongly decided in the light of the decisions of the Constitutional Court in cases, like *National Gambling Board v Premier, KwaZulu Natal and Others*, *Independent Electoral Commission v Langeberg Municipality* and *Islamic Unity Convention v Independent Broadcasting Authority and Others*. Then he argued that even the undisputed facts disclosed a *prima facie* case of improper and disgraceful conduct in that the third respondent had failed to obtain the appellant’s informed consent, that he had failed to conduct pre and post test counselling, or had failed to refer the appellant for such counselling and that he had failed to counsel the appellant on the prevention

---

299 *Veriava* 1985 (2) SA 293 (T)
299 *Health Professions Act* 56 of 1974
299 *Korf* 2000 (1) SA 1171 (T) at 1178 D
299 *National Gambling Board v Premier, KwaZulu Natal and Others* 2002 (2) SA 715 (CC)
299 *Langeberg Municipality* 2001 (3) SA 925 (CC)
299 *Islamic Unity Convention* 2002 (4) SA 294 (CC)
of mother to child transmission of HIV. In respect of informed consent he referred the
court to Castell v De Greef295 and C v Minister of Correctional Services296.

Counsel for the first and second respondents, conceded that the first respondent was
an organ of state as defined in section 23 of the Constitution of the Republic of South
Africa. He argued that the second respondent furnished sufficient reasons for its
decision and that a court would not lightly interfere with the decision. The second
respondent accepted the third respondent’s explanation and there was a rational
connection between the decision and the facts on which it was based. He referred to
the regulations governing the matter and pointed out that the regulations published in
Government Notice R2303 of 29 September 1990 were applicable. In particular he
referred to regulation 7 which entitled Committee of Preliminary Inquiry not to direct
an enquiry if a complaint, even if substantiated, does not constitute improper or
disgraceful conduct. With reliance on the case of Veriava supra he submitted that the
correct test was not whether disputes of fact existed, but whether prima facie evidence
of improper or disgraceful conduct had been presented. He pointed out that the
Committee of Preliminary Inquiry was a peer committee and submitted that it, having
regard to the complaint and the explanation, had found that there was no prima facie
case against the third respondent. To the extent that the third respondent deviated
from the guidelines, he submitted that they were not intended to be followed slavishly. He pointed out that the Promotion of Administrative Justice Act297 had not
come into effect when the second respondent’s decision was taken and that the matter
had to be decided in terms of section 33 (1) of the Constitution. He submitted that the
court should be slow to substitute its opinion regarding the propriety of professional
conduct for that of an expert body. In this regard he referred to Thuketana v Health
Professions Council of South Africa 298.

Judgment

The full court noted that where there is a fundamental dispute of fact the Committee
of Preliminary Inquiry of the HPCSA has no means of resolving it. It finds itself in

295 Castell fn 98 supra at 425 H – I
296 C v Minister Correctional Services 1996 (4) SA 292 (T) at 300 G – J.
297 Act 3 of 2000
298 Thukehana [2002] 4 ALL SA 493 at 504 E – 505 C
much the same position as a court confronted with a dispute of fact in motion proceedings. If the complaint, on the face of it, discloses improper conduct, the only way of resolving the dispute of fact is to direct an inquiry. The court found that there was a fundamental dispute about whether the third respondent had informed the appellant that the blood taken from her would be tested for HIV. It was never suggested that it would have been proper for the third respondent to have taken the appellant’s blood for that purpose without informing her of the purpose of the test. If such a view had been tenable, it would have been possible for the second respondent to decline to direct an inquiry with reliance on regulation 7. It held that it was clear therefore that the second respondent on a vital dispute of fact accepted the third respondent’s version and rejected that of the appellant. In doing that it misconceived its powers and overstepped the bounds of its discretion. For that reason its decision should be reviewed and set aside.

It was argued that if it was not competent for the second respondent to decide the factual dispute about consent, the matter should be referred back to it so that it could reconsider the matter. Technically, said the court, it was correct that it was still open for the second respondent to consider the complaint for the purposes of regulation 7, that is to establish whether the complaint, even if substantiated, did not disclose improper conduct. It was also true, said the court, that the second respondent is peculiarly equipped to make such an assessment. In the circumstances of the case, however, the court found that it would not be appropriate to follow such a course. It stated that if the second respondent had been of the view that the complaint, even if substantiated, did not disclose evidence of misconduct, it could have declined to direct an inquiry in the first place on that ground. Then there was the dispute about whether the third respondent had told the appellant about the purpose of the test. The court stated that it seemed inevitable that that dispute should be resolved and it could only be resolved by means of an inquiry.

The court held that in the circumstances, the appeal should succeed and that relief should be granted in terms of paragraph 2 and 3 of the notion of motion. In view of this conclusion it held that it was unnecessary and also inadvisable, for the court to make any pronouncement on all the arguments to the effect that on the undisputed facts the third respondent was in any event guilty of improper or disgraceful conduct.
Discussion

This case is of interest because it involves the failure of a health professional to disclose information to a patient as much as it does a lack of informed consent to an HIV test. Although so-called therapeutic privilege was not expressly raised as a defence, Dr Labuschagene did state in his response to the plaintiff’s complaint that it seemed cruel to disclose her HIV positive status to a woman pregnant with her first child one month before it is due to be born. Dr Labuschagne had something of a dilemma when the HIV tests result turned out to be positive because he had not obtained the patient’s informed consent to have the test done in the first place. The question is whether there is an obligation upon a health professional to divulge the results of all tests conducted upon the patient or whether he or she is legally entitled to withhold some of this information. Therapeutic privilege and informed consent are intricately intertwined in the provider-patient relationship. If the patient is not sufficiently apprised of the risks of an intervention then the consent falls short of being informed and the provider could be liable in delict. The capacity of an adult patient of sound mind patient to understand, assess and accept medical risk is wholly dependent upon the extent to which he or she is informed of those risks. If, on the other hand, the patient has the metaphorical ‘thin skull’ and is unable for some reason to cope psychologically with the information that is disclosed, there is the risk of a claim in delict for damages for emotional shock.

The Promotion of Access to Information Act\textsuperscript{299} acknowledges that it may not always be appropriate to disclose certain information to a patient where the effect of that information may adversely affect that patient’s health or wellbeing. It is submitted that this is tantamount to statutory recognition of a kind of therapeutic privilege. The relevant sections of the Act, sections 30(1) and 61(1), provide that where the person in charge of a public or private body is of the opinion that the disclosure of the record to the relevant person might cause serious harm to his or her physical or mental health, or well-being, the head may, before giving access in terms of section 60, consult with a health practitioner who, subject to subsection (2), has been nominated by the

\textsuperscript{299} Act No 2 of 2000
relevant person. If, after being given access to the record concerned, the health practitioner consulted in terms of subsection (1) is of the opinion that the disclosure of the record to the relevant person, would be likely to cause serious harm to his or her physical or mental health, or well-being, the head may only give access to the record if the requester proves to the satisfaction of the head that adequate provision is made for such counselling or arrangements as are reasonably practicable before, during or after the disclosure of the record to limit, alleviate or avoid such harm to the relevant person. Presumably, if no such proof is supplied, or proof which is not satisfactory is supplied, access to the record may be withheld.

It is submitted that the recognition in the South African law of delict of the possibility of damages for emotional shock is supportive of the concept of therapeutic privilege. After all one cannot on the one hand recognise that the negligent disclosure of distressing information can cause harm in the context of the law of delict and fail to recognise this same principle in the context of health service delivery. A case in point is *Clinton-Parker v Administrator, Transvaal* Dawkins *v Administrator, Transvaal* 300 in which the court awarded damages for emotional shock to two couples who had discovered that their babies had been swapped after they were born. The plaintiffs discovered the swop some 18 months after they gave birth. The plaintiffs decided to keep the children handed to them by the hospital. They are suing the defendant for damages flowing from the swop. It was common cause that the plaintiffs had suffered severe psychological damage for which they would require treatment in consequence of the swop. Navsa J observed that it was common cause that the fact of the negligent swapping of their children at birth, and the communication thereof some 21 months thereafter, caused the plaintiffs to suffer a psychiatric disorder, viz a mixed anxiety depressive disorder. He noted that the defendant’s counsel in their heads of argument acknowledged that *Bester v Commercial Union Verrekeringsmaatskappy van SA Bpk* 301 "contains the fullest and most recent exposition in our law of the applicable

---

300 *Clinton-Parker fn 225 supra*

301 *Bester 1973 (1) SA 769 (A). In Bester’s case liability was disputed on the basis that the injury suffered was shock of a psychiatric nature and was not a physical injury. Botha JA, in dealing with this argument, said the following: "So’n betoog is uit die aard van die saak vreemd aan die beginsels van ons reg, en ietwat gekunsteld in die lig van die feit dat volgens die Romeins-Hollandses reg aquilicse aanspreklikheid sodanig uitgebrei is dat vergoeding met die actio in factum verhaal kan word van enige skade wat op onregmatig en skuldige wyse veroorsaak is. (Matthews and Others v Young 1922 AD 492 op 504.)" The learned Judge of Appeal then went on to state that the reasonable foreseeability test was the test for liability for negligence and that this has repeatedly been set out in numerous authorities. He also pointed out that damages were regularly awarded for shock, pain and suffering, incapacity, loss of amenities of life and shortened life expectation, "ten minute waar dit met ’n suiwere fisiese beperking gepaard gaan". He concluded that to deny a
principles in regard to claims of this nature”. Counsel were referring to claims for damages where a plaintiff claims that he/she has suffered emotional shock or psychiatric injury as a result of the negligence of a defendant. Navsa J after examining South African and foreign precedent on the subject concluded that there was reason in principle or policy why the plaintiffs should not succeed in their claims. In his view, the harm suffered by the plaintiffs was sufficiently close to the defendant’s negligence for liability on the defendant’s part to arise. There are other cases in South African law which also recognise the possibility of damages for emotional shock. It is submitted that it is therefore technically possible for a health professional who negligently discloses distressing information to a patient who to his knowledge is unlikely to be able to cope with the disclosure and who suffers emotional shock as a result of the disclosure to be liable for damages in delict. Naturally there would have to be a balancing exercise in considering claims of this nature. Strauss observes that jurist’s rigid insistence in the past upon informed consent has in recent years made room for a more realistic approach and that today it is realised that to insist that the patient be fully informed at all times is not always in his interest. He quotes an Israeli judge, J Türkel as stating bluntly that “in the majority of cases, it is our duty to lie to the terminal cancer patient...In principle I cannot see any difference between the giving of an analgesic drug, or other drugs to such a patient and the giving of a drug named illusion”. With respect to that learned judge in that case, the present writer can see a significant difference between these two scenarios which in a phrase is the right to self-determination. An informed patient has a choice as to whether or not to take pain-killing drugs which will hasten his or her death. The same does not apply to a patient who is denied the knowledge of his or her condition. Whilst there may well be cases in which it is in the patient’s best interest not to inform him of his condition, the circumstances of each case must be considered on its merits. The present writer is of the view that patients are in any event not nearly as ignorant as some providers may believe and that in many instances they are likely to be aware that something could be

---

302 See for instance Hauman v Malmesbury Divisional Council 1916 CPD 216; Barnard v Santam Bank Bpk 1997 (4) SA 1032 (T); Road Accident Fund v Sauls 2002 (2) SA 55 (SCA)
303 Strauss fn 29 supra at p18
seriously wrong. Therapeutic privilege should only be exercised in that narrow set of
circumstances in which the patient is likely to be more harmed than helped by the
disclosure. It should not be used as a general excuse not to give a patient from bad
news. The decision of the court in VRM appears indirectly to endorse this view. If the
patient in this case had been informed of her HIV positive status at the time when it
was diagnosed, a number of options may have been open to her. She could have
elected to terminate the pregnancy (although this may not have been a real option so
late in the term) or to continue with the pregnancy and take measures to prevent
mother-to-child transmission of the disease. She could have gone for counselling as to
the implications of her condition for both herself and the child she carried and perhaps
have been better prepared for the possibility that the baby could be stillborn. Instead,
her life fell apart on the day that her child was born dead, she was told in an
apparently callous an unfeeling manner of her HIV positive status and her husband
was also informed of that status. Presumably he did not receive the news well given
the fact that he subsequently tested negative for HIV and that by the time the case
came to court, the couple were already separated.

Having said this, there are circumstances in which it is submitted that therapeutic
privilege even in its wider sense may have a significant role to play. An example is
the case of a minor who has been sexually abused by parents or other family members
in whose custody they find themselves. The irony of the situation is that the very
person who has care and custody of a child and who is therefore ordinarily
responsible for giving informed consent to health care services on his or her behalf is
the one who is abusing the child. It is submitted that in such circumstances it may at
times be useful for a provider to be able invoke therapeutic privilege in
communicating with the child's parent or guardian as to the nature of his or her
condition. One of the worst case scenarios is where a minor is pregnant with the child
of a parent or other relative and, but for the provisions of the Choice on Termination
of Pregnancy Act\(^\text{304}\), would have required the consent of that same parent or relative to

---

\(^{304}\) Act No 92 of 1996. Section 5 provides that –
(1) Subject to the provisions of subsections (4) and (5), the termination of a pregnancy may only take place with the
informed consent of the pregnant woman.
(2) Notwithstanding any other law or the common law, but subject to the provisions of subsections (4) and (5), no
consent other than that of the pregnant woman shall be required for the termination of a pregnancy.
(3) In the case of a pregnant minor, a medical practitioner or a registered midwife, as the case may be, shall advise such
minor to consult with her parents, guardian, family members or friends before the pregnancy is terminated.
terminate the pregnancy. The Act does not obviate the need to be able to invoke therapeutic privilege against a parent or guardian in order to protect the health or wellbeing of a minor since it applies only in the context of terminations of pregnancy. A similar situation would be a case of elder abuse in which an elderly person is suspected of being abused by a caregiver who has brought that elderly person for medical attention. A further example is that of intersexuality in children.

Provided that the termination of the pregnancy shall not be denied because such minor chooses not to consult them.”

In section 1 of the Act a woman is defined as “any female person of any age”

Côté A, ’Telling the Truth? Disclosure, Therapeutic Privilege and Intersexuality in Children’ Health Law Journal Vol 8, 2000 p199 notes that family physicians, paediatricians and geneticists meet a variety of young patients at various stages of the maturing process. As clinicians are privy to information about their patients that may be disturbing, they develop knowledge about human nature and decide, often along with parents, the appropriate level of information for different children and adolescents. She states that while it may be possible in a clinical sense to delineate the differing ages of understanding of a particular patient, the law may not always recognized these incremental changes. The law insists, with few exceptions, that those capable of consenting to treatment deserve the disclosure of appropriate information. After considering the legal and ethical principles of informed consent she goes on to consider therapeutic privilege, its nature and limitations. She notes that if a physician feels that disclosure of certain information will lead to the harm or suffering of the patient, she or he is said to be free to withhold this information. She states that information can be withheld if it is counter therapeutic, dysfunctional or distorting for the particular patient in question. This doctrine is traced back to the American case of Canterbury v Spence 464 F. 2d 772 (d. C. Cir 1972) where it is declared that if information is ‘menacing’ to a patient it need not be disclosed. She points out that the exception is raised were ‘a direct conflict...arises between the doctor’s medico-ethical duty to health and his legal-ethical duty to inform.’ This is based on the assumption that the physician cares not only for the patient’s physiological health but for his psychological and moral well-being as well. Côté notes that while the therapeutic privilege has been termed ‘an American exception’ by one Canadian court, its existence north of the border has nevertheless been alluded to by the Supreme Court of Canada.

In Reib v Hughes, [(1980) 114 D.L.R (3d) 1 (S.C.C.)] Laskin C. J. states that ‘it may be the case that a particular patient may, because of emotional factors, be unable to cope with facts relevant to recommend surgery or treatment and the doctor may, in such a case, be justified in withholding or generalizing information as to which he would otherwise be required to be more specific.’ In response to this, she notes, Maloney J, in Meyer Estate v Rogers [(1991) 78 D.L.R. (4th) 307 (Ont. Gen. Div.) at 312] has nevertheless declared that the therapeutic privilege has no place in Canadian law. The following year, the Supreme Court of Canada in McNerny v MacDonald [(1992) 93 D.L.R. (4th) 415 (S.C.C.)] at 427 again stated that information can be withheld from a patient if it is not in the patient’s best interest to receive it. However, the Ontario Court of Appeal has held that the exception does not apply in the case of elective surgery. (Videto v Kennedy (1981) 125 D.L.R (3d) 127). Côté observes that this limit may not apply in Alberta where the therapeutic privilege exception has been codified in the Health Information Act which provides that – 11(1) A custodian may refuse to disclose health information to an applicant

(a) if the disclosure could reasonably be expected

(i) to result in immediate and grave harm to the applicant’s mental or physical health or safety.

Therefore, she says, while many commentators have called for its elimination the therapeutic privilege remains part of Canadian law. It is worth noting that Ackermann J followed the judgment in Reib v Hughes in Castell v de Grief in the judgment that established the doctrine of informed consent in South African law.

Van Oosten FFW “The So-called Therapeutic Privilege or Contra-Indication: Its Nature and Role in Non-Disclosure Cases” (1991) 10 Med. & L. 31 describes six instances where disclosure is restricted:

(a) where disclosure would endanger the patient’s life or affect physical or mental health;

(b) where disclosure might prevent rational decision-making because the information is confusing or frightening

(c) where disclosure causes such anxiety and distress that it might jeopardise the outcome of the intervention

(d) where the patient is moribund and disclosure would be inhuman

(e) where the risks of disclosure are as much as or more serious than that of intervention

(f) where disclosure would seriously prejudice third parties.

Côté points out that excluding the final category the first five explore only the severity or source of harm to the patient. However, she says, without a definition of ‘serious’, even a detailed list such as this one leaves much to the discretion of the physician. What is certain, says Côté, is that the harm cannot be merely trivial, nor can the ‘harm’ be that a patient may refuse beneficial treatment if informed. The therapeutic privilege must not be invoked because the patient will make an ‘inappropriate’ choice. She states that it is clear that both ethically and in Canadian jurisprudence individuals are permitted to make ‘wrong’ or ‘bad’ choices. If this were not the case then there would be no need for informed consent at all for the doctor’s reasonable medical decisions could be held to stand in for those of the patient or the patient could merely be handed a list of preclassified ‘reasonable’ alternatives from which to choose. She notes that this scenario would obviously make a mockery of the idea of respect for persons and for bodily integrity. According to Côté, there is also a concern that the therapeutic privilege exception will be overused because physicians are anxious to avoid dealing with patients who become upset. She points out that sensitive disclosure can actually help a patient and prevent psychological harm by allaying fears that are exaggerated. Of particular interest to a consideration of the judgment in VRM is her observation that what is not directly addressed in the literature or case law is the issue of whether or not a diagnosis, as opposed to the risks of procedure, can be withheld from a patient because it is feared that its disclosure will cause harm. Côté comments that physicians may rely on the fact that they need not disclose to children or adolescents diagnoses about their genetic or biological sex status because this information would be terribly upsetting to the child.
The National Health Act partially codifies therapeutic privilege. Section 6(1) stipulates that every health care provider must inform a user of:

(a) the user’s health status except in circumstances where there is substantial evidence that the disclosure of the user’s health status would be contrary to the best interests of the user;

(b) the range of diagnostic procedures and treatment options generally available to the user;

(c) the benefits, risks, costs and consequences generally associated with each option; and

(d) the user’s right to refuse health services and explain the implications, risks, obligations of such refusal.”

It is submitted that this codification is only partial because it is questionable whether, the wording of section 6(1) and the reference to health status includes therapeutic privilege with regard to medical procedures. The wording seems only to recognize therapeutic privilege when it comes to diagnosis or the state of health of the patient. The exception is contained in section 6(1)(a) and therefore does not apply to paragraphs (b) to (d) of subsection (1).

There is a further recognition of therapeutic privilege implicit in section 8(3) of the Act which states that: “If a user is unable to participate in a decision affecting his or her personal health and treatment, he or she must be informed as contemplated in section 6 after the provision of the health service in question unless the disclosure of

She observes that on the one hand it is arguable that a patient is at least likely to become upset at this type of information as hearing about a proposed treatment. On the other hand, she says, this is precisely the sort of information for which a patient goes to a physician. One would have to imagine a situation where the diagnosis itself would cause harm to the child (for instance in the case of a suicidal child). However, if the physician relies on a pre-existing mental condition to invoke the privilege, she or he confuses the use of the exception with the doctrine of incapacity. This confusion may cause the overuse and misapplication of the exception. She states that to apply the exception to the withholding of a diagnosis, there needs to be a clear indication that the child will be seriously harmed by the provision of the diagnosis itself (not by a pre-existing condition that would lead to a finding of incapacity). Côté notes that in order to ensure that the exception of therapeutic privilege is not misused by overzealous physicians, there are a number of limitations placed on it. The first of these is that the burden of proof (a “heavy” burden) rests on the doctor. The latter must show that the non-disclosure was in the best interest of the patient. It submitted that highly likely that a similar burden or proof will also rest on a South African health professional in the light of the provisions of section 6(1)(a) of the National Health Bill. Another limitation she identifies is that merely because information disclosed in toto may be upsetting, this does not preclude all disclosure. Not only must the clinician assess whether or not there may be less upsetting ways of disclosing the information, it may be presented in a way that is more generalized than for the average patient. Côté notes that this may be particularly useful when dealing with children and adolescents. Another limitation is the exception is that it may be required (and most certainly would be required in the case of children) that if the exception were invoked, the disclosure must be made to a close relative (most likely parents or guardians in the case of children and adolescents). She says that this disclosure to a relative first ought to be made in order to assess whether the disclosure would in fact be harmful to the child and whether there might be a way to minimize this harm. Therefore parents themselves may be asked to tell children of the genetic or biological sexual abnormality (and any ensuing treatment) in age-appropriate language.

1287
such information would be contrary to the user’s best interest.” This section deals with a situation where due to the severity or nature of his illness a patient was unable to give informed consent to treatment or to participate in a decision as to treatment before receiving it. The section imposes a legal requirement that such person is informed as contemplated in section 6 after having received the treatment. The therapeutic privilege exception is clearly contained in the latter half of section 8(3).

In terms of section 7(3) of the National Health Act the exception of therapeutic privilege is incorporated by reference into the doctrine of informed consent as contained in section 6 of the Act. It states that “For the purposes of this section “informed consent” means consent for the provision of a specified health service given by a person with legal capacity to do so and who has been informed as contemplated in section 6.” Thus where a person has not been informed of their health status because of the exception in section 6(1)(a) but the other criteria in section 6 have been observed, this constitutes informed consent for the purposes of the Act.

It is submitted that the provision for therapeutic privilege in the Bill does not necessarily eliminate the legal dangers of using it. If anything, the Bill reinforces the view of Strauss referred to below that the exception should only be used in circumstances where there is clear and well established evidence of the patient’s sensitivity. The phrase ‘substantial evidence’ it is submitted, is not to be taken lightly in view of the constitutional rights of the patient.

It is submitted that one must balance the merits of exercising therapeutic privilege against the value of pre-disclosure or pre-treatment counselling such as is contemplated in both the Promotion of Access to Information Act and the Choice On Termination of Pregnancy Act. It is submitted that in view of the importance of patient autonomy, the constitutional rights to human dignity, freedom and security of the person and bodily and psychological integrity, (as well as South Africa’s unfortunate history of human rights abuses to which the medical profession was in some instances a party\textsuperscript{06}), pre- and post-event counselling should be explored.

\textsuperscript{06} And for which the then Medical Association of South Africa (which was subsequently transformed into the South African Medical Association) publicly and unreservedly apologised in a resolution adopted in June 1995 (See address by the Deputy President T M Mbeki at the opening of the 48th General Assembly of the World Medical Association http://www.sac.org.za/docs/histories/mbeki/1995/sp961025.htm; Williams J R ‘Ethics and Human Rights in South
wherever possible as an alternative to a situation in which it is anticipated there may be a need to exercise therapeutic privilege. The repeated references of Ackermann J in *Castell v de Greef* to so-called therapeutic privilege also suggest caution in exercising such ‘privilege’. It is probably better phrased as ‘therapeutic non-disclosure’ than therapeutic privilege in view of the legal liabilities that could attach to the non-disclosure of information to a patient. Strauss, writing well before the passing of the National Health Act, notes that the parameters of therapeutic privilege are as yet undefined in American law. He states that in fact so far it is perhaps no more than a theme running through minority decisions and there is some indication that American juries may not be so quick to accept it as a defence. Strauss observes that a doctor would be well-advised not to rely on this defence unless it is clearly documented that the patient’s sensitivity was well above the norm.

9.3 Summary and Conclusions

More detailed conclusions and observations on particular points of law have been made in the preceding pages and will not therefore be repeated here. The observations and conclusions that follow are of a more general nature.

The law of delict is undoubtedly a dynamic and living subject in which not even the basic elements seem certain at present. Whilst this is somewhat disturbing, and it is submitted that there is cause for concern as to the quality of the latest decisions emerging from South African courts, it may be symptomatic of a period in which many long established legal principles of law are being challenged or rethought in the
light of the relatively new constitutional legal dispensation that has yet to settle into the furthest reaches of the South African legal system. Whilst the concerns around fuzziness of elements of the law of delict and the importance of legal certainty should not be downplayed, it is worth noting that the flexibility or fuzziness around the element of unlawfulness, based as it is on the boni mores, has been lauded by more than one academic writer and seems generally to have served the legal system well since it was so incisively described by Rumpff CJ in *Minister van Polisie v Ewels* 310.

There is, however, much room for improvement in the law of delict in its application within the health care context in particular. The most obvious is the need for the courts to revisit their refusal to allow the application of the *res ipsa loquitur* to matters medical.

Without detracting from the importance of the principle of *stare decisis*, one must not forget that the courts do have the power to depart from established principle where it is clearly wrong, something which the doctoral thesis of P van den Heever has hopefully demonstrated with regard to *van Wyk v Lewis* 311 and the applicability of the *res ipsa loquitur* maxim in the context of the delivery of health services. There is a general need to recognise the imbalance of power between the patient and the provider in individual cases and to factor this into decisions concerning wrongfulness and legal causation. Health care services and products are not just another commodity. They have been compared to food by those who argue in favour of a trade based perception of health care transactions but it is submitted that there are significant differences between food on the one hand and health care products and services on the other. These are –

- The production of food is not subject to a licence from a government authority. Unlike most medicines, food can be grown in one’s own backyard;
- Accessibility to food is not governed by the need for a prescription from an expert;
- The production and supply of food does not require years of specialised training and expertise;

310 *Ewels* fn 66 supra
311 *Van Wyk* fn 3 supra
• Whilst it is true that without food the body will die, the environment in which both are required is such that food as a less complex product is generally far more accessible than medicine and in all but the most extreme and unfortunate cases, it is more readily available in terms of factors such as cost and distribution.

• Anyone can supply someone who is hungry with food. The same certainly is not true of health care products and services.

• The level and degree of research that goes into the production of food, whilst it can be significant and intense, is not nearly comparable with that which goes into the production of medicines and health care equipment.

• People are able to significantly adapt their diets, if need be, to their socio-economic circumstances in the sense that, while the food they eat may not be ideal it is enough to keep body and soul together. In the case of medicines and health care services there is no comparable option to adapt.

• Most people have a much greater understanding and appreciation of processes of food production and application than they do medicines.

• Most foods, unlike most medicines, are not poisonous substances.

The tendency of the courts to prefer to decide cases on the basis of the law of delict when faced with claims in both contract and delict, despite the fact that it has been observed that the basis for the delivery of health care services is mostly contractual, is quite possibly indicative of a feeling or belief that the delivery of health care services is more than just business as usual. In the context of the law of delict the legal convictions of the community are brought into play in matters of this nature and the obligations of the provider to the patient must be seen in a larger context than just the narrow terms of a contractual relationship in which there is very clearly the balance of power still favours providers over patients. This said, however, the difference between the law of contract and the law of delict is becoming notional and if the courts could bring themselves to apply the law of contract within the broader context of constitutional rights and principles and at the same time acknowledging the way the world is now, the law of contract still has a useful role to play in the context of health service delivery.
The convergence between the law of contract and of delict is encouraging in the sense that the same constitutional values and principles should underpin them both and that decisions should be consistent across different fields of law as well as within them if the constitutional order is to prevail. It must be stressed however that each of them is a logical system in its own right and, whilst one should never prize legal principles over justice, this should not be seen as a mere technical nuisance by the courts but rather as the basis of logic and experience that ultimately ensures that the end result is, in fact, justice.
Chapter 10

The South African Law on Health Service Delivery: Conclusions and Observations

10.1 Introduction

The delivery of health services in South Africa embraces a number of areas of law. It has not been possible to cover every area in a thesis such as this. The objective here is
a synthesis of the major areas of law impacting on health service delivery rather than a purely analytical study of the impact on health service delivery of the more obscure areas or minute and detailed analysis of technical points. Whilst fine analytical scrutiny has its place, there is great value in stepping back occasionally to survey the law from a panoramic perspective. It is the only way to approach concepts such as “health law” or “media law” that cut across many different aspects ranging from statutes to the common law and from international to domestic law. In terms of this approach the scope of the thesis is defined by the area of human society, in the present case health services delivery, to which law is applicable rather than the field of law itself such as public or private, contract or delict.

In this chapter the skeins of commonality that were identified in the preceding chapters are drawn together and highlighted. Also the flaws and weaknesses within the various areas of law are identified and considered and where appropriate, suggestions are made as to how they may best be remedied. Ultimately, the role of the courts in ensuring that constitutional values and principles irradiate the common law cannot be overemphasised. It is critical that the judiciary recognises, acknowledges and appreciates the pervasive and structural importance of the Constitution. Unfortunately this appreciation is still significantly lacking amongst some judges. The Constitution is perceived by many as having its own compartment within the larger legal system rather than as the new foundation by which the entire structure now stands (or falls).

There is a common thread running through the five areas of law that are covered in this thesis. Broadly speaking this thread is the Constitution and the values that it represents. Even within international law as a broad concept outside of national boundaries, the South African Constitution is a distinct point of focus. International law also clearly influenced the drafters of the Constitution despite the fact that they still came up with a legal grundnorm that is peculiar to the history and culture of this country. The Constitution in its turn mandates a conscious and continued application of international legal principles in a number of spheres, for example the interpretation of the Bill of Rights. It is the interface through which international law, by a process of osmosis, influences South African domestic law. As the foundation of South Africa’s domestic legal order, the Constitution is the primary sourcebook for the
application and interpretation of the common law, including the law of contract and of delict. Administrative law has become a constitutional construct in its own right whereas previously it was merely a patchwork of statutory and common law decisions that were far from homogenous. In a sense the Constitution therefore serves as the lodestar of the South African legal system, polarising and charging the principles of international law that enter into domestic law with the values, ideals and principles of the South African people. It also serves the same purpose for internal, domestic law, ensuring that, irrespective of the area of law concerned, the legal system in its entirety is a cohesive and integrated whole in conformity with constitutional values and principles. This said, it must be noted that law is a dynamic system. The work of the Constitution will never be complete. There will not be a time where it can be said that the domestic legal system is completely and finally aligned with the Constitution, neither will there be a time when constitutional law itself becomes static. That is not the nature of law. There will always be factual permutations that test its strength and push its boundaries. New developments in international law and increasing globalization will maintain the tensions between international law and domestic legal systems and ensure a process of continuous growth and development in legal structure and legal theory both within and outside of South Africa. It is for these same reasons that it is so important to maintain an internally coherent, unitary domestic legal system that accurately reflects the fundamental values and principles of South African society.

There are a number of statutes that specifically govern health service delivery most of which fall within the portfolio of the Minister of Health. They range from statutes governing health professionals and the practice of health care in various disciplines to those dealing with specific health care situations or products such as occupational diseases in mines and works, hazardous substances, human tissue and food and medicines. At present the delivery of health care services in the public sector is

---

1 This is not by any means excuse for failure to make a concerted effort to ensure that the ‘constitutionalisation’ of the South African legal system is of the utmost significance and should be the conscious focus of every practising lawyer here and now. It is simply that in a factual situation in which there was a pre-existing system of law that took hundreds of years to develop, upon which another very different approach has suddenly been imposed, it is likely that the ‘matching’ or complete integration of every area of the older system with the new approach will take a very long time given that it is within human nature to resist change, that the development of law is as much a process of evolution as revolution, that the extent of legal exegesis necessary to achieve this is quite probably beyond the capabilities of a single generation in any event, and the fact that constitutional law itself is a dynamic concept.

2 Simply put, if we know who we are, we can know what we want and where we are going and can ourselves exert an influence on developments on the international legal front that promote and further the national interest.
governed by the Health Act\(^3\). The administration of large sections of this statute was assigned to the provincial governments in 1994 but some remained with the National Department of Health. However the National Health Act\(^4\) was passed by Parliament in 2003 and will soon become operational. This Act will repeal the Health Act and become the central legislation on health service delivery in South Africa in both the public and private health sectors. Since each statute governing health service delivery is quite worthy of a thesis in itself and since the intention of this thesis was not to look at specific situations, products or services as dealt with in the various statutes, specific discussion of individual statutes has mostly been avoided. Where there is a statute that relates to the particular topic under discussion, mention of it has been made in passing and to alert the reader to the fact that it exists and has an impact in a particular area. This thesis focuses on certain aspects of the common law, such as the law of contract and the law of delict, because this tends to be the law upon which relationships between providers and patients - the interface of health services delivery - still largely depends and in terms of which claims in the courts are mostly decided.

Administrative and constitutional law in South Africa, the other two major areas of South African law that impact upon health service delivery, especially in the public sector, and upon which this thesis focuses, cannot be said to consist purely of common law. They are a blend of statutory and common law. The Promotion of Administrative Justice Act and the Constitution itself are central to any discussion of these two areas. Since the Constitution underpins all areas of law in South Africa, careful attention has been given to the treatment of constitutional principles in the context of the areas of the common law that have been covered. The chapter examining international law relating to health service delivery attempts to contextualise the South African legal system within a framework of international concepts and norms in order to ascertain how the former compares. Since international law is not insignificant in South Africa’s constitutional legal dispensation it would have been inappropriate not to consider the position of international law with regard to health service delivery. For the sake of completeness passing reference is sometimes made to statutes that govern more specific areas of

\(^3\) Health Act No 63 of 1977
\(^4\) National Health Act No 61 of 2003
health law such as the Medicines and Related Substances Act\(^5\) or the Medical Schemes Act\(^6\) but this is more in order to highlight a particular point concerning health service delivery than to examine the statute itself in any depths.

The common law in South Africa tends to be developed piecemeal by the courts in the sense that although the principle of *stare decisis* prevails, there is seldom any attempt to cross reference the principles of different areas of law in order to resolve particular cases. In fact the courts in the past have stoutly rejected arguments that might have the effect of hybridising legal principles and concepts developed in one area with those of another. This thesis is critical of such an approach on the basis that since all law must be interpreted and applied with reference to the Constitution, there should be common policies and concepts informing all areas of law relating to a particular field. The preference is for an outcomes based approach to the application and interpretation of law. In the context of health service delivery in particular, it is demonstrable that a rigidly compartmentalised approach to law, which focuses on the means rather than the end, can lead to illogical and unfair decisions. Internal consistency is necessary not only within but across legal disciplines. From a practical perspective too, people do not limit themselves in their daily activities to particular legal areas. In a context such as health service delivery many different legal principles often converge upon a single situation. Consequently, the approach in this thesis to law is based on this reality. Such people are not concerned with whether a particular activity falls within the realm of the law of contract, delict or administrative law and for the most part, neither are their patients. To them, any law that affects the delivery of health services is relevant and the question is what law or laws govern any given situation. Law is therefore treated as a means to an end rather than an end in itself.

On the whole it would appear that there is still much work to be done in terms of the recognition of constitutional principles relating to the law of health service delivery within other branches of law such as the common law of contract and delict. The Supreme Court of Appeal in particular has on a number of occasions demonstrated a surprising lack of cognisance of central constitutional themes. This leads one to the realisation that, ten years into South African democracy and the constitutional legal

\(^5\) Medicines Act No 101 of 1965
\(^6\) Medical Schemes Act No 131 of 1998
order, the process of ‘constitutionalising’ the major part of the South African common law is going to take longer than some might have hoped. South African law lags behind other countries in terms of revised thinking around the purpose of the law of contract, consumerism and the complexity of business and other human relationships in the twenty first century. It is in many ways a reflection of the socio-economic disparities between different levels of South African society. The older, apartheid tempered, approach to law, based on how people who are relatively wealthy would bargain and conduct their affairs, can still be seen existing side-by-side with one of the most progressive, legally elegant constitutions in the world. Wealth is, after all, power. If one’s perception of the power of the individual is based upon an assumption of a certain level of wealth, this will inform the approach one takes when adjudicating matters between contracting parties in terms of the law of contract. If one sees the primary purpose of law as a brake upon transformation - as maintaining the status quo in terms of power distribution, or of attacking post-apartheid systems and structures so as to carry a particular historical bias into the present – this view will undoubtedly emerge in the manner of its application. Conversely if one regards law as a vehicle for positive transformation of society and as a means of promoting equality and freedom for all of its members, this will also be reflected in the manner in which the law is applied\(^7\). One sees a mix of these two approaches to law across the South African judiciary and across the different types of courts. Since the judiciary is a reflection of larger society, this is hardly surprising.

There is much that is admirable about the South African law relating to health service delivery. Compared to the “pie-in-the-sky” of international law, it offers a far more pragmatic and tangible promise of the realisation of human rights goals. It holds a reassurance that socio-economic rights in South Africa are real and enforceable. At the same time, the standard applied to the conduct of government with regard to these rights is one of reasonableness. Whilst some may argue that reasonableness is itself a vague concept that can mean just about anything, it is submitted that reasonableness allows scope for many different points of view, for the possibility of justification of one’s actions from a position of power, for variances based on circumstances, for

\(^7\) In Bel Porto School Governing Body And Others v Premier, Western Cape, And Another 2002 (3) SA 265 (CC) for instance the constitutional court observed: “It is true that, in determining what constitutes procedural fairness in a given case, a court should be slow to impose obligations upon government which will inhibit its ability to make and implement policy effectively. It is also true in a country such as ours, that faces immense challenges of transformation, that we cannot deny the importance of the need to ensure the ability of the executive to act efficiently and promptly.”
argument within the bounds of human weakness and capability that a particular act or omission should be condoned or upheld in law. The concept of reasonableness, it is submitted, covers a multitude of sins in a manner that promotes justice and equality. Reasonableness asks one to think about the consequences of one’s actions, to take account of the needs and views of others and to make informed and rational decisions. It implies a standard of objectivity against which one’s actions are assessed that is neither impossible to work with nor biased on emotional grounds in favour of a particular view. The concept of reasonableness pervades South African law. It is as much in evidence in constitutional law as it is in the law of contract, the law of delict and administrative law. It is a universal theme capable of lending consistency to law as a whole. In the context of health service delivery, as in law, reasonableness is a very relevant concept. It dictates, for instance, the lengths to which one should go to save a life, the extent of the personal sacrifice one must make to help another, the precautions one must take when administering a dangerous drug, the nature and scope of the information to be given to a patient when seeking his informed consent, the standard of care to be adopted in treating a patient, the nature of the particular surgical procedure chosen to address a particular health condition and the acceptability to society of certain contractual terms.

Reasonableness also suggests and promotes another central tenet of law – fairness. Undue favouring of one person’s interests over another is a concern not only of constitutional, administrative and common law but also of those involved in the field of health care rationing and health service delivery. How does one allocate resources in a manner that is fair and equitable? On what basis does one decide that this patient gets renal dialysis and that one does not? Systems of triage on fields of war and in hospital trauma units alike are concerned with issues of fairness. In the health sector, fairness can literally be a matter of life or death. Fairness in law involves not only a balancing of the interests of the parties concerned but also a balancing of the different rights in the Bill of Rights, a balancing of the constitutional values of equality and freedom and the necessary limitation of constitutional rights. An irrational bias in favour of one right against another could lead to injustice just as surely as an irrational

bias in favour of one party against the other since constitutional rights are interrelated and interdependent.

Fairness in turn, is closely associated with equality. For instance unfair discrimination constitutes a denial of equality\(^\text{10}\). Equality as a legal concept is context dependent. In the context of health care one does not promote equality by prescribing the same treatment for all irrespective of their health status and health condition. Instead, one achieves equality in health care by addressing the different health problems of everyone in such a manner as to ensure that at the end of the day that they are all as healthy as possible\(^\text{11}\). Equitable decisions are those that take into account the concerns of all of the parties involved and that deal with them from the perspective of equality. Fairness is a concern of the common law of contract\(^\text{12}\) and the law of delict\(^\text{13}\) as well as the context of health care one does not promote equality by prescribing the same:

\(^{\text{11}}\) In Chairman, Board on Tariffs and Trade, and Others v Brenco Inc and Others 2001 (4) SA 511 (SCA) Zulman JA noted: "Lord Mustill summarised the duty of a public official or body to act fairly in these lucid terms: "What does fairness require in the present case? My Lords, I think it unnecessary to refer by name or to quote from, any of the often-quoted authorities in which the courts have explained what is essentially an intuitive judgment. They are far too well known. From them, I derive the following. (1) Where an Act of Parliament confers an administrative power there is a presumption that it will be exercised in a manner which is fair in all the circumstances. (2) The standards of fairness are not immutable. They may change with the passage of time, both in the general and in their application to decisions of a particular type. (3) The principles of fairness are not to be applied by rote identically in every situation. What fairness demands is dependent on the context of the decision, and this is to be taken into account in all its aspects. (4) An essential feature of the context is the statute which creates the discretion, as regards both its language and the shape of the legal and administrative system within which the decision is taken. (5) Fairness will very often require that a person who may be adversely affected by the decision will have an opportunity to make representations on his own behalf either before the decision is taken with a view to producing a favourable result, or after it is taken, with a view to procuring its modification, or both. (6) Since the person affected usually cannot make worthwhile representations without knowing what factors may weigh against his interests fairness will very often require that he is informed of the gist of the case which he has to answer." \(^{\text{16}}\) Zulman JA stated in Chairman, Board on Tariffs and Trade, and Others v Brenco Incystem and Others (fn 11 supra): "There is no single set of principles for giving effect to the rules of natural justice which will apply to all investigations, enquiries and exercises of power, regardless of their nature. On the contrary, courts have recognised and restated the need for flexibility in the application of the principles of fairness in a range of different contexts. As Sachs LJ pointed out in Re Pergamon Press (1971) 1 Ch 388 (CA) [(1970) 3 All ER 535]: 'In the application of the concept of fair play, there must be real flexibility, so that very different situations may be met without producing procedures unsuitable to the object in hand. . . . It is only too easy to frame a precise set of rules which may appear impeccable on paper and which may yet unduly hamper, lengthen and, indeed, perhaps even frustrate . . . the activities of those engaged in investigating or otherwise dealing with matters that fall within their proper sphere. In each case careful regard must be had to the scope of the proceeding, the source of its jurisdiction (statutory in the present case), the way in which it normally falls to enquire and exercises of power, regardless of their nature." There is another common thread that binds the legal system throughout that is also implied by reasonableness – rationality. There has to be a reason for acting or refraining from acting in a particular way. What is more, the reason must be within the boundaries of common human understanding so that it would constitute a valid reason in the minds of others in similar circumstances. In other words, rationality implies a reason within a framework. A court or government department that gives reasons for its decision which are not based on any commonly understood conceptual framework is acting irrationally. Rationality is reason anchored within a common perception of reality.

The decisions of the judiciary, the actions of the executive, the Acts of the legislature must be reasonable, fair, equitable and rational. Many of these precepts have been introduced or reinforced by the Constitution. The word ‘reasonable’ occurs some thirty two times in the Constitution, the word ‘fair’ eleven times, while the word ‘equitable’ occurs some sixteen times and ‘equality’ occurs some seventeen times. The word ‘justice’ occurs some fifty four times. These statistics are indicative of the preoccupations of the Constitution with deeper social values and fundamental legal norms.

10.2 International Law

17 Logbro Properties CC v Bedderson NO and Others 2003 (2) SA 460 (SCA)

18 Bel Porto School Governing Body and Others v Premier, Western Cape, and Another fn 7 supra Mokgoro J and Sachs J stated: “There are circumstances where fairness in implementation must outtop policy” and “The objective of judicial intervention under that section is to secure compatibility with fundamental notions of fairness in relation to the exercise of administrative power. Once it has been established that conduct is inconsistent with the Constitution the Court, in addition to declaring such conduct to be invalid to the extent of its inconsistency, may make any order that is just and equitable. Thus, it would not be just and equitable to remedy unfairness to some by imposing unfairness on others. On the other hand, the constitutional rights of some cannot be withheld simply because of some potential knock-on effect on others. The test is one of fairness, not legality.” and “Unlike questions of legality, where the exercise of a power either is lawful or it is not, fairness can be a matter of degree. In this respect we can do no better than repeat what Steyn J recently said in R v Secretary of State for the Home Department, Ex parte Pierson: ‘It was suggested that severance would involve “a rewriting” of the policy statement. This is a familiar argument in cases where the circumstances arguably justify a court in saying that the unlawfulness of part of a statement does not infect the whole. The principles of severability in public law are well settled. . . . Sometimes severance is not possible, eg a licence granted subject to an important but unlawful condition. Sometimes severance is possible, eg where a bye (sic) law contains several distinct and independent powers one of which is unlawful. Always the context will be determinative. In the present case the power to increase the tariff is notionally severable and distinct from the power to fix a tariff. . . . It is an obvious case for severance of the good from the bad. To describe this result as a rewriting of the policy statement is to raise an objection to the concept of severance. That is an argument for the blunt remedy of total unlawfulness or total lawfulness. The domain of public law is practical affairs. Sometimes severance is the only sensible course.”” [Footnotes omitted]
Whilst the Constitution makes a number of references to international law\(^9\) discovering what is encompassed by the term 'international law', especially with regard to rights relating to health care services, is easier said than done. There are a number of international conventions to which South Africa is a party or a signatory which impact upon discussions of the law relating to health services delivery in South Africa. They are the Convention on the Rights of the Child (CRC), the International Covenant on Economic, Social and Cultural Rights (ICESCR), the UN Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW), the African Charter on the Rights and Welfare of the Child and the African Charter on Human and Peoples’ Rights. However the point is made in chapter one of this thesis that these instruments of international law have not expressly or directly been enacted in South African legislation neither have they been applied down to the last detail by the constitutional court. A notable example of the latter is the court’s refusal to interpret the socio-economic rights in the Bill of Rights of the South African Constitution, including the right of access to health care services, with reference to a ‘minimum core’ of obligations as contemplated by the ICESCR Committee. In General Comment No 14 the Committee on Economic, Social and Cultural Rights has stated that the realization of the right to health requires that the state ensure equality of access to a system of health care and provide health services without discrimination. Accessibility in turn, has four overlapping dimensions: non-discrimination, physical accessibility, economic accessibility (affordability) and information accessibility\(^20\). The National Health Act embodies these principles of accessibility to a large extent\(^21\). However when they are interpreted and applied by the

---

19. In sections 35, 37, 39, 198, 199, 200, 201, 231, 232 and 233

21. National Health Act fn 3 supra. Thus with regard to economic accessibility section 3 of the Act provides:

   (1) The Minister must, within the limits of available resources—
   
   (a) endeavour to protect, promote, improve and maintain the health of the population;
   
   (b) promote the inclusion of health services in the socio-economic development plan of the Republic;
   
   (c) determine the policies and measures necessary to protect, promote, improve and maintain the health and well-being of the population;
   
   (d) ensure the provision of such essential health services, which must at least include primary health care services, to the population of the Republic as may be prescribed after consultation with the National Health Council; and
   
   (e) equitably prioritise the health services that the State can provide.

   (2) The national department, every provincial department and every municipality must establish such health services as are required in terms of this Act, and all health establishments and health care providers in the public sector must equitably provide health services within the limits of available resources.

   and section 4 provides:

   (1) The Minister, after consultation with the Minister of Finance, may prescribe conditions subject to which categories of persons are eligible for such free health services at public health establishments as may be prescribed.

   (2) In prescribing any condition contemplated in subsection (1), the Minister must have regard to—
   
   (a) the range of free health services currently available;
   
   (b) the categories of persons already receiving free health services;
courts, it may not be with more than a passing reference to the provisions of the international conventions referred to earlier, since the National Health Act is not specifically enacting these conventions. Whilst they may have an influence in the manner in which the Act is interpreted, it is submitted that the South African courts are more likely to interpret the Act with reference to the Constitution and other relevant legislation such as the Promotion of Equality and Prevention of Unfair Discrimination Act, the Promotion of Administrative Justice Act and the Promotion of Access to Information Act. The constitutional right of access to health care services is part of a matrix of rights created in the Bill of Rights and other provisions of the

(c) the impact of any such condition on access to health services; and
(d) the needs of vulnerable groups such as women, children, older persons and persons with disabilities.

(3) Subject to any condition prescribed by the Minister, the state and clinics and community health centres funded by the state must provide—
(a) pregnant and lactating women and children below the age of six years, who are not members or beneficiaries of medical aid schemes, with free health services;
(b) all persons, except members of medical aid schemes and their dependants and persons receiving compensation for compensable occupational diseases, with free primary health care services; and
(c) women, subject to the Choice on Termination of Pregnancy Act, 1996 (Act No. 92 of 1996), free termination of pregnancy services.

With regard to information accessibility section 6 of the Act provides that—

(1) Every health care provider must inform a user of—
(a) the user’s health status except in circumstances where there is substantial evidence that the disclosure of the user’s health status would be contrary to the best interests of the user;
(b) the range of diagnostic procedures and treatment options generally available to the user;
(c) the benefits, risks, costs and consequences generally associated with each option; and
(d) the user’s right to refuse health services and explain the implications, risks, obligations of such refusal.

(2) The health care provider concerned must, where possible, inform the user as contemplated in subsection (1) in a language that the user understands and in a manner which takes into account the user’s level of literacy and section 10 of the Act stipulates that—

(1) A health care provider must provide a user with a discharge report at the time of the discharge of the user from a health establishment containing such information as may be prescribed.

(2) In prescribing the information contemplated in subsection (1), the Minister must have regard to—
(a) the nature of the health service rendered;
(b) the prognosis for the user; and
(c) the need for follow-up treatment.

A discharge report provided to a user may be verbal in the case of an outpatient, but must be in writing in the case of an inpatient and section 12 of the Act provides that—

The national department and every provincial department, district health council and municipality must ensure that appropriate, adequate and comprehensive information is disseminated on the health services for which they are responsible, which must include—
(a) the types and availability of health services;
(b) the organisation of health services;
(c) operating schedules and timetables of visits;
(d) procedures for access to the health services;
(e) other aspects of health services which may be of use to the public;
(f) procedures for laying complaints; and
(g) the rights and duties of users and health care providers.

With regard to physical accessibility the Bill creates a licensing system in chapter 6 based on need which will regulate the distribution of health establishments throughout the country in accordance with the criteria specified in the chapter. Act No 4 of 2000, Act No 3 of 2000 and Act No 2 of 2000 respectively. As noted below, although section 233 of the Constitution requires courts when interpreting legislation to prefer an interpretation that is consistent with international law over one that is inconsistent with it, international law is generally not helpful when it comes to the level of detail required to resolve specific situations. Furthermore, it is submitted that where the Constitution is not on all fours with international law on a particular issue, the provisions of the Constitution will take precedence as demonstrated by the approach of the Constitutional court to minimum core content of socio-economic rights. A further problem is that it is not entirely clear what is meant by international law. It is fairly obvious that public international law and customary international law are included but it is not so obvious that private international law and jus cogens are also included. The Constitution does not define the term ‘international law’. Furthermore, where the provisions of public international law themselves conflict, as can happen with international trade agreements and conventions on human rights from time to time, the dilemma is which international law must the courts prefer. The answer, it is submitted lies in domestic law and more specifically the Constitution. The courts will always revert to the Constitution, as the foundation of the South African legal system, when resolving matters involving socio-economic rights.
Constitution which means that it has to be considered in the context of that matrix and a balancing exercise has to be undertaken in the event of a conflict of rights.

Section 231(4) of the Constitution states that any international agreement becomes law in the Republic when it is enacted into law by national legislation; but a self-executing provision of an agreement that has been approved by Parliament is law in the Republic unless it is inconsistent with the Constitution or an Act of Parliament. The International Health Regulations are the only international agreement that has so far been expressly enacted into law falling within the portfolio of the Minister of Health. Since international law binds nation states rather than their individual subjects, international law is unlikely to have direct application within South Africa. However, it clearly can and does exert a strong influence on how legislation within South Africa is formulated and interpreted, and, because of the provisions of section 39(1)(b) of the Constitution, is also a factor that cannot be ignored by the judiciary when interpreting the Bill of Rights. It is not, however, only international agreements to which South Africa is a party that inform the domestic legal system. As Dugard points out, fears that international human rights law might be narrowly construed to cover only clear rules of customary law, and those human rights conventions to which South Africa is a party, were dispelled by the decision of the constitutional court in *S v Makwanyane and Another*. The judiciary is enjoined in section 233 of the Constitution when interpreting any legislation, to prefer any reasonable interpretation of the legislation that is consistent with international law over any alternative interpretation that is inconsistent with international law. Moreover, section 233 of the Constitution provides that customary international law is domestic law where it is not inconsistent with the Constitution or an Act of Parliament. The problem with international law, especially public international law, is that it sometimes suffers from vagueness as to the practical details necessary for its implementation.

---

23 The International Health Regulations Act 28 of 1974 specifically defines 'the International Health Regulations' as the International Health Regulations adopted by the World Health Assembly at Boston on 25 July 1969, and set out in the Schedule.

24 Dugard *International Law: A South African Perspective* at p 264

25 *Makwanyane* 1995 (3) SA 391 (CC) where Chaskalson JP stated at p 413: "In the context of s 35(1), public international law would include non-binding as well as binding law. They may both be used under the section as tools of interpretation. International agreements and customary international law accordingly provide a framework within which chap 3 can be evaluated and understood, and for that purpose, decisions of tribunals dealing with comparable instruments, such as the United Nations Committee on Human Rights, the Inter-American Commission on Human Rights, the Inter-American Court of Human Rights, the European Commission on Human Rights, and the European Court of Human Rights and, in appropriate cases, reports of specialised agencies such as the International Labour Organisation, may provide guidance as to the correct interpretation of particular provisions of chap 3." [Footnotes omitted]
legislative measures and the assessment of the resources and infrastructures necessary to implement law are usually neglected aspects of domestic legal systems—especially in developing countries. This is even more true of international law. If it is no small task to quantify the financial and operational implications of domestic law it is almost impossible to do so with regard to international law. The wealthy, developed countries of the world seldom if ever talk directly about the costs of implementing international human rights instruments but readily speak, for instance, of the minimum core of socio-economic rights that should obtain within poverty-stricken developing countries.

Despite the fact that the approach of public international law to health care services is much broader and more comprehensive than that of the South African legal system in that the former recognises the right to health rather than just a right of access to health care services, it is submitted that the approach of the latter is preferable for a number of different reasons. Some of these are apparent in the judgments of the constitutional court dealing with the concept of the minimum core contents of socio-economic rights. The court in these cases preferred to look at whether the state had acted

---

26 Thus in *Government of the Republic of South Africa and Others v Grootboom and Others* 2001 (1) SA 46 (CC) the constitutional court observed that: "It is not possible to determine the minimum threshold for the progressive realisation of the right of access to adequate housing without first identifying the needs and opportunities for the enjoyment of such a right. These will vary according to factors such as income, unemployment, availability of land and poverty. The differences between city and rural communities will also determine the needs and opportunities for the enjoyment of this right. Variations ultimately depend on the economic and social history and circumstances of a country. All this illustrates the complexity of the task of determining a minimum core obligation for the progressive realisation of the right of access to adequate housing without having the requisite information on the needs and the opportunities for the enjoyment of this right. The committee developed the concept of minimum core over many years of examining reports by reporting states. This Court does not have comparable information. The determination of a minimum core in the context of the right to have access to adequate housing presents difficult questions. This is so because the needs in the context of access to adequate housing are diverse: there are those who need land; others need both land and houses; yet others need financial assistance. There are difficult questions relating to the definition of minimum core in the context of a right to have access to adequate housing, in particular whether the minimum core obligation should be defined generally or with regard to specific groups of people. As will appear from the discussion below, the real question in terms of our Constitution is whether the measures taken by the state to realise the right afforded by s 26 are reasonable. There may be cases where it may be possible and appropriate to have regard to the content of a minimum core obligation to determine whether the measures taken by the state are reasonable. However, even if it were appropriate to do so, it could not be done unless sufficient information is placed before a Court to enable it to determine the minimum core obligation in the context of our Constitution. It is not in any event necessary to decide whether it is appropriate for a Court to determine in the first instance the minimum core content of a right." (Footnotes omitted)
reasonably in the circumstances – a very pragmatic and far more tangible approach to socio-economic rights than that postulated by international law. International law, in terms of the minimum core concept, attempts to set a universal benchmark against which all efforts to achieve the realisation of the right to health are to be measured, irrespective of the resources available to a particular country or the circumstances of the individuals whose rights are affected. Whilst such an approach might be appropriate for international law – especially public international law - since its main objective as law seems to be to set norms and standards for various national legal systems to live up to, it is not so useful when it comes to the implementation of more or less the same principles within a domestic legal system. The primary object of the South African domestic legal system is not so much to set norms and standards as it is to ensure that the state fulfils its constitutional obligation to respect, protect, promote and fulfil the rights in the Bill of Rights with regard to the terms in which the Constitution is written. Unlike international law, domestic law must have teeth when it comes to the resolution of specific cases in which particular circumstances obtain with regard to identifiable individuals. It is submitted that the approach of South African domestic law, and more particularly South African constitutional law, to the question of the right of access to health care services has far more meaning and significance for those individuals seeking to enforce that right than do the precepts of international law with its top-down, minimum core approach that is not anchored to the realities of each particular situation. The scarcity of resources is one such reality. A socio-economic right which does not take realities of this nature into account ends

"reasonable legislative and other measures, within its available resources, to achieve the progressive realisation of each of these rights". The rights requiring progressive realisation are those referred to in ss 27(1)(a), (b) and (c). In Soobramoney it was said: 'What is apparent from these provisions is that the obligations imposed on the state by ss 26 and 27 in regard to access to housing, health care, food, water and social security are dependent upon the resources available for such purposes, and that the corresponding rights themselves are limited by reason of the lack of resources.' The obligations referred to in this passage are clearly the obligations referred to in ss 26(2) and 27(2), and the ‘corresponding rights’ are the rights referred to in ss 26(1) and 27(1). This passage is cited in Grootboom. It is made clear in that judgment that ss 26(1) and 26(2) 'are related and must be read together'. Yacoob J said: 'The section has been carefully crafted. It contains three subsections. The first confers a general right of access to adequate housing. The second establishes and delimits the scope of the positive obligation imposed upon the state....' It is also made clear that 's 26 does not expect more of the state than is achievable within its available resources' and does not confer an entitlement to "claim shelter or housing immediately upon demand" and that as far as the rights of access to housing, health care, sufficient food and water, and social security for those unable to support themselves and their dependants are concerned, "the state is not obliged to go beyond available resources or to realise these rights immediately". In Grootboom reliance was also placed on the provisions of the Covenant. Yacoob J held that in terms of our Constitution the question is 'whether the measures taken by the state to realise the right afforded by s 26 are reasonable'. Although Yacoob J indicated that evidence in a particular case may show that there is a minimum core of a particular service that should be taken into account in determining whether measures adopted by the state are reasonable, the socio-economic rights of the Constitution should not be construed as entitling everyone to demand that the minimum core be provided to them. Minimum core was thus treated as possibly being relevant to reasonableness under s 26(2), and not as a self-standing right conferred on everyone under s 26(1). He said that a "purposive reading of ss 26 and 27 does not lead to any other conclusion. It is impossible to give everyone access even to a 'core' service immediately. All that is possible, and all that can be expected of the state, is that it act reasonably to provide access to the socio-economic rights identified in ss 26 and 27 on a progressive basis." [Footnotes omitted]
up being hollow and largely unenforceable. The circumstances of the particular case are another reality. It is not enough, said the court in *Grootboom* that the measures taken by the state though statistically successful, fail to respond to the needs of those most desperate. The rights of the individual are of paramount importance in considering South African constitutional rights. This does not mean that the rights of the individual must always take precedence over the rights of the collective or of other individuals. However the statement of the court in *Grootboom* referred to earlier and in other cases demonstrates the focus in constitutional law on the individual. Sachs J noted in *Ex Parte Gauteng Provincial Legislature: In Re Dispute Concerning the Constitutionality of Certain Provisions of the Gauteng School Education Bill of*
that a review of literature by leading authors in the field suggested that over the years there had been a firm movement from the concept of tolerance of religious and other minorities, to that of protection of national groups, to that of guaranteeing rights of individuals. This observation may be true of rights relating to religion but does not necessarily seem to be the case with regard to international rights relating to health care. Article 12(2) of the International Covenant on Economic, Social and Cultural Rights states that:

“The steps to be taken by the States Parties to the present Covenant to achieve the full realization of this right shall include those necessary for:

(a) The provision for the reduction of the stillbirth-rate and of infant mortality and for the healthy development of the child;

(b) The improvement of all aspects of environmental and industrial hygiene;

(c) The prevention, treatment and control of epidemic, endemic, occupational and other diseases;

(d) The creation of conditions which would assure to all medical service and medical attention in the event of sickness.”

The four factors listed above are not, it is submitted, concerned so much with the rights to health of individuals but rather the health of the collective that can be measured in terms of statistics.

The focus of international law thus seems to be more at the macro, collective, level rather than at the micro, individual level when it comes to the right to health. This is understandable since it applies to nation states rather than the individual citizens of those nation states. Domestic law, however, must be binding upon individuals if it is to have any significance or impact upon the manner in which people conduct their affairs. It seems that the primary difference between the approach of the South African legal system and that of international law to the realisation of socio-economic rights is that the former favours a bottom-up approach whereas the latter favours a top-down approach. The value of the bottom-up approach is that it is a more rational and pragmatic method of ensuring the development of domestic law that is capable of realistically addressing the wide variety of individual needs in South Africa.
concerning access to health care services. While concepts such as minimum core may be of direct relevance in homogenous societies with more equitable distributions of wealth and resources, and similar cultural values and beliefs, it is submitted that the diversity of South African society in itself renders the concept problematic in a local context. The available resources in each situation are different. Furthermore different situations call for different kinds of resources at different levels of availability. They do not only vary across parameters such as urban versus rural, public versus private and socioeconomic levels but they also vary in terms of the disease profiles of various populations, the health needs of people in various geographical areas, genetic and cultural differences, community size and type, age groupings etc. At the individual level there are even more variables such as the health status, age, socio-economic status, level of familial or community support, literacy and educational levels, gender etc. Unfair discrimination can be the result of a policy that treats everyone the same since in the health care context, the needs of everyone are not the same. It is submitted that the South African Constitution's emphasis on equality renders the minimum core approach of international law unworkable and in many instances unreasonable because health service delivery has to be personalised to meet the needs of each unique individual.

Public international law still has a significant way to go before it reaches any internal consistency on the general international law front with regard to views on matters such as health care and access to goods and services necessary for the maintenance, preservation and promotion of mental and physical health that, according to international law, is the right of every person. Some of the hottest international legal debates in recent years are represented by the widely differing stances of two international organisations – the World Health Organisation and the World Trade Organisation. The former actively supports the supply of medicines and other health...
care products to developing countries at little or no cost to those countries whilst the interests of the latter lie in the maximisation of the global profits of multinational organisations and the exploitation by them to the full of their hard won intellectual property. Medicines, and to a lesser extent medical devices, are often at the forefront of these debates. Specific international law can have an impact on domestic law. One of the major objections of the Pharmaceutical Manufacturer’s Association to the
Medicines and Related Substances Control Amendment Act\textsuperscript{33} was that it allowed the violation of the TRIPS Agreement by the South African government. The matter was eventually settled out of court with the National Department of Health retaining its legislation intact. This is an example of the way in which international law as contained in international agreements can impact upon South African domestic law relating to health service delivery. The hotly contested amendment allowed for parallel importation of medicines by the South African government. To date the state has not invoked this particular provision of the Act. It is submitted that as a developing country, the South African legal system is most likely to run into conflict situations with international law on the medicines front. The manufacturers of pharmaceuticals are largely multinational organisations operating in global markets and they are the ones most likely to invoke international trade agreements in order to counter a legislative innovation or policy directive of the National Department of Health.

The WTO and the WHO note in their joint report that putting WTO rules into practice can raise difficult questions for health policy makers. For example, what happens when, for a given hazard, there is uncertainty about the risk? This poses a challenge for regulatory action, and responses to uncertainty and risk are likely to be different in different countries. Among the factors to be considered may be the trade-restrictiveness and efficacy of the measure to achieve the level of health protection sought. The WHO has developed International Health Regulations in the interests of infectious disease control. In the report it is noted that in exceptional circumstances, infectious disease control may require trade or travel restrictions. In the past, disease outbreak control concentrated on quarantines or trade embargoes. In recent years, a combination of sensitive early warning surveillance systems, rapid verification procedures and international response networks, epidemic preparedness plans and stockpiles of essential medicines has reduced the need to employ trade embargoes or travel restrictions. The Report states that to the extent trade restrictions are used, they should be time-limited and try to minimize disruption to international trade. This is one of the fundamental principles underlying the WHO's current revision of the International Health Regulations. The renewed International Health Regulations will

\textsuperscript{33} Medicines Amendment Act 90 of 1997
serve as the legal framework for the WHO’s efforts to prevent disease epidemics from spreading globally. The historic purpose of the International Health Regulations is to “ensure the maximum security against the international spread of diseases, with a minimum interference with world traffic.” This purpose will continue in the new International Health Regulations.

In the Report\textsuperscript{34} it is stated that specific measures used to control infectious diseases, whether adopted by national governments, or recommended by WHO in the performance of its IHR duties, may be subject to WTO rules if they affect trade in goods or services. Which rules are relevant will depend on the circumstances of the particular case. For example, while sanitary measures to halt the spread of a food- or animal-borne infectious disease could have a substantial trade impact and would be covered by the SPS Agreement, it is unlikely that regulatory action aimed at mitigating such risks - whatever the pathway or nature of the disease - would run contrary to WTO rules. It is clear from this that the right to health, as envisaged by the WHO\textsuperscript{35} is something potentially quite different when mitigated by WTO Agreements. The right to health, it seems, must not interfere unduly with world trade\textsuperscript{36}.

The first chapter of this thesis identifies the different kinds of international law and their relevance to and influence upon South African domestic law in terms of sections 231, 232 and 233 of the Constitution. The point is made in this chapter that consistency is a prerequisite of a rational and clearly principled domestic legal system. The lack of consistency in international law is not only within public international law but it is also evident within the \textit{jus cogens} and customary international law. These areas of international law seem to be lacking in clear beacons of common principle and understanding that would suggest an internally consistent approach within international law to the question of the right of access to health care.

\textsuperscript{34} WTO/WHO Report fn 32 supra
\textsuperscript{35} The WHO defines health as "a state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity". "Public health" refers to all organized measures (whether public or private) to prevent disease, promote health, and prolong life of the population as a whole.
\textsuperscript{36} See Mitra S "WTO Agreements and Public Health: A nexus rather than an agreement" who criticises the WTO/WHO study as having belied the expectations of those who had hoped for a critical analysis of WTO policies and the likely impact they would have on public health, especially in developing countries. Mitra comments that on the question of coherence between health and trade policies the report states that the WHO’s objective is “the attainment of all peoples of the highest possible level of health”. And what, asks Mitra, has that to do with trade? In this regard the report says, “an underlying assumption is that a liberal international trade regime, subject to reasonably stable and predictable conditions, improves the climate for investment, production and employment creation, and therefore contributes to economic growth and development. Generally the health status of a country is affect positively by such growth.”
services or a right to health generally. It is submitted that international law and South African domestic law relating to health service delivery, whilst they may share the same conceptual structures at some deep level, are far from continuous or even contiguous and that while they have some broad common interests, there are many differences in the detail of their respective approaches to this topic.

10.2.1 Criticisms of International Law

There is no country in the world in which international law applies independently of national or domestic law or where it is the only prevailing system of law. Thus even in those countries whose legal systems espouse automatic incorporation, as opposed to legislative incorporation, or international law into their domestic legal systems, this incorporation is by virtue of domestic, often constitutional legal provisions rather than any stipulation within international law itself. As a result, international law has the potential to be differently understood and applied in practice by various nations states. Its homogeneity, as least as far as its practical application is concerned, is thus notional. It follows that the same can be said of its theoretical and practical content. A right to health, or of access to health care services, is still not recognised in the USA - one of the wealthiest countries of all and with one of the most expensive health systems in the world. By contrast, the right of access to health care services has been recognized in Venezuela, a developing country with a marked lack of resources, despite the fact that the Venezuelan government apparently lacks the means to comply with court orders upholding this right. There has to be a time and place where ideology and reality meet in order for law to become relevant and meaningful. Unfortunately such a happy tête-à-tête seems largely to have eluded international law at least as far as a right to health, or even health care, is concerned.

International law does not take into account inequalities between societies. Foreign aid, when it is made available, comes with a subtle price tag that sometimes directly

---

38 Kingsbury B ‘Sovereignty and Inequality’ European Journal of International Law 9 (1998) 599-625 observes that inequality is one of the major subjects of modern social and political inquiry but it has received minimal consideration as a theoretical topic in the recent literature of international law. He argues that the lack of other means to cope with inequality is a serious problem for international law that has been wrongly neglected, but that the lack of such an alternative provides a strong reason to adhere to the existing concept of sovereignty, however much it may be “strained by practice and problematized by theory”. He states that: “The theory of sovereignty has relieved international lawyers
undermines the sovereignty of the country for whom the aid is destined. The funding in question is often placed in the hands of non-governmental and other private organisations rather than those of the government - no matter how democratically elected. If it is the primary responsibility of the government in question to ensure the progressive realisation of socio-economic and other rights, foreign funding that is channelled away from that government into the private sector has the effect of disempowering government to fulfil its mandate. Yet international law imposes these human rights obligations not upon the private or non-governmental sectors within developing countries but upon their governments. Operationally and functionally speaking therefore, international law is weak and subject to manipulation by the

of the need for a general theory of the legal management of inequality in three ways. First the concept of sovereignty underpins a principle of sovereign equality that has attained an almost ontological position in the structure of the international legal system. This ontological status makes enough difference in the processes of international law and politics to modestly vindicate the significance and effectiveness of the system of sovereign equality: thus very small states are procedurally on an equal footing with the largest or most powerful states in the International Court of Justice, and groups of small states have made some difference in the dynamics of multilateral bargaining on issues such as climate change. In the same spirit, legal doctrines of the special status of great powers have been in the descendant since 1945, and such matters as the structure of the Non-Proliferation Treaty or the UN Security Council are dealt with by most legal writers as anomalies, however necessary or enduring, in the scheme of sovereign equality. This conceptual scheme serves, if very unevenly, as a counter to the vast inequalities that might otherwise be expected to feature in the formal structure of the legal system. Second, the concept of state sovereignty allows questions of social and economic inequality among people to be treated in international law as a responsibility of territorial states. International law and legal institutions are able to promote market activity, for example, through the World Trade Organization or the International Monetary Fund, while in theory leaving largely to states the responsibility of mitigating social and economic inequalities associated with markets. Episodic attempts to address economic and social inequality directly through substantial non-market changes in the international legal order have met with little success outside the established human rights and environmental programmes. Despite economic and political turbulence associated in some respects with inequality, concerns about it have remained displaced by preoccupations with reducing the role of the state in economic activity and in major market-distorting egalitarian redistribution. International institutions continue to play important roles in economic development, and political leaders in prosperous countries confronted with concerns about poverty or maldistribution abroad increasingly hope for solutions from the World Bank and other intergovernmental agencies along with bilateral assistance and the much-vaunted voluntary sector. There is, however, a growing incongruence between the increasing market orientation of international law and the inability of international governance institutions or of many sovereign states to cope with problems of inequality that markets alone do not resolve... Third, the theory of sovereign equality can express, and be considered to have expressed, consent to the application of international legal norms and to international institutional competences. Consent, whether express or tacit, plays a role in legitimating international legal rules and institutional activities in situations where their legitimacy may be in doubt, as where they infringe deeply held egalitarian principles. This legitimating function is of vast importance for the international legal system. It is not clear that in the present state of heterogeneous international society, any non-consensual legitimating principle is viable, and sovereignty appears to be a relatively low cost means to organize 'consent'."

For example, Fidler DP 'Globalization, International Law and Emerging Infectious Diseases' notes that although international control plans would involve private organizations like universities and nongovernmental organizations, the primary actors on the emerging infections stage are sovereign states. He states "The action plans are predominantly blueprints for co-operation among states and represent a call for the internationalization of responses to a problem caused by globalization. Put another way, the proposed solutions to the emerging infections threat rely on the sovereign state, while the threat feeds off the impotence of the state in addressing global disease problems. When it comes to public health activities, globalization erodes sovereignty, but the proposed solution makes sovereignty and its exercise critical to dealing with the threat of emerging infections. The consequences of the unavoidable emphasis on international cooperation in the proposed action plans for emerging infections are troubling. To achieve the desired objectives... states will have to agree on many issues and translate such agreement into guidelines or rules. International law becomes important to the effort for emerging infections control. Political leaders, diplomats and scholars have long recognized the weakness of international law in regulating state behaviour. At first glance the prospect of having to rely on a notoriously weak institution of international relations as part of the global effort to combat emerging infections is unsettling.... The success of WHO in globalizing disease control programs might suggest that the defects of international law have not hindered its effectiveness in improving health care worldwide. However, despite having the authority to do so, WHO has been reluctant to use international law. The International Health Regulations administered by WHO represent the most important set of international legal rules relating to infectious disease control but the regulations only apply to plague, yellow fever and cholera. The importance of health is mentioned in international declarations (for example, see the Universal Declaration of Human Rights art. 25[1]) and treaties (for example see the International Covenant on Economic, Social and Cultural Rights, art.12), leading some legal scholars to argue that international law

1314
more powerful, developed countries to suit their own purposes and further their own causes. The weakness of international law is nowhere more evident than in the

creates a "right to health"; but this "right" does not directly address the control of infectious diseases. WHO has refrained from adopting rules on trade in human blood and organs which does raise issues of infectious disease control as illustrated by the sale of HIV-contaminated blood in international commerce. Issues of disease control also appear in specialized treaty regimes outside WHO such as treaties controlling marine pollution from ships. Other areas of international public health law, for example, rules about infant formula and guidelines on pharmaceutical safety, do not deal with the control of infectious diseases. "[Footnotes omitted]" Fidler goes on to point out that the emerging infections problem exacerbates basic weaknesses in the law and that these infections pose specific difficulties in the law which are related to the nature of disease and its prevention. He observes that part of the reason that the existing International Health regulations cover only a few diseases might be the unwillingness of the WHO member states to commit to more serious infectious disease control measures. He notes that the vagueness and lack of specificity in the so-called "right to health" also illustrate this problem. Fidler identifies as a specific difficulty the extent of medical and scientific resources needed to establish an effective global surveillance and control network for emerging infectious diseases. Fundamental aspects of the proposed action plans involve improving surveillance networks, public health infrastructures, scientific research and medical and scientific training. He points out that some states, particularly in the developing world do not have the resources to undertake such measures. Unless more affluent countries provide the resources, developing states may use the inequity of wealth in the international system as an argument to complicate negotiating a global agreement. In Parisi F and Sellers M (eds) International Legal Theory (a Publication Of The American Society Of International Law Interest Group On The Theory Of International Law) it is stated that: "International law cannot make policy on its own, but people can. Normative knowledge can only serve as a frame of reference, although sometimes a compelling one, for statesmen, political leaders, organizations, corporations, and individuals, who, in the final analysis, are the ones who make the decisions. For normative knowledge, international law, like all law, is ineffective if it lacks "operators", that is, legal subjects entitled to use the law for particular purposes. ("Norms comprise symbols of normative conceptions about reality. A translation of these conceptions is operationalized by the user." B. Holzner et al., Knowledge Application: The Knowledge System in Society 95 (1979).) States, organizations, relevant groups, and individuals can become both target subjects and operators of international legal and institutional frameworks. (The terms "operators," "actors," "decision makers," and "international participants" are used here to refer to international legal subjects that enjoy sufficient access and standing to create policy or make decisions. Thus, for example, states are the only operators and participants with access and standing at the International Court of Justice, though individuals may also become operators before an international human rights court. Presidents, Ministers, leaders of governmental and non-governmental organizations, organizations themselves, and individuals, if entitled with the authority to participate in a decision-making process, are operators or relevant actors.... Once we acknowledge the essential role of human actors in international law, we can only ascertain the effectiveness of international law if, in addition to the more traditional bases of legal inquiry, we consider the interaction of what actors believe--or want to believe--the law is." http://law.uchicago.edu/ciel/iit/2/ 1 1995.pdf See for instance the views expressed in the following sources: Chang H, Kicking Away the Ladder: Development Strategy in Historical Perspective argues that developed countries did not become rich by adopting the 'good practices' and the 'good institutions' that they now present to poorer countries as the essential basis for development. He maintains that the industrialised nations are in this way 'kicking away the ladder' by which they climbed to the top, preventing the developing world from applying the very policies and institutions upon which they themselves had relied in order to develop. Dichter T, Despite Good Intentions: Why Development Assistance to the Third World has failed. The author, himself a veteran aid-agency worker, surveys the history of development assistance from 1945, which has been premised on the belief that the industrialised countries could in some way engineer the acceleration of history in the less-developed world. He argues that the enterprise is internally flawed: the vast differences in power between the donors and recipients of aid, and the organisational imperatives to show 'results', conspire to keep the development industry in business and the unequal relationships intact. If the goal is for aid recipients to become autonomous, free of external control, then the first step has to be to reduce and not increase development assistance, since this serves principally to consolidate the power of the 'helpers'. Ferguson, J The Anti-Politics Machine: 'Development', De-politicisation, and Bureaucratic Power in Lesotho, 1994. Based on a case study of a development project in Lesotho, the author of this work makes a searing critique of the development industry as a whole. The 'anti-politics machine' refers to the process through which outside 'development' agencies and experts wilfully turn the political realities of poverty and powerlessness into 'technical' problems which require an equally technical solution. Using an anthropological approach, the author analyses the institutional framework within which development projects are crafted, revealing how it is that, despite all the 'expertise' that goes into formulating them, these projects often betray a startling arrogance and deep ignorance of the historical and political realities of the communities whom they are intended to help. Escobar, A Encountering Development: The Making and Unmaking of the Third World 1994. In this now classic presentation of post-development thought, Escobar offers a challenging critique of development discourse and practice, arguing that development policies deployed by the West to 'assist' impoverished countries are in effect self-reinforcing mechanisms of control that are just as pervasive and effective as colonialism was in earlier years. To capture the production of knowledge and power in development initiatives, Escobar uses case studies which illustrate how peasants, women, and nature, for instance, become objects of knowledge and targets of power under the 'gaze of experts'. He concludes with a discussion of alternative visions for a post development era. 

Note: The reviews quoted above are in Resources http://www.developmentinpractice.org/readers/Methodslresources.pdf See also Nyamugasira W "Aid, Conditionality, Policy Ownership and Poverty Reduction: A Southern Perspective of Critical issues, Constraints and Opportunities", a background paper presented at the meeting of International Advisory Committee The Reality Aid Project, San Jose, Costa Rica, September 17-21, 2000. http://209.130.12.18/fpdfs/jia/ncvn.pdf. The author, in asking how conditionality crept into the aid business, states that: "Conditionality is most powerful when collectively imposed. In recent years, individual bilateral donors have ceded much of their decision-making power to the IMF, which certifies that the macroeconomic management of a country is
Venezuelan case of Cruz Bermudez, et al v Ministerio de Sanidad y Asistencia Social\textsuperscript{11} where the judgment of the court made no difference to the harsh reality of a lack of necessary resources. Law in a vacuum is meaningless. International law in particular, lacks contextual value. While it is useful when it comes to broad general principles it is not instructive with regard to practical considerations involving individual cases.

International law does not regulate multinational corporations despite the enormous global power that they wield. International law applies to the governments of nation states and not private entities\textsuperscript{42}. The major innovative pharmaceutical companies in the world fall into this category. They guard their intellectual property rights in the medicines they develop with missionary zeal, regardless of the effect on accessibility to these products for developing countries. Their research and development efforts are, furthermore, largely directed at dealing with the health problems of developed countries because that is where the money lies. Diseases of poverty are, by definition, unlikely to yield significant returns unless they start becoming a threat to the developed world\textsuperscript{43}. International law regulates none of this. In fact in many instances

sound and deserving of support. In addition, donors have increased coordination among themselves and increasingly present a united position to the recipient countries. Conditionality has succeeded because: Firstly, the recipients have been denied other alternative sources of development finance. Donors killed off all alternative channels for poor countries to obtain development finance, starting with independent thinking... Secondly comparative advantage has been applied to block potential to generate own resources, condemning Africa to exporting a narrow range of primary commodities whose exchange value never appreciates. Thirdly there is no ideological alternative, the one that gave so much hope to poor people and without which much of Africa would perhaps not have been liberated, having been finally dismantled. Fourthly, vulnerability has increased as developed countries cause exogenous shocks to already weak and vulnerable economies. Fifthly, South-South cooperation joint initiatives have been thwarted, making it hard for disaffected economies to extricate themselves from destructive conditions. The global economy is designed to work against them. Sixthly, have (sic) failed to learn alternative survival skills, poor countries are unable to create internal conditions that strengthen their negotiating position..."

Forsythe DP 'The Political Economy of Human Rights: Transnational Corporations' notes that "Transnational corporations (TNCs) drive globalization, meaning the increasing economic interconnectedness of the world. Their power is widely recognized. Also increasingly recognized is the good or ill they can do for human rights, especially labor rights. The public regulation of TNCs, especially for social reasons like human rights, has long been problematical. Global international law regulates states primarily, not TNCs...It has been long recognized that business enterprises that operate across national boundaries have an enormous impact on the modern world. If we compare the revenues of the twenty-five largest transnational corporations with revenues of states...we see that only six states have revenues larger than the nine largest TNCs...The world's 200 largest TNCs are incorporated in just ten states above all in the United States and Japan." http://www.du.edu/humanrights/work/ingapers/papers/14-forsythe-03-01.pdf

Good examples of this are the diseases caused by parasites known as trypanosomes. Chagas' Disease (American trypanosomiasis) affects 16 to 18 million people in Latin America. Chagas disease is named after the Brazilian physician Carlos Chagas who first described it in 1909. The disease is endemic in 21 countries in Central and South America and is found only in the American Hemisphere. Still it affects 16-18 million people in Latin America and 100 million people are at risk of becoming infected. Chagas is caused by a protozoan parasite, Trypanosoma cruzi, transmitted to humans by blood-sucking insects known in various countries as the "kissing bug", "vinchuca", "barbeiro" or "chipo". The disease is caused by Trypanosoma cruzi (T. cruzi), a flagellated protozoan parasite. The parasite is transmitted to humans in two ways, either by a blood-sucking insect, which deposits its infective feces on the skin at the time of biting, or directly by transfusion of infected blood. Humans and a large number of species of domestic and wild animals constitute the reservoir, and the vector insects infest poor housing and thatched roofs. Chagas disease exists in both acute and chronic stages. After initial infection and a subsequent incubation period, the acute phase of infection begins and typically persists for two months. With a mortality rate of 2%-8%, acute disease is generally seen in children and is characterized by fever, swelling of lymph glands, enlargement of the liver and spleen, or local inflammation at the site of infection. But, commonly, there are no acute clinical manifestations, and those infected may remain without symptoms. Approximately one-third of acute cases progress to a chronic stage, which develops some 10-20 years later and can
cause irreversible damage to the heart, esophagus and colon, with dilatation and disorders of nerve conduction in these organs. Patients with severe chronic disease become progressively more ill and ultimately die, usually from heart failure. There is, at present, no effective treatment for such cases. The geographical distribution of the human Trypanosoma cruzi infection extends from Mexico to the south of Argentina. The disease affects 16-18 million people and some 100 million people (about 25% of the risk of acquiring Chagas disease in Latin America) are at risk of infection with T. cruzi. The disease is directly related to poverty: the blood-sucking triatomine bug which transmits the parasite finds a suitable habitat in crevices in the walls and roofs of poor houses in rural areas and in the urban peripheral slums. The urban/rural migration movements that occurred in Latin America in the 1970's and 1980's changed the traditional epidemiological pattern of Chagas disease and transformed it into an urban infection that can be transmitted by blood transfusion. The figures of infection of blood banks in some selected cities of the continent vary between 3.0 and 53.0 % thus showing that the prevalence is higher than that of HIV infection and Hepatitis B in Chile. Two treatments presently exist for Chagas disease in the acute stages: Benzidazole, given as twice-daily intravenous infusions for 60 days. Nifurtimox, given as three times-daily intravenous infusions for 90 days. Both of these treatments are accompanied by frequent, serious and life-threatening side effects, and the months of treatment required for cure have led to resistance and high levels of treatment failures. Sources: Centers for Disease Control (CDC), United States, Division of Parasitic Disease, Chagas Disease Fact Sheet, http://www.cdc.gov/nchidod/dpd/parasites/trypanosoma/trypanosomiasis.htm and World Health Organization, Special Program for Research and Training in Tropical Diseases, http://www.who.int/tdr; http://www.oneworldhealth.org/

In 'Rare Infection Could Affect U.S. Blood Supply' Health Highlights: Nov. 18, 2003 it is reported: "A parasitic infection that's rare in the United States but common in Latin America could pose a danger to the U.S. blood supply because there's no test to detect it," The New York Times reports. While only nine cases of Chagas disease have been transmitted by blood transfusion or tissue transplant in North America in the past 20 years, more than 18 million people in Latin America are said to be infected. Some 50,000 people in Mexico, Central America and South America die from the disease each year, the newspaper says. A test to detect the disease isn't expected until next year at the earliest. The newspaper cites a Chagas expert at the American Red Cross, who says the risk of acquiring the disease through infected blood is only about 1 in 25,000. Since 1985, several expert panels to the U.S. Food and Drug Administration have recommended that blood be screened for the disease. But no test has been approved yet, and the companies working on one concede they are under no pressure to finish their work, the Times reports. An FDA spokeswoman wouldn't rank Chagas among all threats to the U.S. blood supply, but added "we would certainly recommend a Chagas test if one is developed." http://www.healthfinder.gov/newslnewsstory.asp?docID=516099. In October 2003 the WHO reported on Current global status of Chagas disease as follows: "Large-scale regional initiatives to halt vector-borne transmission and improved screening of blood-donors have been successful. At present, estimates indicate an infection prevalence of 13 million, with 3.0-3.3 million symptomatic cases and an annual incidence of 200,000 cases in 15 countries. The disease remains a priority health problem due to: the need for surveillance and control in areas where sylvatic vectors can invade dwellings; the medical and social costs of care for infected people in the absence of efficient control activities and vector elimination in areas where vectorial transmission has been interrupted; and the need to continue strengthening mandatory blood-donor screening in endemic areas, as well as in non-endemic areas where increased travel and/or immigration of potentially infected donors might compromise donated blood supplies." It stated that "The complexity of the pathology of Chagas disease and the diversity of its clinical manifestations have made the understanding of its pathogenesis difficult. The autoimmune hypothesis, once widely accepted, has increasingly been challenged by the parasite persistence hypothesis. Arguments for the latter hypothesis come from demonstrations of the presence of parasites in tissues of chronic patients, and the fact that treatments that decrease parasite burden are associated with a decrease in clinical symptoms. The two hypotheses might not be mutually exclusive since anti-immunopathogenic responses in chagasic patients might be driven by the parasite burden. Although further studies are needed, including elucidating the role of the recently described parasitokines, these results indicate an urgent need for the development of new antiparasite drugs, and their evaluation in large-scale randomized clinical trials, as well as for the identification and validation of new drug targets, early diagnostic indicators of infection and vaccine candidates, and for the elucidation of the mechanisms underlying host cell invasion, immune response and pathogenesis. The challenge will be to transform new knowledge into cost-effective, equitably affordable interventions and to guarantee their access to the patients and populations of endemic countries."

Naula C and Burchmore R • A Plethora of targets, a paucity of drugs: progress towards the development of novel chemotherapies for human African trypanosomiasis" http://www.future-drugs.com note with regard to Human African Trypanosomiasis (HAT) that it is a major health problem in large regions of Africa. The World Health Organisation has estimated that 300 000 people are infected with HAT and 60 million individuals are exposed to the risk of infection. They note that unfortunately developments in chemotherapy have not kept up with the rise of HAT and the drugs that are commonly employed today are the same as those that were in use in the 1950s. This situation, they say, represents a dramatic failure that has been brought about by a combination of the political situation in endemic countries and the economic reality of the global pharmaceutical industry. Trypanosomiasis is fatal if not treated. The authors observe that trypanosomes are the most intensively studied protozoa but most investigators are based in academia and have focused on the many aspects of trypanosome biology that are unique or unusual. They state; "The orphan disease status of HAT has stimulated support for basic research from public and charitable sources and the community of academics that study trypanosomes and related protozoa is extensive... This interest is not matched in the commercial sector, which is critical for drug development. There has been very little progress by the pharmaceutical industry in developing promising leads. An important reason for this failing is the lack of a wealthy market for drugs to treat trypanosomiasis. Non-profit organisations such as the WHO and Medecins Sans Frontieres (MSF) aim to encourage drug development by a variety of mechanisms. Of particular note is the Drugs for Neglected Diseases (DND) working group, and MSF sponsored initiative... HAT is a significant economic and social problem in large areas of Africa. Existing chemotherapies leave much to be desired. However, this situation is not new and the recent history of antityranosomal drug development is not encouraging. Nevertheless, there have been recent efforts to encourage and facilitate development of antiparasitic drugs by pharmaceutical companies. Increasing awareness of health problems in the under developed world serves to
it upholds the status quo. The World Trade Organisation's interest in intellectual property rights, unaccompanied by any significant desire to counterbalance these against the urgent needs of developing countries, is testimony to this.

A further criticism of international law lacks one of the essentialia of law itself – certainty. In some areas, such as customary international law and jus cogens, there is not even any certainty as to what constitutes international legal principles and what does not and when the transition to international law is made. Certainty is recognised in the South African legal system as a prerequisite for fairness and credibility of law since it impacts on the reliability of the legal remedies offered by law. International law offers no remedies and no certainty. Its enforceability depends upon the interests and motivations of the few countries that can call themselves global powers. International law, at the enforcement level, seems to be a one way street since those doing the enforcing are generally powerful, developed countries or their agencies and those subject to enforcement activity are developing or significantly weaker countries. The likelihood, rate and intensity of the enforcement intervention seems to be directly proportionate to the mainly financial and commercial interests of the enforcer in the country that is being taken to task.

The practical relevance of international law even as an ideal is questionable when considered against the backdrop of South African constitutional law since any comparison of the right to health in international law has to made be at various levels of complex matrices of rights often beset with their own internal conflicts. The point is made in the first chapter that where there is an internal conflict between constitutional rights, a balancing of rights must take place. Thus where there is an internal conflict between human rights at international law and an internal conflict between similar rights in domestic law, the internal conflict between the domestic rights must first be resolved before any consideration of international law can fruitfully take place since consistency is a prerequisite of a rational and certain

---

pressure pharmaceutical companies to address these issues. The market for HAT therapy may not at present be wealthy but it is large and poor prospects for vaccine development suggest that HAT may remain a problem in the long term. There is also a very important veterinary market for trypanosomiasis in cattle... It is to be hoped that success with DB 289 or its related compounds will stimulate commercial interest in the development of novel drugs to treat a disease that threatens such a large population... There can be little hope that new drugs for HAT will come to market in the next 5 years."

As the most recent, large scale, interventions by the American and British governments in Iraq would seem to indicate when compared to the relative disinterest in the continuing or relatively recent gross human rights violations in Zimbabwe and Rwanda respectively.
domestic legal system. Considerations of international law in relation to a single right in the Bill of Rights in isolation from the matrix of rights, of which it is but one inextricable element, can lead ultimately to a fragmented and chaotic domestic legal order with a concomitant diminution in value of the very body of rights the latter seeks to confer.

10.2.2 Imbalance in the Formulation of International Law

Not all countries have an equal say in the formulation of international law because not all countries have equal access — or any access at all for that matter — to powerful international organisations such as the World Trade Organisation (WTO)45 and other bodies under whose auspices public international law is created. One of the key functions of the World Trade Organisation is to serve as a forum for international trade negotiations. As such it attracts large and powerful developed countries that have equally large and powerful interests in global trade. The magnitude of their bargaining power in relation to much smaller and weaker developing countries whose stake in international trade is exponentially smaller than that of their developed counterparts creates a considerable imbalance in the formulation of international law.

This is disjunctive of the fact that public international law that is created under the auspices of the World Trade Organisation impacts not only upon trade issues but significantly affects human rights and other aspects of international law as well. WTO Agreements such as the Agreement on Trade Related Aspects of Intellectual Property (TRIPS) and GATS were formulated before many of the developing countries became members of the WTO. The chances of their being able to effect amendments to the terms of such agreements are slight. The difficulty with which developing countries succeeded in the meeting of the WTO at Doha is testimony to this. The Africa group of negotiators went to Doha opposed to adding new issues to the trade agenda until a

45 By February 2002, 144 countries were members of the WTO. Together they account for more than 90 per cent of world trade. In the WTO, gaining membership is not automatic. Countries negotiate their accession to the WTO with existing members. WTO agreements are, in general, ratified in members' parliaments. Currently, several countries are actively negotiating their entry into the organisation, including the Russian Federation. There is growing consensus that WTO membership constitutes a key step towards integrating developing countries into the global economy and the international trading system. Countries that wish to join the WTO must negotiate with existing WTO members and a working party is set up to handle each application. Accession working parties are open to all WTO members, and countries with an interest in the applicant country's trade join the working party. Accession working parties must then undergo a fact-finding process regarding their trade policy and undertake a series of commitments to bring trade policy into line with the WTO agreements. The accession process can be quite burdensome, complicated, and lengthy. As of February 2002, 16 of the 44 governments that had applied for WTO membership had completed the process and become WTO members. The entire process, which in some cases began before 1995 under the GATT, took between 3 and 10 years, except in the case of China, which recently became a member after 15 years of accession negotiations.
better deal was reached on those already covered. With the notable exception of South Africa, which announced beforehand that it would support the launch of a broad new round of negotiations, most African countries wanted Doha to concentrate on resolving outstanding “implementation issues” such as the failure of Northern governments to reduce tariff barriers to African exports. One of the major steps forward at Doha in terms of the recognition of the needs of developing countries was a declaration on TRIPS and public health was adopted in terms of which the 142 countries stated inter alia:

“1. We recognize the gravity of the public health problems afflicting many developing and least developed countries, especially those resulting from HIV/AIDS, tuberculosis, malaria and other epidemics.
2. We stress the need for the WTO Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS Agreement) to be part of the wider national and international action to address these problems.
3. We recognize that intellectual property protection is important for the development of new medicines. We also recognize the concerns about its effects on prices.
4. We agree that the TRIPS Agreement does not and should not prevent members from taking measures to protect public health. Accordingly, while reiterating our commitment to the TRIPS Agreement, we affirm that the Agreement can and should be interpreted and implemented in a manner supportive of WTO members’ right to protect public health and, in particular, to promote access to medicines for all.”

The Doha Declaration went on to recognize the right of each member to grant compulsory licences and the freedom to determine the grounds upon which such licences are granted. It also recognised that each member has the right to determine
what constitutes a national emergency or other circumstances of extreme urgency, it
being understood that public health crises, including those relating to HIV/AIDS,
tuberculosis, malaria and other epidemics, can represent a national emergency, or
other circumstances of extreme urgency. Of particular importance to developing
countries, the Declaration recognized that WTO members with insufficient or no
manufacturing capacities in the pharmaceutical sector could face difficulties in
making effective use of compulsory licensing under the TRIPS Agreement. It
instructs the Council for TRIPS to find an expeditious solution to this problem and to
report to the General Council before the end of 2002\(^\text{47}\).

The point is that when TRIPS was first formulated this was apparently not done with
reference to other instruments of international law relating to human rights and also
without reference to the needs and concerns of developing countries and their other
international law obligations. Its effects had to be modified, and then only with
considerable difficulty, in order to gain some acknowledgment from the powerful
developed countries who first formulated it, of these important issues. International
law is clearly not a unified, coherent and internally consistent body of universal legal
principles that takes into account the needs of both the powerful and powerless
countries of the world. The more cynically minded might regard it as an instrument
for the validation of the application of power by dominant countries to those
susceptible to domination. Inevitably this is accompanied by debates concerning the
north-south global divide.

10.2.3 Compliance With International Law Affords No Protection

Compliance with international law, contrary to expectation, apparently offers no
protection from larger and more powerful national interests\(^\text{48}\). The stance of the

\(^{47}\) According to Kraus D ‘DOHA Declaration on the TRIPS Agreement and Public Health: Current State of Discussion’
(http://www.ige.ch/EN/newsinfo/1110100.htm): A solution was subsequently postulated that another Member having
manufacturing capacity could issue a compulsory licence for the exportation of the product to the Member lacking such
capacity. However the principle of territoriality of patents allow a Member to issue a compulsory licence only
predominantly for the supply of the domestic market. While until 2005 exportation is possible from Members enjoying a
transition period a long-term solution has to be found which takes all interests into account, including those of victims of
pandemics and the necessity to assure further research and development into the needed pharmaceutical products.

\(^{48}\) McCauley J, an international trade associate at the Washington DC based law firm Collier Shannon Scott, PLC in an
article entitled ‘Lessons from South Africa: Striking a Balance Between the Protection of Intellectual Property Rights
and Access to Pharmaceuticals in Developing Countries While Complying With TRIPS’ written for Security Policy
Group International (http://www.spgi.org/articles/mccadney_aidsdrugs.html) observes that “even though South Africa’s
legislation incorporated permissible, flexible mechanisms of TRIPS, including compulsory licensing and parallel
imports, it was met with a backlash of disapproval from developed countries, as well as the global pharmaceutical
United States of America on the TRIPS agreement and the debates relating to access to pharmaceuticals by developing countries is a case in point. The controversy surrounding the South African government’s proposed legislation would allow the parallel importation of medicines in certain circumstances was hotly debated in a number of international forums all over the world at the time. It would
seem from the experience of South Africa with regard to the Medicines Amendment Act\textsuperscript{51} and the reaction of the developed world to its attempts to improve access to health care services for its people, that international law is designed to benefit primarily developed countries. This is clear from the fact that although the law in question did not and still does not violate the TRIPS Agreement, in the years 1997 to 2000, the American government pressurised South Africa to drop its plans to seek cheaper alternatives to medicines for HIV and AIDS. The US government backed the pharmaceutical companies that took the South African government to court with regard to the Medicines and Related Substances Amendment Act\textsuperscript{52}. According to a 1999 US State Department report: “U.S. Government agencies have been engaged in a full court press with South African officials from the Departments of Trade and Industry, Foreign Affairs and Health, to convince the South African government to withdraw or amend the offending provisions of the law”\textsuperscript{53}. When South Africa continued to defend the law, asserting that it was in full compliance with TRIPS requirements, the U.S. Trade Representative placed South Africa on the Special 310 Watch List which lists countries under scrutiny for possible intellectual property violations. A U.S. trade official is quoted as saying “While we don’t say it explicitly, it’s a warning for investors going to that country that there are potential problems with respect to protection of intellectual property”\textsuperscript{54}. The failure of other countries of the developed world who were members of the World Trade Organisation to speak out against the hostility of the US government towards South Africa when it became clear

\textsuperscript{51} Medicines Amendment Act fn 33 supra
\textsuperscript{52} Medicines Amendment Act fn 33 supra
\textsuperscript{53} Chaudhry L. U.S. to South Africa: Just Say No’ (http://www.wired.com/news/nolitics/OI2833587400.html)
\textsuperscript{54} Chaudhry L. In fn 50 supra. When it became apparent to even the Americans that the legislation was not in violation of the TRIPS Agreement, a U.S. Trade official stated that: “We consider TRIPS to be a minimum standard.” Under congressional mandate, mere TRIPS compliance is not sufficient to keep a country off the 301 List. While the US trade official would not specify exactly what ‘TRIPS plus’ entailed, reports Chaudhry, he said both compulsory licensing and parallel importing were ‘not considered appropriate’. It is therefore strange to note that, without any further amendments to the South African Medicines legislation on the subjects of parallel importation or compulsory licensing in December 1, 1999, the US Trade Representative announced the removal of South Africa from the Special 301 Watch List, based on a bilateral understanding developed with South Africa under which both Governments reaffirmed their shared objective of fully protecting intellectual property rights under the WTO TRIPS Agreement, while addressing the health issues identified by South Africa. South Africa agreed that it would address health needs in a manner that fully protects intellectual property rights. The US Trade Representative apparently took this action as a result of this understanding, as well as other steps South Africa had taken and was taking to improve further the protection of intellectual property.

1323
that South African law was not in violation of the TRIPS Agreement is remarkable. It is another indicator of the weakness of international law and its tendency to resemble a one-way street. Developing countries must comply with TRIPS as a minimum standard but this apparently does not prevent developed countries from taking further action against a nation state as they see fit. The message seems to be: "You had better comply with this standard of international law because if you don’t, we will penalise you, but if you do and we don’t like it, we will penalise you anyway." This is born out by the observation of the WTO/WHO Report that the WTO facilitates the implementation, administration and operation of the various covered agreements but the power of initiative in the context of the organization rests not with the Secretariat but with member governments whose representatives constitute and preside over the many councils and committees dealing with issues that arise in connection with the agreements. The certainty factor is once again conspicuous in its absence from international law.

10.2.4 ‘Standard Setting’ Approach Not Helpful To The Developing World

One of the problems that South Africa faces, even internally, is that of the setting of standards. In the health sector particularly, the problem is exacerbated by the significant disparities in wealth that exist across the public and private sectors. The question in setting standards is, does one set a standard that is low enough that the often cash strapped public health sector can attain or does one set the standard much higher, in the full knowledge that it will be unattainable within the public health sector but will challenge the private health sector? If one sets two different kinds of standards, what message does this give to a country with a legacy of apartheid? A similar problem exists with regard to international law which is more often than not developed by the wealthy countries of the northern hemisphere. One of the major roles of international law is to set up global standards to which everyone must aspire but if some of the nations of the world have a head start on others, the race can hardly be said to be fair. If the standard is set with regard to well-resourced, well developed countries and what they are capable of, it is hardly surprising that international law in the eyes of developing countries is of little constructive use.

55 WHO/WTO Report fn 32 supra at p 26
It is not without significance that the WTO is not a funding organization. It has no mandate to finance development projects. The nature of the technical assistance to developing countries that the WTO does provide is also significant. According to the WTO/WHO Report, the aim of the ‘assistance’ is both to assist members in the implementation of WTO agreements and to train officials so that they understand the system and its agreements, know how to administer them, and negotiate more effectively. Technical assistance is also extended to acceding countries. The Report states that the training is often rather “legal” and is aimed at providing an understanding of rights and obligations members have under the various agreements. The ‘assistance’ provided by the WTO to developing countries is thus self-serving in that it is designed to promote and enforce the adherence of those countries to the principles of public international law as formulated by the WTO without assisting them in terms of the resources they might need to observe these principles of law.

Under the WTO agreements, as in the dark, all cats are grey. Countries cannot normally discriminate between their trading partners. A special benefit granted to one country must be granted to all other WTO members56. While this may seem superficially to be beneficial to all in that no-one is given preferential treatment, the question is who does this rule actually favour in practice? This principle conveniently ignores the fact that some countries are developing countries and others are developed countries. Their problems, needs and concerns are uniquely different. Health care is an extremely good example of this. Many developing countries have serious problems with tropical diseases such as malaria and cholera and diseases of poverty such as tuberculosis, diseases caused by nutritional deficiencies and HIV/AIDS. Disease profiles in developed countries show diseases of ageing and lifestyle as being the predominant public health problems. The disease profiles of populations in developing countries are clearly very different to those in developed countries57. Of the top 15 causes of mortality in Africa only 8 can be considered to significantly

56 WHO/WTO Report fn 32 supra at p 29. The Report states: This principle, known as most-favoured-nation (MFN) treatment, is enshrined in Article I of the GATT, which governs trade in goods. MFN treatment is also one of core obligations of the GATS (Article II) and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) (Article 4). Together, those three Agreements cover the main areas of trade covered by the WTO. In general, MFN means that every time a country lowers (or introduces) a trade barrier or opens up a market, it has to do so for the same goods or services or service suppliers from all its fellow WTO Members - whether rich or poor, weak or strong.

57 Gwatkin, D and Guillot M ‘The Burden of Disease among the Global Poor: Current Situation, Future Trends and Implications for Strategy’ World Bank, Washington 2000 p 9 of the top five causes of death, there is only one that overlaps between developed and developing nations – ischaemic heart disease.
affect the developed world. The products and services required to manage and counteract these different disease profiles are very different to those required in developed countries. Malaria drugs and continued research into malaria treatment and prophylaxis are critical to developing countries whereas in developed countries this need is negligible. If public international law on trade governs the supply of such goods and services to developed countries, it is not difficult to appreciate their impact on the health status of people in countries where malaria is a problem. This principle ties the hands of those developed countries that would wish to give more favourable terms to developing countries with the result that the ability of developing countries to enter international markets and their concurrent capacity to improve the lives of their residents is effectively stymied. The principle does not incentivise developed countries to assist developing countries and has the overall effect of maintaining the balance of power in favour of the developed world. The result is that foreign aid is substituted for trade. Developing countries must constantly look to developed countries for financial and other aid instead of becoming empowered, through global trade and world markets, to meet the needs of their people themselves.

According to the WTO/WHO Report, article XX of GATT guarantees the members’ right to take measures to restrict imports and exports of products when those measures are necessary to protect the health of humans, animals and plants (Article XX(b)) or otherwise relate to the conservation of natural resources (Article XX(g)). Article XIV of the GATS authorizes members to take measures to restrict services and service suppliers for the protection of human, animal or plant life or health. If the relevant conditions are met, including the good faith obligations inherent in the chapeaux of these Articles, they provide an override of any other obligations, including tariff concessions on goods or specific commitments on services, that WTO members have undertaken under WTO agreements. These provisions recognize that there are cases where members may wish to pursue other legitimate policy objectives, such as health. It is alleged in the WHO/WTO Report that the health exceptions allowed for in GATT and GATS indicate the importance that WTO members assign to national autonomy in the protection of health. TRIPS does not contain an exception for health purposes per se, but it does allow measures necessary to protect public health and nutrition.

---

58 Moran M ‘Reneging on Doha’ Médecins Sans Frontières, 2002
provided they are consistent with other TRIPS provisions (TRIPS, Article 8 - Principles). It is submitted that the reality of these concessions to health concerns are belied by the stance of the US towards the South African government on the subject of parallel importation. The question of equality between nations, in terms of their relative resources, levels of development and international obligations is not a notable feature of international law.

10.2.5 Absolute Rights v Relative Rights

International law is generally not helpful when it comes to situations requiring the balancing of conflicting rights. One of the reasons for this, it is submitted, has been quite well captured by Schlemmer-Schulte\(^59\) who notes that human rights are for structural reasons not the best tools to put a more human face to development. She states that especially economic and social human rights obligations lack teeth as they are formulated as relative rights instead of absolute rights of individuals with their implementation being dependent on the state's capacities and discretionary power in setting policy priorities and that even where human rights are used as benchmarks (e.g. in the regional human rights system), their use requires a sophisticated institutional system, particularly independent courts to develop and clarify their contents for application purposes. She comments that, generally speaking detailed entitlement legislation is a better guarantee of human rights than a mere human rights catalogue. International law provides no assistance or guidance as to how rights should be prioritized or realized in practice. It does not even suggest appropriate vehicles of domestic law for this purpose. For example, in a country in which the majority of people cannot afford to purchase health care products and services, a very important question arises as to the suitability of the law of contract to ensure that their right to access health care services is fulfilled. The World Trade Organization views medicines and the related intellectual property as a commercial commodity that is the subject of international trade. The implication is that commercial law, such as that of contract, is the legal regime of choice as far as these products are concerned. This is not in keeping with the idea of medicines as a public good, to which the World Health

---

Organization apparently subscribes, to which everyone should have access irrespective of their ability to pay for them. It also does not recognize the realities of the developing world in which the majority of people are in no position to bargain with multinational manufacturers of pharmaceuticals in order to gain access. In fact one finds that international organizations whose activities revolve around international finance, such as the World Bank, and trade, such as the World Trade Organization, have a remarkably non-interventionist approach when it comes to ensuring that developing countries meet international human rights standards. To be blunt, the international community is not particularly adept at putting its money where its mouth is. Furthermore, offers of financial assistance, when they do come, usually have strings attached with very vested interests visible at the other end. International law, like international development programmes, tends to be fragmented in the sense that it does not offer internally consistent, holistic solutions to problems at a practical level. The right to health was first recognized as a fundamental right when in 1946 the Constitution of the World Health Organisation was adopted at the International Health Conference held in New York from 19 June to 22 July, and signed on 22 July by the representatives of 61 states. It has been observed that on a strict understanding a ‘right to health’ ‘implies somewhat absurdly that everyone has the guarantee of perfect health.’ The Pan American Health Organisation suggested in 1989 that it would be more correct to speak of a “right to health protection, including two

---

60 Schlemmer-Schulte (fn 59 supra) writes "Weaknesses of the international human rights system (in particular United Nations (UN) human rights machinery) have led to calls on international financial institutions such as the World Bank (the Bank) to use their financial muscle to improve implementation of and compliance with international human rights standards. The Bank has, however, been reluctant to follow these calls as it was neither created for the purpose of protecting human rights nor can it so easily change its legally prescribed mandate, or (nor ?) would it be practical to base its work on human rights in order to promote development with a human face....Human rights are, however, of great inspirational value in the improvement of Bank policies. A survey of Bank policies would be useful to help fill substantive gaps (lack of policy on education) and correct formal defects (vague instead of precise directions in the area of gender and adjustment). Finally a human rights inspired review of Bank policy alone will not solve what many consider currently the major problem of development assistance programs. In conjunction with these programs a broader perspective should be used to screen adjustment policies and individual programs carefully, primarily for lack of attention to social concerns. The "Washington Consensus" recipe which has been used by the Bank since the 1980s and which included trade, capital and financial markets liberalization, privatization and fiscal austerity neither promoted global financial economic stability nor led to steady development in several Third World regions. On the contrary the "Washington Consensus" recipe contributed to the outbreak of crises and even exacerbated them. In order to end the social sufferings that occurred during these crises and in their aftermath, no bits-and-pieces solution such as the simple introduction of a labour standard policy is needed by a comprehensive look at the entire recommended adjustment package and a checking of its contents against vital elements of sound economies..."

61 The statement of Professor T C Van Boven, at the United Nations workshop on 'The Right to Health' in 1979 that: "Three aspects of the right to health have been enshrined in the international instruments on human rights; the declaration on the right to health as a basic human right; the prescription of standards aimed at meeting the health needs of specific groups of persons; and the prescription of ways and means for implementing the right to health", it is submitted is not correct since whilst international instruments such as the ICESCR does specify certain steps to be taken in to realise the right to health, these steps are by no means exhaustive and do not in themselves guarantee the realisation of the right to health. They are also not contextualised with regard to other areas of international law or even with regard to other internationally recognised human rights that also require a great deal of resources. The ICESCR requires states to reduce the stillbirth rate. It has been observed by lizzard R 'Background to the Medicine and Human Rights Module' http://www.dundee.ac.uk/med/humanrights/SSM/intro/in-background.html that the term 'the right to health' therefore tends to be used for the sake of convenience and implies a reasonable, as opposed to an absolute, standard.
components, a right to health care and a right to healthy conditions. This inability to agree even on the language to be used to describe the right intended does not bode well for a universally recognized right of access to health care within international law. Furthermore, instead of working with the realities of the situation and establishing measures to cope with the relative nature of the right, it tends to be stated in public international law instruments in the broadest and vaguest of universal terms in a manner that serves only to hide a multitude of sins.

10.2.6 Conclusions Concerning International Law

At the level of customary international law, the conclusion that one draws as to whether or not a right to health has passed into customary international law depends on the theory of customary international law to which one subscribes. This obviously fails one of the most basic tests of law – that of certainty. If one cannot state with any conviction what the law is, how can it be law? Despite the fondest wishes of legal academics in the health arena, if it can at all be said that there is a right to health, or health care, in customary international law, it is only at the most abstract and idealistic level. This is of no assistance to the people of South Africa in the face of the much more concrete and pragmatic arguments of constitutional law and the need to balance conflicting rights.

Whilst there is a considerable body of public international law on the subject of the right to health, much of it is not binding upon South Africa or its subjects. South Africa has not ratified the International Covenant on Economic, Social and Cultural Rights which contains the most comprehensive statement of the right to health in public international law according to its drafters. Furthermore, although South Africa has ratified the Convention on the Rights of the Child (CRC) and the Convention on the Elimination of all Forms of Discrimination Against Women (CEDAW), it has not expressly enacted the provisions of these instruments into domestic law. Undoubtedly the Constitutional proscription of unfair discrimination supports the principles of CEDAW and section 28 of the Constitution largely supports those of the CRC. The Promotion of Equality and Prevention of Unfair Discrimination Act is also in keeping

---

with the former but its concerns are much wider than just discrimination against women and are based on the grounds of unfair discrimination identified in the Constitution. Furthermore the constitutional court has expressly and repeatedly refused to apply the public international law concept of minimum core obligations to socio-economic rights as expressed in the South African Constitution.

There is no golden thread of commonality discernible within the various public international law instruments that contain references to rights relating to health. They are often couched in subjective terms that make objective identification of practical standards of quality and levels of care impossible. The content of the right to health care or the right to health, there is even uncertainty as to how best to express it, is quite simply anyone’s guess. At best it is an abstract concept that is dependent upon domestic law and local courts for its content. Since this naturally varies from one country to another one cannot help but draw the conclusion that at international law, the right to health care is a vague and somewhat emotional notion that appeals to the higher nature of humankind but adds very little to its practical reality.

10. 3 Constitutional Law

As stated previously constitutional law, and more specifically the Constitution, is the central theme running through this thesis. It defines a number of rights relating to health care most notably the right of access to health care services including reproductive care, the right not to be refused emergency medical treatment, the rights of the child to basic health care services and the rights of prisoners to medical treatment.

These rights were previously non-existent at worst and unacknowledged at best. The Constitution has therefore introduced in the relevant sections in the Bill of Rights, certain legal concepts with which the legal systems of many other countries throughout the world, and international law, have still to come to grips. Socio-economic rights, such as that of access to health care services, are still controversial in many countries despite international legal instruments such as the International

10.3.1 Individual Rights vs Rights as Elements of a System

In contrast to international law, there is no express mention of a broad right to health in the Constitution. As stated previously, however, the approaches of the Constitution and international law can be distinguished in that whereas the former tends to have a bottom-up approach the latter has a top-down approach. One would therefore not expect to see a right to health *per se* in the Constitution but rather all of the elements of law necessary to ensure health as an outcome of the application of the Bill of Rights. This is in effect what one finds. The rights in the Bill of Rights are not discrete legal concepts but rather elements of a system of fundamental rights that are inextricably interlinked. It is a requirement of any coherent system that its elements operate in harmony to further or achieve a specific goal. In practice, it is submitted, the constitutional approach is preferable to that of international law which still shows a clear tendency to view rights in isolation from each other. Whilst there are groupings such as the socio-economic rights reflected in the ICESCR and the CRC, such groupings tend not to be contextualised within a single, homogenous system of international law generally. Whilst the Constitution facilitates an integrated and holistic approach that requires a balancing of all relevant rights, international law does not. The constitutional rights to life, dignity, freedom and security of the person, bodily and psychological integrity, privacy, emergency medical treatment, access to health care services including reproductive health care, sufficient food and water, an environment that is not harmful to health or wellbeing and social security all contribute to health as an outcome. The operation of each right with equal strength and power in any single given situation is neither necessary nor appropriate in order to achieve the desired outcome. Their importance varies between different factual situations. It is relative. The constitutional court has committed itself to a purposive approach\(^{63}\) to the interpretation of the Bill of Rights. It is submitted that this approach

\(^{63}\) Thus the constitutional court in *Dawood and Another v Minister of Home Affairs and Others; Shalabi and Another v Minister of Home Affairs and Others; Thomas and Another v Minister of Home Affairs and Others* 2000 (1) SA 997 (C) pointed out that: “Following the ‘purposive’ approach to the interpretation of the Constitution which has been adopted by the Constitutional Court, the right to human dignity which is in issue in the present proceedings must not be construed
is laudable and appropriate in the light of South Africa's historical context and the need to avoid distortion of the spirit of the law through the abuse of the letter of the law such as was all too often the case prior to 1994. It indicates a preoccupation with justice and other values that underpin the Constitution rather than a concern with law, for law's sake. It also indicates the need to approach law and its interpretation in a manner that differs significantly from the thinking that held sway when the South African legal system was essentially driven by the common law as opposed to the Constitution. Regrettably within certain quarters of the South African judiciary this departure from an outmoded jurisprudence is still meeting with considerable resistance. It is at worst a temporary problem stemming from the reluctance of a

---

64 Sachs J noted in S v Mhlungu and Others 1995 (3) SA 867 (CC): “In any event, a question mark has to be placed over the usefulness of common law presumptions in interpreting the Constitution. As Wilson J pointed out in a notable dissent, 'such presumptions can be inconsistent with the purposive approach to Charter interpretation which focuses on the broad purposes for which the rights were designed and not on mechanical rules which have traditionally been employed in interpreting detailed provisions of ordinary statutes in order to discern legislative intent.' Sir Rupert Cross suggests that even in a constitutional context, various interpretable approaches cannot be alternatives amongst which the judge chooses; there are multiple poles in a complex field of forces, among which Judges navigate and negotiate. I don’t believe that any responsible constitutional adjudicator will end up, over any interesting run of cases ignoring any of the factors; perceived verbal significations, perceived concrete intentions, perceived general purposes, perceived and evaluated social consequences, perceived and intended normative theories or unifying visions.’ (1995 (11) SAHR 477 at 483.) In certain cases the purposive approach represents the most appropriate within the interpretive repertoire in order to guide the process of interpretation. As Smallberger JA said in Public Carriers Association and Others v Toll Road Concessionaries (Pty) Ltd and Others 1990 (1) SA 925 (A) at p 943, ‘the purpose of a statutory provision can provide a reliable pointer to such interpretation where there is ambiguity’.

65 A case in point is Afrax Healthcare Limited v Strydom 2002 (6) SA 21 (SCA) in which the court failed to notice and apply the pertinent observations of Sachs J in S v Mhlungu And Others (in 64 supra) to the effect that it is necessary to achieve an appropriate weight for each of the competing provisions especially where, as Carstens P and Kok A point out at p 444 in ‘An assessment of the use of disclaimers by South African hospitals in view of constitutional demands, foreign law and medico-legal considerations’ SA Public Law Vol 18 No 2 2003 p 430, one is an express and specific constitutional right of access to health care services whilst the other, the essentially common law rule of the sanctity of contract (pacta sunt servanda) is not. The court also failed lamentably to apply the purposive approach to an interpretation of the right of access to healthcare. This case aptly demonstrates the inability of law alone to promote justice in the absence of a purposive approach to interpretation that turns the focus to the spirit of the law.
previous generation to relinquish the conceptual relics of an unfortunate past and will no doubt disappear with time and the processes of attrition. The purposive approach does not preclude the limitation of rights. In the context of the right of access to healthcare services which is inherently limited by the available resources referred to in section 27(3) of the Constitution the purposive approach would include conscious cognisance of such limitation.

It is submitted that the meaning of the right

---

66 Jones in Phato v Attorney-General, Eastern Cape, and Another: Commissioner of the South African Police Services v Attorney-General, Eastern Cape, and Others 1995 (1) SA 799 (E) observed the following: "Hogg Constitutional Law of Canada 3rd ed 1992 puts it thus at para 33.7(c) (at 814-15): "The Court has generally assumed that a 'purposive' approach and a "generous" approach are one and the same thing - or at least are not inconsistent. Indeed, statements of the purposive approach have nearly always been accompanied - often in the same sentence - by statements of the generous approach. In the case of some rights, that is, a purposive interpretation will yield a broad scope for the right. In the case of most rights, however, the widest possible reading of the right, which is the most generous interpretation, will "overshoot" the purpose of the right, by including behaviour that is outside the purpose and unworthy of constitutional protection. The effect of a purposive approach is normally going to be to narrow the scope of the right. Generosity is a helpful idea as long as it is subordinate to purpose. Obviously, the Courts in interpreting the Charter should avoid narrow, legalistic interpretations that might be appropriate to a detailed statute. But if the goal of generosity is set free from the limiting framework of purpose the results of a generous interpretation will normally be inconsistent with the purposive approach.'

One of the reasons for placing proper limits upon the content of a fundamental right in chap 3 is the interplay between the interpretative process of defining the right in the first place and the adjudicative process of determining whether a restriction upon the constitutional right as defined is justified in terms of s 33 of the Constitution. Hogg (op cit) proposes a disciplined and far-sighted approach to constitutional interpretation. I would only add the reminder that any limit upon the definition or content of chap 3 right must, of course, be in accordance with proper and acceptable rules of constitutional interpretation, which should not be "narrow, legalistic interpretations that might be appropriate to a detailed statute." Hogg (op cit)."

67 Thus in Soodaramoney v Minister of Health, KwaZulu-Natal (fn 28 supra) the constitutional court observed specifically with regard to the right of access to healthcare services that "Unlike the Indian Constitution ours deals specifically in the bill of rights with certain positive obligations imposed on the State and, where it does so, it is our duty to apply the obligations as formulated in the Constitution and not to draw inferences that would be inconsistent therewith. This should be done in accordance with the purposive approach to the interpretation of the Constitution which has been adopted by this Court. Consistently with this approach the rights which are in issue in the present case must not be
of access to health care services in section 27(1) of the Constitution must be interpreted be ascertained by an analysis of the purpose of such a guarantee. It must be understood in the light of the interests it was meant to protect. This analysis is to be undertaken, and the purpose of the right is to be sought, by reference to the character and larger objects of the Constitution itself, to the language chosen to articulate the specific right, to the historical origins of the concepts enshrined, and where applicable, to the meaning and purpose of the other specific rights and freedoms with which it is associated within the text of the Constitution. The interpretation should be a generous rather than a legalistic one, aimed at fulfilling the purpose of the guarantee and securing for individuals the full benefit of the Constitution’s protection.

In the past, health care services were effectively denied to the majority of people in various ways. Health professionals condoned human rights violations in their failure to speak out when they were called in to treat the results of gross violations of human bodily and psychological integrity. They did their work secure in the knowledge that should their conduct towards their patients in these cases have amounted to something less than professional, the authorities, including the statutory professional body responsible for disciplining medical practitioners for unprofessional conduct, could not have cared less and their patients certainly had no choice in the matter. The quality of the health services people received from health professionals prior to 1994 was thus largely dependent upon the ethical beliefs and principles, or lack thereof, of the individual professional in question. Access to health care services does not, it is

68 See S v Makwanyane and Another fn 25 supra para 9 at p 403.
69 See Sidley P 'South Africa's Doctors Apologise for Apartheid Years' British Medical Journal 1995 311 p 148 in which it is noted that the apology stated that: "the association remained silent on race and public policies affecting the medical profession and the community. Examples include the restriction of medical school admissions on the basis of race, the segregation of hospitals and other health facilities, the maintenance of separate waiting rooms by doctors and tolerating interference with doctors' treatment of prisoners and detainees.... While the apology is long overdue, the association has made no mention of specific incidents that helped to isolate it internationally during the apartheid years — incidents such as the organisation's refusal to deal with the medical and ethical issues raised by the death of Steve Biko, a political activist who died in prison in the late 1970s and the inadequate performance of the district surgeon attending to him. One of these, Dr Benjamin Tucker, was a member of the association. The association refused to take action against him and to dissociate itself from the South African Medical and Dental Council's refusal to discipline the district surgeons."

See also Williams J R 'Ethics and Human Rights in South African Medicine' Canadian Medical Association Journal 18 April 2000; 162 (8) who observes that the failings of South Africa's medical profession were revealed at the Truth and Reconciliation Commission hearings as being of two kinds: toleration or active promotion of inequities in health care and complicity in gross violations of human rights. The commission's report condemns the Medical Association of South Africa for failing to draw attention to: "(a) the effects of the socioeconomic consequences of apartheid on the health of black South Africans, (b) the fact that segregated health care facilities were detrimental to the provision of health, (c) the negative impact on the health of millions of South Africans of unequal budgetary allocations for the health
submitted mean access to unprofessional, unethical or otherwise unacceptable health care services that do not take into consideration a patient’s rights to human dignity, to bodily and psychological integrity, to equality and to life. This cannot be the access that was contemplated in the Constitution because the right of access to health care services has to be read in the light of the character and larger objects of the Constitution itself. The sacrifice of such fundamental rights on the altar of the sanctity of contract is unjustifiable and in itself unconstitutional since the state is obliged, in terms of section 7(2) of the Constitution to respect, protect, promote and fulfil the rights in the Bill of Rights. The sanctity of contract is a common law right that does not appear in the Bill of Rights. Furthermore, only a strained interpretation of the right to freedom can include sanctity of contract since, on a purposive interpretation, the right to freedom does not mean the right to conduct oneself in a manner that contradicts the principles and values of the Constitution or that undermines the rights contemplated therein. The interests that the right of access to health care services were meant to protect are not only the procedural aspects of access but also the substantive aspects. It is submitted that access to health care services that are not of a sufficient quality or standard necessary to achieve their intended purpose is not access as contemplated by the Constitution. The condonation of unprofessional or unethical conduct that adversely affects the health or wellbeing of a patient is in fact tantamount to a denial of access. It is submitted that a purposive interpretation of the right of access to health care services is the only one capable of giving meaning to the right, of fulfilling the purpose of its guarantee and securing for individuals the full benefit of the Constitution’s protection. A legalistic interpretation will only result in the very inequities that the Constitution as a whole is designed to preclude.

care of difference ‘racial groups’, (d) the fact that solitary confinement is a form of torture and (e) the severe impact of detention on the health of children.” The report, notes Williams, is equally critical of similar failings on the part of the South African Medical and Dental Council, the body responsible for licensing, ethics and standards of practice. He notes that the Truth and Reconciliation Commission hearings witnessed numerous accounts of gross human rights violations in the health care sector. Many examples of misconduct of the district surgeons who were responsible for the health care of prisoners, apart from that of Steve Biko were reported, especially complicity in torture by police interrogators. This involved among other things, advising torturers on how not to leave telltale signs on their victims and falsifying medical reports and death certificates to omit any mention of the effects of torture. Other physicians who worked in emergency wards of hospitals routinely broke patient confidentiality by reporting patients with gunshot wounds to the police. Despite many complaints the South African Medical and Dental Council habitually failed to discipline or even investigate physicians involved in state-sanctioned violations of human rights. Williams notes that the medical profession’s complicity in apartheid cannot be explained by ignorance of the human rights abuses that were being perpetrated. He states that although individual physicians may not be to blame for ignorance of basic principles of medical ethics, the same cannot be said for the medical profession as a whole. It is this history, it is submitted, that must be taken into account when interpreting the right of access to health care services in section 27(1) of the Constitution. It is this history that the court in Afrox Healthcare v Strydom (fn 65 supra) chose to ignore in making its decision on disclaimers used in South African hospitals, suggesting that the threat of disciplinary action by a professional body was a sufficient deterrent and remedy for the patient who is the victim of negligent and unprofessional conduct.
A right to health *per se* is not only vague but unnecessary in South African law. Socio-economic rights at international law have been criticised as being relative rather than absolute\(^{70}\) and this has been equated with a lack of teeth. The comment has also been made that detailed entitlement legislation is a better guarantee of human rights\(^ {71}\) than a mere human rights catalogue such as is found, it is submitted, at international law. However, it is further submitted that is not the relative nature of the rights that are problematic. It is rather a weakness of international law that it can only at best provide a catalogue of rights without any meaningful content. This is precisely because rights cannot exist in a vacuum independently of the structures and values of the society in which they operate. Since international law by definition cannot accommodate the variations in social structures and values of the different nations of the world it cannot satisfactorily address the content of socio-economic and other rights. The strength of the constitutional Bill of Rights lies in the fact that all of the rights it contains are relative. The relative nature of the rights in the Bill of Rights is clearly seen in numerous dicta of the courts\(^ {72}\). The relativity is also contained in the constitutional notion that the rights must not only be fulfilled, they must also be protected, respected and promoted. In the health care context, health care services do not always promote and fulfill life, particularly if one accepts that life is a state that is not necessarily dependent upon access to health care services. It is submitted in chapter two that emergency medical treatment essentially protects life much more than it promotes or fulfills it. It is life preserving not life fulfilling. Thus in terms of the Constitution, not only different contexts but also different obligations impact upon...

\(^{72}\) *Rudolph and Another v Commissioner for Inland Revenue and Others* *fn 28* *supra*; *Case Ieni v Minister of Law and Order and Another* 1994 (3) *SA 625 (E)*; *Soobramoney v Minister of Health, KwaZulu-Natal* *fn 28* *supra* (Durban High Court); *De Reuck v Director of Public Prosecutions, Witwatersrand Local Division, and Others* 2003 (3) *SA 389 (W)*. See also *Van der Vyver D Seven Lectures on Human Rights* (quoted with approval by the court in *Phato v Attorney-General, Eastern Cape, And Another*; *Commissioner of the South African Police Services v Attorney-General, Eastern Cape, and Others* 1995 (1) *SA 799 (E)* and also in *Shabalala v Attorney-General, Transvaal, and Another Gumedze and Others v Attorney-General, Transvaal* 1995 (1) *SA 608 (T)*) who says at p 64-5: 'The lesson to be learned from the West German Constitution is that a bill of rights does not and, if it were to be feasible, cannot imply that the rights and freedoms it contains ought to confer unrestricted claims and competencies. I have gained the impression that the generally entertained distrust in South African of human-rights ideas has to a large extent been cultivated upon this false notion - which may, incidentally, have been inspired by the sweeping phraseology of the American Bill of Rights and certain international human-rights documents - that human rights are supposed to be absolute rights. The truth is that all rights and freedoms claimed by an individual have their appropriate boundaries to be determined, in general, by both the equal rights and freedoms of other persons and by state or community interests - provided that state interests are restricted in view of the true function of a state as an historical community destined to create and preserve law and order. Nor ought the scope and importance of one right or freedom to be preferred over that of another. In short, the only significance of a bill of rights would be that the government is constantly reminded that the rights and freedoms it contains have been regarded as of special importance for the preservation of a free society, that those rights and freedoms can be abridged in the specified circumstances and to the specified extent only, and that restrictions upon those rights and freedoms ought always to remain the exception and not the rule. Inclusion of a particular right or freedom in a bill of rights ought in no way to change its nature or ambit.'
different rights differently. The right to life is not absolute in the sense that one cannot choose to give it up. In South African law everyone has the right to refuse medical treatment even if, without that treatment, the patient would surely die. It is also relative in the sense that the sacrifice of the life of one may be necessary to save the lives of many and therefore fully justifiable in certain albeit limited circumstances. In the context of health services delivery more than most one encounters such situations in which those rendering such services are forced to make difficult choices. When the courts, on rare occasions, are asked to make, or at least adjudicate, these choices it becomes international news, for instance in the case of Soobramoney. However health professionals and public health administrations are obliged to makes such choices often as a normal part of the execution of their professional duties. In the case of the former one, sees this frequently in the form of triage procedures within trauma units that experience a sudden influx of critically injured people consequent upon a multiple motor vehicle accident or some other manmade or natural disaster. In the case of the latter it takes the form of resource rationing decisions that have to be made in order to achieve the most effective and optimal distribution and utilisation of limited resources. In such circumstances anyone who tries to argue that the right to life is absolute is nothing short of naïve. There are many who would argue that life without dignity and freedom is no life at all. A pertinent example of the truth of this argument in the health care context is that of the persistent vegetative state in which the unfortunate patient in Clarke v Hurst found himself.

Rights are thus relative as between different individuals who hold the same or different conflicting rights, as between each other when viewed in the context of a single individual who holds a number of conflicting rights and also as between the individual and society as a collective – the latter often represented by the State. The relativity of rights is also evident in the varying obligations to respect, protect, promote and fulfill them. The possibilities for legal permutations between these various planes of relativity are infinite when combined with the various factual permutations that can arise in real life. Thus one can have a decision in Soobramoney,

---

73 In the case of Jehovah's witnesses they choose to value their right to freedom of conscience, religion, belief and opinion above their right to life when it comes to blood transfusions. The right to refuse a blood transfusion has been recognised by a South African court in Phillips v de Klerk TPD (unreported) March 1983 (see Strauss SA Doctor Patient and the Law: A Selection of Practical Issues p 29 and 94)
74 Soobramoney fn 28 supra
75 Clarke 1992 (4) SA 630 (D)
which favours the rights of a group over those of a single individual, sitting comfortably side by side with a judgment in the TAC\textsuperscript{76} and Grootboom\textsuperscript{77} cases which focus very much upon the rights of individuals. The point is that relativity of rights promotes flexibility of law and flexibility of law in its turn permits justice to prevail in different circumstances.

10.3.2 The Right of Access to Health Care Services

The right of access to health care services should not be confused with the notion that there is a right to indefinitely evade death\textsuperscript{78}. It is submitted that this view of the court in Soobramoney is entirely consistent with the spectrum of health services contemplated by the Constitution since the latter include palliative care in a hospice setting which involves the psychological preparation of the individual for death and the alleviation of physical suffering in the end stages of life. It was the view of the constitutional court in Soobramoney that life includes death and that one cannot therefore take the attitude that the right of access to health care services precludes death from the equation. If one did so, then it is submitted that the term “health care services” could not be read to include the kinds of services rendered by hospices. This principle is exceptionally important when one is dealing with limited resources in the delivery of health services. If it were not recognized, people would be able to demand access to the most expensive, latest technological developments in health care in the world solely on the basis that this would prolong their lives.

The point is made in chapter two of this thesis that there can be fundamental differences, and even conflict, between a right to health and a right of access to health care services. The example is used of spraying dwellings with DDT, an environmentally harmful substance, in an effort to protect the inhabitants from malaria carrying mosquitoes. The concept of a right to health in South African law is likely to be of limited value since it is the interaction of the various rights in the Bill of Rights which will determine the outcome of a particular case involving health care services rather than a global consideration of a right to health \textit{per se}.

\textsuperscript{76} Minister of Health and others v Treatment Action Campaign and Others (No 2) fn 26 supra
\textsuperscript{77} Government of the Republic of South Africa and Others v Grootboom and Others fn 26 supra
\textsuperscript{78} Soobramoney v Minister of Health, KwaZulu-Natal fn 26 supra
It is clear that the right of access to health care services is justiciable. Although the term ‘health care services’ is not defined in the Constitution, it is submitted that the scope of the health care services contemplated in the Constitution is very broad, including as it does ‘reproductive health care’. Pregnant women are not ill but they are entitled to health care services in support of their pregnancy. The term “health care services” means more than just curative or therapeutic services because the term “health care” suggests the promotion, maintenance and preservation of health as much as it does the restoration of health. It also means more than just “medical treatment” as evidenced by the use of this term in section 27(3) of the Constitution to distinguish it from the right referred to in section 27(1). There is thus an important distinction drawn in the Constitution itself between “health care services including reproductive health care” on the one hand and “medical treatment” on the other. The right in section 27(3) refers to “emergency medical treatment”, suggesting that there are other kinds of medical treatment. However the section 27(1) of the Constitution refers to a right of access to health care services as opposed to “medical treatment”. It is submitted that medical treatment is therefore a subset of the health care services contemplated in section 27(1) of the Constitution.

The right expressed in section 27(1) of the Constitution is not a right to health care services but a right of access to health care services. It is argued that this acknowledges and supports the other rights in the Bill of Rights such as the rights to dignity and bodily and psychological integrity. In keeping with these other rights, health services may only be lawfully rendered on the informed consent of the patient because it is a right of access and not a right to health services. The language of the Constitution in expressing the right to health care services also indicates a certain responsibility upon the individual to avail him or herself of the services in question. Access is a channel or path by means of which an object is attained – it is not the object itself. The individual must therefore walk that path if he or she wishes to obtain the health services to which it leads. A person cannot complain that health services have not been delivered to him when they are accessible to him.

79 Grootboom fn 26 supra
A further implication of a right of access to, as opposed to a right to, health services is that the state is not obliged, in terms of the manner in which the right is expressed in section 27(1) of the Constitution to provide health services. It can ensure access without necessarily providing the health services itself. Thus if a person is a contributor to a medical scheme which assures her access to private health care facilities she is not necessarily entitled to free health care services from the state at public health facilities merely by virtue of section 27(1). Indeed she may not be entitled to any health care services at a public health establishment, whether she pays for them or not, if she has sufficient access to equivalent health services in the private sector. Similarly if the state adopts a means test in order to decide who should contribute to the costs of their health care services a public health establishment and who should obtain those services free of charge, such an attitude on the part of the state would not necessarily be unconstitutional provided that the fees payable are reasonable in relation to the means of the patient and consistently applied to everyone in the same means category.

The question of a medical scheme member's rights as against the state when he or she exhausts the benefits available under the scheme depends upon whether or not the required treatment is available to patients commonly serviced within the public health sector. A good example of this is the treatment of AIDS through the use of antiretroviral drugs. If these drugs are available to public sector patients but there is no mandatory requirement for medical schemes to provide benefits to secure the same treatment then a medical scheme member would be entitled to access the drugs at a public health establishment. This does not, however, mean that such access will be free of charge if there is a system of fees generally applicable within the public sector based upon the patient’s ability to pay. In South Africa, at present, membership of a medical scheme is voluntary. Therefore people can choose to belong to a medical scheme, which in most cases still assures them of a certain degree of access to private health facilities, or they can choose not to in which case they will have to pay out of their own pockets for access to those same private health facilities or avail themselves of health services in the public sector where they may still be obliged to contribute towards the costs of those services on the basis of a means test. Where the treatment in question is highly specialized and is not available in the public sector, it is submitted that a medical scheme member who exhausts his medical scheme benefits
in obtaining such highly specialized treatment will have no right to claim those same services from the state on the basis of section 27(1) of the Constitution. Sections 213 to 215 of the Constitution make provision for the allocation of revenue and the mechanisms that must be employed in this regard. It is submitted that the state also has a right to allocate resources on the basis of sections 85 (in the case of the President in Cabinet) and 125 (in the case of provincial governments) which provide the authority for the developing and implementing of national and provincial policy, coordinating the functions of state departments and provincial administrations and performing any other executive functions assigned to them by the Constitution or legislation. It is submitted that provided that decisions by the state concerning the allocation of resources are lawful, fair, rational and reasonable and meet the criteria laid down in *inter alia* Soobramoney, the courts will be extremely reluctant to interfere with such decisions since, constitutionally speaking, they are the province of executive government and not the judiciary.

The point is made in chapter 2 that “access” implies much wider obligations upon the state than mere availability of health care services and that the obligations of the state in respect of section 27(1) do not stop at the boundaries of the jurisdiction of the national and provincial departments of health. Access implies adequate roads to and from health facilities, reliable transport services from people’s homes to health establishments, sufficient numbers of suitably qualified and skilled health professionals to be able to provide the required services, adequate supplies of water and sanitation, the maintenance of government buildings and facilities from which or within which health services are delivered and the allocation of sufficient funding to the various state departments concerned to ensure that they can fulfil these mandates. The right of access to health care services therefore impacts upon the roles and functions of the departments of provincial and local government, public works, transport, water affairs and the national and provincial treasuries.

### 10.3.3 Realisation Of The Right Of Access To Health Care Services

The Constitution requires the progressive realisation of the right of access to health care services and obliges the state to take reasonable legislative and other measures to
achieve this. In cases such as *Grootboom*⁸⁰, *Soobramoney*¹¹, and *TAC*² the constitutional court has provided some guidelines as to the approach that should be adopted in this regard. In *Grootboom* the court stated the following broad principles:

(1) Questions involving socio-economic rights must be considered on a case-by-case basis, considering the terms and context of the relevant constitutional provision and its application to the circumstances;

(2) The rights must be understood in two contexts – firstly their textual context and secondly their social and historical context;

(3) Socio-economic rights cannot be considered in isolation but must be considered in the setting of the Constitution as a whole;

(4) The obligations imposed upon the state are not absolute or unqualified. The state’s obligation with regard to socio-economic rights is defined by three key elements –
   (a) the obligation to take reasonable legislative and other measures;
   (b) to achieve the progressive realisation of the right; and
   (c) within available resources;

(5) Policies and programs must be determined in the light of the creation by the Constitution of different spheres of government and the allocation of powers and functions amongst these different spheres thus emphasising their obligation to co-operate with one another in carrying out their constitutional tasks;

(6) The formation of policies and programs are just one of the aspects of the task that must be reasonable. Implementation of such programs and policies must also be reasonable;

⁸⁰ *Grootboom* fn 26 supra
¹¹ *Soobramoney* fn 28 supra
²² *TAC* fn 26 supra
(7) In order to be reasonable, a program must be balanced and flexible and make appropriate provision of attention to crises and to short, medium and long term needs;

(8) A program excluding a significant segment of society is not reasonable;

(9) Reasonableness had to be understood in the context of the Bill of Rights as a whole, especially the constitutional requirement that everyone be treated with care and concern and the fundamental constitutional value of human dignity;

(10) Accessibility has to be progressively facilitated, requiring the examination of legal, administrative, operational and financial hurdles which have to be lowered over time;

(11) The obligation does not require the state to do more than its available resources permit. This means that both the content of the obligation in relation to the rate at which it is achieved as well as the reasonableness of the measures employed to achieve the result are governed by the availability of resources;

(12) There is a balance between goal and means. The measures must be calculated to attain the goal expeditiously and effectively but the availability of resources is an important factor in determining what is reasonable;

(13) The national government bears the overall responsibility for ensuring that the state complies with its obligations with regard to socio-economic rights;

(14) Provision must be made for relief for those in desperate need. Programs and policies that do not cater for them are unconstitutional.

In the *TAC* case many of these principles were simply endorsed by the court with reference to *Grootboom*. The court in *Grootboom* approved of the principles laid down in the judgment in *Soobramoney*. 
The court in *TAC* added the following principles or refinements to those referred to in *Grootboom*:

1. A policy that excludes those that can reasonably be included is unconstitutional;
2. Not everyone can immediately claim access to benefits;
3. State policy must take into account disparities in access between the private and public sectors;
4. An approach that nothing but the best should be provided is unconstitutional if it has the effect of denying access to a benefit that is substantive even though less than optimal;
5. Transparency of government policies and programmes and widespread communication of such policies and programmes in an essential element of the State’s obligations with regard to the progressive realisation of socio-economic rights.

From *Soobramoney* the following principles emerge:

1. The criteria for the courts in deciding whether or not interfere with a decision of the political organs and medical authorities responsible for such matters as stated by the court are rationality and good faith.
2. In support of the purposive approach to the interpretation of the right of access to health care services the court observed that the constitutional commitment to address the deplorable conditions of great poverty, high levels of unemployment, inadequate social security and widespread lack of access to clean water and adequate health services, is expressed in the preamble which, after giving recognition to the injustices of the past, states: ‘We therefore, through our freely elected representatives, adopt this Constitution as the supreme law of the Republic so as to -
Heal the divisions of the past and establish a society based on democratic values, social justice and fundamental human rights;

... Improve the quality of life of all citizens and free the potential of each person.' Therefore one the central purposes of the right of access to health care services is to improve the quality of life of all citizens and free the potential of each person. This carries the implication that health services that fail unreasonably to achieve these objectives cannot be regarded as the kind of health services to which access is contemplated by the Constitution.

(3) The right not to be refused emergency medical treatment must not be confused with the right of access to health care services.

(4) The purpose of the right not to be refused emergency medical treatment seems to be to ensure that treatment be given in an emergency, and is not frustrated by reason of bureaucratic requirements or other formalities. A person who suffers a sudden catastrophe which calls for immediate medical attention should not be refused ambulance or other emergency services which are available and should not be turned away from a hospital which is able to provide the necessary treatment. What section 27(3) requires is that remedial treatment that is necessary and available be given immediately to avert that harm.

(5) The government, which is responsible for health services, has to make decisions about the funding that should be made available for health care and how such funds should be spent. These choices involve difficult decisions to be taken at the political level in fixing the health budget, and at the functional level in deciding upon the priorities to be met. A court will be slow to interfere with rational decisions taken in good faith by the political organs and medical authorities whose responsibility it is to deal with such matters.

(6) The state's failure to provide a particular kind of health care service for everyone is not necessarily unconstitutional but must be considered in the light
of prevailing circumstances, including the availability of resources and how rationally they have been deployed.

### 10.3.4 Horizontal Application

It is submitted that the foregoing principles are not necessarily confined to the delivery of health care services by the state. If the fact is accepted that the wording of the right of access to health care services in section 27(1) of the Constitution is sufficiently wide that the state is not necessarily obliged to itself deliver health care services to every individual and that it can take other measures to ensure access, such as the regulation of medical schemes and health establishments and professionals in the private sector and the provision of health financing in terms of a social health insurance scheme, then the right of access to health care services cannot be regarded as imposing a corresponding obligation upon the state alone. The fact that state resources may be overburdened and incapable of accommodating everyone who needs health care services cannot be used as justification to argue that the State's obligations in terms of section 27(1) begin and end with the public health sector. A purposive interpretation of sections 27(1) and 27(2) of the Constitution, it is submitted, obliges the state to take reasonable legislative and other measures to ensure that the right of access to health care services is also capable of realisation within the private sector and this obligation will remain for as long as the state itself does not have the capacity to render health care services to everyone. For this reason, it is submitted that the constitutional principles outlined above apply, mutatis mutandis to the private health sector as much as they do in the public health sector. Moreover they must infuse and inform other areas of law that are applicable in the context of health service delivery, such as the law of contract to the extent that contracts are used as the legal vehicle for the provision of health care services, the law of delict to the extent that it redresses the wrongs done to patients in the provision of health care services and administrative law to the extent that it applies to the decisions and conduct of statutory professional bodies, private entities performing a public function (for example members of the private health sector who have been awarded state tenders for the delivery of health services or the supply of health products) and governmental institutions and public entities (including the Medicines Research Council and the National Health Laboratory Services).
The question of payment for health care services within the private sector is not necessarily a bar to the application of section 27(1) to providers of health care services in the private sector. Patients are required to make payments in respect of health care services in the public sector where a means test demonstrates that they have the necessary resources. This is not unconstitutional. In the private health sector such a means test is simply less overt since one cannot access health services in the private sector in the absence of the means to pay for them. Since in many instances patients serviced by both the public and the private health sectors have the means to pay (whether by virtue of their membership of a medical scheme, because of some kind of social insurance scheme such as is currently provided for occupational illnesses and injuries in terms of the Compensation for Occupational Injuries and Diseases Act or by virtue of their own personal resources) it would be a mistake to use this single issue in isolation as a justification for the horizontal inapplicability of the right in section 27(1) within the private sector.

It is further submitted that the right contemplated in section 27(1), as seen against the wider context of the Bill of Rights, applies equally to all persons whether they access health care services in the public or the private sector. Thus a refusal by a private sector provider to treat a patient in a manner or on a ground that is unfairly discriminatory or that unreasonably impacts on the patient’s rights to psychological or bodily integrity would be just as unconstitutional as a similar refusal within the public sector. An unreasonable refusal by a private provider of health care services to treat a patient or to comply with certain statutorily imposed standards of quality in regard to a particular patient could most certainly be argued as impacting upon his or her constitutional right of access to health care services. Contractual terms that vitiate or nullify the constitutional right of access to health care services cannot and should not be upheld by courts of law since the courts form a part of the state and the state is required to take reasonable legislative and other measures to respect, protect, promote and fulfil the rights in the Bill of Rights83. This obligation, it must be noted, does not specifically extend to rights other than those expressed in the Bill of Rights. The

83 In President of the Republic of South Africa and Others v United Democratic Movement (African Christian Democratic Party and Others Intervening; Institute for Democracy in South Africa and Another as Amici Curiae) 2003 (1) SA 472 (CC) the court observed that the three branches of government are indeed partners in upholding the supremacy of the Constitution and the rule of law. In President of the Republic of South Africa and Another v Hugo 1997 (4) SA 1 (CC) the court said that there are only three branches of government, viz legislative, executive and judicial.
sanctity of contract is one that falls within the common law rather than constitutional law. Since the common law must be informed by and developed so as to be consistent with the Constitution, there is in any event a constitutional mandate for judiciary to prefer constitutional rights to rights at common law where there is a conflict.

10.3.5 Conclusions Concerning Constitutional Law

Due to the fact that the rights in the Bill of Rights cannot be construed in isolation, questions involving the right to health care services are unlikely to be resolved only with regard to the right expressed in 27(1) and indeed they should not be. The rights in the Bill of Rights are interdependent and interconnected and a right of access to health care services is no exception. Other rights that are most likely to be involved are the right to human dignity, the right to life, the right to freedom and security of the person, the right to bodily and psychological integrity, the right to an environment that is not harmful to health or wellbeing. The approach of the courts to the right of access to health care should be considerably broader than it is at present in order to fully embrace this idea of rights as a composite concept. From the judgments discussed in the second chapter of this these, including the adoption of the constitutional court of the purposive approach to the Bill of Rights, it is clearly wrong to adopt a narrow and purely analytical approach to constitutional rights. Since constitutional rights themselves are not applied in a vacuum but may well be contextualized even further within the common or statutory law, one can no longer justifiably adopt a purely reductionist approach to these areas of law either. Legal synthesis and the construction of the right within its factual and legal contexts against a background of constitutional values and broad constitutional principles is essential if one is to give effect to the spirit of the law as embodied in the Constitution throughout the South African legal system. A meagre, starkly analytical approach that fails to take account of these issues is unlikely to infuse the common law with constitutional values and is even more likely to fall short of that most elusive of social goals – justice. Sarat and Kearns\(^{84}\) point out that contrary to popular belief, law is often

\(^{84}\) Sarat A and Kearns T R (edts) *Justice and Injustice in Law and Legal Theory*. In chapter one, Sarat observes the following: “Justice, Drucilla Cornell argues, “is precisely what eludes our full knowledge.” We cannot “grasp the Good but only follow it. The Good . . . is a star which beckons us to follow.” While justice, or what Cornell calls the Good, is, on her account, always present to law, it is never completely realized in law. Or, as Judith Butler puts it, “[T]he law posits an ideality . . . that it can never realize, and . . . this failure is constitutive of existing law.” Law exists both in the “as yet” failure to realize the Good and in the commitment to its realization. In this failure and this commitment, law is...
associated rather more with injustice than with justice despite the fact that in earlier times law and justice where perceived as synonymous. South Africans in particular have good reason to know the truth of this and just how naïve is the idea that law and justice are one and the same. In the book by Sarat and Kearns, the point is made that Commentators from Plato to Derrida have called law to account in the name of justice, asked that law provide a language of justice, and demanded that it promote the attainment of justice. The fact that justice itself is a balancing exercise, often between the interests of the individual and the collective, is no small coincidence. Human two things at once: the social organization of violence through which state power is exercised in a partisan, biased, and sometimes cruel way, and the arena to which citizens address themselves in the hope that law can, and will, redress the wrongs that are committed in its name. These thoughts remind us that running throughout the history of jurisprudence and legal theory is concern about the connections between law and justice and aside from how law is implicated in injustice. Commentators from Plato to Derrida have called law to account in the name of justice, have asked that law provide a language of justice, and have demanded that it promote, insofar as possible, the attainment of a just society. Yet the justice described is elusive, if not illusory, and in some scholarship disconnected from the embodied practices of law, including law's violence. In an earlier day, speaking about law and justice was not so vexing or difficult. Justice (just meaning 'law') was a legal term, pure and simple. At one time, laws which were 'given' and held to be unchanging and unchangeable. This ineluctable link between justice and law, as put forth by Hobbes, had the virtue of making the boundaries of justice more or less clear; but it had the considerable vice of labelling even heinous, iniquitous laws just. Justice could do no critical/reconstructive work because it was impossible to think of justice as external to law. Apart from Hobbes, most natural-law thinkers have resisted the result by insisting that unjust laws are not law, though doing so meant the end of any easy identification of positive or human law with "real" or following law. The alternative, embraced by perhaps a majority of those who continue to be at ease in this idiom, is to cut justice and law free from one another, to insist that justice is more than mere conformity to law, and to acknowledge that even unjust laws might nonetheless be law. Most recently, the distance between law and justice has been recognized in postmodern theorizing about ethics. Thus, as Douzinas and Warrington argue, "[J]ustice has the characteristic of a promissory statement. A promise states now something to be performed in the future. Being just always lies in the future, a pledge to look into the event and the uniqueness of each situation This promise, like all promises, does not have a present time, a time when you can say: 'there it is, justice is this or that.' Suspended between the law and the good...justice is always still to come or always already performed." Severance of the definitional tie between justice and law has left both notions free (if also bound) to acquire new identities. In both cases, former boundaries have been enlarged. Thus, matters other than those directly regulated by law (for example, the distribution of wealth) are viewed as falling under the purview of justice, and patent unjust legal arrangements (for example, apartheid in South Africa) are accepted as lawful despite their moral repugnance. But as Clarence Morris notes, "Though there can be law without justice, justice is realized only through good law. In fact, law and legal theory continue to be shaped by concerns about justice and injustice, just as understandings of these latter notions are shaped by an awareness of law and the concerns of legal theory." [Footnotes omitted]. Pecarelli comments that: "It is my opinion, based on my years of private practice and public service, that: Justice cannot be declared by judicial fiat within a legal system. Justice is transitory when the adjudication of a dispute is consistent with one person's preconceived concept of a desired result, but is inconsistent with another person's concept of a desired result. Justice requires a fundamental understanding and uniform result desired by all. Justice is considered a special virtue of what is the just thing to do in the circumstances of actual life or as a directive for acting toward each other to do or not to do something that concerns the other, the performance of which elicits approval. The source of the approval may be from another person or society in general. Justice, sometimes, is described or defined as the imposition of obligations or duties which supplies its own sanction and needs no norm or standard by which it is to be measured. In each such instance a range of meaning is expressed in which precision is transitory. The dilemma becomes acute in attempting to reconcile the objectivity of Positive Law, or the objectivity/subjectivity of Sociological Law, and the subjectivity of Natural Law. The expectation that the purpose of law is to increase justice creates an ambiguity. Law and justice are not mutually inclusive as the adjudication of a dispute may be perceived by some people in a given society as justice, while others could perceive the adjudication of the same dispute as injustice. See Dyzenhaus D Judging The Judges, Judging Ourselves for further views on this subject. See Sarat fn 84 supra. See Kastner F 'How To Deal With Paradoxes of Justice: The Ultimate Difference Between a Philosophical and a Sociological Observation of the Legal System' Paper for the Conference "The Opening of Systems Theory at Copenhagen Business School, May 23-23 2003 http://asp.sbs.dk/ccs/ who notes that: 'There had been a certain
rights considerations in particular often seem to raise this type of dichotomy and in
the field of public health it is also common. What benefits the individual does not
always benefit society as a whole and the cost of treating and individual may at times
even be detrimental to the collective as Soobramoney's case so clearly shows. The
constitutional court has made considerable headway in setting out some guiding
principles for executive government as to how to approach socio-economic rights.
Many of these principles are very prominent aspects of administrative law and the
concept of administrative justice or more detailed glosses on these principles.
Transparency, the consideration of the interests of everyone concerned as opposed to
only a single sector, the need to make provision for exceptions to the general rule, the
importance of taking all of the relevant factors into account when designing a
programme affecting socio-economic rights, reasonableness of not only programme
design but also implementation – many of these principles as outlined above can be
seen as being based in or stemming from administrative law considerations such as
that of audi alteram partem, that those tasked with decision-making must apply their
minds, that the facts and merits of each case must be taken into account, that there
must be no bias (nemo iudex in sua causa), or unfair prejudice, in deciding for or
against a particular individual or grouping, that decisions must be taken bona fides,
and that everyone should be given an opportunity to make representations stating her
particular case. These are all well recognised and established principles of
administrative law and arise from its preoccupations with fairness and the principles
of natural justice. It is fitting that this should be the approach of the constitutional
court since this is in keeping with the doctrine of separation of powers in terms of
which it is the function of the executive to make the policy decisions, to determine the
allocation of resources and to manage them in a manner that fulfils its own peculiar
obligations in terms of the Constitution. The court cannot substitute its own judgment
or opinion for that of the executive branch of government merely because believes
that this is preferable\(^8\). As the court in Soobramoney stated clearly:

\(^8\) Thus In Premier, Mpumalanga, and Another v Executive Committee, Association of State-Aided Schools, Eastern
Transvaal 1999 (2) SA 91 (CC) at para 41 the constitutional court states: "In determining what constitutes procedural
fairness in a given case, a court should be slow to impose obligations upon government which will inhibit its ability to
make and implement policy effectively (a principle well recognised in our common law and that of other countries). As
a young democracy facing immense challenges of transformation, we cannot deny the importance of the need to ensure the
ability of the Executive to act efficiently and promptly. On the other hand, to permit the implementation of retroactive
decisions without, for example, affording parties an effective opportunity to make representations would flout another
important principle, that of procedural fairness. . . . Citizens are entitled to expect that government policy will ordinarily
The provincial administration which is responsible for health services in KwaZulu-Natal has to make decisions about the funding that should be made available for health care and how such funds should be spent. These choices involve difficult decisions to be taken at the political level in fixing the health budget, and at the functional level in deciding upon the priorities to be met. A court will be slow to interfere with rational decisions taken in good faith by the political organs and medical authorities whose responsibility it is to deal with such matters.89

In view of these observations the importance of administrative law in the delivery of healthy care services cannot be overstated.

10.4 Administrative Law

Administrative law can be a highly confusing and technical area of law with which many people, including government officials, are largely unfamiliar. It is traditionally not an area of law that has preoccupied the private sector to any significant extent. Section 33 of the Constitution states that everyone has the right to administrative action that is lawful, reasonable and procedurally fair. It further states that everyone whose rights have been adversely affected by administrative action has the right to be given written reasons and that national legislation must be enacted to give effect to these rights.

In *Pharmaceutical Manufacturers Association of SA and Others: In re Ex parte President of the RSA and Others*90 it was held that administrative law, which occupies a special place in South African jurisprudence, is an incident of the separation of powers under which courts regulate and control the exercise of public power by the other branches of government.

Principles of administrative law under the common law should not be seen as separate from those under the Constitution91.

89 Soobramoney fn 28 supra at p776
90 *Pharmaceutical Manufacturers 2000 (2) SA 674 (CC)
91 Chaskalson P stated in *Pharmaceutical Manufacturers* fn 84 supra that: "The control of public power by the Court through judicial review is and always has been a constitutional matter. Prior to the adoption of the interim Constitution this control was exercised by the Courts through the application of common-law constitutional principles. Since the adoption of the interim Constitution such control has been regulated by the Constitution which contains express provisions dealing with these matters. The common-law principles that previously provided the grounds for judicial
10.4.1 The Promotion of Administrative Justice Act No 3 of 2000

The Promotion of Administrative Justice Act\textsuperscript{92} (PAJA) defines administrative action as -

"any decision taken, or any failure to take a decision, by-

(a) an organ of state, when-

(i) exercising a power in terms of the Constitution or a provincial constitution; or

(ii) exercising a public power or performing a public function in terms of any legislation; or

(b) a natural or juristic person, other than an organ of state, when exercising a public power or performing a public function in terms of an empowering provision,

which adversely affects the rights of any person and which has a direct, external legal effect, but does not include-

(aa) the executive powers or functions of the National Executive, including the powers or functions referred to in sections 79 (1) and (4), 84 (2) (a), (b), (c), (d), (f), (g), (h), (i) and (k), 85 (2) (b), (c), (d) and (e), 91 (2), (3), (4) and (5), 92 (3), 93, 97, 98, 99 and 100 of the Constitution;

(bb) the executive powers or functions of the Provincial Executive, including the powers or functions referred to in sections 121 (1) and (2), 125 (2) (d), (e) and (f), 126, 127 (2), 132 (2), 133 (3) (b), 137, 138, 139 and 145 (1) of the Constitution;

(cc) the executive powers or functions of a municipal council;

(dd) the legislative functions of Parliament, a provincial legislature or a municipal council;

\textsuperscript{92} Promotion of Administrative Justice Act fn 22 supra
the judicial functions of a judicial officer of a court referred to in section 166 of the Constitution or of a Special Tribunal established under section 2 of the Special Investigating Units and Special Tribunals Act, 1996 (Act 74 of 1996), and the judicial functions of a traditional leader under customary law or any other law;

(ff) a decision to institute or continue a prosecution;

(gg) a decision relating to any aspect regarding the appointment of a judicial officer, by the Judicial Service Commission;

(hh) any decision taken, or failure to take a decision, in terms of any provision of the Promotion of Access to Information Act, 2000; or

(ii) any decision taken, or failure to take a decision, in terms of section 4 (1);”

In terms of the Act, ‘administrator’ means an organ of state or any natural or juristic person taking administrative action.

In terms of PAJA ‘decision’ means any decision of an administrative nature made, proposed to be made, or required to be made, as the case may be, under an empowering provision, including a decision relating to-

(a) making, suspending, revoking or refusing to make an order, award or determination;

(b) giving, suspending, revoking or refusing to give a certificate, direction, approval, consent or permission;

(c) issuing, suspending, revoking or refusing to issue a licence, authority or other instrument;

(d) imposing a condition or restriction;

(e) making a declaration, demand or requirement;

(f) retaining, or refusing to deliver up, an article; or

(g) doing or refusing to do any other act or thing of an administrative nature, and a reference to a failure to take a decision must be construed accordingly”

These are important definitions. Their extent of their applicability to the exercise of various powers exercised by government officials is not always clear. In the context

93 See for instance Minister of Home Affairs v Eisenberg & Associates: In Re Eisenberg & Associates v Minister of Home Affairs and Others 2003 (3) SA 281 (CC) in which Chaskalson CJ observed that: ‘The definition of ‘decision’ does not refer to the making of regulations and it is not clear whether this constitutes administrative action for the purposes of PAJA. Moreover, the definition of ‘administrative action’ specifically excludes ‘any decision taken, or a failure to take a decision, in terms of s 4(1)’. It may be open to doubt, therefore, whether reliance could be placed on PAJA in the
of the delivery of health care services it would seem that a refusal to deliver up a
health record, the imposition of a condition or restriction upon access to a health
service, the refusal of a certificate of need to a health facility could all fall under the
definition of the term ‘decision’ a PAJA. The performing of the public function or
exercise of the public power in question must have a direct, external legal effect in
order for it to be classified as administrative action under PAJA. The exercise of a
public power or the performance of a public function by a natural or juristic person
that does not have such an effect is clearly not administrative action for the purposes
of PAJA.

The constitutional right to administrative action contemplated in section 33 of the
Constitution must be pursued and enforced in terms of the PAJA. In Jayiya v Memper
of the Executive Council for Welfare, Eastern Cape, and Another 94 the court made the
point that where the lawgiver has legislated statutory mechanisms for securing
constitutional rights, and provided, of course, that they are constitutionally
unobjectionable, they must be used. It found that the Promotion of Administrative
Justice Act did not provide for the kind of relief afforded to the appellant in
paragraphs 2(c) and 3 of the order.

10.4.2 The Nature of the Function Not the Functionary

In Pennington v Friedgood and Others95, the court stated that it was in agreement with
the following words of Devenish and Govender and Hulme96:

circumstances of this case. The scope of PAJA and its relationship to administrative law principles based in common law
is also not entirely clear,” In South African Shore Angling Association and Another v Minister of Environmental Affairs
2002 (5) SA 511 (SE) Erasmus J observed that: “Counsel for applicant submits that in s 6, PAJA simply re-enacts the
common law. He suggests that for an administrative action to be regarded as lawful, reasonable and procedurally fair, it
must now comply with the provisions of s 6(2) of PAJA supra. He submits that, in particular, paras (h) and (i) are of the
utmost importance insofar as it is there provided that the action must be reasonable and must not be unconstitutional or
unlawful. Counsel for respondent have a somewhat different view of the legislation. They submit that s 6 of PAJA was
intended as an exhaustive codification of the law relating to the judicial review of the exercise of public power. They
submit that this understanding of the intended scope of the Act is fortified by the decision of the Constitutional Court in
Pharmaceutical Manufacturers Association of SA and Another: In re Ex parte President of the Republic of South Africa
and Others 2000 (2) SA 674 (CC) (2000 (3) BCLR 241) at para [51], where Chaskalson P says that judicial review of
the exercise of public power is a constitutional matter that takes place under the Constitution and in accordance with its
provisions. Whatever the precise status of common-law principles in proceedings for judicial review of administrative
action may be, clearly those proceedings are now conducted under s 6 of PAJA. The basic approach, however, is the
same as before: the Court considers the administrative action in the light of the evidence.”

Jayiya 2004 (2) SA 611 (SCA)
Pennington 2002 (1) SA 251 (C)
Devenish GE, Govender K and Hulme D Administrative Law and Justice in South Africa at p 25
"Administrative action’ is the conduct of public authorities and indeed private entities when they exercise public powers, perform public functions or are obliged to exercise authority in the public interest. This means that common-law review now only applies in a very narrow field in relation to private entities that are required in their domestic arrangements to observe the common-law principles of administrative law. This applies in relation to voluntary associations, such as sporting clubs and religious organisations.”

It is clear from this that the question of whether or not an activity such as the delivery of health care services falls within the purview of administrative law depends not on whether the functionary or entity delivering those services is a public or private body but whether the delivery of health care services is a public function or is the consequence of an exercise of a public power or authority in the public interest. It is submitted that in a situation in which a private entity has been contracted by the state to deliver health care services pursuant to the constitutional obligations of the state contemplated in section 27(1) of the Constitution decisions of that private entity could constitute administrative law decisions depending on the terms of the contract and the nature of the decisions taken. The provision of health care services to patients in the absence of a contractual relationship between the provider and the patient, it is submitted, could promote an inference that the relationship is governed by administrative law to the extent that the provision of those health care services is regarded as a public function.

To take a practical example –

The provincial governments are required by section 16 of the Health Act No 63 of 1977 to provide hospital facilities and services. There appears to be nothing in the Act to prevent a provincial government from contracting with a private sector hospital group to provide these services and to ensure the carrying out of those daily activities sufficiently to fulfil the provincial government’s obligations as contemplated. If the provincial government itself had performed these activities this would no doubt have constituted a public function. Why should the situation change simply because a private provider has now been contracted to do the job? To the extent that the private provider fails to comply with administrative law in the decisions it takes concerning

---

97 The court in Pennington (fn 95 supra) stated: “Since the advent of the Constitution and, pursuant thereto, the PAJA, a requisite jurisdictional fact for success on judicial review is that the impeached conduct must constitute administrative action. From the above-quoted dicta from Pharmaceutical Manufacturers and from the PAJA, it is clear that whether such conduct constitutes administrative action falls to be decided by reference to whether such action amounts to the exercise of public power or the performance of a public function.”
the provision of those health care services, it should be subject to administrative law review in the same manner in which the provincial government would have been. This is not to suggest that the contractual relationship between the provincial government and the private provider could ever have the effect of absolving the former from its constitutional obligations in terms of section 27(1). However the arrangement does have the effect of bringing the private provider within the purview of administrative law.

The question as to whether or not a juristic person or entity other than an organ of state is performing a public function was considered in the case of *Transnet Ltd v Goodman Brothers (Pty) Ltd*98. In that case, which was decided before PAJA came into effect, the court carefully considered the nature of the duties of Transnet. It noted in this regard that from the history of the creation of Transnet, one could only deduce that all the powers and functions of the former S A Transport Services were transferred to Transnet, which was now obliged to exercise the said powers and perform the said functions. In doing so, Transnet merely stepped into the shoes of the SA Transport Services. Like the latter, it is performing a public service and function and exercising all the powers of a government department. Furthermore, said the court, the state is the only member and shareholder of Transnet; the entire commercial enterprise of the state (previously existing as the South African Transport Services), including all assets, liabilities, rights and obligations, was transferred to Transnet; the state is the only member and shareholder of Transnet and controls Transnet; an employee of Transnet is deemed to be an employee of the state; Transnet is obliged to provide a service that is in the public interest; the Minister of Transport is entitled to make regulations on a large range of matters relating to the control and functioning of Transnet. These observations were supported by the legislative provisions that established Transnet.

---

98 *Transnet* 2001 (1) SA 853 (SCA) The court observed in this case: "The right to equal treatment pervades the whole field of administrative law, where the opportunity for nepotism and unfair discrimination lurks in every dark corner. How can such right be protected other than by insisting that reasons be given for an adverse decision? It is cynical to say to an individual: you have a constitutional right to equal treatment, but you are not allowed to know whether you have been treated equally. The right to be furnished with reasons for an administrative decision is the bulwark of the right to just administrative action."
The court in *Transnet* observed that according to the *SARFU* case what has to be taken in consideration is, *inter alia*, the source of the power exercised, as well as ‘... the nature of the power, its subject-matter, whether it involves the exercise of a public duty, and how closely it is related on the one hand to policy matters which are not administrative, and on the other to the implementation of legislation, which is’ and that the implementation of legislation is an administrative responsibility, and will ordinarily constitute ‘administrative action’ within the meaning of s 33.

10.4.3 The Distinction Between Public and Private Powers

In *Pennington v Friedgood* the court held that the distinction between public and private (or non-public) powers is reflected in a comparison of four decisions: on the one hand, *Dawnlaan Beleggings (Edms) Bpk v Johannesburg Stock Exchange and Others* and *Johannesburg Stock Exchange and Another v Witwatersrand Nigel Ltd and Another* and on the other hand, *Herbert Porter & Co Ltd and Another v Johannesburg Stock Exchange* and *Cape Metropolitan Council v Metro Inspection Services (Western Cape) CC and Others*. After examining the relevant dicta in these cases the court observed that a medical scheme is a body corporate. It noted that in terms of the Act it acquires such status upon registration and that it is governed by the Act, the regulations and the scheme rules. Such rules, said the court, constitute the contract between the scheme and its members. A meeting of the members of a scheme is thus similar to a meeting of the members of a company. Both acquire status in terms of an Act of Parliament. Hodes AJ found that the relationship between the trustees (the first to fourth respondents) and the members of the scheme is governed by the Medical Schemes Act, the regulations and the rules. In the case of a company the relationship between members and the company is governed by the Companies Act and the articles of association of that company. He held that just as a meeting of shareholders of a company is not subject to the review of the High Court, so too the proceedings of an annual general meeting of a medical scheme are also not subject to

---

99 President of the Republic of South Africa and Others v South African Rugby Football Union and Others 2000 (1) SA 1 (CC)
100 Pennington fn 95 supra
101 *Dawnlaan Beleggings* 1983 (3) SA 344 (W)
102 *Witwatersrand Nigel Ltd* 1988 (3) SA 132 (A)
103 *Herbert Porter* 1974 (4) SA 781 (T)
104 *Cape Metropolitan Council* 2001 (3) SA 1013 (SCA)
105 Meaker NO v Roup, Wacks, Kaminer & Kriger and Another 1987 (2) SA 54 (C) at 61G - 62C.
the review of the High Court, for they do not constitute administrative action. Judicial review is a remedy to curb improper or inappropriate exercise of public power. Nothing contained in the Act, the regulations or the scheme rules, said Hodes AJ, imports a requirement by the trustees to observe the common-law principles of administrative law.

In *Cronje v United Cricket Board Of South Africa*¹⁰⁶ the court pointed out that in exceptional cases private bodies are vested with public powers by statute. It said that they are then subject to the rules of public law in the exercise of those powers. Those rules may expressly or by necessary implication prescribe the manner in which their powers must be exercised. If the repository of the power does not exercise them in the prescribed way, its conduct is subject to judicial review under public law. But these consequences flow, not from the nature of the body or the impact of its conduct, but from the underlying statute. Kirk-Cohen J noted that the rules of natural justice are thus in the first place rules of public law, but they do sometimes apply in the sphere of private law, but then only when they are incorporated by contract. Contracts between private individuals and bodies, he said, are ordinarily not governed by the rules of natural justice but they may be incorporated expressly or by necessary implication, depending upon the terms of the contract. Such a right may even be granted to an outsider if a private body by contract extends such a right to an outsider¹⁰⁷. The court stated that it is only where the constitution of a voluntary association incorporates the rules of natural justice that they then apply between the association and its members or those with whom it has privity of contract. The rules do not apply to a non-member who is not a party to the contract.

Despite this, it is submitted that where the Board of Trustees of a medical scheme acts in a manner that adversely and unlawfully impacts upon a member’s constitutional rights of access to health care services, human dignity, privacy or bodily or psychological integrity or in a manner that is unfairly discriminatory, it can be taken to task on the basis of constitutional law. Since constitutional law itself incorporates

---

¹⁰⁶ *Cronje* 2001 (4) SA 1361 (T)

¹⁰⁷ Examples of this are *Marlin v Durban Turf Club and Others* 1942 AD 112 at 126 - 7, *Anschutz v Jockey Club of South Africa* 1955 (1) SA 77 (W) at 80, *Jockey Club of SA v Transvaal Racing Club* 1959 (1) SA 441 (A) at 450, *Turner v Jockey Club of South Africa* 1974 (3) SA 633 (A) at 645 - 6, *Theron en Andere v Ring van Wellington* 1976 (2) SA 637 (W) at 721 - 2, *Government of the Self-Governing Territory of KwaZulu v Mahlangu and Another* 1994 (1) SA 626 (T) at 634 - 5 and *Lamprecht and Another v McNeillie* 1994 (3) SA 665 (A) at 668.
many of the principles of administrative law, the decision of the Board of Trustees could in certain cases be set aside on grounds closely resembling those of administrative law.

Despite the views of Hodes AJ in Pennington\textsuperscript{108}, it is submitted that there are many similarities between the Boards of Trustees of medical schemes and bodies that exercise a public function. They may not act outside of the boundaries of the Medical Schemes Act\textsuperscript{109} and Regulations for instance. They are obliged to ensure that the scheme provides for a minimum package of benefits as contemplated in the Act and spelled out in the Regulations. They may not step outside of the boundaries of the scheme rules which must be lodged with and approved by the Registrar of Medical Schemes in terms of the Medical Schemes Act. Medical schemes are free to determine their own rules only up to a point. Section 29 of the Act contains detailed provisions concerning matters for which the scheme rules must provide. It is respectfully submitted that the statement of Hodes AJ to the effect that nothing contained in the Act, the regulations or the scheme rules imports a requirement by the trustees to observe the common-law principles of administrative law was not strictly correct. Section 57(6) of the Medical Schemes Act states –

"The board of trustees shall-

(a) take all reasonable steps to ensure that the interests of beneficiaries in terms of the rules of the medical scheme and the provisions of this Act are protected at all times;
(b) act with due care, diligence, skill and good faith;
(c) take all reasonable steps to avoid conflicts of interest; and
(d) act with impartiality in respect of all beneficiaries."

10.4.4 Lawfulness

It has been held that it is fundamental to the principle of the rule of law that entities act within the powers lawfully conferred upon them. It will be recalled that lawfulness

\textsuperscript{108} Pennington fn 105 supra
\textsuperscript{109} Medical Schemes Act No fn 5 supra
is one of the aspects of the right to administrative justice contemplated in section 33 of the Constitution. In Kolbatschenko v King No and Another\footnote{Kolbatschenko 2001 (4) SA 336 (C)} the court held that it was only in highly exceptional cases that a court would adopt a hands off approach where a discretion has been exercised or an executive or administrative decision made which directly affects the rights or interests of an individual applicant. At common law, lawfulness is determined on the basis of public policy. It is a concept that is fundamental not only to administrative law but also to the law of contract and delict. The link between public policy and the values expressed in the Constitution was elucidated in Ryland v Edros\footnote{Ryland 1997(2) SA 690 (C)} in which the court held that the values of equality, tolerance of diversity and recognition of the plurality of South African society were among the values that underlie the Constitution and that those values “irradiate” the concepts of public policy and boni mores that the courts have to apply. Public policy and constitutional values are inextricably intertwined. Administrative action that is contrary to public policy as informed by constitutional values is unlawful and subject to administrative review.

10.4.5 Reasonableness

Reasonableness is another aspect of the right to administrative action in terms of section 33 of the Constitution. Significantly it is also the standard by which contractual clauses are adjudicated in relation to public policy and against which the actions or omissions of a tortfeasor are measured in terms of the law of delict. As such it is a concept that is central to South African law generally as opposed to one limited area. Reasonableness and rationality are two sides of the same coin. In order to be reasonable an administrative decision must be rational i.e. it must be justifiable\footnote{Manfongost and Others v United Democratic Movement and Others 2002 (5) SA 567 (TK.H)}. Administrative decisions moreover must be rationally related to the purpose for which the administrative power was given. Thus in administrative law, administrative action must be consistent with the objects of the empowering statute. In S v Manamela and Another \cite{S v Manamela 2000 (3) SA 1 (CC)} the court pointed out that reasonableness is a legal commonplace in the courts which are required to apply it daily in determining the standard of care expected of persons in ordinary life.
Reasonableness is clearly another of those golden threads that runs through the larger body of South African law. The constitutional court criticised the decision of the government not to provide Nevirapine in public sector health facilities in the grounds of reasonableness. Although this was a policy decision rather than an administrative one and so was not subject to administrative review per se this did not preclude the court from setting it aside inter alia on the grounds that it was unreasonable. The chances are that if the concept of reasonableness, as applicable to administrative action, had been applied by the state in the determination of its policy in the provision of Nevirapine then the TAC case would not have materialised. Reasonableness is a cross-boundary issue. It is not confined to administrative action or a particular field of law. This is its value as a unifying factor within the South African legal system. The court in Grootboom stated that a policy that excludes a significant sector of society is not reasonable. Similarly, it is submitted, administrative action that excludes or prejudices a significant sector of society is unreasonable.

10.4.6 Procedural Fairness

Procedural fairness is the last of the three aspects of administrative justice explicit in section 33(1) of the Constitution. Like lawfulness and reasonableness, it is a pervading principle of administrative justice rather than an isolated aspect thereof. Procedural fairness invokes the principles of natural justice as expressed in the maxims audi alteram partem and nemo iudex in sua causa. Notice and comment procedures are important in the process of administrative decision-making. Section 4 of PAJA makes provision for notice and comment procedures to be followed or public inquiries to be held where administrative action 'materially and adversely affects the rights of the public' In Mafongosi and Others v United Democratic Movement and Others the court stated that there were no separate principles applicable to the exercise of power by functionaries other than organs of state where the rights entrenched in section 33 of the Constitution were involved. Procedural fairness it is submitted is particularly important in decisions involving the allocation or distribution of resources. The emphasis of the constitutional court on not only the rationality of

---

114 TAC (No 2) fn 26 supra
115 Grootboom fn 26 supra
116 Mafongosi fn 112 supra
programmes affecting socio-economic rights but also the *implementation* of those programmes supports this conclusion. Procedural fairness is directly concerned with the practical aspects of health service delivery. In the context of public health services for instance, would it be procedurally fair to ‘fast-track’ medical scheme patients by putting them in a different queue to those queuing for the same service who are not medical scheme beneficiaries? Similarly would it be procedurally fair to stop a particular health service to which people had previously enjoyed access without notifying them of the intention to do so? It is submitted that procedural fairness is of considerable significance in ensuring absence of bias in administrative action and that decisions involving the allocation of health resources are according to objective, rational criteria.

4.5 Administrative Bodies Other Than Organs of State Involved in Health Services Delivery

It is likely that the Health Professions Council of South Africa, the South African Nursing Council, the Pharmacy Council, the Allied Health Professions Council, the Dental Technicians Council and possibly even the Council for Medical Schemes, the Medical Research Council, the National Health Laboratory Services will be regarded as exercising a public function on the strength of the judgment of the court in *Association of Chartered Certified Accountants v Chairman, Public Accountants' and Auditors' Board*17. In that case the court observed that the Board clearly exercises a public power, that it is a creation of statute and that the source of its power is to be found in the Public Accountants’ and Auditors’ Act18. It noted that the Board also appears to fulfil a public function in terms of the said legislation since it is a regulatory body entrusted with the task of ensuring that proper standards are maintained in the accounting and auditing profession. It functions in close cooperation with structures of state authority, its members are appointed by the Minister and include persons selected among the persons holding office as state functionaries, it is also dependent upon the state for infrastructural support.

---

17 *Association Of Chartered Certified Accountants 2001 (2) SA 980 (W)*
18 *Public Accountants' and Auditors' Act No 80 of 1991*
Section 13(1)(g) of the Act vested the Board with the discretionary power to prescribe the degrees, diplomas and other qualifications which entitled any person to exemption from the requirements to be complied with by persons desiring to be registered as accountants and auditors. The applicant had made a formal application to the Board in terms of the Act for the recognition of its examinations for the purposes of exemption of its members from having to sit at the Board’s examination. The Board, received, understood and considered the application in performance of its statutory powers. On 11 and 12 June 1996 the executive committee of the Board resolved that it would accept the education and training programmes of the applicant but that the applicant’s candidates would still have to write the Board’s qualifying examination for ‘an interim period’. The court found that the rejection by the Board of the recognition sought by the applicant constituted an administrative act or decision taken by the Board in the exercise of its discretionary powers as a public body. It observed that at common law a right to administrative action arises where such act or decision affects the rights, privileges or liberty of another and that this well-established ground for judicial review of public power has been subsumed under the Constitution. The court found that the Board’s decision has plainly affected the rights and interests of the applicant. In that it had determined its rights. The applicant asserted that it was indirectly affected by the Board’s decision because the value of its examinations would be greatly enhanced if the exemption sought were granted. Boruchowitz J held that the applicant’s reputation had also been adversely affected as the Board expressly impugned the standards applied by the applicant in its programmes, courses and examinations and that its decision constituted ‘administrative action’ that was reviewable in terms of section 33 of the Constitution. It is submitted that the councils referred to above who operate in the health sector, whilst they may not be organs of state as defined in the Constitution, are very much capable of administrative action on the same basis as the Public Accountants and Auditors Board.

119 Minister van Onderwys en Kultuur en Andere NO en Ander en ‘n Ander NO en ‘n Ander 1995 (4) SA 383 (A) at 388H; Toerie en ‘n Ander v De Villiers NO en ‘n Ander 1995 (2) SA 879 (C) at 885E - F.

120 In Korfu Health Professions Council v South Africa 2000 (1) SA 1171 (T) the court stated that: “The issue whether or not the respondent is an organ of State arose squarely in Mistry v interim National Medical and Dental Council of South Africa and Others (supra). In that case both Booysen J, who dismissed the applicant’s claim for interim relief, and McLaren J, who dismissed the applicant’s claim for final relief, applied the control test and concluded that the respondent’s predecessor was not an organ of State. It will serve no purpose to repeat the facts set out at 947 - 8 of the judgment which led the Court to come to this conclusion. There has been no material change. The State is not in control of the respondent. The respondent is not an organ of State.” It is submitted that to the extent that Korfu seems to give the impression that only organs of state can exercise a public power or perform a public function it is clearly wrong. If the refusal of the Health Professions Council to grant access to the records sought had been approached on the grounds of administrative law to the extent that the decision of the Council not to grant access constituted administrative action it would have been subject to review by the courts. In any event both PAJA and the Promotion of Access to Information...
10.4.7 Administrative Agreements

Burns observes that it has been said that although South African courts have recognised the administrative disposition and private law contract concluded by the state, they have not as yet, recognised the administrative law agreement. She notes that it has also been said that these administrative agreements in which the state acts in its capacity as an organ of state and exercises a measure of state authority fall somewhere in between the boundary of public law and private law. Public authorities are not empowered to conclude contracts which are incompatible with the proper exercise of their powers and duties: such contracts or actions are void because the authority has exceeded its power and has acted *ultra vires*. Burns says the question is whether the state is liable for damages arising from administrative agreements, such as a contract between the municipality and private agency regarding the removal of rubbish in its municipal area. Where a private contractor performs its contractual obligations negligently, an individual such as a ratepayer who suffers damage as a result of this negligence may sue the private contractor for damages in delict. To succeed in delict, all the elements of the delict must be proved, namely that the action was wrongful, the contractor was at fault, that the damage was caused by the contract, and so on. What is the position asks Burns, where a private contractor is unable to meet the financial commitments arising from claim negligence? Since the individual ratepayer is not party to the original contract, he or she is unable to sue the state for damages based on this contract. The situation then leads to the inevitable question of how and from whom the ratepayer may recover damages. Burns notes that although there are a number of administrative agreements entered into between the state and independent contractors in South African law, the law has not as yet laid down any general rules relating to the liability of these independent contractors for the negligent exercise of the contractual duties or a failure to exercise these duties. The question is whether one simply accepts that the state is not liable for damages under these circumstances once it has concluded a contract with a third party. She says the most important issue to be addressed by lawyers and the courts alike is whether the ultimate

---

121 Act No 2 of 2000 have subsequently overtaken this decision and it is unlikely to be followed to the extent that it is now inconsistent with these two statutes.

responsibility lies for damages, which ensue under these circumstances and that a further question to be addressed is whether there are certain public functions, which are categorised as essential services and which remain the responsibility of the state at all times? In other words, can it be said that the state cannot divest itself of its responsibility for these essential services, even when services are provided by an independent contractor? The liability of the state for administrative agreements is anything but clear, says Burns. At this stage, a delictual claim against the state for the negligent action of independent contractors will in all probability unsuccessful. Burns notes that a further point which militates against the success of a delictual claim is that the state will generally not be in a position to supervise or exercise control over the actions of the private agency, while it is fulfilling its contractual obligations. She asks whether it could not be argued that the state should compensate individuals for damages, where, for example, it has acted negligently in contracting with the private agency in question? If it becomes apparent that from the outset, the appointed private agency was unable to perform the function required, one could argue that the state was negligent and therefore liable in delict. Burns observes that currently administrative agreements are governed in the main by the rules of private law and courts are influenced by the private law of contract when determining the rules which applied to administrative agreements. She suggests that once the courts recognise the true nature and extent of the administrative agreements, they will be in a position to develop legal rules to address the issues which she raises.

It would seem that the primary question to be answered with regard to so-called administrative contracts is whether elements of public law, more specifically administrative law, should be applied to what is fundamentally a contractual relationship. It is submitted that the short answer is a qualified 'yes'. However, it is submitted that the motivation for doing so should stem from the Constitution itself rather than common law considerations such as whether or not claims should be entertained against the state under the law of delict. The discussion of this issue by Burns approaches the question of administrative agreements from only one limited angle – that of when the state should be held legally liable for the work of a contractor who has been hired to fulfil a statutory obligation of the state. It is submitted that where there is a constitutional right to the public service in question and particularly where there is an obligation upon the state to take reasonable legislative and other
steps to achieve the realisation of the right\textsuperscript{122}, administrative law principles should apply to the measures taken by the state to fulfil the rights in the Bill of Rights. The other measures that the state can take in fulfilling its constitutional obligations in section 27(2) could well include contractual measures with providers of health services in the private sector. It is submitted that principles of administrative law should not only be applicable to these contracts but also to the contracts concluded between the private sector provider and those to whom it is rendering health services. This is in keeping with the provisions of the PAJA. A contract that arises between a private health service contractor to the state and a beneficiary of those services should not be differently construed merely because the state is in a relationship once removed from the beneficiary. Furthermore, it is submitted that the question of whether or not the state can be held delictually liable for the actions of its contractors should be determined in accordance with the normal principles of the law of delict. The failure of the state to fulfil its constitutional obligations may or may not give rise to a delictual claim depending upon the individual circumstances of each case. It is also not necessarily the case that if a delictual claim can only be brought against the contractor that an applicant would not be able to claim some form of relief against the state in respect of its failure to meet its constitutional obligations. To assume, as Burns seems to, that the state in interposing a third party contractor between itself and the beneficiary can escape liability or even avoid its constitutional obligations is not correct\textsuperscript{123}. Burns\textsuperscript{124} is apparently of the view that if the contractor cannot meet the claim in delict then the state should be obliged to do so because the contractor is executing the state’s mandate. It is submitted that this view seems to be based on the feeling that the state, as a larger target with far more resources should be made liable for the contractor’s unlawful and negligent conduct. This argument it is submitted, uses the same justifications as those used for vicarious liability of employers for the actions of employees\textsuperscript{125} and is tantamount to saying that that a contractor should be

\textsuperscript{122} Such as that contained in section 27(2) of the Constitution which obliges the state to take reasonable legislative and other measures to achieve the progressive realisation of the rights to health care services, sufficient food and water and social security (the rights contemplated in section 27(1))

\textsuperscript{123} The state’s obligations with regard to socio-economic rights are contained inter alia in section 27(2) of the Constitution. It is submitted that any attempt to interpret a contract contrary to the provisions of this section or any attempt to alter the state’s obligations as set out in this manner would in itself be unconstitutional and should not be upheld by a court of law.

\textsuperscript{124} Burns fn 121 supra

\textsuperscript{125} Burchell J Principles of Delict states at p 215 that: “In terms of the principles of vicarious liability, an employer is made liable for the wrongs (delicts) committed by his or her servants in the course and scope of the servant’s employment. The employer need not be personally at fault in any way but the wrong of the servant is imputed or transferred to the employer who often has the ‘deeper pocket’ or ‘broader financial shoulders’ to compensate the person injured by the
regarded in the same light as an employee in this respect. It is submitted, however that
the considerations even if one regards the state in the same light as an employer and
the contractor in the same light as an employee, there are some materially different
and important considerations in which the position of the state differs from that of an
ordinary employer. Firstly the state, unlike employers in the private sector, is not
acting for its own personal gain in conducting its business. Secondly the state is
obliged to find ways of realising the achievement of socio-economic rights. The
state's obligations may be even more specific in terms of some empowering statute.
There is generally no general legal obligation upon an employer to conduct a
particular business or even in many instances a more specific legal obligation to
conduct it in a particular manner.\textsuperscript{126} Fourthly, if the only sustainable manner in which
the state can achieve the progressive realisation of the right of access to certain
healthcare services is to transfer some of the risk to the private sector, why should this
be problematic? Social health insurance envisages a situation in which everyone who
earns a certain income is obliged to make some kind of contribution to the costs of his
or her health care – this is in effect a transfer of some level of risk from the state to the
individual citizen. If a state run social health insurance fund enters into a capitation
agreement with a provider of private health care services because the state is unable to
provide those services itself in a particular area or if it contracts a private provider to
provide certain ‘high tech’ health services because they carry a high degree of risk tat
it cannot itself sustain for various reasons, why should the state be held liable for the
contractor’s wrongdoing? The ‘broad financial shoulders’ of the state may not be as
broad as Burns\textsuperscript{127} would like to believe. Fifthly, the state, unlike the private sector
employer, cannot freely choose with whom it contracts. It is bound to follow tender
procedures and the principles of administrative justice in selecting those with whom it
contracts. It cannot simply identify and approach a party of its choice to perform the
required services. In the tender process, the state cannot consider parties who have not
submitted their tender documentation in time or whose documentation is incomplete
or who have not tendered at all - even if the officials dealing with the tender are aware
that such parties may be the best ones for the job and those that have submitted

\begin{thebibliography}{9}
  \bibitem{126} Servant's negligence... A number of other justifications for vicarious liability have been advanced: the employer's fault in
  the selection of the servant (culpa in elegendo); the servant's acts are those of the master; and the theory which seems to
  be gaining prominence -- the employer by engaging a servant to carry out his or her interests, creates a risk or danger for
  the community and the employer should, therefore bear the financial loss if this risk materialises.
  \footnote{126}{Over and above the usual legal substratum that exists in all societies and that is generally preoccupied with the concept
  of not harming one's fellow citizens by or in pursuing one's business activities.}
  \bibitem{127} Burns fn 121 \textit{supra}
\end{thebibliography}

1367
tenders correctly are actually second choice. Time constraints within and around tender processes sometimes preclude the possibility of a second bite at the cherry. There are also administrative law constraints - especially if other parties who have tendered for the work seem on the documentation submitted to be capable of performing it adequately. The state generally does not have any way of checking, apart from asking for references, as to the suitability of a contractor to do the job because unlike the employer in the private sector, the state is not ‘in the business’ and does not have personal knowledge and experience of who is in fact good and who is not.

Quite aside from these considerations, however, it is a general rule of South African law that an employer is not responsible for the negligence or wrongdoing of an independent contractor employed by him. The exception is where the employer itself has been at fault or negligent with regard to the conduct of the third party contractor. It is submitted that Burns’ attempts to support the concept of administrative contracts using arguments based on an extension of the concept of vicarious liability in terms of the law of delict are ill conceived. The application of the principles of administrative justice, it is submitted, would go a long way towards achieving equality in access to health care services and other constitutional rights across the public and private sectors because of the preoccupation of administrative law with reasonableness and fairness. The allocation of resources to and within health care services is central to the delivery of health care services whether by the private or public sector. The right of access to health care services is not such, it is submitted that it can be confined only to the public sector, although different considerations may be applicable with regard to the legal nature of the relationship between the parties. For instance, why should a private sector provider’s abandonment of a patient be any less unconstitutional than a public sector provider’s abandonment of a patient?

---

128 See for instance Burchell J fn 125 supra at p 227 and the discussion of Langley Fox Building Partnership (Pty) Ltd v de Valence 1991 (1) SA (A). Burchell makes the important point in discussing this case that the relationship of the principal and the contractor in this case more closely resembled that of employer and employee in view of the level of control assumed by the principal over the contractor. He points out that the line between a master-servant and employer-independent contractor is a fine one and that particularly since South African courts have indicated some support for the risk theory of vicarious liability, it is not too far fetched to see the relationship between principal and contractor in this case as based also on the right of control that the principal had over the contractor. The Appellate Division, despite its decision in this case, was at pains to stress the general rule that a principal is not liable for the wrongdoing of the contractor.
It may be helpful in answering the primary question as to when administrative law principles should be applied in a contractual context to consider whether the act of contracting in each instance constitutes administrative action as defined in the PAJA with reference to both organs of state and other entities. The definition of administrative action in the PAJA has already been canvassed elsewhere. The point to note is that all organs of state derive their power from statutes. Even the power to enter into binding contracts is derived from the State Liability Act. This does not necessarily mean that every act of contracting by an organ of state constitutes administrative action. Otherwise Burns and the courts would not even be considering whether the private law of contract governs contracts to which an organ of state is a party let alone applying it. Furthermore, administrative action is not confined in the PAJA to organs of state. It is submitted that the PAJA in principle supports the concept of administrative contracts but not necessarily the associated discussion by Burns of claims against the state in delict flowing from such contracts.

In *Independent Municipal And Allied Trade Union and Others v MEC: Environmental Affairs, Developmental Social Welfare and Health, Northern Cape Province, and Others* [129], Steenkamp AJP noted that in *Goodman Bros (Pty) Ltd v Transnet Ltd* [130] the court ruled that the respondent and decision-maker in regard to the decision to terminate the agreement was a public authority and since its authority to appoint the first applicant derived from a public power, it must follow that its authority to terminate the agreement with the first applicant similarly derived from a public power. This, together with the peculiar content of the agreement, rendered the agreement an administrative agreement. The Supreme Court of Appeal in *Cape Metropolitan Council v Metro Inspection Services (Western Cape) CC and Others* [131] referring to Burns [132] held that it served little purpose to classify the agreement between the first respondent and the appellant as an administrative agreement and that

---

129 It is significant to note in this regard that in terms of the PAJA, 'empowering provision' means a law, a rule of common law, customary law, or an agreement, instrument or other document in terms of which an administrative action was purportedly taken (writer’s italics). The definition of administrative action includes any decision taken, or any failure to take a decision, by a natural or juristic person, other than an organ of state, when exercising a public power or performing a public function in terms of an empowering provision which adversely affects the rights of any person and which has a direct, external legal effect.

130 *Independent Municipal* 1999 (4) SA 267 (NC)

131 *Goodman Brothers* 1998 (4) SA 989 (W). The court in this case referred to the decision in *Administrator, Transvaal, and Others v Zenzile and Others* 1991 (1) SA 21 (A).

132 *Cape Metropolitan* fn 104 supra

133 Burns fn 121 supra
the question remained whether the cancellation of the agreement constituted ‘administrative action’. The court in this case found that Zenzile was no authority for the proposition that, if a public authority derived its authority to enter into a particular contract from a public power, its authority to terminate the contract similarly derived from a public power, entitling the other contracting party to the benefit of the application of the principles of natural justice before cancellation of the contract. The court held further that section 33 of the Constitution was not concerned with every act of administration performed by an organ of state, but was designed to control the conduct of the public administration when it exercised a public power, and that whether or not conduct amounted to ‘administrative action’ depended on the nature of the power being exercised. Other relevant considerations, said the court, were the source of the power, the subject-matter, whether it involved the exercise of a public duty, and how closely it was related to the implementation of legislation.

One of the distinguishing features of an administrative agreement according to these cases is that it involved an agreement to render public services. The situations covered so far have been those in which the organ of state contracts with a third party to perform a service which the organ of state is empowered and obliged to perform. Thus in the health care context an administrative agreement might come into being if a provincial government enters into a public private partnership with a private hospital group to fulfil the former’s obligations to provide hospital services in a particular area. Whether or not this amounted to an administrative agreement would depend, according to the courts, on whether the contract involves the exercise of a public duty, how closely it is related to the implementation of legislation and whether the agreement was for the rendering of public services. However in the context of health service delivery, the contractual relationship in question could be with the patient directly. Legislation such as the Health Act mandates the delivery of health care services by organs of state but does not preclude a contract as the legal vehicle for that delivery. It is submitted that such a contract should be an administrative contract in the sense that although it is governed by the private law of contract administrative law principles should also be applicable to the relationship. In other words the relationship is a legal hybrid that is governed by the principles of more than just one field of law.

---

134 Zenzile fn 131 supra
The interesting question is whether health care services are 'public services'. In other instances whether services are public or not is fairly straightforward since most people would readily concede that waste disposal, sanitation services and the provision of water supplies are public services. Whilst there may well be private contractors who are frequently contracted to perform such services, they are essentially the responsibility of the municipality concerned in terms of Schedule 5 of the Constitution. Private contractors wishing to undertake these services would contract with the municipality in question as opposed to individual ratepayers. In the health care context the situation is a little different in the sense that where a private provider renders health care service to a patient, the contractual relationship is still usually with that patient directly as opposed to some organ of state that could be said to be responsible for the provision of health care services. Must one assume that when a health care service is rendered by a private provider it is not a public service but that when it is rendered by an organ of state it is? The further question would then be why services that are essentially identical in nature change their identity on the basis of who renders them? Is there any sound reason in law why this should be so? Alternately are all health care services public services in which case what are the implications for private providers of health care services? The final alternative is that health care services are not public services irrespective of whether or not they are rendered within the public or private health sectors.

In *Ex Parte Chairperson of the Constitutional Assembly: In Re Certification of the Amended Text of the Constitution of the Republic of South Africa, 1996*135 the court noted that in terms of IC 126 (the Interim Constitution) a provincial legislature is given jurisdiction to make laws with regard to all matters which fall within the functional areas which are specified in IC Schedule 6 but the national Parliament itself also has legislative competence in those areas. A conflict between a law passed by a provincial legislature and an Act of Parliament in these areas is regulated by the relevant parts of IC 126, which read as follows:

"(3) A law passed by a provincial legislature in terms of this Constitution shall prevail over an Act of Parliament which deals with a matter referred to in ss (1) or (2) except

135 Certification Judgment 1997 (2) SA 97 (CC)
insofar as the Act of Parliament is *inter alia* necessary to set minimum standards across the nation for the rendering of public services",\(^{136}\) This principle has been carried through into the Constitution in section 146 (2) but without explicit reference to ‘public services’. Significantly this term seems to have been replaced by the phrase ‘government services’. Thus national legislation prevails over provincial legislation where the former is necessary for “the promotion of equal opportunity or equal access to government services”.

In *Directory Advertising Cost Cutters v Minister For Posts, Telecommunications and Broadcasting and Others*\(^{137}\) the court stated that it is interesting to note that in Canada the courts have rejected a functional link with government as the test for the applicability of their Charter of Rights and Freedoms. Van Dijkhorst J observed that the control test is applied, which looks to an institutional or structural link with government to determine whether a public body is covered by the Charter and that it is irrelevant that a university and hospital are performing a ‘public service’ as long as they do so independently of government. These remarks, said Van Dijkhorst J, should be read against the background of s 32 of the Charter in terms of which it is applicable to ‘government’. He stated that the Courts had to define the scope of that concept. Unlike the Constitution, the Charter does not apply to the private sector or to non-governmental actors in the public sector\(^ {138}\). The question of whether or not a service is a public service is clearly not so easily decided simply with reference to whether it involves a right in the constitutional Bill of Rights. Section 8(2) of the Constitution sets out the parameters as to when the Bill of Rights binds a natural or juristic person. It states that a provision of the Bill of Rights binds a natural or juristic person if, and to the extent that, it is applicable taking into account the nature of the right and the nature of any duty imposed by that right. One also cannot assume that simply because a private provider is rendering health care services that this is not a public service or function since the PAJA expressly acknowledges the possibility that a private body can perform a public function.

\(^{138}\) Van Dijkhorst J referred to Hogg *Constitutional Law of Canada* 3rd ed 34-13; Jones & De Villars *Principles of Administrative Law* 2nd ed 42-7; McKinney *v University of Guelph* [1990] 3 SCR 229; *Harrison v University of British Columbia* [1990] 3 SCR 451; *Stoffman v Vancouver General Hospital* [1990] 3 SCR 483; *Douglas College v Douglas/Kwantlen Faculty Association and Others* [1990] 3 SCR 570
In Independent Municipal and Allied Trade Union and Others v MEC: Environmental Affairs, Developmental Social Welfare and Health, Northern Cape Province, and Others\(^{139}\) the predecessor-in-title to the second respondent (the HDC) had entered into an agency agreement with predecessor-in-title of the first respondent’s department (the department) to render certain primary health services on the latter’s behalf in terms of s 20(1)(d) of the Health Act\(^{140}\), which agreement could be terminated on one year’s notice. In this case the court held that the performance of health services by first respondent was a statutory power and if the agency agreement was concluded in terms of statutory power then it was an administrative action. Similarly the termination of the agency agreement was also an administrative action. It also held that the HDC had no statutory or constitutional right to perform health services because health services formed no part of the second applicant’s functions unless expressly identified in terms of the Regional Services Councils Act\(^{141}\) and that the HDC had not proved that these functions had been identified. The court found that that the first respondent was not obliged in law to consider the provisions of the Local Government: Municipal Structures Act\(^{142}\) which were not in existence when he took his decision in 1997 or in September 1998 and, accordingly, the HDC had no statutory function to render health services. The functions rendered by the HDC stemmed from the agency agreement. By cancelling the agency agreement, said the court, the first respondent had not infringed any statutory or constitutional rights of the HDC. It held, further, that the *audi* rule was not applicable to first respondent as an employer in terms of the agency agreement, but it may have been applicable in terms of the doctrine of legitimate expectation. The court found that taking into consideration all the circumstances and evidence, the doctrine of legitimate expectation applied and the third and other applicants were entitled to a fair hearing by the first respondent before their employment was terminated by the HDC as a result of the termination of the agency agreement. It stated that that the duty of the first respondent to afford the third and other applicants a fair hearing and to grant them an opportunity to make representations in compliance with the *audi* principle would only have come into existence when the first respondent decided that he was intending to compel the HDC to terminate the employment of the third and other applicants. In such a case he was

\(^{139}\) Independent Municipal fn 130 supra  
\(^{140}\) Health Act fn 3 supra  
\(^{141}\) Regional Services Councils Act No 109 of 1985  
\(^{142}\) Local Government: Municipal Structures Act No 117 of 1998
oblighed by the administrative law to afford the third and other applicants a fair hearing before he decided whether to compel the second applicant to terminate the employment of the third and further applicants. The parties to the contract in this case were both apparently organs of state, the one being the North West Regional Services Council and the other Administration of the Province of the Cape of Good Hope which is why the court said that the applicants did not have a right to render primary health services.

It is submitted that administrative agreements could prove to be a useful concept in the context of contracts for health services both as between an organ of state as principal and a private provider as contractor and between a private or public provider of health care services on the one hand and the patient on the other. In order to ascertain, however, whether the agreement is one to which the principles of administrative law are applicable, regard should be had to the circumstances of each individual case, in the light of the factors mentioned by the courts in the cases referred to above, such as the content of the contract, and whether the act of contracting constitutes administrative action. A further question that cannot be explored in any depths in this thesis is whether an administrative agreement is essentially an administrative relationship that contains certain principles of the law of contract or whether it is a essentially a contractual relationship that contains certain principles of the administrative law. The response it likely to be that this depends on the context and that generally speaking one might say that in the case of a public sector provider the former would be prevalent and in the case of a private sector provider the latter is more likely. Some may consider that attempts at such levels of refinement, though exploratory, are too presumptuous in light of the relative paucity of recognition given by the courts thus far of the broad concept of administrative agreements.

10.4.8 Conclusions Concerning Administrative Law

Administrative law, especially in the public health sector, offers an alternative basis in law to pure contract for the provider-patient relationship. In many ways it is preferable to a purely contractual relationship because of the many inbuilt protections and legal requirements for administrative action. Contracts can be unfair but courts can and still do refuse to strike them down purely on this basis. Administrative action
on the other hand is much more likely to be struck down on grounds of unfairness. The fees payable by patients in the public sector are often published in the form of regulations that can be attacked on constitutional grounds. Regulations are usually subject to notice and comment procedures before they are promulgated giving interested parties an opportunity to make representations. In the private sector, the patient usually has little or no choice in the fees that he or she must pay and no say in the setting of them either.

Although policy decisions are not within the scope of administrative law, decisions involving the implementation of legislation are. Thus to the extent that a health official in the public sector does not observe the principles of administrative justice in implementing a regulation concerning fees payable for health care services or the nature of the services that must be provided in terms of a legislative provision his or her actions can be challenged on administrative law grounds. Subject to what has been said earlier on the subject of administrative agreements, there is no equivalent protection in the purely private health care environment in which patients are generally restricted to remedies based on the law of delict or of contract. The considerations of these areas of law elsewhere in this thesis demonstrate that they do not yield results that are entirely satisfactory from the point of view of the patient.

In the public sector, treatment protocols and guidelines developed pursuant to an empowering provision of a statute such as section 16 of the Health Act\textsuperscript{143} would have to be with due regard to the principles of administrative law. Treatment programmes cannot be unfairly discriminatory either in terms of the nature of the treatment administered to different patients or in terms of the procedure in terms of which the treatment is administered. Treatment guidelines must be fair and rational and implemented fairly and reasonably. Health care services must, in terms of administrative law, be efficient and avoid undue or unnecessary delays. It is submitted that the principles of administrative law are an extremely useful and effective mechanism for ensuring distributive justice in the health sector and it is a great pity that they apply rather more to organs of state and other public bodies than they do to private entities. Concepts of fairness, reasonableness and lawfulness, however are not

\textsuperscript{143} Health Act fn 3 supra
confined to the private sector, and thanks to the Constitution, they are likely to become increasingly applicable in more varied ways in fields of law that have in the past been regarded as purely private.

10.5 The Law of Contract

There are many things the courts could do to ensure that the law of contract reflects and upholds the principles and values of the Constitution. The bases upon which to achieve this are easily identifiable since they are the same themes that permeate the other fields of law that are discussed in this thesis — the themes of public interest, *bona fides* or good faith, public policy, reasonableness and fairness. What is more, they have a clearly recognised mandate in terms of the Constitution to develop the common law. It would seem that in the law of contract more so than any other area of law, the courts are particularly incapable of making the transition to a constitutional way of thinking. Perhaps it is because of an ingrained view that the law of contract, more than any other area of law, is within the domain of private law and that the Constitution, which many perceive to be primarily public law, should not be permitted to intrude in private affairs. It is submitted that this view of the Constitution is neither appropriate nor correct given the provisions of section 8 and the fact that it states categorically that the Bill of Rights applies to all law. The provisions of section 2 of the Constitution also leave no room for doubt in stating that the Constitution is the supreme law of the Republic and that law or conduct inconsistent with it is invalid. Moreover an unwarranted preoccupation with classification of law into various categories does not take into account either the constitutional dispensation that superseded a legal system based essentially upon the common law, the fact that justice cannot be confined with artificial conceptual boundaries or that law that is based on a Constitution must be seen as an internally consistent and coherent system.

---

144 In *Carmichele v Minister of Safety and Security and Another (Centre For Applied Legal Studies Intervening)* 2001 (4) SA 938 (CC) Ackermann and Goldstone JJ stated: "It needs to be stressed that the obligation of Courts to develop the common law, in the context of the s 39(2) objectives, is not purely discretionary. On the contrary, it is implicit in s 39(2) read with s 173 that where the common law as it stands is deficient in promoting the s 39(2) objectives, the Courts are under a general obligation to develop it appropriately. We say a 'general obligation' because we do not mean to suggest that a court must, in each and every case where the common law is involved, embark on an independent exercise as to whether the common law is in need of development and, if so, how it is to be developed under s 39(2). At the same time there might be circumstances where a court is obliged to raise the matter on its own and require full argument from the parties."
10.5.1 Tacit or Implied Terms in Healthcare Contracts

In the fourth chapter of this these it is suggested that certain tacit terms are implicit within contracts for healthcare services whether they are rendered within the public or the private sector. These are –

1 The provider must take all reasonable steps to ensure that the health professional, e.g., the nurse, doctor or physiotherapist, in the employ of the provider is qualified to perform the services the patient is receiving and such professional meets with the licensing requirements of any law with respect to his or her profession. See Metewa v Minister of Health 1989 (3) SA 600 (D) in which the court said “The two Transvaal cases, as well as Buls and Another v Tsatsarolakis 1976 (2) SA 891 (T), neither mention nor support the distinction, which is pivotal to the decision in the Lower Umfolosi case, between professional work over which the hospital is said to have no control and for which it is accordingly not liable, and managerial or administrative duties performed by an employee, for which it is responsible. In the Transvaal cases the issue was simply whether the particular member of staff was negligent in the exercise of his duties, regardless of whether he was part of a professional team or not.” See also Buls and Another v Tsatsarolakis 1976 (2) SA 891 (T); Minister van Politie en ‘n Ander v Gamble en ‘n Ander 1979 (4) SA 759 (A); Minister of Police v Rabie 1986 (1) SA 117 (A).

2 The patient will be treated with a reasonable degree of professional skill and care and to a standard required by the professional and ethical rules of the profession to which the relevant health practitioner belongs. See Blyth v Van Den Heever 1980 (1) SA 191 (A) and Durr v Absa Bank Ltd And Another 1997 (3) SA 448 (SCA) in which the court observed: “Not only did the Judge below adopt the ‘typical broker’ test, but he held that Mrs Durr tendered no evidence as to the duties and functions of bankers under circumstances such as exist in this case. That is not entirely correct. Mr Goldhawk had said: ‘If a person holds himself out as an expert and there is support, such as a financial institution confirming that he’s an expert, then any person dealing with him should be entitled to expert advice. There’s the analogy of if you get into a taxi and the taxi driver is a bad driver, does that remove any negligence claim you may have against him?’ Mr Goldhawk is a chartered accountant and a specialist investigating accountant. He was appointed as such by the liquidators of ‘Supreme’ and gained a deep insight into the group and its penumbra. In Jansen Van Rensburg NO and Another NNO v Kruger 1993 (4) SA 842 (A) the court said “The duty of a physician to respect the confidentiality of his patient is not merely ‘ethical but is also a legal duty recognised by the common law.” See also Dube v Administrator, Transvaal 1963 (4) SA 260 (W).

3 Decisions concerning the patient’s treatment will be taken by the provider in a manner that is lawful, reasonable and procedurally fair. In practice this means that the patient will be consulted before such decisions are taken and that he or she will be informed of the decision before it is taken.

See also Jansen Van Rensburg NO and Another v Minister of Trade and Industry and Another NNO 2001 (1) SA 29 (CC); Winckler and Others v Minister of Correctional Services and Others 2001 (2) SA 747 (C) Section 33(1) guarantees everyone the right to administrative action that is lawful, reasonable and procedurally fair. See also South African Veterinary Council and Another v Veterinary Defence Association 2003 (4) SA 346 (SCA). It is submitted that the same considerations should be applicable to such decisions in the private sector. Equality is not just a constitutional right. It is also a constitutional value. Why should patients in the private sector be treated differently to those in the public sector in terms of considerations of administrative justice? In what basis could one justify an absence of procedural fairness to private sector patients?
4 The patient’s informed consent will be obtained with regard to treatment that is administered to him or her prior to the administration of such treatment\textsuperscript{148}.

5 The provider undertakes to render the health services in accordance with the patient’s consent and on the basis of the information supplied to the patient in order to obtain that consent\textsuperscript{149}.

6 The patient will be informed of the fact that treatment is of an experimental nature or is being conducted in the course of research and will be given the opportunity to refuse such treatment before it is administered\textsuperscript{150}.

7 The patient’s health information will be kept confidential and will not be used in a way that will cause harm to the patient. It will not be disclosed to anyone without the patient’s prior consent\textsuperscript{151}.

8 The patient is entitled to rely on and act in accordance with the advice of the health professionals treating him or her in their capacity as experts\textsuperscript{152}.

9 Unless specifically stated otherwise in express and unambiguous terms the provider does not undertake to cure the patient\textsuperscript{153}.

\textsuperscript{148} Lymbery v Jeffries, 1925 AD 236; Esterhuizen v Administrator, Transvaal 1957 (3) SA 710 (T); Richter and Another v Estate Hammann 1976 (3) SA 226 (C); Castell v De Greef 1994 (4) SA 408 (C); Broude v McIntosh and Others 1998 (3) SA 60 (SCA)

\textsuperscript{149} Esterhuizen v Administrator, Transvaal fn 149 supra

\textsuperscript{150} Section 12(2)(c) of the Constitution

\textsuperscript{151} Jansen van Vuuren and Another v NNO Kruger 1993 (4) SA 842 (A)

\textsuperscript{152} In Pinshaw v Nexus Securities (Pty) Ltd and Another 2002 (2) SA 510 (C) the court said that “Clients are wont to place their trust not just in the company, but also in the individuals within the company with whom they deal. Clients tend to expect, and in my view are entitled to expect, the exercise of skill and care from the individual advisers and managers. A failure to exercise appropriate skill and care can have devastating consequences, as Durr’s case supra illustrated. Furthermore, financial advisers and managers can vis-a-vis their immediate clients contract out of or limit liability, and as I see the position, they can for delictual purposes do the same for their employees. To fix Van Zyl with a duty to Mrs Pinshaw, in the circumstances pleaded, strikes me as being fair and in accord with the legal convictions of the community. It seems to me, therefore, that policy considerations favour upholding the duty rather than negating it.” See Strauss Doctor, Patient and the Law at p 40-41

\textsuperscript{153} In Bula and Another v Tsatsaralakis fn 145 supra the court commented: “Every man has a legal right not to be harmed; but is there, apart from a contract, a legal right to be healed? It is no doubt the professional duty of a medical practitioner to treat his patient with due care and skill, but does he, merely by undertaking a case, become subject to a legal duty, a breach of which founds an action for damages, to take due and proper steps to heal the patient? It is an interesting question but, because it was not argued and because it is not necessary for the purposes of the present decision to answer it, I shall not discuss it further.” See Strauss Doctor, Patient and the Law at p 40-41 at which he submits that where a patient consults a doctor who undertakes to treat him, the doctor assumes no greater duty than to treat the patient with due care and skill, unless the doctor has expressly guaranteed that the patient will be healed by his treatment – something which the prudent doctor will not generally do.
10 The provider will always act in the best interests of the patient and will only administer treatment that is medically necessary\(^{154}\).

11 The patient will not be abandoned by the provider. Alternative health services will be provided where the provider can no longer provide the health care services previously supplied to the patient. The provider will ensure that where a course of treatment has commenced it will be completed\(^{155}\).

12 The provider is entitled to payment for health care services where this is provided for by law or by mutual agreement and the patient or other person responsible for the patient is liable to pay a reasonable price for such services\(^{156}\).

13 In the absence of provisions in law to the contrary, the patient will not be detained against his or her will by the provider\(^{157}\).

14 The provider will take reasonable measures to ensure the health and safety of the patient while he or she is receiving health services at the provider's premises\(^{158}\).

15 The goods supplied to the patient in the course of medical treatment are fit for the purpose for which they were supplied and are free of latent defects\(^{159}\).

---

\(^{154}\) See *The State v Situmyana and Others* 1961 (3) SA 549 (E) in which the court stated: “The medical practitioner who performs a dangerous operation with his patient's consent incurs no criminal responsibility if just cause for the operation exists, for the law does not regard his conduct as improper: but if “there is no just cause or excuse for an operation, it is unlawful even though the man consents to it” vide *Bravery v Bravery*, 1954 (3) A.E.R. 59 at p. 67, per Denning, L.J. Any intentional act which involves the likelihood of bodily harm to another and which is not recognised by modern usage as a normal and accepted practice of society is forbidden by law and is in no way dependent upon the absence of consent on the part of the victim.” It is submitted that due to the nature of the services provided the relationship between provider and patient is fiduciary and that where there is a conflict of interests between the provider and patient it is the duty of the latter to declare it to the patient and to ensure that the patient’s interests are not compromised.

\(^{155}\) See *Applicant v Administrator, Transvaal, And Others* 1993 (4) SA 733 (W)

\(^{156}\) See the discussions in the chapter on the law of contract of the legislation in the different provinces and their fee regulations. It is submitted that where the price in the private sector is unreasonably high, this will impact on the constitutional right of access to health care services and may justify state intervention such as is presently happening in terms of section 22G of the Medicines and Related Substances Act No 101 of 1965 with regard to the pricing of medicines.

\(^{157}\) See also section 9(1) of the Occupational Health and Safety Act No 85 of 1993 which states that “Every employer shall conduct his undertaking in such a manner as to ensure, as far as is reasonably practicable, that persons other than those in his employment who may be directly affected by his activities are not thereby exposed to hazards to their health or safety.” The definition of ‘employer’ in the Act is wide enough to include the state.

\(^{158}\) In *Curtatecrafts (Pty) Ltd v Wilson* 1969 (4) SA 221 (E), the court said that a purchaser of an article is entitled to expect is that the article shall be free from such latent defects as are not to be expected in an article of that quality, price and type, unless he obtains a warranty in expressly wider terms. *Kroonslad Westelijke Boere-Ko-Operatiewe Vereniging Bpk v Botha and Another* 1964 (3) SA 561 (A) Liability for consequential damage caused by latent defect attaches to a
The patient's constitutional rights to life, bodily and psychological integrity, human dignity, privacy, freedom and security of the person, freedom of religion, belief and opinion, and access to health care services will be respected, protected, promoted and upheld by the provider.

These provisions are clearly supported by both the common law and the Constitution in most instances. It is submitted, furthermore, that in terms of the officious bystander test, if one had to ask any patient and provider in the process of concluding a contract whether or not such terms should be included, one or both of them is guaranteed to reply with an impatient affirmative. It is submitted that an acknowledgement by the courts of these terms and a legal base from which to adjudicate matters involving contracts for health care services would go a long way towards addressing the current defects in the law of contract as it pertains specifically to such services. The point is made repeatedly in this thesis that law must be considered and applied within its factual context in order to have any meaningful result. Where that context is specialised or structured in a particular manner and generalizations that are valid within other contexts are clearly inapplicable or inappropriate such generalizations cannot rationally or reasonably be applied.

merchant seller, who was unaware of the defect, where he publicly professes to have attributes of skill and expert knowledge in relation to the kind of goods sold.

See also Crawley v Frank Pepper (Pty) Ltd 1970 (1) SA 29 (N) A seller is obliged to disclose all material latent defects which unfit or partially unfit the res vendita for the purpose for which it was intended to be used. By operation of the Aedilitian Edicts, as expounded and adopted in our law, into every contract of sale there is imported a warranty by the seller against such latent defects. Although a seller may contract out of his obligations to disclose and out of the statutorily imported warranty against latent defects, the existence of which he does not know at the time of the sale, if he purports to contract out of his obligation to disclose and of the implied warranty against material latent defects unfitting, or partially unfitting, the res vendita for the purpose for which it is sold, and those defects are present to his mind at the time of the sale, but he remains silent about them although he must know that to disclose their existence would cause a prospective buyer either not to purchase at all or to insist on a lower price than he otherwise would pay, he will be given the "replication of fraud" (de dolo replicationem).

See also Holmdene Brickworks (Pty) Ltd v Roberts Construction Co Ltd 1977 (3) SA 670 (A) where it was held that a merchant who sells goods of his own manufacture or goods in relation to which he publicly professes to have attributes of skill and expert knowledge is liable to the purchaser for consequential damages caused to the latter by reason of any latent defect in the goods. Ignorance of the defect does not excuse the seller. Once it is established that he falls into one of the above-mentioned categories, the law irrebuttably attaches this liability to him, unless he has expressly or implicitly contracted out of it. The liability is additional to, and different from, the liability to redhibitorial relief which is incurred by any seller of goods found to contain a latent defect. Broadly speaking, a defect may be described as an abnormal quality or attribute which destroys or substantially impairs the utility or effectiveness of the res vendita for the purpose for which it has been sold or for which it is commonly used. Such a defect is latent when it is one which is not visible or discoverable upon an inspection of the res vendita.

This is an obligation imposed upon the state by section 7(2) of the Constitution. However it is submitted that in the healthcare context where a patient is often weak and debilitated, physically or mentally incapacitated and has no control over his or her immediate personal environment it would not be difficult to argue that the same considerations apply mutatis mutandis to private sector providers of health care services. To suggest any different would be unconstitutional in terms of section 2 of the Constitution. To the extent that a patient is temporarily or even permanently unable to enforce or protect his or her own constitutional rights to dignity, life, privacy, bodily and psychological integrity etc, it is submitted that it is the responsibility of the person in whose care he or she resides to reasonably do so.

1380
10.5.2 Contracts Within The Public and Private Health Sectors

Recognition must be given to the fact that the Constitution has irrevocably altered the commercial status of health care services. The right that are granted in section 27(1) and 27(3) mean that health care services can no longer be regarded as simply another commodity in trade. The law of contract, it is submitted, must be influenced and informed by this fact whether the services are delivered in the private or the public health sector. To suggest otherwise is to ignore the Constitution. There is therefore now an added dimension to the business of those in the private health sector who trade in health care products and services. There is a constitutional obligation upon the state to take legislative and other measures to achieve the realisation of the right of access to health care services that is not restricted to the public sector. The Minister of Health has recently publicly acknowledged the important role of the private health sector in the delivery of health care services and categorically denied claims that the state is trying to destroy it. However, the private health sector will have to undergo certain fundamental paradigm shifts in order to avoid the perpetuation of its previous flaws and weaknesses and to align its operations with constitutional principles. Its reluctance to transform is evident from the litigation by the National Convention on Dispensing and others challenging the provisions of the Medicines and Related Substances Act concerning the requirement that health professionals other than pharmacists who wish to dispense medicines must obtain a licence from the Director-General to do so. This is also evidenced by the litigation in the Cape High Court against the regulations on the pricing of medicines by inter alia New Clicks Ltd, the Pharmaceutical Society of South Africa and the Netcare group of private hospitals. The court battles are an apparently unavoidable step in the process of transformation of the health sector that was contemplated in policy documentation going back to 1996. The regulations concerning the pricing of medicines alone indicate that contracts for involving health care services will have to be considered in a somewhat different light to what they were previously.

---

161 Judgment is due to be handed down in the Pretoria High Court on 02 July 2004, subsequent to the time of writing.
162 At the time of writing judgment has been reserved by the court.
163 The National Drug Policy which clearly spells out the principles that have subsequently been legislated is dated October 1996. A copy is available at http://www.doh.gov.za
It is submitted that while contracts between patient and provider in the public health sector are by no means essential to the delivery of health care services, they can nevertheless play a valuable role in a number of respects. Firstly they serve to emphasis the importance of a patient as an individual to be respected and treated with dignity. Secondly they highlight the fact that the patient has certain entitlements and expectations regarding the health services he or she has contracted for and that there is a legal relationship between the provider and the patient that the courts are able and willing to uphold. Patients in the public sector are too often treated in a dehumanising and demeaning way that does not acknowledge their intrinsic and inestimable worth as human beings. Thirdly, a consciously contractual relationship that is negotiated with a patient, even a non-paying patient, obliges public health officials to talk to and interact with patients as equals, to enquire as to their needs and requirements and to understand that they may incur legal liability should they fail to uphold agreed terms. Contracts can have the effect of humanising the private health sector if they are used in such a way as to promote this. There is thus much to be said for contractual relationships even within the public health sector, between patient and provider. Having said this it is deeply ironic that the law of contract as applied to contracts for health services in the private sector has had the exact opposite effect.

Within the private sector, although there is a general assumption that contracts are the legal vehicles of choice for the delivery of health care services, the law of delict has assumed a significant weight in the adjudication by the courts of cases where contracts existed between the parties. It has been noted elsewhere in this thesis that the courts seem to prefer to adjudicate matters on the basis of the law of delict than on the law of contract given the choice. The difference between the law of contract and the law of delict in terms of the damages that can be awarded may have something to do with this since, in terms of the law of contract, damages may not be awarded for pain and suffering and similar almost inevitable consequences of contractual breach where the contract in question is for health care services. This is a failing of the law of contract specifically in the health services context which arises directly as a consequence of a compartmentalised approach to law that seeks to keep the legal principles underpinning the law of delict firmly in the box labelled ‘delict’. It is a failure to recognise that they could and should be of more universal application within
specific contexts where the principles of fairness, reasonableness and public policy so demand.

The value of a contract to a patient in the private health sector is presently significantly limited and may even be negative rather than positive, given the decision of the Supreme Court of Appeal in *Afrox*. The law of contract offers little or no guarantees that one will be treated in good faith in a fair, reasonable, professional or even ethical manner. Neither does it afford one any remedies in the event of the failure of the provider to do so. It prefers the inferred ‘constitutional’ principle of sanctity of contract to the express constitutional right of access to health care services because a visually impaired court could not see how a contractual term could limit the latter. The result is that on the whole, the private health care contract presently serves as nothing more than a convenient means for the provider to enforce payment for the services in question. The requirements of informed consent transcend the law of contract and are not dependent upon the law of contract for their enforceability. It is, significantly, the law of delict that comes to the rescue in this regard. It is quite probably not in the private patients best interests to enter into any kind of a contractual relationship with a private hospital given that such a contract is now, thanks to the Supreme Court of Appeal, guaranteed to deprive him or her of his rights and remedies in terms of the law of delict. The irony is that a private hospital patient may not even have any real choice as to whether or not to contract with the provider given the imbalance of power in favour of the provider which the Supreme Court of Appeal has recently heavily reinforced in *Afrox*. It may be that the price increase implemented by the Supreme Court of Appeal in respect of private health care services in at least the hospital sector, with its reputedly higher standards of professional care, is currently way too high for patients such as the applicant in the *Afrox* case. At least within the public sector a patient is virtually guaranteed of a sympathetic judicial ear where the respondent is the government and one can be certain that any attempts by the state to apply the judgment in *Afrox* to its own contractual relationships with patients will not be upheld by any court.

10.5.3 Potential Solutions For Health Care Contracts
Since the judiciary has unquestionably failed consumers in the context of contracts for private health services delivery it may be appropriate for the legislature to intervene if not generally within the law of contract then specifically in the law of contract relating to health care services. This would not be without precedent. There is an Act called the Housing Consumers Protection Measures Act\textsuperscript{164} which provides the following with regard to the conclusion of agreements and implied terms in regard to housing in section 13 –

(1) A home builder shall ensure that the agreement concluded between the home builder and a housing consumer for the construction or sale of a home by that home builder-

(a) shall be in writing and signed by the parties;

(b) shall set out all material terms, including the financial obligations of the housing consumer; and

(c) shall have attached to the written agreement as annexures, the specifications pertaining to materials to be used in construction of the home and the plans reflecting the dimensions and measurements of the home, as approved by the local government body: Provided that provision may be made for amendments to the plans as required by the local government body.

(2) The agreement between a home builder and a housing consumer for the construction or sale of a home shall be deemed to include warranties enforceable by the housing consumer against the home builder in any court, that-

(a) the home, depending on whether it has been constructed or is to be constructed-

(i) is or shall be constructed in a workmanlike manner;

(ii) is or shall be fit for habitation; and

(iii) is or shall be constructed in accordance with-

(aa) the NHBRC Technical Requirements to the extent applicable to the home at the date of enrolment of the home with the Council; and

(bb) the terms, plans and specifications of the agreement concluded with the housing consumer as contemplated in subsection (1);

(b) the home builder shall-

(i) subject to the limitations and exclusions that may be prescribed by the Minister, at the cost of the home builder and upon demand by the housing consumer, rectify major structural defects in the home caused by the non-compliance with the NHBRC Technical Requirements and occurring within a period which shall be set out in the agreement and which shall not be less than five years as from the occupation date, and notified to the home builder by the housing consumer within that period;

(ii) rectify non-compliance with or deviation from the terms, plans and specifications of the agreement or any deficiency related to design, workmanship or material notified to the home builder by the housing

\textsuperscript{164} Housing Consumers Protection Act No 95 of 1998
consumer within a period which shall be set out in the agreement and which shall not be less than three months as from the occupation date; and

(iii) repair roof leaks attributable to workmanship, design or materials occurring and notified to the home builder by the housing consumer within a period which shall be set out in the agreement and which shall not be less than 12 months as from the occupation date.

Housing, like health care services, is the subject a constitutional right. It is submitted that there is arguably sufficient motivation for similar legislative provisions with regard to health care services not only on the basis of the law of contract but also to address the failure of the courts to apply the maxim *res ipsa loquitur* to delictual claims in this context and to protect consumers of health care services against unscrupulous, unfair or unconstitutional practices by providers of such services. The legislative provisions in question could assist consumers of health care services in stipulating what they need to do in order to shift the evidentiary burden to the shoulders of the expert respondent.

Closer to home in terms of section 47 of the National Health Act –

(1) All health establishments must comply with the quality requirements and standards prescribed by the Minister after consultation with the National Health Council.

(2) The quality requirements and standards contemplated in subsection (1) may relate to human resources, health technology, equipment, hygiene, premises, the delivery of health services, business practices, safety and the manner in which users are accommodated and treated.

(3) The Office of Standards Compliance and the Inspectorate for Health Establishments must monitor and enforce compliance with the quality requirements and standards contemplated in subsection (1).

It may be that this section will give sufficient powers to the Minister of Health to ensure that exculpatory clauses in private hospital contracts are largely harmless to patients if they are permitted at all.

The Consumer Affairs (Unfair Business Practices) Act could also afford a measure of assistance. In terms of this Act, “business practice” includes—

(a) any agreement, accord, arrangement, understanding or undertaking, whether legally enforceable or not, between two or more persons;

---

165 Section 26 of the Constitution stipulates that everyone must have access to adequate housing and that the state must take reasonable legislative and other measures, within its available resources, to achieve the progressive realisation of this right.

166 Consumer Affairs Act No 71 of 1988
(b) any scheme, practice or method of trading, including any method of marketing or distribution;
(c) any advertising, type of advertising or any other manner of soliciting business;
(d) any act or omission on the part of any person, whether acting independently or in concert with any other person;
(e) any situation arising out of the activities of any person or class or group of persons,

but does not include a practice regulated by competition law

and

'unfair business practice' means any business practice which, directly or indirectly, has or is likely to have the effect of-
(a) harming the relations between businesses and consumers;
(b) unreasonably prejudicing any consumer;
(c) deceiving any consumer; or
(d) unfairly affecting any consumer.

The Act establishes mechanisms for the investigation of unfair business practices and their prohibition. There are also consumer affairs courts in various provinces that exist in terms of provincial legislation and that have powers to adjudicate matters affecting consumers in terms of that legislation. At least in such forums it is likely that there will be a focus on the more modern approach of consumerism and considerations such as unreasonableness, good faith and fairness will occupy centre stage.

10.5.4 Conclusions Concerning The Law of Contract

The law of contract as a legal vehicle for health services delivery is presently not ideal. This is not so much due to the fact that the concept of a contract as a binding agreement between two parties is in itself problematic as it is to the antiquated approach of South African courts to this area of the law. To be blunt, the law of contract has not kept pace with sociological and commercial developments whether these are expressed in terms of changing structures and groupings within society or in terms of shifts in balance of power brought about by concepts such as mass production and the increasing idea that certain items are public rather than private goods to which everyone should have access whether or not he or she is able to pay for them. Worst of all there is still an almost complete failure to incorporate constitutional principles and values into the law of contract. Whereas developments in other countries in the law of contract have seen conscious acknowledgement of the need to afford greater protection to consumers, to ensure that contracts are
fundamentally fair and reasonable as between parties in a world where the balance of power is usually heavily in favour of the powerful and wealthy corporate entities that comprise the supply side of the market and to create conditions in which the interests of the individual consumer in the bargaining situation are taken into account by the law that supports the concept of contract as an instrument of trade and commerce, courts in South Africa remain either impervious or oblivious to the need and importance of ensuring similar developments in South African law. In areas such as health care services where the circumstances and the nature of the item of trade in and of themselves should make it quite obvious that there is an unacceptable imbalance of power that should be rectified in order to avoid injustice no less a body than the Supreme Court of Appeal has said that it cannot see the difference between providers of health care services and any other service provider. The result is that South African law of contract appears to remain largely trapped within a judicial mindset that would be at home in the Victorian era.

The problems within the South African law of contract have not gone unremarked. The South African Law Commission in 1996 in a paper entitled ‘Unreasonable Stipulations In Contracts and The Rectification of Contracts’ stated that with the rise of the movement for consumer protection in the early seventies, it became the generally accepted view in most first world countries that legislative action was required to deal with contractual unconscionability and noted that the South African proponents of granting such a power of review to the courts support legislation that will introduce the doctrine of unconscionability and the concomitant review power of the courts. Furthermore, said the Commission, the question is being asked whether the “unconscionability” or the “good faith” approach should be followed. In the end, the two approaches may be thought to lead to the same result. When considering the historical background of the South African law, and taking into account the general use of the unconscionability approach by the legal systems close to our own, the

167 Afrox Healthcare v Strydom fn 65 supra
168 Matlala D ‘The Law of Contract: When the Supreme Court of Appeal Fails to Act’, Senior Lecturer, University of Venda http://wwwserverJaw.wits.ac.za/workshop/workshop03/WV15SMatlala.doc points out that, in the case of the law of contract, the courts are still happy to follow a statement made by Chief Justice Innes a century ago in Burger v Central South African Railway 1903 TS 571 to the effect that it is a sound principle of law that a man, when he signs a contract, is taken to be bound by the ordinary meaning and effect of the words which appear over his signature' even though it has the effect that a partially literate and partially sighted signatory is held bound by certain Latin expressions which he does not understand (Matthole v Mathle 1951 (1) SA 256 (T) or that a signatory who cannot read or write any language is held bound by a document written in English which she did not understand and which was apparently misrepresented to her (Khan v Naidoo 1989 (3) SA 724 (N))
169 Discussion Paper 65 (Project No 47) (1998)
unconscionability criterion is considered advisable. The Commission expressed the widespread disappointment that was felt when the Appellate Division saw fit to do away with the exceptio doli in *Bank of Lisbon and South Africa (Ltd) v de Ornelas*.170

The team that did the preliminary research work for the Discussion Paper identified a number of common provisions which could and should receive the critical attention of the legislature:

(i) Clauses reversing the ordinary burden of proof and requiring a debtor to prove facts which according to the ordinary rules of evidence the creditor would have had to prove, e.g. usually the creditor (seller) has to prove delivery of the goods sold; a clause reversing this burden of proof makes it virtually impossible for the debtor (buyer) to prove the negative of non-delivery.

(ii) Under the existing parol evidence rule, facts extrinsic to the written documents may not be adduced in evidence to modify or contradict the writing. A verbal assurance by a creditor may thus not be proved and relied on by the debtor if it contradicts the written contract.

(iii) Clauses excluding, waiving or limiting the protection afforded by consumer protection legislation or legislation aimed at the modification of unfair contract terms.

(iv) The research team proposed a review of, but not a witch-hunt against exemption clauses. These clauses do have a legitimate place but they should

170 *Bank of Lisbon* 1988 (3) SA 580 (A). The SALC put it as follows: “The Appellate Division held that on a correct interpretation of the contract the bank was indeed entitled to retain the securities. But the respondents relied on a counter-argument, that the conduct of the bank was contrary to the view our society takes of what is right or wrong in the requirements of good faith. They relied on the common-law remedy of the exceptio doli generalis. In theory, this was a defence available to a defendant, who, though liable according to the letter of a contract and in strict law, could show that implementation of the contract would be unconscionable or inequitable. But even before this case was heard, this remedy was not rigorously applied by our courts. Yet one could have hoped that a doctrine of relief against unconscionable claims could be founded on this exceptio. It was not to be. In this case the majority of the Appellate Division Bench, per Joubert J A, decided “... once and for all, to bury the exceptio doli generalis as a superfluous, defunct anachronism. Requiescat in pace” (let it rest in peace). The learned judge also held that equity could not override a clear rule of law, neither could the application of good faith do so. The “clear rule of law”, presumably, was the rule that contracts must be performed according to their terms. For those hoping that our courts would develop a doctrine of relief in cases of unconscionability, the judgment was a great disappointment.”
not be tolerated where, in the circumstances of a particular case, their implementation would lead to harsh and unjust results.

(v) Choice-of-law clauses, whereby parties agree that legislation, other than that of South Africa, should apply to a contract concluded and implemented here and adjudicated upon by a South African court, should be limited to contracts concluded between foreign contracting parties or between South Africans and foreigners contracting in the ordinary course of their profession or business.

(vi) Clauses by which rights and defences are lost in the case of cession or discounting of contracts. It appears that there is a standard practice by which a seller sells goods to a purchaser on condition that if the seller cedes or discounts the contract to a third party (e.g. a bank or financial institution) the purchaser will not be able to raise any defence (e.g. that the goods suffered from latent defects, that warranties were not honoured) against the third party.

(vii) Clauses under which the weaker party submits to the jurisdiction of a magistrates' court, but the stronger party (the seller, usually) does not agree that it may be sued in such court.

(viii) Clauses by which jurisdiction is conferred upon a court which would not otherwise have had jurisdiction in the matter, to the detriment of, usually, the debtor, by the stratagem of a clause under which it is "acknowledged" that the contract had been concluded or executed or breached in the area of jurisdiction of the said court, etc.

(ix) Clauses by which jurisdiction is limited to the High Court, thereby making it more difficult for the weaker party to gain access to the courts, in the light of the higher costs of litigation in the High Court.

(x) Clauses by virtue of which the usual defences available to a debtor under a contract of suretyship (the benefit of prior exclusion, the benefit of division,
the benefit of simultaneous citation and division of debt, the benefit of cession of actions) and to a debtor under a contract of loan (the exception of non-payment of the capital of the loan) are excluded.

(xi) Clauses by which certain rules of court are waived, e.g. that in provisional sentence cases the creditor must prove the legality of the document sued upon or the amount of the debt.

(xii) Clauses waiving -

"all exceptions, defences, benefits and rights, of whatever nature, the content and meaning thereof being known by me".

(xiii) Clauses by which certain statutory defences, e.g. by the Prescription Act171, the Agricultural Credit Act172 or the Moratorium Act173, are waived.

(xiv) Clauses by which a claim for damages for breach of contract is excluded, e.g. where an agricultural co-operative or a seed company sells infertile seed to a farmer.

The research team found that courts in Germany, England, the USA, Sweden, Israel, the Netherlands and Denmark may take judicial action against unfair terms, in addition to which preventative control may also be used against unfair terms174. It proposed that legislation should make it possible to test terms in standard contracts against the criterion of good faith. A number of people made important comments175.

171 Prescription Act No 68 of 1969
172 Agricultural Credit Act No 28 of 1966
173 Moratorium Act 25 of 1963
174 See also the more recent observations of Carstens P and Kok A in 'An assessment of the use of disclaimers by South African hospitals in view of constitutional demands, foreign law and medico-legal considerations' SA Public Law vol 18 No2 2003 who point out that in the USA courts have rejected exculpatory agreements signed by patients on the basis that these agreements affect the public interest and cannot be upheld and that the German law of contract recognises in principle that exculpatory clauses/disclaimers in hospital contracts whereby medical negligence is excluded are against public policy
175 The Commission noted that in a valuable contribution to the research project, the renowned jurist, Prof Hein Kötz of the Max Planck Institute at Hamburg, advised as follows regarding the question of private litigation as a remedy as opposed to administrative control. Enacting new substantive rules on the control of unfair contracts terms is an important step. What is equally important, however, is to consider whether there exist adequate mechanisms through which these
The Commission eventually published the 1998 document\textsuperscript{176} to which Davis J referred in Mort NO v Henry Shields-Chiat\textsuperscript{177}. It recommended the introduction of the principles of fairness and good faith in the law of contract and that legislation is necessary to effect the necessary changes. The Commission prepared draft legislation (under the cumbersome but self explanatory title of ‘Control of Unreasonableness, Unconscionableness or Oppressiveness in Contracts Bill’) which accompanied its report. The draft Bill met with a significant amount of criticism by those who apparently do not perceive the pressing need to remedy the situation and who still naively believe that the courts are capable of the job\textsuperscript{178}.

Regrettably the South African judiciary does not demonstrate the neutrality and objectivity that one would hope from so eminent an institution as the bench\textsuperscript{179}. Matlala goes so far as to say that the inability of the judges to rigorously pursue and implement the spirit, purport and objects of the Constitution as regards contractual fairness, equity, dignity and equality may be one reason for the President to be careful

\begin{quote}
rules are to be made effective. The mechanism normally available is private litigation in which an individual bases his claim or his defence on the invalidity of the contract term on which his opponent relies. For various reasons this mechanism, if taken alone, cannot be regarded as a satisfactory solution of the problem. If an unfair contract term is used throughout an industry it may affect the interests of many people at the same time, but the individual injury will often be so small that there is no point in seeking redress by way of bringing or defending the court action. Sometimes the unfair contract term will typically harm people who are too poor to pay for the expenses of litigation but are too ‘rich’ to qualify for legal aid, if legal aid is available at all. Even where legal aid is available the persons affected may belong to population groups who lack the skills and sophistication required to make use of existing procedures. On the other hand, the interest at stake for the party who proposed the unfair term is typically much larger than the interest of the other side. As a result, there is a strong incentive for the proponent of an unfair term to buy the other side off and thus keep the clause out of the courtroom. Even where a particular clause has been held invalid by a court there is nothing to stop the proponent of the clause to continue its use with impunity in the hope that other less aggressive or less sophisticated parties will fail to pursue their rights in the mistaken belief that the clause is effective. In sum, it is all very well to enact rules defining unfair contract terms and to give the courts a power to set them aside. This will not get you very far in an area where there are few plaintiffs around who are in a position to make an effective use of the available controls by way of private litigation. This is why most European legal systems have not confined themselves to the enactment of substantive provisions on unfair contract terms. They have developed new control systems which do not, like traditional litigation, depend on the existence of an aggrieved individual willing and able to bring or defend a court action. Instead, public officials or consumers organisations have been given standing to institute control procedures before the ordinary courts or special tribunals which may lead to injunctions or cease-and-desist orders if contract terms used or recommended by the defendant are found invalid under the applicable substantive law.
\end{quote}

\textsuperscript{176} Report on Unreasonable Stipulations in Contracts in 169 supra
\textsuperscript{177} Mort 2001 (1) SA 464 (C)
\textsuperscript{179} The present writer can state from personal experience that many judges, even a few of those at the level of the constitutional court, do not even attempt to conceal their hostility when the executive branch of government is a party to litigation before them. Whilst it may be an inevitable, though unfortunate, consequence of a liberal constitutional dispensation that it has become fashionable to sue the state, and more particularly the executive branch of government, it is submitted that it is completely alien to the spirit and intent of the Constitution to have a judiciary that is clearly predisposed against the state. One can only hope that the judiciary fails in its apparent attempts, whether conscious or subconscious, to provoke a constitutional crisis. The Constitution is the embodiment of the values and principles of a democratic state that is peculiarly South Africa. It is the culmination of the blood, sweat and tears of many thousands of people who, over the years, considered it worth fighting for. It is not fitting for the judiciary, of all institutions, to ignore or demean it, although, given the role of the judiciary in South African history prior to 1994, it is hardly surprising that it does so.
when it comes to making judicial appointments. He points out that in view of the Constitution and its Bill of Rights there is no more reason for South African courts to hesitate in reading constitutional imperatives and values into all contracts. He states that the refusal of the Supreme Court of Appeal to do this in respect of contracts is disappointing to say the least. It is not the intention here to repeat or revisit the work of the South African Law Commission but rather to highlight the fact that the problems with the South African law of contract have been documented at least as far back as 1995.

Whilst there have been a few glimmers of hope that South African contract law is beginning to evolve in the right direction ‘being that happy state in which principles of good faith, fairness, equity and reasonableness underpin the law of contract’, such as may be gleaned from the decisions in *Eerste Nasionale Bank van Suidelike Afrika v Saayman NO*, *Mort NO v Henry Shields-Chiat*, *Shoprite Checkers (Pty) Ltd v Bumpers Schwarmas CC and Others*, it is submitted that still has a long way to go as is clear from the decisions of the Supreme Court of Appeal in *Afrox Healthcare Bpk v Strydom* and *Brisley v Drotsky*.

10.6 The Law of Delict

There is a general need to recognise the imbalance of power between the patient and the provider in individual cases and to factor this into decisions concerning wrongfulness and legal causation. Without detracting from the immense importance of the principle of *stare decisis*, one must not forget that the courts do have the power to depart from established principle where it is clearly wrong. They also have the power to develop the common law in order to align it with the Constitution. Health care services and products are not just another commodity. For one thing they are the

180 Matlala fn 168 supra states that: “One can easily foresee a situation unfolding in which when future appointments are made, preference is given to nominees who are considered as likely to give effect to the ‘spirit, purport and objects’ of the Constitution. Were this to be the case the judiciary would have nobody but itself to blame for its inability to take the lead in developing the common law, and in so doing take into account the interest of justice as required by s 173 of the Constitution or promoting the spirit, purport and objects of the Bill of Rights when developing the common law as required by s 39(2)”

181 Matlala fn 168 supra

182 *Saayman* 1997(4) SA 302 (SCA)

183 *Mort* fn 177 supra

184 *Shoprite Checkers* 2002 (6) SA 2002 (C)

186 *Brisley* 2002 (4) SA (1) (SCA)
subject of constitutional rights. They are also, paradoxically, dangerous to health and even life if misused or misapplied and so delictual considerations involving being in control of a dangerous thing come into play for health professionals. The standard of care under the law of delict is thus modified to the standard of the reasonable health professional who is practising in the same field and at the same level of expertise as the respondent. Thus one would not judge a general practitioner by the standards of a gynaecologist neither would one judge a nurse against the standards of a physiotherapist or a medical officer in a district hospital by the standards of an orthopaedic surgeon. Lack of skill or experience is no defence if a health professional undertakes treatment in respect of which he or she has not been trained or of which he or she has insufficient personal experience. It is permissible for health professionals to observe and respect each other’s scopes of practice when working as a team and one cannot be held liable for the delict or wrongdoing of another.

There is some degree of convergence between the law of contract and of delict. This is encouraging in the sense that the same constitutional values and principles should underpin them both and that decisions should be consistent across different fields of law as well as within them if the constitutional order is to prevail. The law of delict is not as problematic as the law of contract when it comes to the provision of health care services but there are borderline cases such as that of Collins v Administrator Cape when the principles of the law of delict seem somehow to fall slightly short of justice. The principle that the law of delict seeks to restore the victim of a civil wrong to the position in which he occupied before that wrong is not honoured in this particular case because, according to the reasoning of the court, the harm done was so great that no amount of compensation could achieve this objective. The logic that no amount of money can make up for the loss of use of an arm or an eye or a good name but that courts still award amounts in damages for these kinds of injuries anyway did not convince the court in Collins that damages should be awarded in respect of a child who was left in a persistent vegetative state due to the negligence of the respondent. Whilst the point is made that the object of the law of delict is compensation, and not

---

187 See for instance Van Wyk v Lewis fn 146 supra; Dube v Administrator, Transvaal fn 146 supra; Michael and Another v Linksfield Park Clinic (Pty) Ltd 2001 (3) SA 1188 (SCA)

190 Collins 1995 (4) SA 73 (C)
punishment which is the domain of the criminal law, the fact is that not all delicts are crimes, that not all crimes are prosecuted successfully and that criminal sanctions such as imprisonment and fines payable to the state are not always appropriate when the respondent involved is a corporate entity such as a private company or a provincial government. It is submitted that there is scope for the argument that in some cases compensation is not merely the making good of a loss, it can also mean satisfaction in the sense that society’s need for justice to be done and to be seen to be done is satisfied. The point is also made that it is not only the individual who has an interest in the successful prosecution of a delictual claim – broader society also has an interest. This is clearly evidenced in the considerations that the courts apply in the test for unlawfulness when adjudicating delictual claims. The legal convictions of the community play a key role. Why should the legal convictions of the community not also influence the consideration of awards in damages in certain cases? Scott J’s approach to distributive justice in the case of Collins is distinctly utilitarian in the sense that the resources must remain where they are most useful. There is no point in transferring resources to a person who has no need of or use for, them. In the context of Collins, it is a highly persuasive argument in a country where health care services in the public sector are significantly under-resourced. In terms of traditional legal reasoning, it is not the calculation of damages that is influenced by public policy – only the element of wrongfulness[191]. Even in cases where wrongfulness is proven, this

[191] In fact the argument that there are no public policy considerations applicable in assessing the quantum of damages is not correct. The element of legal causation for the purpose of limiting the extent of the damages for which a defendant is liable is also very much dependent on public policy considerations. With regard to the purely compensatory nature of damages in delict, see the dicta of Scott J in Zylas and Others v Sentow 1996 (1) SA where he states: “The modern South African delictual action for damages arising from bodily injury negligently caused is compensatory and not penal. As far as the plaintiff’s patrimonial loss is concerned, the liability of the defendant is no more than to make good the difference between the value of the plaintiff’s estate after the commission of the delict and the value it would have had if the delict had not been committed. See Dippenaar v Shield Insurance Co Ltd 1979 (2) SA 904 (A) at 917B. Similarly, and notwithstanding the problem of placing a monetary value on a non-patrimonial loss, the object in awarding general damages for pain and suffering and loss of amenities of life is to compensate the plaintiff for his loss. It is not uncommon, however, for a plaintiff by reason of his injuries to receive from a third party some monetary or compensatory benefit to which he would not otherwise have been entitled. Logically and because of the compensatory nature of the action, any advantage or benefit by which the plaintiff’s loss is reduced should result in a corresponding reduction in the damages awarded to him. Failure to deduct such a benefit would result in the plaintiff recovering double compensation which, of course, is inconsistent with the fundamental nature of the action. Notwithstanding the foregoing, it is well established in our law that certain benefits which a plaintiff may receive are to be left out of account as being completely collateral. The classic examples are (a) benefits received by the plaintiff under ordinary contracts of insurance for which he has paid the premiums and (b) moneys and other benefits received by a plaintiff from the benevolence of third parties motivated by sympathy. It is said that the law baulks at allowing the wrongdoer to benefit from the plaintiff’s own prudence in insuring himself or from a third party’s benevolence or compassion in coming to the assistance of the plaintiff. Nor, it would seem, are these the only benefits which are to be treated as res inter alios actae. In Mutual and Federal Insurance Co Ltd v Swanepoel 1988 (2) SA 1 (A) it was held, for example, that a military pension which was in the nature of a solatium for the plaintiff’s non-patrimonial loss was not to be deducted. Nonetheless, as pointed out by Lord Bridge in Hodgson v Trapp and Another [1988] 3 All ER 870 (HL) at 874a, the benefits which have to be left out of account, ‘though not always precisely defined and delicately’, are exceptions to the fundamental rule and ‘are only to be admitted on grounds which clearly justify their treatment as such’. It is submitted this baulking of the law to which Scott J refers is based on none other than consideration of public policy. In fact Scott confirms this subsequently in the judgment when he goes on to observe: “It is doubtful whether the distinction between a benefit which is deductible and one which is not can be justified on the basis of a single jurisprudential principle. In the
on its own is insufficient to succeed in a claim in delict. The object of pursuing such a claim is compensation for the loss suffered. Therefore the loss is so great that no amount of damages will constitute satisfactory compensation, the utilitarian approach is that no award of compensation can be made. It is submitted, however, that the common law is no longer only about cold logic expressed in utilitarian terms. It is also about values, more specifically constitutional values and even more specifically the rights to life and to bodily and psychological integrity and the weight that South African society has attached to these concepts. If cold logic is the only legal standard then why should people not be able to sell their body parts for what they can get for them? Why should one treat people who are suffering from terminal illnesses such as certain kinds of cancer and AIDS? Why waste valuable resources on those with a death sentence over their heads when such resources could be better spent in giving those who can recover from other less serious ailments a better chance to do so? Why treat the aged with suffering from terminal illnesses such as certain kinds of cancer and AIDS? Why waste valuable resources on those with a death sentence over their heads when such resources could be better spent in giving those who can recover from other less serious ailments a better chance to do so? Why treat the aged with increasingly expensive medicines and surgical interventions for that matter? Of what utilitarian value are their lives once they reach retirement age? This is why the decision in Collins sits so uncomfortably. Those who defend it point out that one must

past the distinction has been determined by adopting essentially a casuistic approach and it is this that has resulted in a number of apparently conflicting decisions. Professor Boberg in his Law of Delict vol 1 at p 479 explains the difficulty thus: `Where the rule itself is without logical foundation, it cannot be expected of logic to circumscribe its ambit.'

But, whatever the true rationale may be, if indeed there is one, it would seem clear that the inquiry must inevitably involve to some extent, at least, considerations of public policy, reasonableness and justice (see Sastan Versekeringsmaatskappy Bpk v Byleveldt 1973 (2) SA 146 (A) at 150E-F and 153B-C; see also Neethling, Potgieter and Visser The Law of Delict 2nd ed at 221-2). This in turn must necessarily involve, I think, a weighing up of mainly two conflicting considerations in the light of what is considered to be fair and just in all the circumstances of the case. The one is that a plaintiff should not receive double compensation. The other is that the wrongdoer or his insurer ought not to be relieved of liability on account of some fortuitous event such as the generosity of a third party.

Another case which clearly demonstrates the relevance of public policy considerations to the quantum of damages is Jones v K. 1996 (1) SA 504 (T). In that case Kirk-Cohen J stated obiter that: it is the policy of South African law and practice that for breach of contract the injured party is entitled to no more than compensation for the damages actually suffered by him. The quantum is not in any way dependent upon, or influenced by, the reprehensible behaviour of the defendant or the flagrancy of the breach (Administrato, Natal v Edouard 1990 (3) SA 581 (A)). The same applies to the assessment of the quantum of damages under the lex Aquilia: see Sastan Versekeringsmaatskappy Bpk v Byleveldt 1973 (2) SA 146 (A) 152H. It is thus trite that the award of punitive damages in such instances, in which category falls the award in this case, is alien to our legal system. The mere fact that awards are made on a basis not recognised in this country does not entail that they are necessarily contrary to public policy. Whether a judgment is contrary to public policy depends largely upon the facts of each case. In principle it would be wrong to refuse to enforce a foreign order of punitive damages merely because it is unknown in this country. In my view it cannot be said that the principle involved is necessarily unconscionable or excessive or exorbitant." Provisional sentence was refused on the grounds that (a) while the appeal was still pending in the US Court of Appeal, the judgment of the US Court was not a final one; (b) the award of punitive damages was contrary to public policy and a foreign order for such damages would not be enforced by South African Courts; and (c) the award of compensatory damages rested upon the same foundation as the award of punitive damages and would thus not be enforced. In Jones v Krok 1995 (1) SA 677 (A) the Appellate Division reversed the decision of Kirk-Cohen J holding inter alia with regard to the Court a quo's refusal of provisional sentence on the grounds that the award of 'compensatory' damages by the foreign Court had been 'arbitrary' and that it would be contrary to public policy to enforce it, the Court held that there had been no valid basis for such findings and, in any event, that such findings seemed to have involved entering into the merits of the case adjudicated upon by the US Court, which was not permissible. It concluded that public policy afforded no ground for denying the appellant relief in respect of the amount of US$13 670 987. Although Kirk-Cohen J concluded that the punitive award of damages would not be enforced the obiter dicta in this judgment indicate that there may be circumstances in which damages that are not purely compensatory could be recognised. This view seems to have been supported by the Appellate Division in reversing the decision of Kirk-Cohen J.
be fair to the respondent too. Unfortunately in view of the weight that is attached to life and the ability to enjoy it is such that one cannot help but feel that the scales are balanced rather more in favour of the victim on these thankfully rare occasions.

10.6.1 Constitutional Delicts

The question of constitutional delicts, which can best be described as unconstitutional conduct that is unlawful, blameworthy and which causes personal or patrimonial loss to a person is discussed in chapter five of this thesis. It is submitted that if such a delict is recognised, the most likely situation is that described by the court in Soobramoney v Minister of Health, KwaZulu-Natal\(^{192}\) in reviewing the facts of the Indian case of Paschim Banga Khet Mazdoor Samity and Others v State of West Bengal and Another\(^{193}\). It was a case in which constitutional damages were claimed. The claimant had suffered serious head injuries and brain haemorrhage as a result of having fallen off a train. He was taken to various hospitals and turned away, either because the hospital did not have the necessary facilities for treatment, or on the grounds that it did not have room to accommodate him. As a result he had been obliged to secure the necessary treatment at a private hospital. It appeared from the judgment that the claimant could in fact have been accommodated in more than one of the hospitals which turned him away and that the persons responsible for that decision had been guilty of misconduct. There is no magic in the term ‘constitutional delict’, however. The act or omission would still have to satisfy the requirements of the law of delict before it could fall within the ambit of the law of delict. The added element would simply be that the delict constituted a violation of the Constitution. The unconstitutionality of the act or omission would go a long way to proving its unlawfulness. The question of whether it is constitutional to contract out of delictual liability was settled for the present in the case of Afrox Healthcare v Strydom\(^{194}\) which has already been discussed but judging from the amount of criticism that this decision has attracted it is unlikely to be the last word on the subject for very long.

\(^{192}\) Soobramoney fn 28 supra
\(^{193}\) Paschim 1996 (AIR) SC 2426.
\(^{194}\) Afrox fn 65 supra
10.6.2 Unlawfulness

The element of wrongfulness or unlawfulness in the context of the law of delict is particularly well placed to accommodate the golden themes of reasonableness, public policy (boni mores), fairness and good faith. The courts have openly acknowledged that a determination of wrongfulness requires a value judgment. The values of South African society are to be found primarily in the Constitution whilst some writers have argued that the legal convictions of the community at common law are wider than just those principles and values contained in the Constitution it is submitted that only to the extent that common law policy considerations can be regarded as logically and legally consistent extensions of the constitutional values and principles, can they legitimately be applied in deciding claims in the law of delict. Those that contradict constitutional values and principles clearly cannot stand. In the context of health care services, Burchell points out that a person who occupies a special or protective relationship towards another may be under a legal duty to protect that person from harm. For instance a gaoler is under a legal duty to protect a prisoner from being assaulted or to obtain prompt medical treatment for a sick detainee. The courts have recognized this principle inter alia in the cases of Magware v Minister of Health NO and Dube v Administrator Transvaal.

10.6.3 Medicines and Medical Devices

The subject of medicines and medical devices raises the question of strict liability on the part of manufacturers in the health sector. It has been observed that in the United States strict liability for physical injury to person and property caused by defective products has been the result of long and complicated development and that the most common justification for strict liability is that the manufacturer has created the risk of personal injury or other tangible damage and should, therefore bear the consequences of the creation of the risk. In South African law the principle enunciated in

---

195 See for instance Aucomp and Others v University of Stellenbosch 2002 (4) SA 544 (C)
197 Burchell fn 125 supra at p 43
198 Magware 1981 (4) SA 472 (Z)
199 Dube fn 146 supra
200 Burchell fn 125 supra at p246. He notes that Prosser and Keeton in Prosser and Keeton on Tort, p 678 identify four possible theories of recovery under the complexities of products liability law: (1) strict liability in contract for breach of a warranty, express or implied; (2) negligence liability in contract for breach of an express or implied warranty that the
Donoghue v Stevenson\textsuperscript{201} a manufacturer who intends his product to reach the consumer in the form in which it left him, with no reasonable possibility of intervening inspection, owes a duty to take care that the consumer does not suffer injury or loss as a result of using the product still generally prevails and delictual liability is for the most part fault based. In the case of medicines and medical devices their use contrary to the instructions of the manufacturer can have the effect of nullifying a claim in delict on the ground that the fault does not lie with the manufacturer but with the user. Moreover in situations in which medicines and medical devices are administered or applied by someone other than the patient, for example a health professional, the chain of causation and fault that might have led back to the manufacturer can begin and end with the health professional in question. The fact is that health products are not ordinary consumer goods and that their specialized nature complicates matters when it comes to questions of who in the supply chain is liable. Furthermore, medicines do not come with a guarantee of efficacy. Some medicines are more or less effective than others from one individual to another depending upon the infinite number of variations in biochemistry and illness within the human body. One person’s medicine may quite literally be another’s poison and this through no fault of the manufacturer. Strict liability would be particularly difficult to impose in the context of medicines in the absence of highly specific circumstances where the liability of everyone except the manufacturer can convincingly be ruled out.

In Wagener v Pharmacare Ltd; Cuttings v Pharmacare Ltd\textsuperscript{202} the court considered just these circumstances with regard to a local anaesthetic called Regibloc. It was manufactured by the respondent, it was defective when it left the respondent’s control, it was administered in accordance with the respondent’s accompanying instructions, it was its defective condition which caused the alleged harm and such harm was reasonably foreseeable. The court observed that if there were strict liability, it would not be open to a manufacturer to rely on proof that it had taken all reasonable care, but then one must ask what real difference that is likely to make. It stated that once there is prima facie proof, direct or circumstantial, that the product was defective at the

\begin{itemize}
\item product was designed and constructed in a workmanlike manner;
\item negligence liability in tort largely for physical harm to persons and tangible things, and
\item strict liability in tort largely for physical harm to persons and tangible things.\textsuperscript{201}
\end{itemize}

\textsuperscript{201} Donoghue [1932] AC 562 (HL)
\textsuperscript{202} Wagener 2003 (4) SA 283 (SCA)
various times material to the action, it is virtually inevitable that *res ipsa loquitur* will apply and require an answer from the manufacturer. It said that whilst the maxim comes into play only if the plaintiff's evidence is such that it can be said that the event (in this case, for example, the necrosis) would not ordinarily occur without there having been negligent manufacture (involving, perhaps, some scientific explanation in addition to the mere fact of the injury) it is perfectly conceivable that the courts may develop reasons for being readier in some cases of alleged defective manufacture to draw the necessary *prima facie* inference of negligence where expert evidence is extremely difficult for the plaintiff to acquire, and perhaps even more so where administration of a substance made to be applied to the human body has apparently had an effect quite contrary to the manufacturer's stated aim. The choice of a health professional of a particular medical device or medicine for use on or by a patient cannot be attacked on the basis of fault unless it was unreasonable when compared to the choices of other health professionals practicing the same discipline.

It is submitted with regard to medicines that product liability need not necessarily arise only from the *design* of the drug. This would involve largely patented drugs since generic drugs are not 'designed' to the same degree as much of the development work has already been done by the erstwhile patent holder. There may not be negligent deviation from the formula of the drug so much as negligence in the manufacturing process itself so that certain active ingredients are for instance inadvertently rendered inactive, or that specific storage conditions for the drug, such as refrigeration at a specific temperature, are not followed. No matter how well designed the drug is, manufacturing processes can and do go wrong. Accidents happen on the production line. Contamination of raw materials can occur. The raw materials can be obtained from an inferior source. Insufficient quality guarantees may be obtained by the manufacturer from the supplier of the active pharmaceutical ingredients. It is in recognition of these dangers that the medicines control legislation in South Africa requires manufacturers to comply with what is commonly referred to as GMP or “Good Manufacturing Practice”. There is also the question of the indication for which the drug is registered in South Africa. It often happens that drugs are registered for more than one indication in other parts of the world or that new indications for existing drugs are subsequently discovered. The registration process requires approval of registration for specific indications of the drug and not just
blanket registration for every possible indication. The use of the medicine for an
indication in respect of which it has not been registered can hardly be blamed upon
the manufacturer in the absence of conduct on his part which promotes or advocates
such use.

In *Wagener v Pharmacare Ltd; Cuttings v Pharmacare Ltd* the court seemed to
prefer the application and even extension of the *res ipsa loquitur* principle to the
imposition of strict liability on the manufacturer of a product as being the lesser of
two evils. However, the predilection of the court in *Pringle v Administrator, Transvaal*
to apply the doctrine only where the alleged negligence depends on absolutes does not take into account that where the alleged negligence is so
dependent upon absolutes it is probably a lot easier for the defendant to produce
evidence of negligence in the normal way and the application of the doctrine in such
circumstances is likely to be unnecessary in many instances. Part of the reason for the
transfer of the evidentiary burden to the defendant by *res ipsa loquitur* is precisely
that the plaintiff does not necessarily know what exactly happened and is not
necessarily even in a position to identify such 'absolutes'. It is submitted that such an
extremely narrow approach defeats the object of the maxim to a large degree since
one is effectively saying that the circumstances of the case must be such that there is
no significant doubt that there was negligence due to the presence of the 'absolutes'
in question.

10.6.4 Delict in the public v the private sector

There is no difference in principle between delicts committed by the state and those
committed by private entities or persons. The private sector and the public sector tend
to have certain operational differences with regard to the manner in which they render
health care services and so in practice different emphases are likely to be placed on
different aspects of the law of delict within the two sectors.

---

203 *Wagener* 2003 (4) SA 285 (SCA). Howie P stated at p 294: "As regards the problem of proving fault, counsel for the
respondent pointed out that even if strict liability were imposed a plaintiff would still have to prove that the product
concerned was defective when it left the manufacturer. If that were indeed established, then application of *res ipsa
loquitur* would suffice to place the manufacturer on its defence and, in effect, compel an exculpatory explanation, if one
existed. In the circumstances it was submitted that proving fault was really no more difficult than proving
defectiveness."

204 *Pringle* 1990 (2) SA 379 (W)
Vicarious liability is, for example, of much greater interest to the public sector than the private sector in terms of the risks it poses simply because the public sector employs more kinds of health professionals than does the private sector. Furthermore the state, unlike the private sector does not purchase public liability insurance but self-insures instead which means that there is no sharing of risk by the public sector with other providers of health care services.

The public sector is concerned with the public demand for health care services in a quite different way to the private sector and legal issues involving the rationing of health care services, for instance, are much more likely to be an issue in the public sector than in the private sector.

In the public sector, by contrast, competitive issues are not nearly as significant as they are in the private sector although the sharp divide that once existed between these two sectors in terms of their respective ‘turf’ is becoming less distinct in that changes to medical schemes legislation allow for the designation by medical schemes of public health facilities as preferred providers and some public hospitals are actively targeting as patients medical scheme members.

In the private sector commercial considerations such as reductions in public liability insurance premiums, are more likely to lead to contractual avoidance of delictual liability whereas in the public sector the courts are likely to invoke the constitutional obligations of the state to strike down attempts at contractual avoidance of such liability.

10.6.5 Conclusions Concerning the Law of Delict

The law of delict in relation to health services delivery has its blind spots. The persistent refusal by the courts to apply the doctrine of res ipsa loquitur to claims involving health care services has recently been the subject of a doctoral thesis of its own\(^{205}\). Whilst the Supreme Court of Appeal has demonstrated the same unfortunate

---

1401
tendencies in the law of delict as it has in the law of contract to ignore the Constitution, the constitutional court has given some promising and enlightened judgments involving the law of delict such as *Carmichele v Minister of Safety and Security and Another (Centre for Applied Legal Studies Intervening)*. As regards the common law there are a great many more cases involving health care services that have been decided on the basis of the law of delict than on that of the law of contract with the courts displaying an apparent preference for the former where they have a choice. While the same set of facts can give rise to a claim both in terms of the law of delict and for breach of contract under the law of contract, it is preferable given the current weaknesses in the law of contract to have one's claim adjudicated in terms of the law of delict.

Although the law of delict essentially seeks to place the claimant in the position in which he or she found himself prior to the unlawful act or omission whereas the law of contract seeks to place the claimant in the position he or she would have occupied had the contract been fulfilled, in the context of health services delivery this is more often than not, a notional distinction at best since it is a general feature of the law of contract relating to health services delivery that the contract seldom guarantees a specific outcome. There is no implied or express undertaking to cure the patient except in specialised cases such as cosmetic surgery and sterilisation procedures in which the term ‘cure’ is itself usually inappropriate. Since pain and suffering and non-patrimonial loss are almost an inevitability in cases of breach of contracts for health services, and since the law of contract only recognises and permits damages for patrimonial loss, this is another reason to prefer the law of delict when dealing with claims involving health service delivery. Of course, such a choice is not always possible given that the elements of a delict, namely conduct that is unlawful, blameworthy and causes of damage or injury to property or person. The boundaries between the law of contract and the law of delict are by no means set in stone.

Burchell points out that a breach of contract is also a civil wrong but that the traditional approach has been to draw a distinction between a delict and a breach of

\[\text{supra in extensive detail and comes to the conclusion that there was no reason in that case why the maxim should not have been applied and that the court in fact erred in stating that it was not applicable in the medical context.}\]

\[\text{Carmichele fn 144 supra}\]

\[\text{Burchell J fn 125 supra at p 3}\]
contract in terms of a separate but equal approach. He notes that it was said that a
delict consists of a breach of a duty imposed by law independently of the will of the
party bound whereas a breach of contract consists of a breach of a duty voluntarily
assumed. This distinction, says Burchell, is not entirely satisfactory for a number of
reasons not least of which is that it describes a delict solely in terms of a breach of a
duty, rather than an infringement of a right or interest. It is submitted that this
distinction is clearly not in keeping with the central importance accorded to the
concept of rights by the Constitution. Burchell states that the traditional distinction
between delict and breach of contract also requires modification in the light of the
Appellate Division decision in Lillicrap, Wassenaar and Partners v Pilkington
Bros208. In his commentary on this case he observes that commentators have been
equally consistent in their criticism of the judgment of Grosskopf AJA as they have
been in praise of the approach taken by Smuts AJA. The thrust of the criticism of
Grosskopf’s judgment is that it draws too rigid a line between physical loss and pure
economic loss and unduly prevents a desirable confluence of contract and delict.
Burchell notes that there are differences between the remedy for breach of contract an
for delict but states that where fault is present and no damages for pain and suffering
are claimed, there is a major area of potential overlap between the two forms of civil
remedy. It is submitted that even the justifications for differences between the two
areas of the law in terms of the kinds of damages payable are flimsy enough in certain
contexts, such as that of health care services, that one can argue that damages for pain
and suffering should be payable in terms of the law of contract where such damages
are an inevitable or probable consequence of breach. Burchell suggests that there is a
possible and less stringent approach to Grosskopf AJA’s reasoning. He asks whether
Grosskopf AJA was not merely stating that an infringement of a pure economic loss
interest (which may also amount to a breach of contract) may be unlawful in delict but
is not per se unlawful since policy factors may militate against unlawfulness. It is
submitted that Lillicrap’s case is in a sense at the opposite end of the spectrum to
delictual claims involving health services delivery in terms of a contract since in the
former the applicant’s sought to recover damages for purely patrimonial loss in terms
of the law of delict because the claim in contract had prescribed. In the case of the
latter the debate concerning the conflation of delictual and contractual remedies is

208 Lillicrap 1985 (1) SA 475 (A)
whether damages for non-patrimonial loss should be permitted in terms of the law of contract. It nevertheless illustrates the reluctance of the courts to permit cross-pollination between areas of law. Burchell states that a more helpful definition of a 'delict' is one which states the essence of the type of wrong concerned and which draws a fundamental distinction between criminal and delictual liability, while leaving open the possibility of a confluence of delictual and contractual liability.

The law of delict is far from static and whilst the concerns around fuzziness of elements of the law of delict and the importance of legal certainty should not be downplayed, it is worth noting that the flexibility or fuzziness around the element of unlawfulness, based as it is on the *boni mores*, has been lauded by more than one academic writer and seems generally to have served the legal system well.

The question of causation is divided into factual and legal causation the latter being concerned with the limitation of liability on public policy principles. The *sine qua non* test generally works quite well in most cases but in situations where there are multiple probable causes that are so entangled that it is impossible to clearly identify a single cause the law of delict becomes more problematic. One solution put forward seems to be based upon the concept joint and several liability but this has been criticised and that there should in such cases be an open departure from the *conditio sine qua non* approach to factual causation. In such cases perhaps only the element of legal causation, as established on the basis of public policy principles, should be the deciding factor. In the health care context where there are a number of different health professionals taking care of a patient situations may arise where it is not always possible to establish whether the actions of a particular individual caused the harm. It is conceivable that the error of one can be compounded or exacerbated by others who should have picked up on it and failed to do so. In such situations the application of the *conditio sine qua non* test may well yield unsatisfactory results and the question of causation may have to be decided on the basis of legal causation alone.

---

209 Burchell fn 125 supra suggests at p 10 the following definition: “A delict is an unlawful, blameworthy (i.e. intentional or negligent) act or omission which causes another person damage to person or property or injury to personality and for which a civil remedy for recovery of damages is available.” He points out, however, that one disadvantage of this definition is that it does not accommodate an important, fast developing fact of the law of delict – liability based not on fault but strict or no-fault liability.
Whilst the courts in the past\footnote{For instance in \textit{Stoffberg v Elliott} 1923 CPD 148} have tended to refer to the right to security of the person as an absolute right this clearly is no longer correct under the present constitutional dispensation. The right to security of the person is now expressed in section 12 of the Constitution and all constitutional rights are relative as was pointed out earlier in this chapter. They are all interdependent and interrelated. Informed consent is essential in order to justify conduct which would ordinarily constitute a violation of the right to freedom and security of the person and bodily and psychological integrity. It is therefore a concept which is totally consistent with these rights and also the right to human dignity in the Constitution. The National Health Act enacts certain provisions which will have the effect of creating statutory requirements for informed consent whereas previously it was a purely common law construct. The provisions in the Act are, however, fairly comprehensive and if anything broaden the common law concept of informed consent in providing that where a person other than the patient has the power to give consent on the patient’s behalf, the patient must nevertheless wherever possible be consulted and informed at a level best suited to his or her capacity and understanding of the treatment to be administered and his or her wishes must be taken into account. This is important for the protection, and promotion of the patient’s right to human dignity even where the patient is a child or a very old person whose mental faculties may not be what they were in her youth.

10.7 In Conclusion

The law as it relates to health service delivery is clearly a complex and voluminous topic to which a single thesis, no matter how ambitious, can only partially do justice. Nonetheless it has become clear in the course of the journey reflected within this thesis that health care law in its broadest sense, including medical law, is a worthy subject of study, debate and discussion in its own right. The factual context in which law is applied is becoming increasingly important since legal principles considered in the abstract can at best only deliver abstract answers that have no practical relevance for the real world. It is when one contextualises the law, for instance in the area of health care, that one realises its significance and its strengths and weaknesses in that context. Health care law is an internationally recognised subject that is not necessarily
widely taught or even accepted as a legitimate area of study by some South African universities. This is unfortunate. The law of contract as it relates to information and telecommunication systems, it is submitted, is very different in practical terms to the law of contract as it relates to the media or to health care for the simple reason that the context in which the law is applied cannot be separated from the law itself. Considerations of public policy, of which the law expressly takes cognisance, as is clear from the examination in this thesis of international, constitutional, administrative, contractual and delictual law, can be very different, depending on the context. Furthermore, what is fair and reasonable in a purely commercial context may not be fair and reasonable in a public health context. The view of health care as a public good is at odds with the need of the private health sector to make a profit. Health law straddles commercial law as well as human rights law. Just as there is tension is within international law with regard to the exploitation of intellectual property and trade rights as opposed to international human rights so in health law there is a tension between humanitarian beneficence and the need to make money. Even in the public sector, which is not profit driven, the management of income and expenditure presents a constant headache to health officials who must find ways to optimise the utilisation of resources. There is a significant ethics base with regard to health care that quite possibly has no parallel in any other area of human activity. Since the time of Hippocrates people have discussed and debated the many and varied aspects of health ethics. The ethical aspects of health care must have an influence on the health law to which they are so closely related by way of public policy. After all principles of ethics are in many ways distillations of the boni mores or public policy in a particular area.

Health care is an area of many legal interfaces such as the interface between the law of contract and the law of delict or that between constitutional law and the law of contract or that between administrative law and constitutional law or that between the law of delict and constitutional law. The Constitution itself underpins them all. The five areas of law that have been chosen for study are considered not only in terms of their own content but also in terms of their interaction with one another. It is only upon the examination of boundary conditions that many areas of knowledge become meaningful. Health law abounds with boundary conditions. One can study the content of the individual traditional branches of law up to a point but the concept of a legal
*system* only becomes meaningful when one also examines the friction between its elements and the manner of their interaction. The five areas of law examined in this thesis are the major building blocks for health law in South Africa but one cannot derive a significant understanding of health law by studying them separately. It is only in combining them in the context of health care that one comes up with a legal discipline in its own right. This study of the law of health care thus demonstrates that the whole is more than the sum of its parts.

It has been shown in this thesis that the five areas of law considered are but facets of a larger whole, that they are not discrete and cannot be isolated from the broader underlying constructs that link them all. The crystal lattice that binds and structures them into the greater whole of a legal system consists of the principles and values expressed in the Constitution. The Constitution thus manifests not only as a single facet of the law. It also represents its underlying molecular structure. There is consequently no better way of perceiving its internal harmony and construction than to examine a number of areas of law and the manner in which they interface. A further benefit is that this promotes greater internal consistency within the legal system and strengthens and enriches each of the different facets of law through a process of logical and moral reinforcement by the others. Like most crystals, the law is not perfect. It has its flaws and these have been highlighted as they have emerged from the study embarked upon in this thesis. Like crystals in their natural environment, the law is capable of refinement, growth and development. It is subject to all kinds of environmental pressures and forces. It is a dynamic system. Herein lies hope for positive change and growth and the possibility of remedying the flaws that impair its purity and beauty. For the law is beautiful. It is has a certain elegance of logic, a certain rightness of reason, which when correctly understood and applied, is no less entrancing than the constructs of higher mathematics.
Explanatory Notes on Formatting

1. In the main body of this thesis, the initials of the authors are given only in the first occurrence of
the reference within a chapter. Thereafter, only their surnames are used in indicating the
reference in the remainder of the chapter since these are cross-referenced to the first occurrence
of their names. Their initials are also reflected in the Bibliography below.

2. The year of publication of textbooks is not given in the body due to the fact that, unlike
periodicals, these change with much less frequency and are not essential to locating the relevant
text and there is enough detail in the footnotes without further complicating them unnecessarily.
However, for the sake of completeness the year of publication is given in the Bibliography
below.

3. Where a passage from a judgement or textbook is quoted and the quote itself contains references
to other materials, the format of these references has not been altered to follow the format in the
text of the thesis on the basis that it is a quote and as such must remain unaltered.

4. With regard to journal references their abbreviated names are used in the main body of the text
and also in this Bibliography since their full names can be found by referring to the Table of
Abbreviations.

5. References to case names appear in the main body of the text in italics except when they are
intended as references to the people themselves in which case they appear as regular text: eg
Soobramoney means the case of Soobramoney v the Minister of Health, KwaZulu-Natal while
Soobramoney means the applicant in that case.
