DEVELOPMENT OF A TECHNOLOGICAL PACKAGE FOR SUSTAINABLE USE OF DAMBOS BY SMALL-SCALE FARMERS

A.E. DAKA
DEVELOPMENT OF A TECHNOLOGICAL PACKAGE FOR SUSTAINABLE USE OF DAMBOS BY SMALL-SCALE FARMERS

by

ANGEL ELIAS DAKA

Thesis submitted in partial fulfilment of the requirements of the degree of Doctor of Philosophy: Land Use Planning

Department of Plant Production and Soil Science
Faculty of Natural and Agricultural Sciences

University of Pretoria

Promoter: Professor M.C. Laker

Pretoria
April 2001
Dedicated to Mum and Dad (Posthumously)

"Water resources, and the related ecosystems that provide and sustain them, are under threat from pollution, unsustainable use, land-use changes, climate change and many other forces. The link between these threats and poverty is clear, for it is the poor who are hit first and hardest."

ABSTRACT

The sustainable use of Dambos for crop production using a technological package is presented. Dambos which are known as vleis in South Africa and Zimbabwe, fadamas in West Africa and mbugas in East Africa are identified as potential environments and key-resource areas for alleviating poverty and hunger in arid and semi-arid areas where drought occurrences are characteristic and limit upland crop production. Dambos present themselves as environments with soil moisture potential and high water tables ranging from 50 - 100 cm below the ground surface for most part of the year. Particular difficulties arise in abstracting this water for use to irrigate crops in Dambos. Most small-scale farmers use a rope and a bucket to draw water from hand dug wells. These methods are labour intensive and thus limited lands are cultivated by small-scale farmers.

This study has identified, modified and introduced a treadle pump as a technology for lifting water from shallow water tables such as in Dambos. The treadle pump also lifts water from rivers, swamps, wells and dams within a suction lift of 0-8 m to the intended place of use i.e. vegetable garden, domestic application, livestock watering and in construction. The study has further investigated and introduced the clay pot as a water saving device. The clay pot sub-surface irrigation technology saves between 50 and 70% of water as compared to conventional watering can and bucket systems. This technology can combine well with the treadle pump by using the latter to refill water in the former, thus making it easy to fill the system once the water is depleted.

The use of the treadle pump has demonstrated its impact on the society in many ways. Firstly: the small-scale farmer is now able to increase the size of his/her garden from 0.1 ha irrigating using watering cans/buckets to between 0.25 ha and 0.5 ha using the treadle pump. With this innovative way of irrigating, farmers have thus been able to diversify cropping. Secondly: farmers have been able to increase household income from a meager US$125 without a treadle pump to US$850 and US$1700 on a 0.25 ha piece of land with a treadle pump on a 300% cropping intensity (growing crops three times a year). This has helped the country reduce on imported vegetables and thus save
the much needed foreign exchange. Thirdly: the technology has contributed to employment creation, notably from the manufacturing point of view where artisans are employed to make the pump and carpenters to make the wooden parts. On the output side for buyers (merchants/hawkers) and transport contractors who trade and transport the produce.

The study essentially alludes to the great impact the treadle pump has made by noting the brand naming of the pump as ‘Chova pump’ by the small-scale farmers. Chova is a local name, which means to boost one’s income or to pedal signifying the manner in which the pump is operated. Dambos, cover about 3.6 million hectares of land in Zambia and are suitable environments for application of the treadle pump. The potentials and limitations of Dambos are highlighted and the impact of their use using treadle pumps elucidated. Marketing of Dambo produce is discussed with respect to the adoption of the technology. The study notes that Dambos are highly accessible with no land tenure limitations. Thus the more than 800,000 small-scale farmers in Zambia have an opportunity to utilize Dambos for crop production and help reduce poverty and food insecurity at household level.
ACKNOWLEDGEMENTS

I would like to sincerely acknowledge the many contributions to this thesis, words of wisdom and encouragement received from many individuals and institutions.

My first and foremost heart-felt and invaluable thanks to my promoter Professor M.C. Laker for his tireless efforts to go through the so many preparatory manuscripts of this thesis and his unending words of encouragement from the inception of this work up to its completion. I remember his giving up of his precious time to show me the various departments of the university, the registration hall and university and departmental libraries at my first registration and beginning of my first academic year. This action has never been forgotten and meant a lot to me. His patience and reactions to my ideas has made it possible to accomplish this work.

I wish to recall and thank Professor R. Dudal of Belgium whose inspiring words gave me patience to acquire experience in the field and write on real-life situations. He told me then in 1986 after obtaining my Masters degree in Irrigation Engineering as I wanted to proceed to a PhD. study, that "a PhD is not got from thin air but with field real-life experiences it is more exacting than otherwise". At that time I had already conceived the idea of understanding wetlands and particularly Dambos which then received very low position on policy agendas worldwide but today rank highest with respect to environmental concerns and conservation of biodiversity. Fifteen years from that time, I am submitting work in this field.

I would like to thank the International Foundation of Science for awarding me a Research Grant from 1992 to 1997 to study Dambos indepth. It is from this work that the hydrodynamic evolution of water tables, the movement of water and its fate in Dambos became clear from a technical point of view.
To Professor P.S. Hammes, the Head of department for his efficiency in processing motivated proposals for students and his understanding of problems postgraduate students face. His actions have always been amazingly positive and cannot be acknowledged adequately using any combination of words in the dictionary.

To my wife Felisters Daka and my children Audrey-virginia, Austin, Angel, Angela, Bartholomew and Allan for their patience to miss my attention during the preparation of this thesis. I thank them for sharing with me the day to day troubles and lifting my spirits when my energy ran low and would have despaired at the time I was diagnosed to be a third diabetic person in the family at the peak of this study.

I would further like to acknowledge the assistance rendered by Messers Evans Mweemba and Oscar Malumbe for helping me to proof read some of the manuscripts of this thesis.

To Dr. Richard Stirzaker of CSIRO (Australia) LAND and WATER for very fruitful discussions on the subject at the time he was visiting the University of Pretoria. His comments and contributions are highly appreciated.

To Professor J.G. Annandale for words of encouragement and his great interest on my work dealing with water management. His encouraging comments during the postgraduate presentation have been an inspiration to me.

I am truly grateful to Peter Elkind, Director of the International Development Enterprises (IDE) Zambia for facilitating programmes on the promotion, demonstration and marketing of the treadle pump technology.
I would like to further thank Dr. K. Munyinda, Dr. W. Mwale and Mr. A. Chalabesa all who have at one time or another played the role in their capacity as Deputy Director of the Department of Research and Specialist Services to facilitate my sponsorship through ASIP (Agricultural Sector Investment Plan) under the Ministry of Agriculture Food and Fisheries.

I thank Dr. Yerukon of the University of Zambia for giving me the inspiration to forge ahead and was always willing to discuss various aspects of my work at any time that I called upon him.

To Sister Mary Noel Adjaearo, I say many great thanks for the inspiration and prayers to see this work become a dream come true. I am truly thankful for those many reminders to keep abreast with time and deadlines.

Allow me to remember and thank posthumously a friend and colleague of mine Dr. Willie Mulonga who with great wishes for me to complete my PhD. studies gave me his cherished PhD. thesis copy just before he died and inscribed in it "To Angel Daka-wishing you all the best". I have always remembered this; May His Soul Rest In Peace.

Lastly but not the least I wish to express my sincere gratitude to my co-ordinator at the Cooperative League Of the United States of America (CLUSA) Mr. George Allison and his deputy Mr. Mike Mailloux for granting me short leave days when I needed to accomplish my work and meet the deadlines, I am truly grateful to both of them.
