Declaration

I declare that the experimental work described in this thesis is my original work (except where the input of others is acknowledged), conducted in the Phytomedicine Programme, Department of Paraclinical Sciences, Faculty of Veterinary Sciences, University of Pretoria, and has not been submitted in any other form to any University or academic institution. I Mohammed Musa Suleiman declare the above statement to be true.

Dedication

This work is dedicated in loving memory to Halimatu Sadiya. May her gentle soul rest in perfect peace. Amen. Every soul will taste death, and then to US will you be returned (Quran 29:57).
Acknowledgements

I am most thankful to Prof J.N. Eloff for his dedicated mentorship towards achieving this goal of getting a PhD. Your positive comments and encouragements are highly appreciated. You also stand by me during the passing away of my wife (Halimatu Sadiya). Upon your recommendation I received a PhD bursary from the South African National Research Foundation (SA-NRF). I will forever, remain indebted to Kobus for his noteworthy contribution to my academic development and his kindness to me and my entire family.

The steadfast supervision provided by Prof V. Naidoo in the design, execution and documentation of the animal studies is greatly appreciated. His encouragements and keen interest led to the realization and successful completion of this study.

I will like to extend special thanks to Dr L.J. McGaw who did the proof reading of most of the drafted manuscripts from this thesis. Her patience, kindness and willingness at all times to offer a helping hand are gratefully acknowledged.

My sincere thanks also goes to Dr S.B. Babatunde and Prof N. Duncan for assisting with structure elucidation of isolated compounds and histopathological sections and interpretations, respectively.

I am also grateful to Antonette van Wyk (Poultry Reference Centre UP), Elsabe Myburg (Veterinary Clinical Pathology Section, UP) for their wonderful technical assistance.

My profound gratitude goes to Ella Bischoff, Lita Pauw, Tharien De Winnar, and Denise Marais for your wonderful planning and execution of all administrative duties relating to my research work. You ensure that all necessary funds, equipment and materials that could facilitate my welfare, comfort and academic pursuit are made available on time. “Baie dankie”

I am particularly thankful to Dr V. Bagla (colleague and friend) for teaching me techniques on cell culture and Dr E. Iwalewa for useful discussions that helped in my research work.

I fully appreciate the kind help provided by Bellona Sakong, in ensuring that all consumables used in the course of my research are adequately provided in the Phytomedicine laboratory, UP. “Ngiyabonga”
The patience and understanding of my mother, that of my late wife, Halimatu Sadiya, my daughters, Aishatu and Khadija, as well as that of the rest of my family and friends are highly appreciated.

I reserved special thanks to the families of Prof. D.A.Y. Adawa, that of Drs. Idris Abubakar Misau, Rabiu Nasiru Charanci, Haruna Jibrin, Sodangi A Luka and Mrs Hassana Muazu for being special parents to Aishatu and Khadija (my daughters).

I shall remain ever grateful to Profs. Y.O. Aliu and M. Mamman for their advice when I almost gave up coming to back to Pretoria after I lost my beloved wife.

I extend special thanks to the entire staff of the Department of Veterinary Physiology and Pharmacology, Ahmadu Bello University (A.B.U.), Zaria for sharing my teaching responsibilities during the period of my study fellowship, authorities of (A.B.U.) for granting me the study fellowship, University of Pretoria for partially financing my studentship through the University postgraduate bursary and also funding my PhD research.

Above all, I remain eternally grateful to GOD (The Exalted, The Almighty) for His mercy.

Abstract

The main aim of this study was to find a plant extract or isolated compound that could be used to combat aspergillosis in animals. *Aspergillus fumigatus* is one of the most common pathogenic fungal species in humans and animals. *A. fumigatus* is also an economically important fungus in the poultry industry. Current treatment of the disease is hampered by drug resistance of the organism to conventional antifungals and also its widespread toxicity to the animals.

Seven tree species that had good antifungal activity against *Cryptococcus neoformans* in the Phytomedicine Programme database were selected for further work. These tree species were: *Combretum vendae* A.E. van Wyk (Combretaceae), *Commiphora harveyi* (Engl.) Engl. (Burseraceae), *Khaya anthotheca* (Welm.) C.DC (Meliaceae), *Kirkia wilmsii* Engl. (Kirkiaecae), *Loxostylis alata* A. Spreng. ex Rchb. (Anacardiaceae), *Ochna natalitia* (Meisn.) Walp. (Ochnaceae) and *Protorhus longifolia* (Bernh. Ex C. Krauss) Engl. (Anacardiaceae). The antimicrobial activity of leaf extracts of the selected plant species were determined against four important nosocomial bacteria (*Staphylococcus aureus*, *Enterococcus faecalis*, *Escherichia coli* and *Pseudomonas aeruginosa*) and five important animal fungi (*Aspergillus fumigatus*, *Candida albicans*, *Cryptococcus neoformans*, *Microsporum canis* and *Sporothrix schenckii*) using a serial microplate dilution method. The minimal inhibitory concentrations (MIC), of an acetone extract of *Loxostylis alata* was the lowest against *Aspergillus fumigatus* with an MIC value of 0.05 mg/ml. The number of antifungal compounds in extracts was determined by bioautography. The acetone extract of *L. alata* had the most active zones (10).

The antioxidant, antiplatelet and cytotoxic effects of the seven plant species were evaluated using established *in vitro* assays. All the extracts had comparably low toxicity except for the extract of *C. harveyi* that had high haemagluttination assay titre value, which indicates toxicity. The extracts of *P. longifolia*, *K. wilmsii*, *O. natalitia*, *L. alata*, *C. harveyi* and *C. vendae* contained antioxidant compounds in the qualitative assay using DPPH. In the quantification of antioxidation using ABTS, only the extracts of *P. longifolia*, *L. alata*, and *C. vendae* had substantial antioxidant activity with respective TEAC value of 1.39, 1.94 and 2.08. Similarly, in the quantitative DPPH assay, *L. alata* (EC50, 3.58 ± 0.23 µg/ml) and *K. wilmsii* (EC50, 3.57 ± 0.41 µg/ml) did not differ significantly (p ≤ 0.05) from the positive control (L-ascorbic acid). *K. anthotheca* had a much lower antioxidant activity (EC50 176.40 ± 26.56 µg/ml), and differed significantly (p ≤ 0.05) from all the other extracts and control. In addition, the extract of *C. vendae* and *C. harveyi* had significant (p ≤ 0.05) antiplatelet activity and did not differ from the control (aspirin) with EC50 of 0.06 ± 0.01 µg/ml, 0.19 ± 0.00 µg/ml, respectively. Lower EC50 values in the antioxidant and antiplatelet studies are indicative of
superior activity of the plant extract against oxidation and platelet aggregation. Based on the results obtained *L. alata* was selected for further examination.

To simplify the isolation of the antifungal compounds from the *L. alata* fractions the acetone extract was first separated into six different fractions based on polarity in a mild solvent-solvent fractionation process. The fractions were aqueous methanol, butanol, carbon tetrachloride, chloroform, hexane and water fractions. The antimicrobial activities of the fractions as well as other relevant pharmacological tests on the different fractions were carried out.

The number of antimicrobial compounds present in the aqueous methanol (AM), butanol (BT), carbon tetrachloride (CCl₄), chloroform (CC), hexane and water fractions was determined by bioautography. The CCl₄ extract was active against six out of the 9 microbial strains used and was particularly active against *S. aureus*, *E. faecalis*, *A. fumigatus*, *C. albicans*, *C. neoformans* and *M. canis* with MIC of 0.04, 0.04, 0.1, 0.1, 0.06 and 0.03 mg/ml, respectively. *Microsporum canis* was the most sensitive organism with the lowest average MIC of 0.16 mg/ml. Qualitative antioxidation using DPPH and quantitative assay using both ABTS and DPPH radicals revealed the presence of several antioxidant compounds in the AM, BT and water fractions of *Loxostylis alata*. This supported the usefulness of *L. alata* in treating fungal diseases, as aspergillosis and most fungal infections are associated with immune depression of the host. Antioxidants may reverse several conditions associated with immune deficiencies, resulting in increased levels of interleukin-2, elevated numbers of total lymphocytes and T-cell subsets.

*Loxostylis alata* is used in southern African traditional medicine to control labour pain and to boost the immune system. Extracts and compounds isolated from leaves of *Loxostylis alata* were therefore also evaluated for their *in vitro* antimicrobial, anti-inflammatory (cyclooxygenase-1 and -2) activities and evaluated for their potential toxic effects using 3-(4,5-dimethylthiazolyl-2)-2,5-diphenyltetrazolium bromide (MTT) and *Salmonella typhimurium* tester strains TA98 and TA100. Antimicrobial activity was evaluated using a serial microdilution assay. The bacterial strains used were *Staphylococcus aureus* (ATCC29213), *Enterococcus faecalis* (ATCC 29212), *Pseudomonas aeruginosa* (ATCC 27853) and *Escherichia coli* (ATCC 25922). The fungal strains used were *Cryptococcus neoformans*, *Sporothrix schenckii*, *Aspergillus fumigatus*, *Microsporum canis* and *Candida albicans*. A bioassay guided fractionation of the crude extract yielded two antimicrobial compounds namely, Lupeol and β-sitosterol. Lupeol had the most pronounced zone of inhibition against *S. aureus* and *A. fumigatus*. When MICs of the 2 compounds were determined, only lupeol had relatively good activity with MICs values ≤ 100 µg/ml against 8 out of 10 of the tested pathogens. However, β-sitosterol had activity against only *S. aureus* and *E. coli* with MICs values of 90 and 110 µg/ml, respectively. In addition β-sitosterol had selective inhibition of COX-1 (IC₅₀ = 55.3 ± 2) None of
the compounds isolated were toxic in the Salmonella typhimurium/microsome assay and MTT cytotoxicity test. The isolation of these two compounds is reported for the first time from Loxostylis alata.

It was disappointing that the two antifungal compounds isolated from L. alata had such a low activity against Aspergillus fumigatus. This inhibits the development of a single compound that can be used therapeutically. Because the crude extract had very good activity we decided to investigate the safety and potential use of this extract in target animal species. At a dose of 300 mg/kg, the chicks had some signs of intoxication, but not at a dose of 200 mg/kg.

Aspergillosis was induced experimentally, in broiler chicks. The degree of infection was assessed by comparing degree and severity of clinical signs, lesion scores and fungal re-isolation from treated chicks with those from infected chicks not treated with the extract. The extract at a dose of 100 and 200 mg/kg reduced significantly ($p \leq 0.05$) the lesions due to aspergillosis and the amount of Aspergillus fumigatus isolated from infected chicks in an excellent dose related response. The crude extract of L. alata leaves was as active as the commercially used ketoconazole against avian aspergillosis. It appears likely that the crude acetone extract could be produced at a much lower cost than ketoconazole or other chemical antimicrobial products. If these results can be confirmed in larger studies and if the crude extract does not have a negative effect on the production of the poultry the crude extract of L. alata may prove to be a viable and cost effective alternative to using current antimicrobial products. This study proves that it may be worthwhile to invest human and financial resources in searching for plant related products than can increase animal health and productivity.

White areas indicate inhibition of microbial growth after 60 minutes of incubation at 37°C

Figure 6.3. Chromatogram of hexane (HX), chloroform (CC), carbon tetrachloride (CT), aqueous methanol (AM), butanol (BT) and water (WT) extracts of Loxostylis alata separated with CEF mobile phase and sprayed with 0.2% DPPH. Antioxidant compounds are indicated by yellow areas over purplish background

Figure 6.4. Inhibition of ROS production in Vero monkey kidney cell by L. alata fractions
Chapter 7

Figure 7.1. Carbon tetrachloride (CT), hexane (HX), chloroform (CL), aqueous methanol (AM), butanol (BT) and water (WT) fractions of L. alata separated on TLC plates using CEF and sprayed with S. aureus and 24 h later by INT. White areas indicate inhibition of microbial growth (black arrow) after 60 minutes of incubation at 37 °C.

Figure 7.2. F1-F13 fractions of CCl₄ separated on TLC plates using CEF and sprayed with A. fumigatus (A) and S. aureus (B) and 24 h later by INT. White or yellow areas on the bioautogram indicate inhibition of microbial growth after 60 minutes of incubation at 37 °C.

Figure 7.3. Structure of lupeol (1) and β-sitosterol (2) isolated from Loxostylis alata leaves.

Figure 7.4. Isolated compounds of Loxostylis alata spotted on TLC plates and eluted in hexane: ethylacetate (7:3) solvent system. The compounds (spotted left to right) are β-sitosterol (BS) and lupeol (LP). The plates were sprayed with acidified vanillin (A), A. fumigatus (B) or S. aureus culture (C). White or yellow areas on plate B and C indicate inhibition of microbial growth after 60 minutes of incubation at 37 °C.

Chapter 8

Figure 8.1. The effect of crude extract of L. alata on weight of broiler chicks.

Figure 8.2. Liver tissue of birds treated with 300 mg/kg of extract showing scattered bile duct proliferation, focal periductular fibrosis and lymphocytes accumulation. Normal liver tissue (B) is shown.

Figure 8.3. The heart tissue of birds treated with 300 mg/kg of extract showing lymphoplasmacytic pericarditis. Normal heart tissue (B) is shown.

Figure 8.4. The lungs tissue of birds treated with 300 mg/kg of extract showing moderate fibrinopurulent bronchitis. Normal lung tissue (B) is shown.

Figure 8.5. Effect of different doses of L. alata extract on pathological lesions in the lungs, airsac and liver of broiler chicks caused by A. fumigatus.

Figure 8.6. Re-isolation of A. fumigatus from the lung, airsac and liver of infected broiler chicks treated with different doses of L. alata.

Figure 8.7. Aspergillus fumigatus hyphae (arrow) radiating in a pulmonary lobule of one of the infected chicks (x1000).

LIST OF TABLES

Chapter 2

Table 2.1. Summary on the data and traditional uses of the plants selected for this study.
Chapter 3

Table 3.1. Botanical names and traditional use of the plants studied plants against bacteria tested after 1- and 2-h incubation period at 37 °C extracted by different solvents

Table 3.2. Minimum inhibitory concentrations (average of triplicate determinations) of 4 different extracts from seven South African plants tested against bacteria. MIC assessment was done 1 and 2 h after INT (indicator of bacterial growth) was added to the bacterial cultures

Table 3.3. Minimum inhibitory concentrations (average of triplicate determinations) of four different extracts from 7 South African plants tested against some animal pathogenic fungi

Table 3.4. Total activity in ml/g of 7 South African plants screened for antibacterial activity

Table 3.5. Total activity in ml/g of 7 South African plants screened for antifungal activity

Chapter 4

Table 4.1. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against S. aureus

Table 4.2. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against E. faecalis

Table 4.3. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against E. coli

Table 4.4. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against P. aeruginosa

Table 4.5. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against A. fumigatus

Table 4.6. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against S. schenckii

Table 4.7. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against M. canis

Table 4.8. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against C. neoformans

Table 4.9. Inhibition of growth on bioautographic TLC plates by 24 extracts of 7 South African tree leaves against C. albicans

Chapter 5

Table 5.1. Antioxidant and antiplatelet activity of acetone extracts of 7 South African plants

Table 5.2. Cytotoxic effect of acetone extracts of 7 South African plants on formaldehyde-fixed equine erythrocytes

Chapter 6
Chapter 7

Table 7.1. Minimal inhibitory concentrations and safety evaluation of various fractions of *Loxostylis alata* against *Aspergillus fumigatus*------------------------------------------------- 112
Table 7.2. $^{13}$C NMR spectra data for compound 1 (C1) ----------------------------------------------- 114
Table 7.3. $^{13}$C NMR spectra data for compound 2 (C2) ----------------------------------------------- 115
Table 7.4. Minimal inhibitory concentrations and safety evaluation of compounds isolated from *Loxostylis alata*------------------------------------------------------------------------------------------------- 117
Table 7.5. Mutagenic activity expressed as the mean and standard error of mean of the number of revertants/plate in *Salmonella typhimurium* strains TA98 and TA100 exposed to extract and compounds of *Loxostylis alata*, at different concentration--------------------------------------- 119

Chapter 8

Table 8.1. Biochemical indices of broiler-chicks given varying doses of crude extract of *Loxostylis alata*------ 127
Table 8.2. Haematological indices of broiler-chicks given varying doses of crude extract of *Loxostylis alata*-- 128
Table 8.3. The effect of the extract dose on survival of chicks infected with *Aspergillus fumigatus*---------- 130
Table 8.4. Biochemical indices of broiler-chicks infected with *A. fumigatus* and treated varying doses of crude extract of *Loxostylis alata*------------------------------------------------------------------------------------------ 134
Table 8.5. Haematological indices of broiler-chicks infected with *A. fumigatus* and treated varying doses of crude extract of *Loxostylis alata*------------------------------------------------------------------------------------------ 135
