Declaration

I declare that this dissertation, which I hereby submit for the degree Philosophiae Doctor at the University of Pretoria, is my own work and has not previously been submitted by me for a degree at this or any other tertiary institution.

13 December 2005

For Linda

Gonometa postica

female

male

Summary

The African Wild Silk moths (*Gonometa* spp., Lasiocampidae) are species that are presently of particular economic interest in southern Africa. Both *Gonometa postica* and *G. rufobrunnea*, two species of African Wild Silk moth native to southern Africa, have been shown to possess a silk fibre of exceptional quality. A small-scale cottage industry utilizing the silk of *Gonometa* species currently exists in southern Africa, yet a consistent complaint is the lack of supply of cocoons. The *Gonometa* species in southern Africa have been shown to exhibit large inter-annual population fluctuations. However, it is uncertain whether eruptions are only the result of local populations experiencing ideal conditions or whether current eruptions are initiated by dispersal of individuals from eruptive populations in previous generations. A second observation, regarding eruptions, is that they are patchily distributed at both the local (within outbreaks) and regional scale (across southern Africa).

In this thesis I have studied population eruptions through distribution analysis of three years of presence/absence data, and through spatial and temporal population genetic analysis. The analysis of population genetic data allows the inference of population demographic parameters such as population size fluctuations and migrations. In particular, the use of microsatellite markers allows a high-resolution analysis of the connectivity of populations, and provides signal of population size fluctuations. I utilise both mitochondrial DNA control region sequences and polymorphic microsatellite loci to make inferences of population processes in *G. postica*, using a combination of both analytical and simulation model analysis approaches. The results, in general, indicate that dispersal of moths across South Africa is extensive. These results are further considered in light of the effects of population size fluctuations on spatial genetic pattern, where the potential exists for unstable population demography to influence the inference of dispersal from population genetic data. The population genetic analyses presented here allow the inference of the extent of a local population/outbreak, and the degree of movement between local populations. Given that a large-scale population dynamics project based on *G. postica* is currently under development, the results determine the geographical extent at which the population dynamics study should be conducted. Furthermore, the population genetics data

generated will contribute to the construction of a population dynamics model, including abiotic and biotic variables, which will allow a better understanding of eruptions in this species.

Acknowledgements

“But thanks for your time
Then you can thank me for mine
And after that's said
Forget it”

Rodriguez

Perhaps a little more blunt than I intended, but so many need to be acknowledged that I have approached this section with much restraint. I owe so much gratitude to my advisors, Paulette Bloomer and Willem Ferguson. Paulette and Willem have quietly instilled in me an obsession with population genetics. I think they saw the sparkle in my eye at the mere mention of working below the level of the species, and have done everything necessary to develop this mild interest into a maddening obsession. Paulette has created an academic environment that encourages creativity, and for this I am extremely grateful. Willem put me behind a computer, bought me a Delphi software license and let me be. Thanks Willem, I've learnt so much. The interaction with international post-doctoral fellows, Michael Cunningham and Kelley Whitaker, has been extremely fruitful and has created a dynamic academic environment for the research group. Michael and Kelley have demonstrated that there are Australians worth talking to; “no worries mate!” I owe Michael Cunningham more thanks than can be expressed with mere words. I have learnt so much since we first started talking about coalescence and population genetics. Thanks Michael. The rest of MEEP (Molecular Ecology and Evolution Programme) have been great. Thanks to listening to my ramblings in journal club. To Isa-Rita Russo, Carel Oosthuizen, Arrie Klopper, Sarita Maree, Catherine Sole, Maria-Noel Cortinas, Joha Grobbelaar, Lucille Hermann, Ernst Swartz and Jonathan van Alphen-Stahl I have the following to say: The only way to familiarize oneself with complex ideas is to discuss them. We've had great discussions in journal club. Keep it up and we'll all reap the rewards. I owe special thanks to Isa-Rita Russo (aka bench-babe) for keeping me warm on that cold winter night in Windhoek whilst sampling moths. Not quite what it sounds like, but Isa knows the punch line. Isa you've been a great friend in the lab and office. Thanks. I'm sure one day we'll happily reflect on our graduate student days from the comfort

of our permanent university posts (I hope). Ernst Swartz, I guess I should also thank you for keeping me warm on that cold night in Venda. Definitely not at all what it sounds like. Ernst, we've had a few good grogs (beers) and great discussions. Thanks. Tony Knowles, I've missed the good grogs we shared before you moved to Stellenbosch. I know we will still publish a manuscript from the Brincadian Institute of Science. Thanks for great discussions in our undergraduate and early graduate years. They have culminated in where I stand today, thesis in hand and a mind packed full of ideas. Thanks boet.

I have had such great opportunities in the last three years and again I have my advisors, Paulette Bloomer and Willem Ferguson, to thank. Through the support of the Mellon Foundation Programme, at the University of Pretoria, I was able to attend an international conference (European Society of Evolutionary Biology 2003), a workshop on molecular evolution (<http://workshop.molecularevolution.org/>) at Woods Hole, MA, and gain experience in an international silk moth genetics laboratory (Dr J. Nagaraju, Centre for DNA Fingerprinting and Diagnostics, Hyderabad, India). Without this funding these experiences would not have been possible. Thanks to Willem and Paulette for encouraging my development as an academic, and for utilizing the Mellon funds exclusively for this purpose.

Moving away from the academic realm I have my close friends, Darryl and Tracy Adriaanzen, Andrew and Gina Smith, Ralph & René (soon to be) Tudhope, to thank. You guys have been so supportive and have always had absolute confidence in my abilities to pursue my academic endeavors. Yes we will enjoy that bottle of Johnny Walker Blue, let me first find a job though. Maybe you'll see me on John Vorster drive with my sign: "PhD Genetics, no work, no soap, no kids to feed. Please help!" From friends to family, Mom, Dad, and boet Sean: you have supported me and have always believed that I could accomplish what I initially set out to do. Thank you. The love and support from you has been unconditional, as it has been from our Father. Bradley, my nephew, I will kick your butt at Need for Speed. Maybe now I have time to practice. To my other parents, Kaki and Rina, thanks for believing in me and for entrusting your daughter to an unemployed scientist. I'm not sure I would've done likewise. My sisters, Jax and Tashi, you guys are great. Somehow you thought it was cool that I was still at university. Thanks. Jax, I worry about you. I see that academic

glow in you. Don't do it. Leave now, get a job, a big screen tv, and two weeks annual leave. No do it, and give it all you have. I know you have the potential. Finally, to my wife, Linda: you have supported me, loved me and embraced me. Thanks for putting up with late nights in the office, late nights in the lab and late nights at home. Linds, your support has been exceptional. Also thanks for listening to my ramblings, thanks for believing that my ramblings made sense, thanks for encouraging me to get my ramblings down on paper, and thanks for reading my ramblings. Now I can submit my ramblings and continue with our life together.

Table of Contents

Chapter 1	Introduction	1
Chapter 2	Temporal and spatial distribution of African Wild Silk Moth, <i>Gonometa postica</i> , eruptions in southern Africa	22
Chapter 3	Characterisation of six microsatellite loci in the African Wild Silk Moth (<i>Gonometa postica</i> , Lasiocampidae)	41
Chapter 4	The effect of large annual population size fluctuations on spatial genetic pattern in the continuously distributed African Wild Silk Moth (<i>Gonometa postica</i>)	48
Chapter 5	Temporal and spatial genetic patterns in the African Wild Silk Moth (<i>Gonometa postica</i>) and implications for cyclical population dynamics	89
Chapter 6	CoalFace: a graphical user interface program for the simulation of coalescence	114
Chapter 7	Conclusions	124
Appendix I	A population genetics pedigree perspective on the transmission of <i>Helicobacter pylori</i>	130
Appendix II	LatticeFlucIII C Source code	160
Appendix III	CoalFace Kylix/Delphi Source Code	207

List of Tables

Chapter 2	1 Climatic predictors and response variables used to model the distribution of <i>Gonometa postica</i> eruptions	29
	2 Total number of sampled sites and proportion of presence sites of all sites sampled during 2002, 2003 and 2004.	32
Chapter 3	1 Microsatellite loci isolated and optimized for <i>Gonometa postica</i> .	45
Chapter 4	1 Statistics for the optimal distance classes chosen for spatial correlogram analysis.	57
	2 Sampling variance in the calculation of neighbourhood size.	61
	3 Indirect morphological estimates of dispersal ability in <i>Gonometa postica</i> .	62
	4 Calculation of mtDNA pairwise-population F_{ST} values using Arlequin (Schneider <i>et al.</i> 2000) for subpopulations/demes defined in Figure 1.	64
	5 Tests of the deviation from Hardy-Weinberg, the random-association of alleles within diploid individuals as calculated using Arlequin v2.0 (Schneider <i>et al.</i> 2000).	67
	6 Results of permutation tests for the regression of spatial autocorrelation statistics against $\ln(\text{distance})$.	69
	7 Relationship between dispersal parameter, d , and the equilibrium neighbourhood size for a continuous population of constant size.	75
Chapter 5	1 Custom migration model enforced in migrate-n such that only migration between populations in successive years is estimated.	96
	2 The spatial distribution of alleles for each of the six microsatellite loci.	99
	3 Maximum likelihood estimates of migration between	101

2002 demes (Figure 1) and θ ($4N\mu$, N = population size, μ = mutation rate) for each deme, as estimated with migrate-n (Beerli & Felsenstein 1999, 2001).

- 4** Maximum likelihood estimates of temporal migration and θ (boxed), as estimated with migrate-n (Beerli & Felsenstein 1999, 2001). 104
