July 2000

TO MY PARENTS, FAMILY AND FRIENDS

"I took in February three table-spoonfuls of mud from three different points, beneath water, on the edge of a little pond; this mud when dry weighed only 6¾ ounces; I kept it covered up in my study for six months, pulling up and counting each plant as it grew; the plants were of many kinds, and were altogether 537 in number; and yet the viscid mud was all contained in a breakfast cup" (Darwin, 1859).

ABSTRACT

SEED BANK DYNAMICS OF THE STRANDVELD SUCCULENT KAROO

by

ADRIAAN JAKOBUS DE VILLIERS

Supervisor: Dr M.W. van Rooyen

Co-supervisor: Prof. G.K. Theron

DEPARTMENT OF BOTANY

PHILOSOPHIAE DOCTOR

The seed bank dynamics of the Strandveld Succulent Karoo was described in terms of spatial and temporal variation in seed bank size and composition. Factors affecting inputs and outputs, such as seed production, predation, dispersal, dormancy, germination, seed-borne fungi and environmental conditions, were investigated. This information was incorporated in the development of suitable post-mining revegetation strategies at a management level.

Phytosociological benchmark studies on the pre-mining standing vegetation and seed bank indicated that a realistic revegetation goal will be to return 30% of the total number of plant species recorded. The revegetation program should concentrate on perennial species, as these dominate the pre-mining standing vegetation. Perennial shrub species exhibited transient seed bank strategies, while perennial herb species exhibited both transient and persistent strategies. Seed banks of annual species were of a persistent nature and large in comparison with annual inputs and losses. Since annual species predominated the soil seed bank, topsoil replacement as well as sowing and transplanting of selected perennial species will be essential for the rehabilitation of the area.

Spatial variation in seed bank size and composition, at community level, was not as pronounced as temporal variation. The general dissimilarity between the seed bank and its associated vegetation was manifested in species composition, plant/seed densities and frequencies.

Taking seed bank dynamics into account, mining authorities should achieve great success in revegetating mined areas. Furthermore, knowledge obtained from this seed bank study will aid plant ecologists in gaining a better understanding of the processes contributing to reproductive strategies and plant population and community dynamics in the Strandveld Succulent Karoo.

UITTREKSEL

SAADBANKDINAMIKA VAN DIE STRANDVELD SUKKULENTE KAROO

deur

ADRIAAN JAKOBUS DE VILLIERS

Leier: Dr. M.W. van Rooyen

Medeleier: Prof. G.K. Theron

DEPARTEMENT PLANTKUNDE

PHILOSOPHIAE DOCTOR

Die saadbanksdinamika van die Strandveld Sukkulente Karoo is beskryf in terme van ruimtelike en temporele variasie in saadbanksaagte en -samestelling. Faktore wat toevoegings en verliese beïnvloed, byvoorbeeld saadproduksie, predasie, saadverspreiding, dormansie, ontkieming, saadswamme en omgewingstoestande, is ondersoek. Hierdie inligting is op bestuursvlak geïnkorporeer in die ontwikkeling van gesikte plantegroeihervestiging strategieë vir gebruik in rehabilitasie van gemynde areas.

Fitososiologiese studies van die staande plantegroei en die saadbanksaag het aangetoon dat 'n hervestigingsdoelwit van 30% van die totale aantal spesies aangeteken, realisties sal wees. Die hervestigingsprogram moet konsentreer op meerjarige spesies, aangesien dié spesies die oorspronklike staande plantegroei domineer. Meerjarige struikspesies het kortstondige, en meerjarige kruidspesies het beide kortstondige en blywende saadbanksstrategieë getoon. Die saadbanksaag van eenjarige spesies was blywend en groot in vergelyking met jaarlikse toevoegings en verliese. Aangesien eenjarige spesies die saadbanksaag oorheers, sal die terugplaas van bogrond sowel as die saai en oorplant van geselekteerde meerjarige spesies, noodsaaklik wees vir die rehabilitasie van die gebied.

Op gemeenskapsvlak was ruimtelike variasie in die grootte en samestelling van die saadbanksaag nie so opvallend soos variasie in tyd nie. Die algemene onoordeelkostigheid tussen die saadbanksaag en geassosieerde staande plantegroei is bevestig deur spesiesamestelling, plant/saad digthede en frekwensies.

Mynbou-instansies behoort groot sukses te behaal in die hervestiging van plantegroei op gemynde areas, indien hulle die saadbanksdinamika in ag neem. Die kennis ingewin deur hierdie saadbanksstudie sal plantekoloë help om die prosesse wat bydra tot voortplantingstrategieë asook plantpopulasie- en gemeenskapsdinamika van die Strandveld Sukkulente Karoo beter te verstaan.

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude to the following persons and organizations.

- My supervisors, Dr M.W. van Rooyen and Prof. G.K. Theron, for their guidance and assistance.
- Prof. N. van Rooyen for his assistance with the chapter on vegetation diversity.
- Hester Steyn for her assistance, support and motivation during this study.
- Marie Pretorius, Miranda Deutschländer, Helena du Plessis, Hendrik Wentzel, Adri Engelbrecht, Martin Potgieter, Helga Rösch and Magda Nel for their assistance during the field work.
- Albert van Niekerk and Etienne Erasmus for their support, patience and motivation.
- The University of Pretoria for the use of various facilities.
- The Mazda Wildlife Fund for the use of a 4 x 4 vehicle.
- The Department of Botany, University of Pretoria, the National Research Foundation and Anglo American Corporation for financial support.
- Namakwa Sands for accommodation and transport at Brand-se-Baai.
- Johan Grobler and Wentzel Horniman of Namakwa Sands for their support and arrangements concerning accommodation and transport at Brand-se-Baai.
- The personnel of Variety Control, Roodeplaat, for their support and motivation.
- My parents, family and friends for their patience, support and motivation.
