

## SUPPLEMENTARY DATA

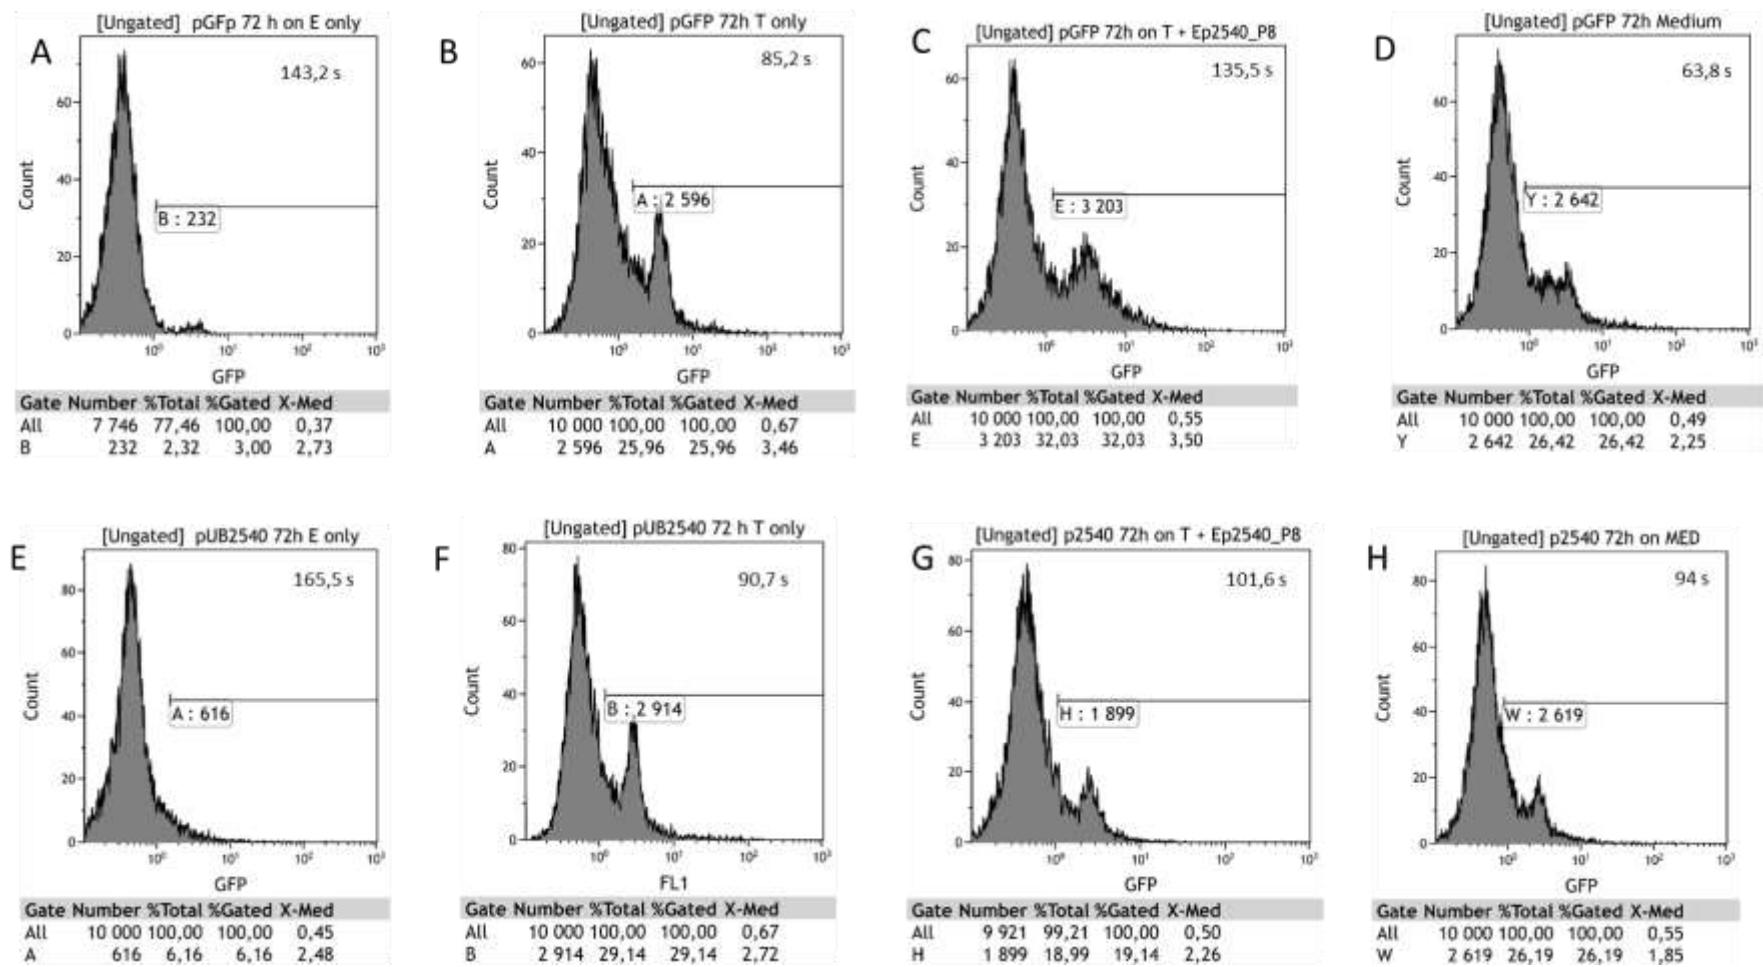

**STable 1.** Amino acid sequences and *in silico* predicted epitopes of the peptides derived from Erum0660, Erum2330, Erum2540, Erum2550, Erum2580, Erum2590 and Erum5000 that tested positive. *In silico* predicted epitopes are indicated in red.

<sup>a</sup>In peptides with more than one distinctive predicted epitope, the additional epitopes are indicated in bold red and overlapping amino acids are underlined.

**SFigure 1.** A schematic representation of the Overlap extension PCR cloning to produce the pCMViUBs\_gene\_IRES\_GFP plasmid.

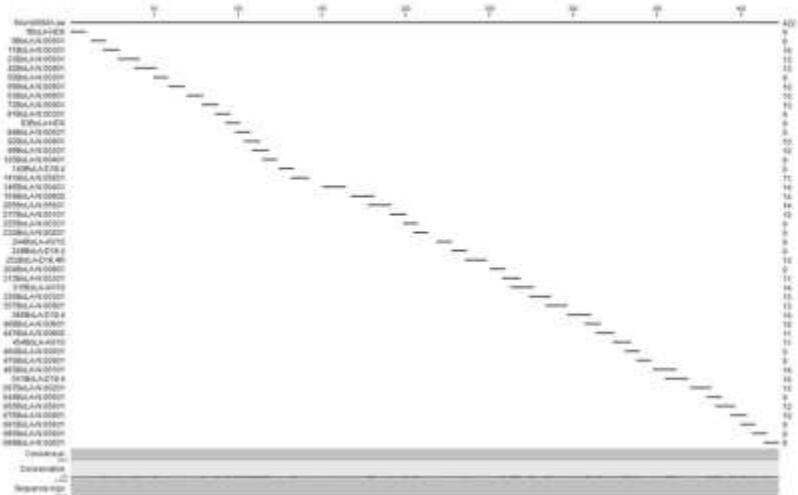

**SFigure 2.** Representative FATT-CTL assay data for Erum2540 peptide 8. The total number of GFP positive events in the pGFP control samples (A-D) and the pUB2540 samples (E-H) are shown and all the controls for the analysis included. The time in s for each sample is also indicated in the right top corner. The E stands for effector cells and T for target cells. Each sample was tested in triplicate and the average used for the % lysis analysis where events per second is calculated (Table 1). This was also repeated at three time points with similar results obtained each time.

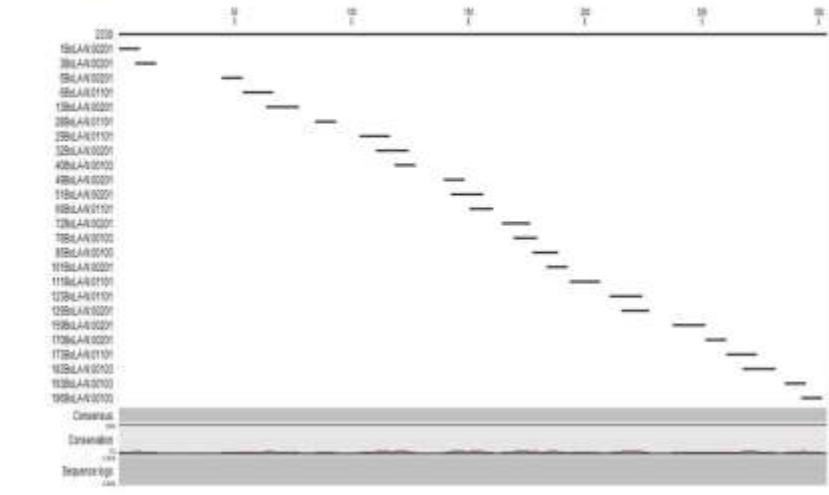

**SFigure 3.** Representative dot plots showing phenotype analysis and intracellular cytokine staining (ICS) data for sheep 6823 immune PBMC. PBMC were stained with markers for CD8 and intracellular IFN- $\gamma$  (A-D) or with CD8 and CD45Ro (F-H), after incubation with ConA (B, F), unstimulated PBMC medium (C,G) or recombinant Erum2590 protein (D, H) for 72 h. Isotypic controls for each panel are indicated (A, E).

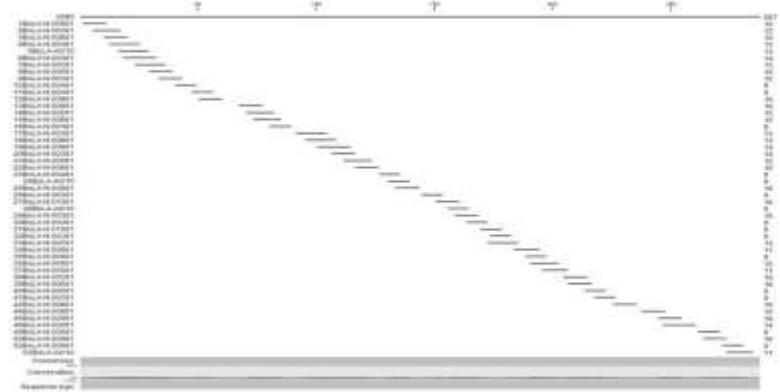

A: Erum0660

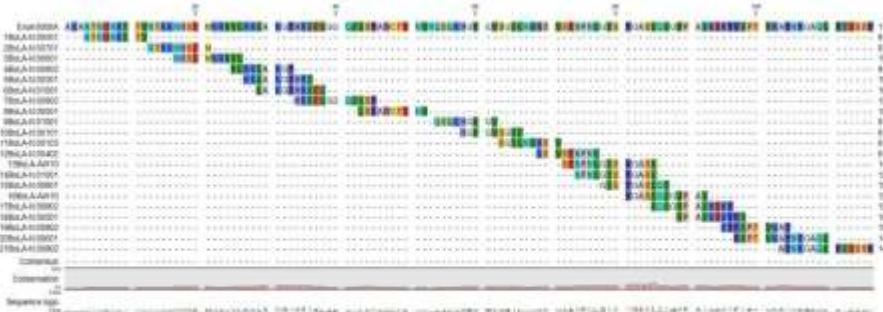

B: Erum2330

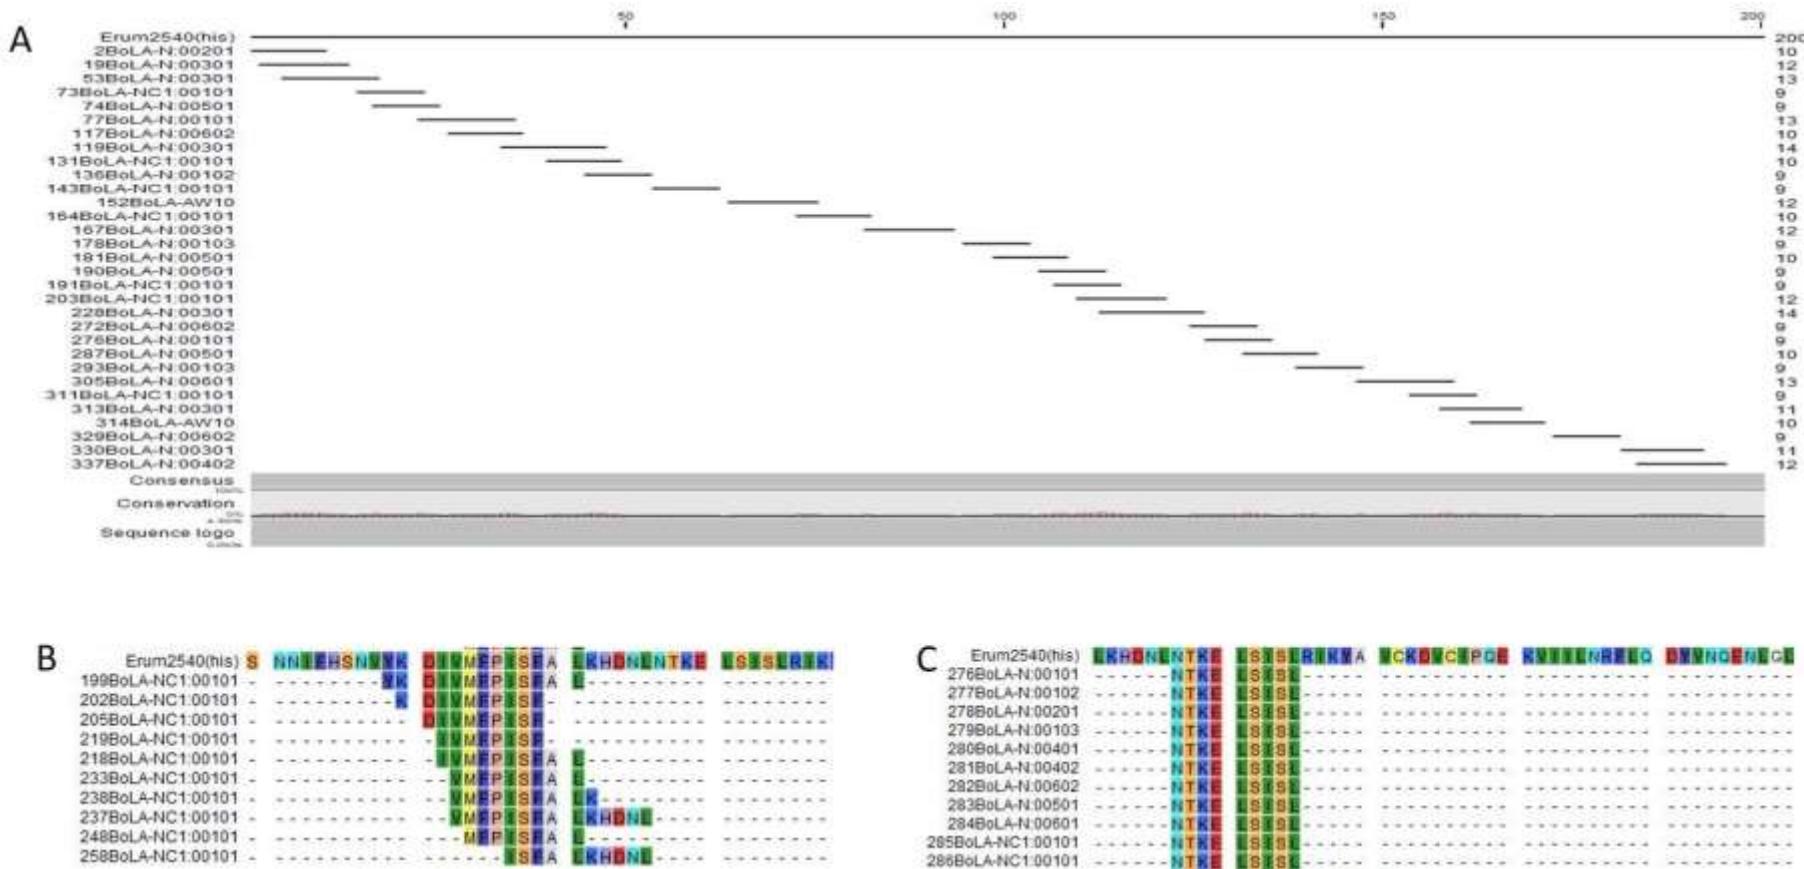

C: Erum2580

D: Erum5000

**SFigure 4.** Epitope prediction analysis showing representative epitopes across proteins from A) Erum0660, B) Erum2330; C) Erum2580 and D) Erum5000. Epitopes were predicted using Bovine MHC class I alleles from the IEDB Analysis Recourse database (<http://tools.immunepitope.org/mhci>).

**SFigure 5.** Epitope prediction analysis showing representative epitopes across Erum2540 (A). Specific alignments showing the diverse epitopes predicted by one allele (BoLA-NC1:00101) in peptide Erum2540-P15 are shown in (B) and more than one Bovine MHC I allele predicting the same epitope in peptide Erum2540-P16 (C). Epitopes were predicted using Bovine MHC class I alleles from the IEDB Analysis Recourse database (<http://tools.immuneepitope.org/mhci>).
