1. Introduction

This document provides data supplementary to “Exploring process-level genotypic and environmental effects on sugarcane yield using an international experimental dataset” by Jones et al., 2019. The data presented include the following: a list of acronyms/symbols used in this document (1.1); shoot population thresholds for estimating date of primary shoot emergence (1.2); descriptions of the process followed to estimate date of 50% shoot emergence from shoot population data, and the modified Canesim canopy model used for estimating fractional interception of photosynthetically-active radiation (FiPAR, %) from observations to calculate seasonal radiation interception (1.3); shoot population (1.5) and FiPAR (1.6) observed data graphs; results of statistical analyses (1.7); phenotypic parameter correlation matrix (1.8); and tables of phenotypic parameters for all genotype and environment combinations (1.9).

1.1 List of acronyms and symbols

Table A- 1. Symbols, their units and meanings.

Acronym	Units	Description
ADM	t/ha	Above-ground dry biomass
ADM_OSG	t/ha	ADM at date of OSG
AS		APSIM-Sugar
CS		Canesim
DAP_EM50	D	Days from crop start to 50% primary shoot emergence
DC2		DSSAT-Canegro v4.5_C2.2
FiPAR	%	Fractional interception of PAR
FiPAR _{cs,d}	%	Daily Canesim-simulated FiPAR
OSG		Onset of stalk growth (phenological event)
P		Plant crop
PAR	MJ/m ²	Photosynthetically-active radiation
PFINAL	shoots/m ²	Final POPN
PI	°Cd/leaf	Leaf phyllochron interval
POP_100	shoots/m ²	100% primary shoot population
POPN	shoots/m ²	Shoot population
PPEAK	shoots/m ²	Peak POPN
PTQ	MJ/m ² /°Cd	Photothermal quotient
RUE	g/MJ	Radiation use efficiency calculated as biomass produced over a given period, divided by intercepted photosynthetically actively radiation over the same period
RUEmax	g/MJ	Maximum observed RUE calculated over four biomass sampling periods
R1		First ratoon crop
SDM	t/ha	Stalk dry mass
SRAD	MJ/m ²	Global solar radiation
STKPF	t/t	Stalk partitioning fraction
TAR	shoots/m ² /°Cd	Tiller appearance rate per unit TT
T	°C	Mean daily air temperature
TMAX	°C	Maximum daily air temperature
TMIN	°C	Minimum daily air temperature
TT	°Cd	Thermal time
TT_EM50	°Cd	TT from crop start to 50% primary shoot emergence
TT_Fi50	°Cd	TT from TT_EM50 to 50% FiPAR
TT_OSG	°Cd	TT from DAP_EM50 to date of OSG
TT16	°Cd	TT calculated with DC2 cardinal temperatures for tillering
WSI		Water stress index

1.2 Shoot population thresholds for estimating emergence date

Table A- 2. Shoot population (shoots/m²) considered to represent 100% of primary shoots, by Experiment and Cultivar. Experiment names in italicized text were water-stressed. ‘obs’ indicates cases where time to 50% emergence was provided as an observation.

Experiment	Cultivar						
	N41	R570	CP88-1762	HoCP96-540	Q183	ZN7	NC0376
<i>La Mare, P</i>	obs	obs	obs		obs		obs
La Mare, R1	27.2	16.8	16.4		19.6		17.8
Pongola, P	6.0	3.7	5.0	4.5		4.6	
<i>Pongola, R1</i>	23.4	15.4	18.6	18		17.8	
Belle Glade, P	obs	obs	obs	Obs			obs
Belle Glade, R1	obs	obs	obs	Obs			obs
<i>Chiredzi, P</i>	obs	obs	obs	Obs	obs	obs	
Chiredzi, R1	11.0	14.0	9.0	12.0	10.0	10.0	

1.3 Additional canopy development methodology notes

Inference of date of 50% shoot emergence from shoot population observations

In cases where date of 50% shoot emergence (DAP_EM50, d) had not been recorded, this was inferred from shoot population (POPN, shoots/m²) observations. 100% primary shoot population (POP_100, shoots/m²) was estimated for the Pongola and Chiredzi P crops as the POPN on the date that the POPN curve (plotted using linear interpolation against TT16) showed an inflection point corresponding with the start of secondary shoot production. DAP_EM50 was the date at which POPN was approximately 50% of POP_100. For R1 crops other than Belle Glade, POP_100 was taken as the final stalk population of the previous crop. The DSSAT-Canegro v4.5_C2.2 (DC2, Jones & Singels, 2018) model was calibrated interactively to fit simulated values to observed POPN, to permit inference of POPN values earlier in the cropping season than the first observations were taken. DAP_EM50 was taken as the date when simulated POPN was nearest 50% of the POP_100

Modified Canesim canopy model

A modified Canesim canopy model was implemented to fit a continuous canopy curve to FiPAR observations. This model is described as follows:

$$FiPAR_{CS,d} = Flo_d \left(1 - \left(WSI_d \frac{WSM}{100} \right) \right) \quad (A-1)$$

$$Flo_d = 100 \left(\frac{TTI_{k,d}}{0.5^k + TTI_{k,d}} \right) \quad (A-2)$$

$$TTI_{k,d} = \left(\frac{\max(0, (TT16_{cd} - TT_EM50_{16}))}{TT_Fi50} \right)^k \quad (A-3)$$

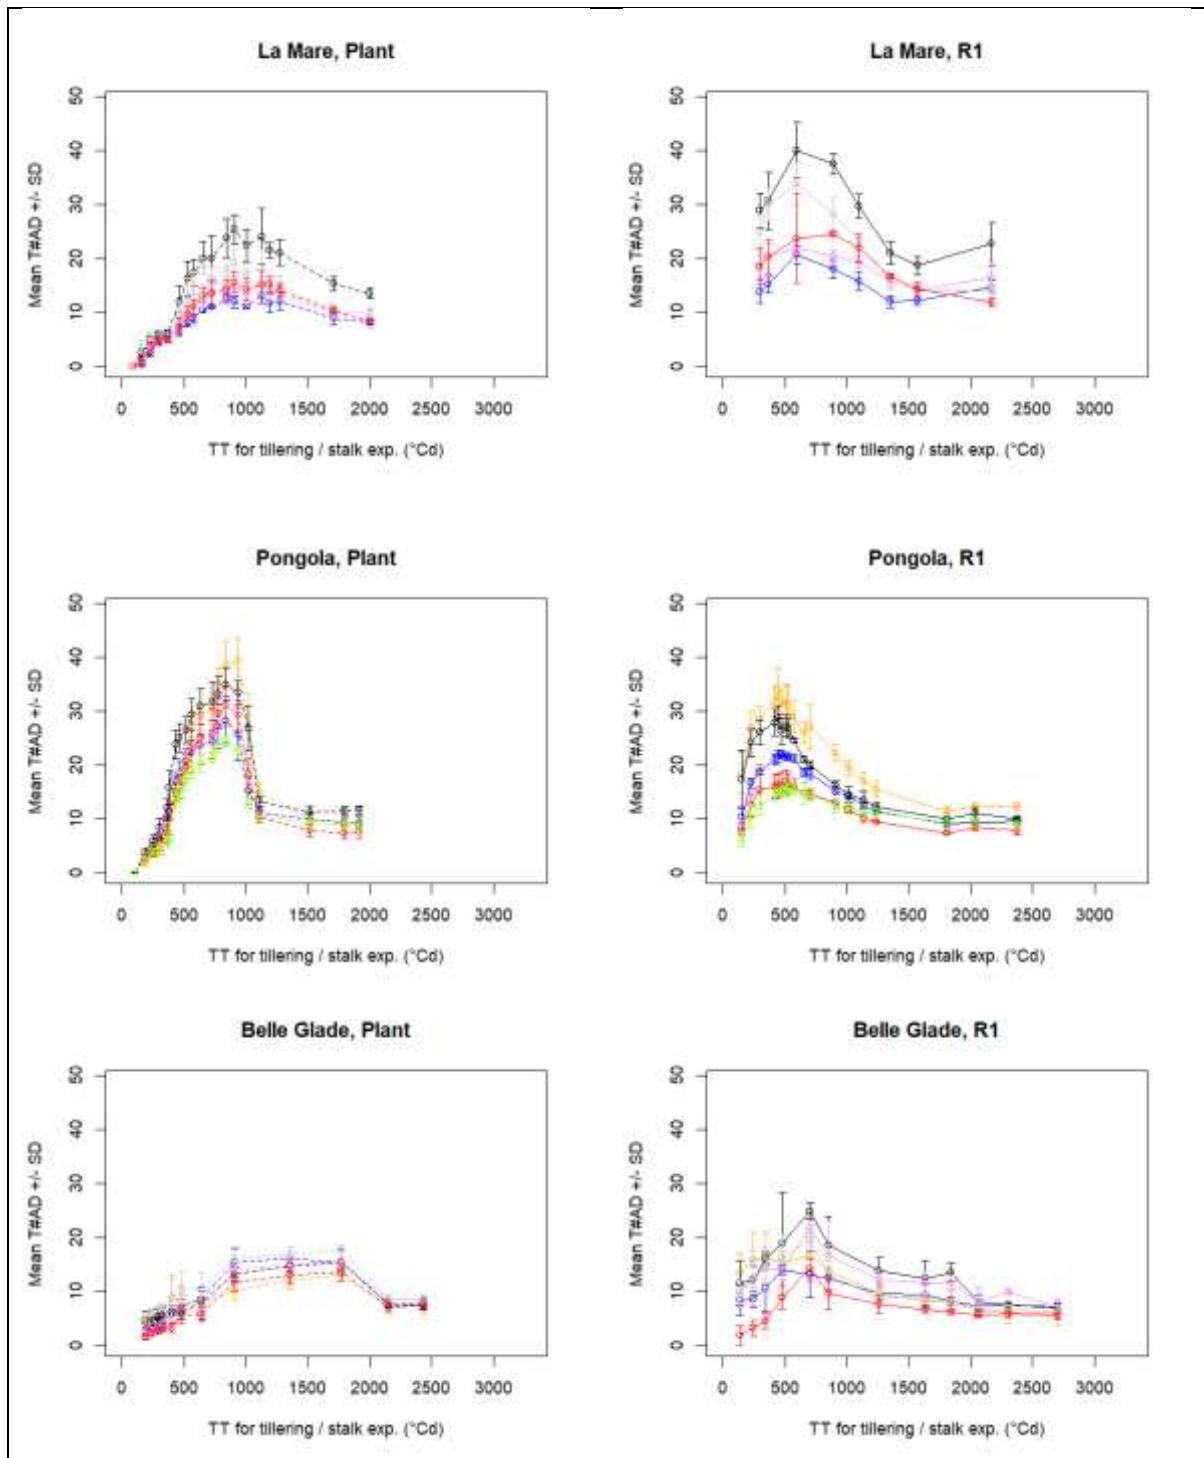

where, for day d, $FiPAR_{CS,d}$ is predicted FiPAR, WSI_d is the 30-day rolling average WSI, Flo_d is unstressed FiPAR, $TTI_{k,d}$ is a TT index, k is a constant (2.453), $TT16_{c,d}$ is TT16 from crop start to day d, and TT_EM50_{16} is TT_EM50 expressed in TT16.

1.4 Climate summary per development stage

Table A- 3. Number of days, average daily mean (T), maximum ($TMAX$) and minimum ($TMIN$) temperature, sum of solar radiation ($SRAD$), average daily photothermal quotient (PTQ), and average daily water stress index (WSI) for growth phases as defined by the DSSAT-Canegro model standard parameters. WSI is low for germination because there is no transpiration before emergence.

Experiment	Days	T ($^{\circ}C$)	$TMAX$ ($^{\circ}C$)	$TMIN$ ($^{\circ}C$)	$SRAD$ (MJ/m^2)	PTQ ($MJ/^{\circ}Cd$)	WSI

Table A- 10. Final (at harvest) above-ground dry mass (ADM, t/ha) and stalk dry mass (SDM, t/ha), and average stalk partitioning fraction (STKPF, t/t), per experiment and cultivar. ‘Avg (cmn.)’ is the average value for the three common cultivars (N41, R570 and CP88-1762); ‘Avg’ is the average of all cultivars.

Table A- 11. Average seasonal fractional interception of photosynthetically-active radiation (FiPARavg), and maximum sampling-period radiation use efficiency (g/MJ intercepted PAR), by Experiment and Cultivar. Experiment names in italicized text were water-stressed. ‘Avg (cmn.)’ is the average value for the three common cultivars (N41, R570 and CP88-1762); ‘Avg’ is the average of all cultivars.
