

**Journal of Biogeography**

**SUPPORTING INFORMATION**

**Geographical variation in ant foraging activity and resource use is driven by climate and net primary productivity**

Chaim J. Lasmar, Tom R. Bishop, Catherine L. Parr, Antônio C. M. Queiroz, Fernando A. Schmidt,  
Carla R. Ribas

**Appendix S2 – Tables**

**Table S2.1.** Representation of temperature data from the nearest climatic station (NCS) from our sampling transects for different Brazilian biomes. Data were extracted in Instituto Nacional de Meteorologia (<https://portal.inmet.gov.br/>). Here we also specify the location of our NCS and the average distance from our transects for each biome. NCS sampling days temperature is based on measure for the exact days in each month and year we carried out the sampling. This measure is the mean of the hourly temperature across the days of sampling, accounting only the morning periods (07:00 AM – 12:00 AM) for all biomes, except for caatinga, that was extracted for the afternoon (01:00 PM – 17:00 PM). We pointed out the mean values of the total temperature range (mean), the mean of the maximum temperature (Max. mean) and the mean of minimum temperature (Min. mean). SD is the standard deviation of those means across the hours and days.

Biome	Nearest climatic station (NCS)	Average distance of NCS from the sampling points	NCS sampling days temperature
<b>Amazon</b>	Rio Branco – AC Lat: -9.750839° Lon: -67.647458°	32 km	Mean = 23 °C (SD = 1.82) Max. mean = 23.13 °C (SD = 1.81) Min. mean 22.33 °C (SD = 1.43)
<b>Atlantic Rainforest</b>	Itapeva – SP Lat: -24.307536° Lon: -48.412762°	55 km	Mean = 20.90 °C (SD = 1.06) Max. mean = 21.12°C (SD = 1.14) Min. mean = 20.30 °C (SD = 0.76)
<b>Caatinga</b>	Arcoverde – PE Lat: -8.54168° Lon: -37.253093°	24 km	Mean = 20.86 °C (SD = 0.82) Max. mean = 21.54 °C (SD = 0.78) Min. mean = 19.85 °C (SD = 0.76)
<b>Cerrado</b>	Brasília – DF Lat: -15.96575° Lon: -47.886521°	15 km	Mean = 20.82 °C (SD = 1.66) Max. mean = 21.01 (SD = 1.74) Min. mean = 20.07 °C (SD = 1.19)
<b>Pampa</b>	Uruguaiana – RS Lat: -30.179853° Lon: -57.498731°	55 km	Mean = 19.55 °C (SD = 2.27) Max. mean = 19.75 °C (SD = 2.21) Min. mean = 18.62 ° C (SD = 1.70)
<b>Pantanal</b>	Cuiaba – MT Lat: -16.508505° Lon: -56.41628°	93 km	Mean = 24.86 °C (SD = 0.95) Max. mean = 25.07 °C (SD = 0.88) Min. mean = 24.39 ° C (SD = 0.52)

**Table S2.2.** Model selection considering the ant foraging activity in control tubes (distilled water) and controlling for the relative distilled water use, using the Dredge function (Barton, 2015) based on the Akaike information criterion (AICc) ranking, across six Brazilian biomes (n =60). For question 1 and 2, the generalized linear mixed models were constructed with the explanatory variables: temperature (monthly mean temperature, MMTemp), precipitation (monthly precipitation, MPrec), temperature seasonality (TSeas), net primary productivity (NPP). Biome was the random variable. In question 2, the models were ran separately for four resources types represented as a solution (distilled water/volume) of: 1% sodium (NaCl), 20% sugar (CHO, made with sucrose), 20% amino acid (AA, made with unflavored whey protein isolate), and only distilled water as control. To control for relative distilled water use in other resources (NaCl, CHO and AA), we also added the relative use of distilled water (Control) as an additional explanatory variable, in order to verify if patterns remain the same. We only considered and pointed out models equal or lower than  $\Delta\text{AICc} = 2$ . Degrees of freedom of the model (d.f.), differences in AICc-values ( $\Delta\text{AICc}$ ) and Akaike weight ( $\omega$ ). Marginal R<sup>2</sup> is the coefficient of determination of fixed effects (ecological drivers) and Conditional R<sup>2</sup> is the coefficient of determination of fixed effects plus random effects (biomes).

<b>Question 1: How do ecological drivers influence ant foraging activity?</b>							
<b>Model</b>	<b>d.f.</b>	<b>AICc</b>	<b><math>\Delta\text{AICc}</math></b>	<b><math>\omega</math></b>	<b>Log Likelihood</b>	<b>Marginal R<sup>2</sup></b>	<b>Conditional R<sup>2</sup></b>
MPrec	4	96.8	0.00	0.17	-44.01	0.25	0.81
MPrec + TSeas	5	97.0	0.26	0.15	-42.95	0.44	0.80
TSeas +NPP	5	97.7	0.99	0.10	-43.31	0.45	0.74

**Table S2.3.** Number of tubes visited by at least one ant individual at different biomes and different solutions (distilled water/ volume) of resources: 1% sodium (NaCl), 20% sugar (CHO, made with sucrose), 20% amino acid (AA, made with unflavored whey protein isolate), and lipid (extra virgin olive oil) and distilled water, as a control. For each resource type, there were 50 tubes placed in each biome. Each entry in the table represent the number of visits in each resource per biome and in branches is the relative use of a given resource per biome.

	CHO	Lipids	AA	NaCl	Control	Total visits per biome
<b>Amazon</b>	48	46	44	47	9	194
<b>Atlantic rainforest</b>	38	46	13	16	1	114
<b>Caatinga</b>	32	38	4	4	0	78
<b>Cerrado</b>	29	40	7	31	4	111
<b>Pampa</b>	35	20	3	2	1	61
<b>Pantanal</b>	45	38	11	9	1	104
<b>Percentage of visited tubes across the study</b>	34%	34%	12%	17%	3%	

**Table S2.4.** Ant species list sampled in six Brazilian biomes: Amazon, Atlantic rainforest, Caatinga, Cerrado, Pampa and Pantanal.

Amazon		
Ant species	Number of individuals	Number of visits in baited tubes
<i>Brachymyrmex</i> sp. 3	47	3
