

Figure S1. Relationship between serological test result and meerkat age. All 704 serology samples collected were classified as either positive or negative and assigned to a category based upon the animal's age at the sampling point. No association is seen between an animal's age, and its tuberculosis test status based upon serology.

Figure S2. IFN γ Inducible-Protein 10 Release Assay results for individuals in 4 social groups (F, N, Q, and Z). Results are consistent within a group over the three years of testing, except for group N where a disease outbreak was observed in late 2016. Results are given for Optical Density OD of the PCHP assay adjusted for background IP-10 ($OD^{PCHP-nii}$).
