

Phylogenetic analysis of *Teratosphaeria destructans* isolates obtained from Malaysia

Maximum likelihood phylogenetic analyses were conducted using concatenated sequences of the ribosomal RNA Internal Transcribed Spacer gene (ITS), partial β-tubulin gene (TUB) and elongation factor 1-alpha gene (EF-1α) regions. Genbank accession numbers of sequences used in this phylogeny are presented in a table on the next page. Bootstrap support values were calculated from 1000 replicates and clades with bootstrap support values of ≥ 70% were considered significant (Hillis & Bull, 1993).

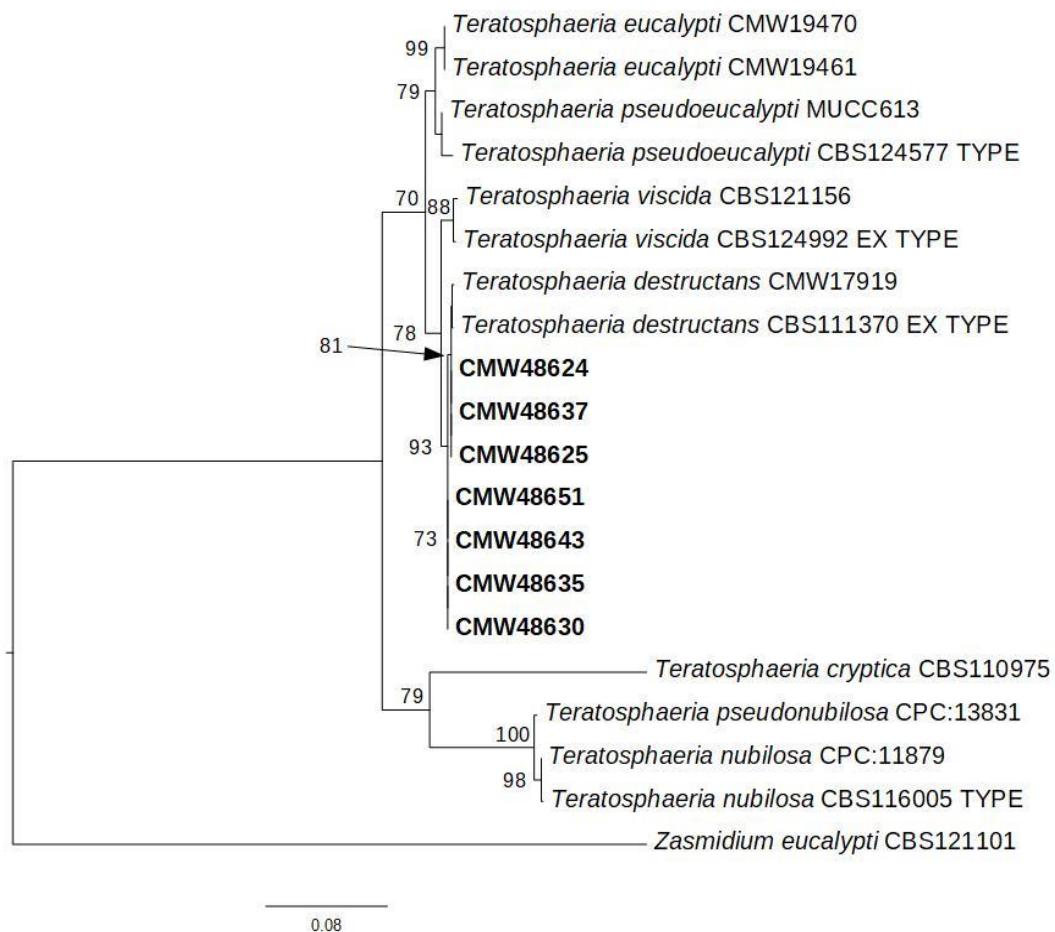

FIGURE S1. Maximum likelihood phylogenetic tree of *Teratosphaeria* species, based on concatenated ITS, β-tubulin and EF-1α sequence data. Bootstrap support of ≥70% is shown. Outgroup = *Zasmidium eucalypti*. Isolates from Malaysia sequenced in this study are indicated in bold.

TABLE. *Teratosphaeria* isolates and their sequences used for phylogenetic analyses

Species	Strain number	Host	Location	Genbank Accession Number			Source
				ITS	EF	β-tubulin	
<i>Teratosphaeria cryptica</i>	CBS110975	<i>Eucalyptus globulus</i>	Victoria, Australia	KF901573	KF902998	KF903299	Quaedvlieg et al. (2014)
<i>Teratosphaeria destructans</i>	CBS111370	<i>Eucalyptus grandis</i>	Indonesia	KF901574	KF903301	KF903000	Quaedvlieg et al. (2014)
