

Extended Data Fig. 3: Time course of the mechanical wound-induced response of JA in *Ginkgo biloba*.

From: The genome of homosporous maidenhair fern sheds light on the euphyllophyte evolution and defences

Leaves of *G. biloba* were wounded with a hemostat. Damaged leaves were harvested at the indicated time points after wounding and analysed for jasmonates (the precursor OPDA [\blacktriangle], jasmonic acid (JA) [\bullet], and JA-Ile [\blacksquare]) accumulation by HPLC-MS; each data point represents the mean \pm SD of five biological replicates.
