

Supplementary Material

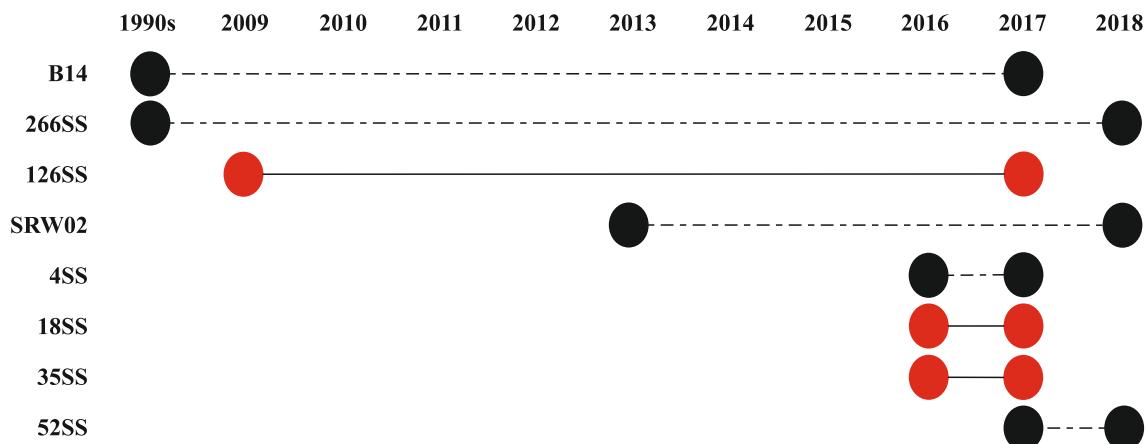

Fig. S1 Captures and re-captures of *Eubalaena australis* samples during several seasons in South Africa. The left column are sample names, the black dots represent the year of capture/recapture, the dashed connection lines with black circles are males, and full connection lines with red circles represent females.

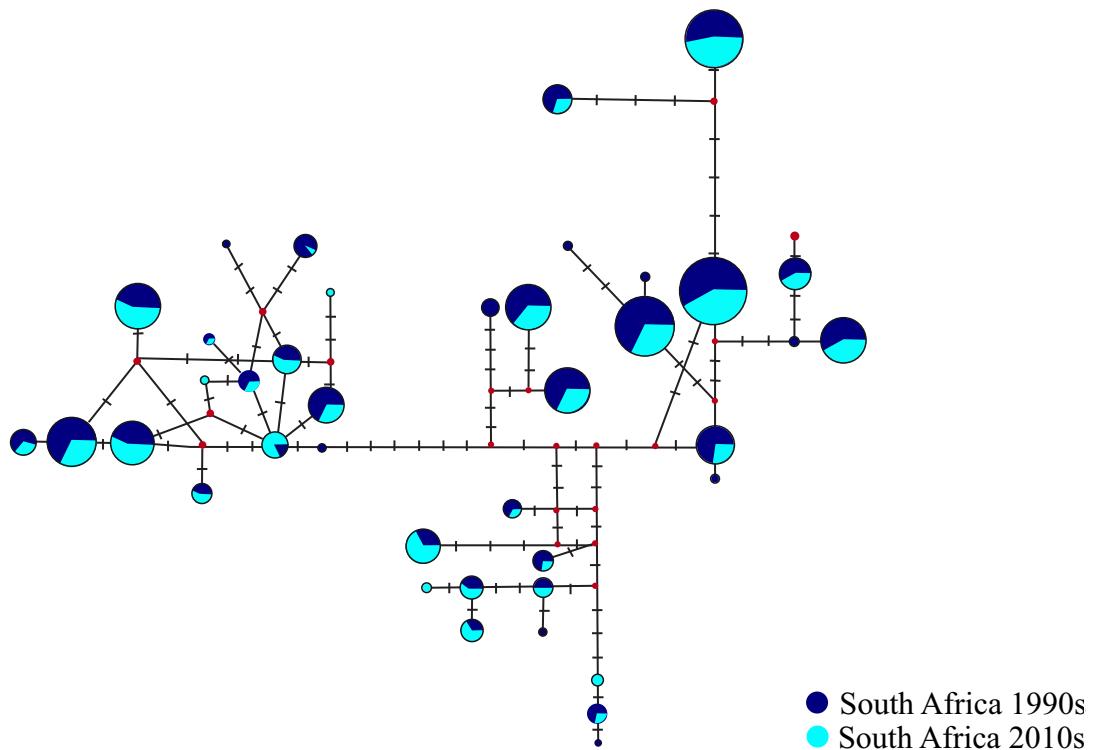

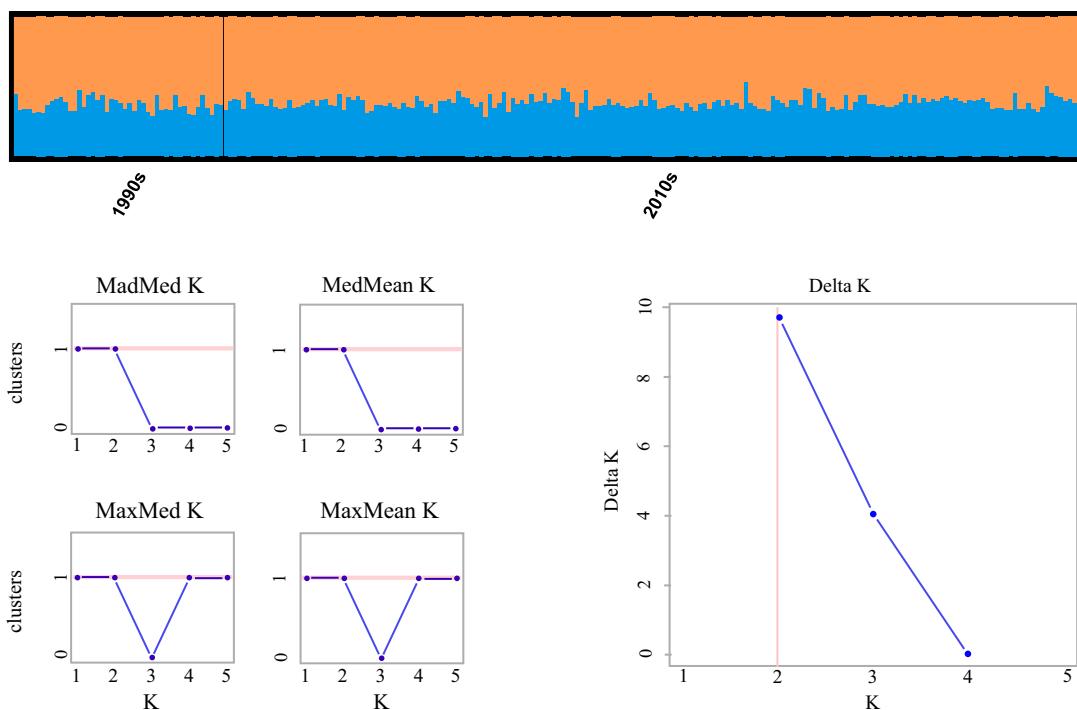

Fig. S2 Median joining network of 595 sequences of *Eubalaena australis* mtDNA control region haplotypes comparing 1990s and 2010s samples from South Africa. Colour codes represent 1990s or 2010s eras. Unsampled haplotypes are shown by red squares. Number of transverse lines denote mutations between haplotypes and each circle is proportional to haplotype frequency.

(a)

 $K = 2$ 

(b)

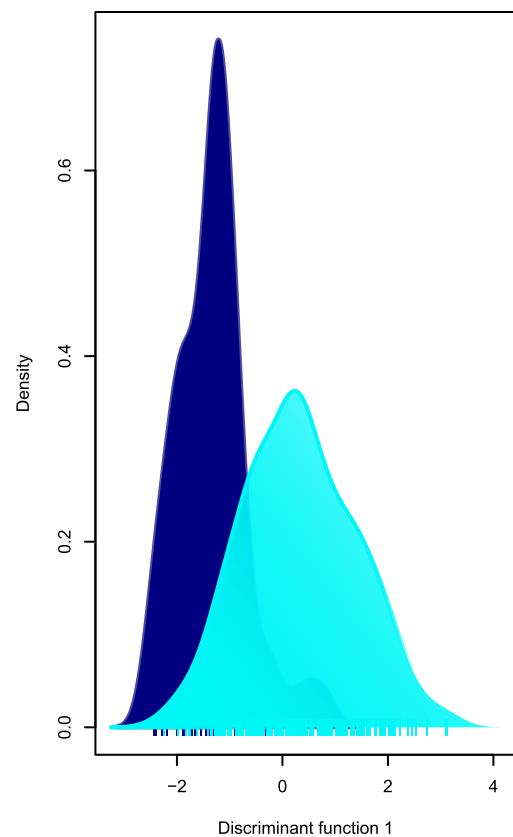

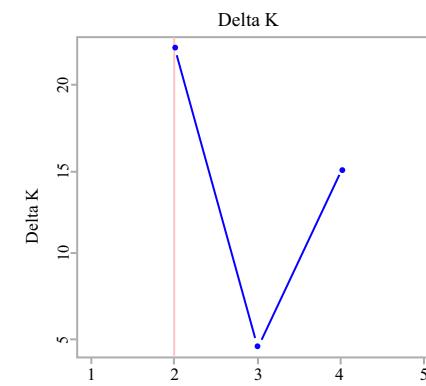

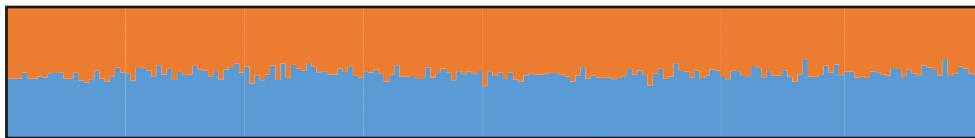

Fig. S3 Comparison between 1990s and 2010s population samples of *Eubalaena australis* from South Africa. (a) Structure Bayesian clustering of 233 nuclear microsatellite genotypes with the prior populations defined; (b) DAPC of 233 genotypes with prior populations defined.

(a)

K = 2

(b)

K = 2

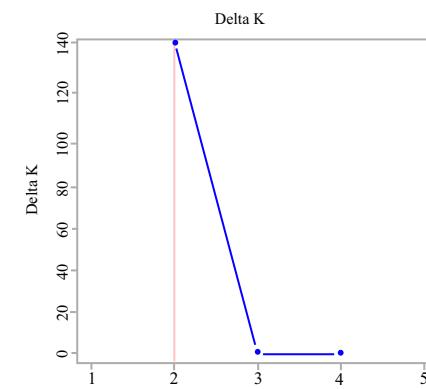

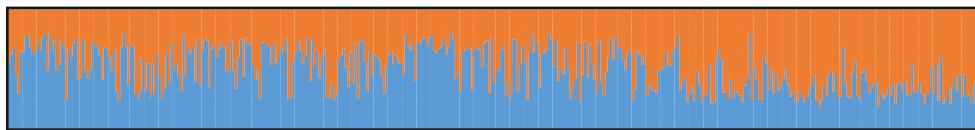

Fig. S4 Clustering of *Eubalaena australis* nuclear microsatellite genotypes based on 14 loci. (a) Bayesian clustering in Structure for recent African population (189 individuals with the locprior function off. (b) Bayesian clustering in Structure for global dataset (410 individuals) with locprior function off. Each genotype is denoted as a vertical bar divided into K colour segments. Proportions of colour segments are equivalent to Structure q values.

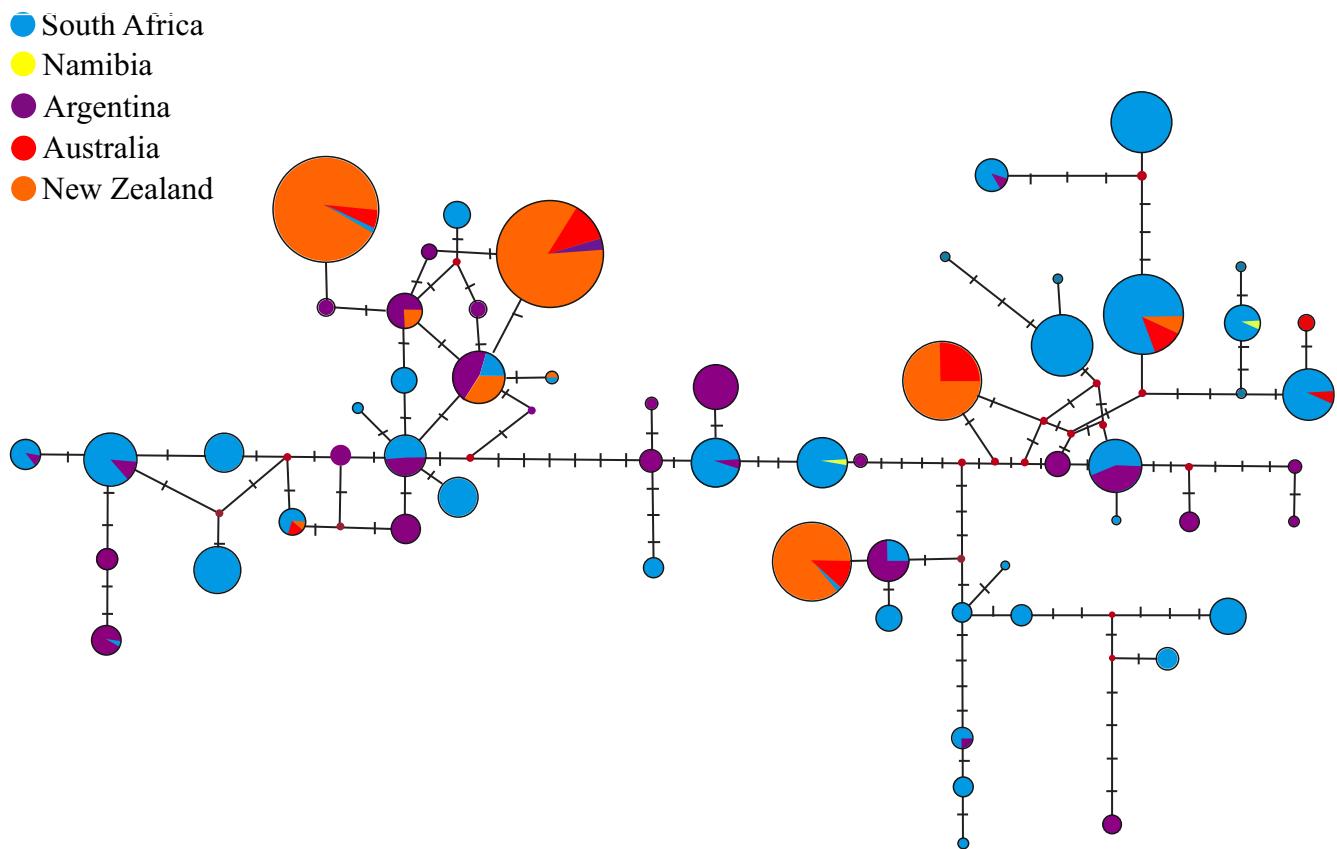

Fig. S5 Median joining network of *Eubalaena australis* mtDNA (5' end of control region) haplotypes for global population based on 1602 sequences. Colour codes represent source populations. Unsampled haplotypes are shown by red squares. Number of transverse lines denote mutations between haplotypes and each circle is proportional to haplotype frequency.

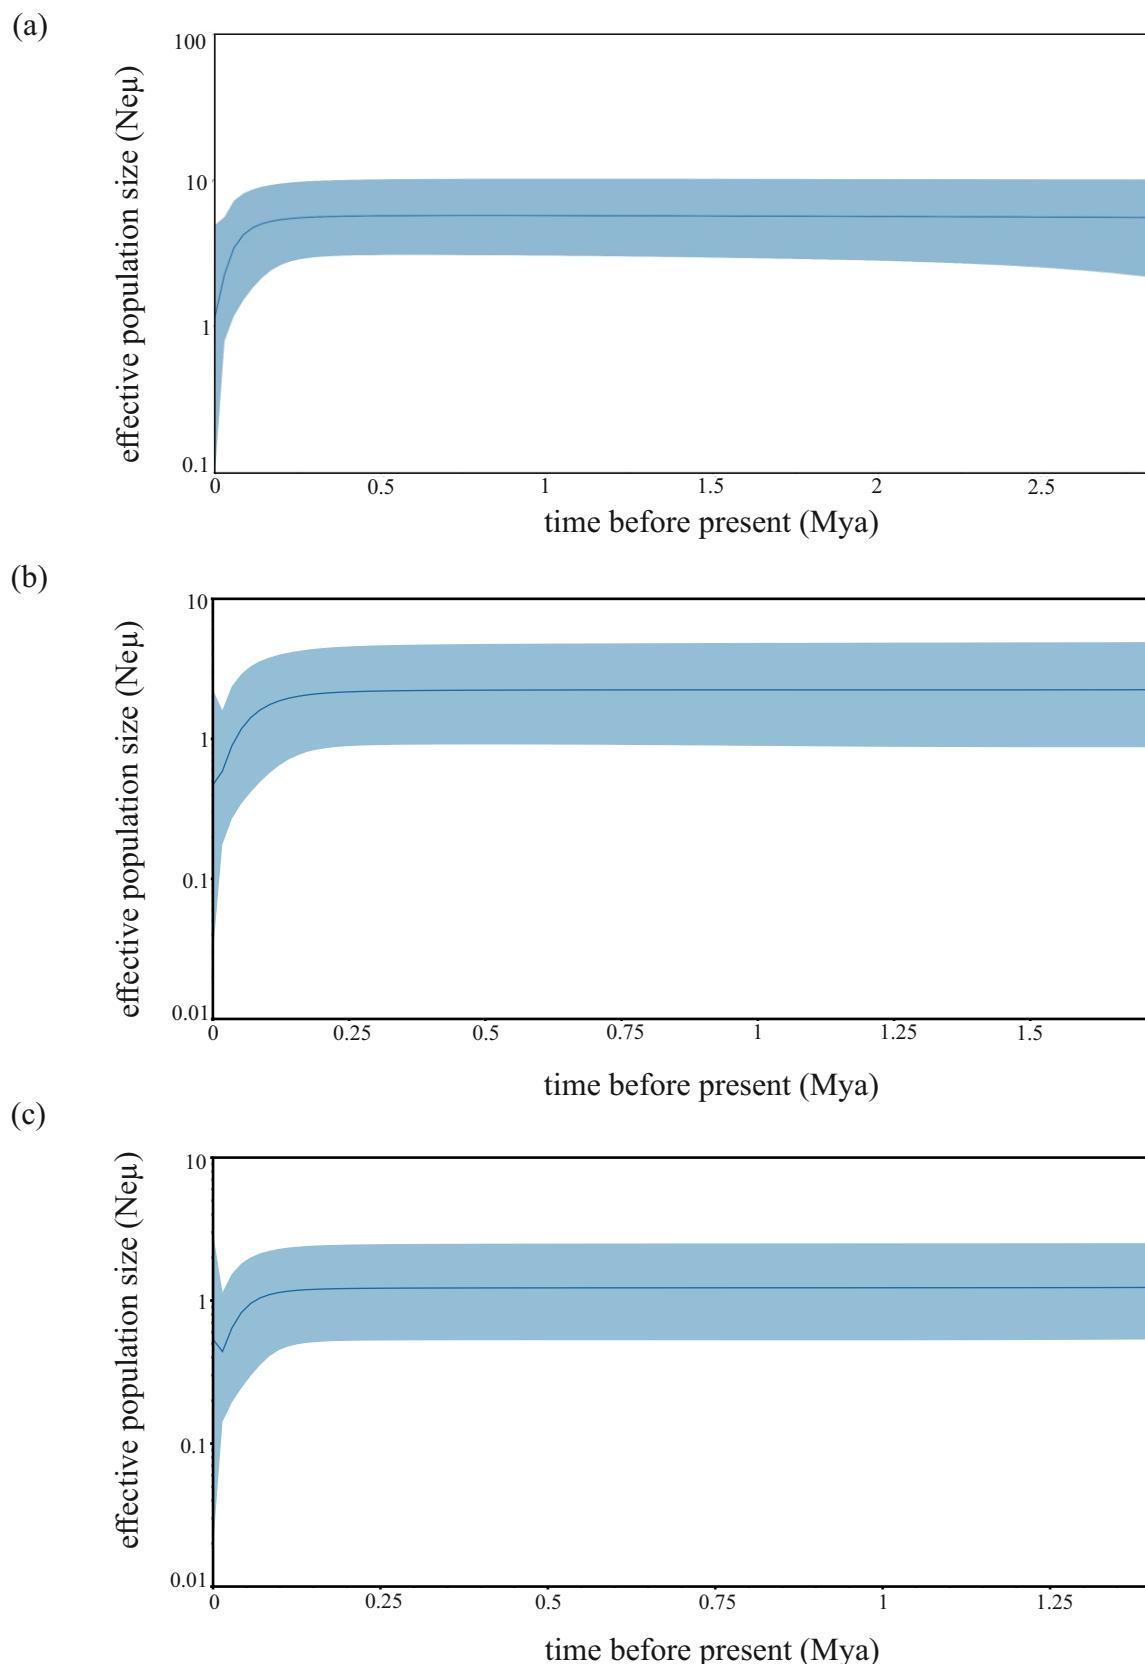

Fig. S6 Bayesian Skyline Plots of mtDNA (left hypervariable domain of control region) for *Eubalaena australis* for (a) South American population based on 208 sequences. GTR + I + G model of sequence evolution was used; ESS = 211.1 (b) Australian population based on 105 sequences. HKY + I model of sequence evolution was used; ESS = 3438.2 and (c) New Zealand population based on 692 sequences. HKY + I + G model of sequence evolution was used; ESS = 224.5. All graphs display changes in effective population size ($N\mu$) over time (Mya). The dark blue line depicts the median estimate, and the margins of the blue area represent the highest 95% posterior density intervals.

Table S1 Sample information: species determination, sample code, date of collection, date of potential recapture, assignment to decade, locality and country of origin, assignment to population, sample type, mitochondrial haplotype, GenBank Accession Number, availability of microsatellite genotype, sex determination (SRY), sampling logistics (MRI - Mammal Research Institute, University of Pretoria; DICT - Dyer Island Conservation Trust; DIC - Dyer Island Cruises) and reference

nr.	species	sample code	date of capture	date of recapture	pop - chrono	locality, country	pop - geo	sample type	haplotype	GenBank Acc. No.	microsatellites	sex	lgt	reference

*These reactions have cycling conditions of (i) an initial denaturing step at 94 °C for 3 min; (ii) 35 cycles at 94 °C for 30 sec, TA for 30 sec and 72 °C for 30 sec; and (iii) a final extension step at 72 °C for 10 min.

**This primer pair has a touchdown PCR protocol: for the cycling, each annealing temperature is used for five cycles before stepping down to the next annealing temperature; the final annealing temperature is used for 10 cycles, resulting in a total of 30 cycles. Annealing temperatures are 68°C, 64°C, 61°C, 58°C and 55°C (Carroll et al., 2015).

Table S3 Number of samples collected and unique genotypes (which represent individual animals) from *Eubalaena australis* in southern Africa during winter field works.

year of collection	nr of samples collected	QC	nr of unique genotypes	males	females	unknown sex	sample type
2003	1	1	1	0	1	0	biopsy
2007	1	0	0	0	0	1	biopsy
2009	19	17	14	8	6	0	biopsy
2011	1	1	1	1	0	0	biopsy
2012	6	5	5	4	1	0	biopsy
2013	8	7	7	6	1	0	biopsy
2016	39	31	25	9	16	0	sloughed skin
2017	154	115	87	53	34	0	biopsy/sloughed skin
2018	96	56	49	19	30	0	sloughed skin
overall total	325	233	189	100	89	1	

Notes and abbreviations: QC, the number of samples after quality control; unknown sex, the sex could not be genetically determined

Table S4 Estimate of null allele frequency of each locus in each population of *Eubalaena australis*.

Table S5 Genotype profiles of southern right whales recaptured in South Africa during field work. Genotype comprise genetically identified sex, mitochondrial control region (haplotype name as described in Carroll et al., 2019) and multilocus genotype (EV1 - TR3F4). Nloci describes the number of loci each sample is amplified at and NM the number of matching loci, the year of sample collection is also stated, for column SEX F represents female and M represents male. Missing data are marked as "0"
