

Figure S1: Principal component analysis (PCA) of the technical RNA-seq repeats. The technical repeats of each culture type clustered as expected and a total of 62% of the total variation was explained by the first two components. Square, light-coloured nodes represent the vegetative isolates, while circular, dark-coloured nodes represent the crossed culture types.

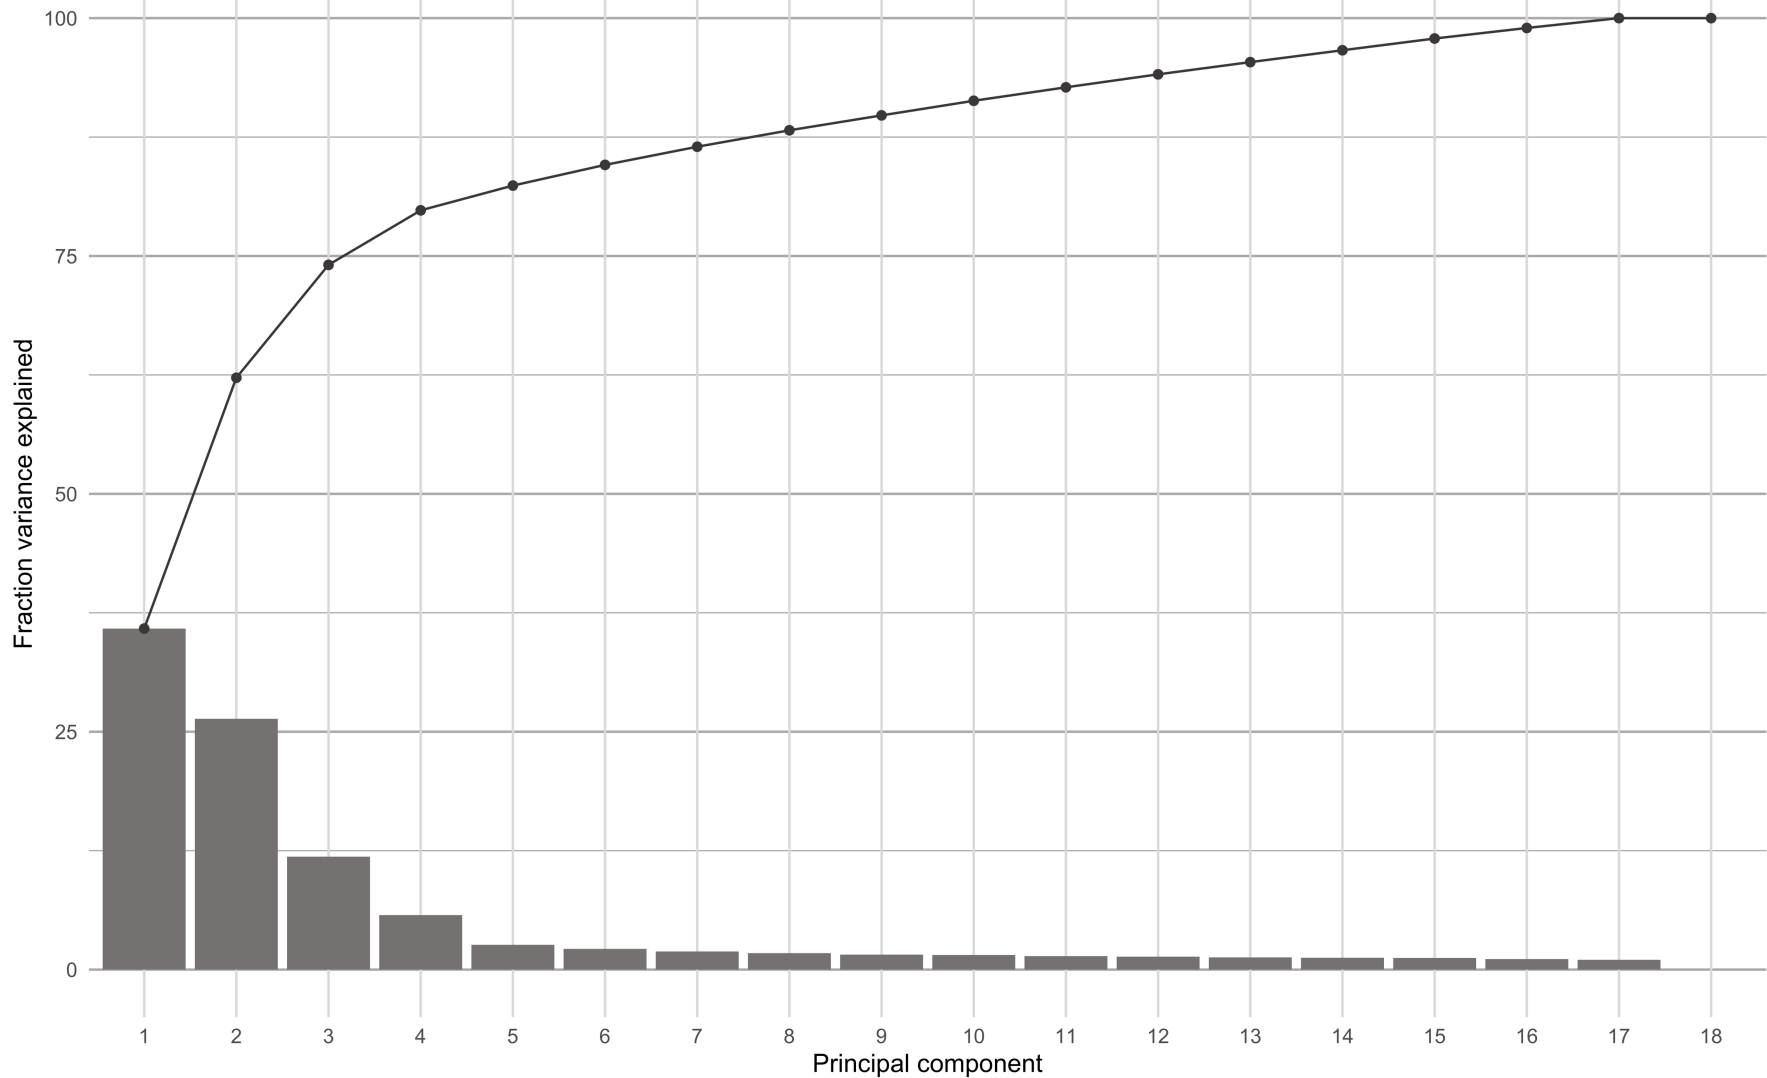

Figure S2. Screen plot from the principal component analysis (PCA). Almost 36% of the variance is explained by the first component and a further 26% is explained by the second component.
