

Figure S1. PCR confirmation of *S. sclerotiorum* (CN15D1 isolate), re-isolates from inoculated plantings and *S. minor*, sequenced at FABI sequencing facility using *lac* and *aspr* markers. The expected marker size was 540 bp. Lane abbreviations are L-100 bp ladder, with 500 bp pointed at with a black line that is closer to the expected marker size (540 bp). Re-isolations of CN15D1 from October (O1-O4), November (N1-N4), December (D1-D4), January (J1-J4), February (F1-F4) and March (M1-M4) plantings; positive control CN15D1 (P) and negative control (N; *S. minor*).

ach three-day interval.
