Supplementary Figures 1 to 3

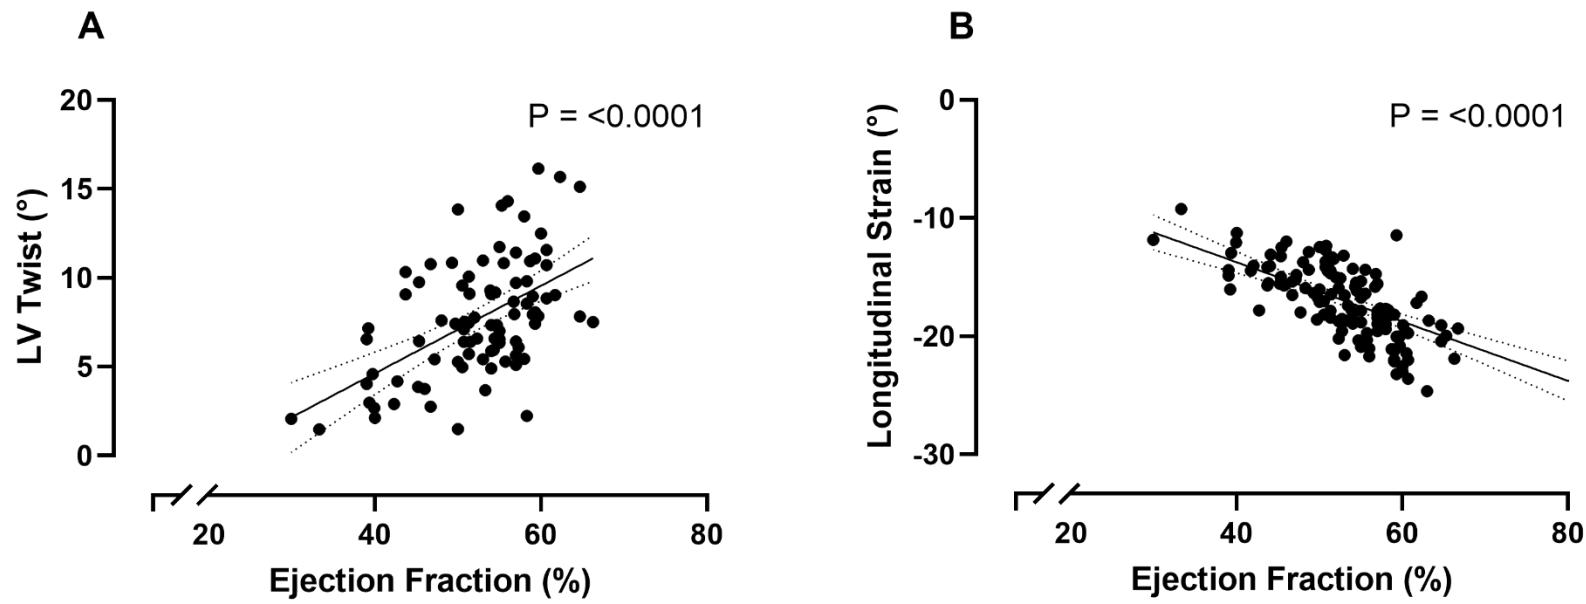

Supplementary Tables 1 to 3

Supplementary Figure 1. Example image showing a transverse slice at the mid-level of the left ventricle in an adult chimpanzee (*Pan troglodytes*) post-mortem heart, demonstrating a high degree of trabeculation. A ruler is shown for scale, with measurements in both inches (left) and centimetres (right).

Supplementary Figure 2. A 2D echocardiographic example of a parasternal short-axis image acquired at the left ventricular apex, illustrating the measurement of the trabecular (red) and compact (blue) myocardium in a chimpanzee (*Pan troglodytes*).

Supplementary Figure 3. The relationship between ejection fraction and peak left ventricular (LV) twist (A) (male $n = 47$, female $n = 43$) and peak longitudinal strain (B) (male $n = 66$, female $n = 66$) in adult male chimpanzees (*Pan troglodytes*). Linear regression lines are shown in solid black, with 95% confidence bands represented by the dotted line.

Supplementary Table 1. Left ventricular ratio of trabecular to compact myocardium in great apes. Trabeculation was assessed in accordance with the Jenni Criteria at end-systole, using short-axis echocardiographic images of the LV, in accordance with the 16-segment model recommended by the American Society of Echocardiography.

Trabecular:compact ratio for each left ventricular segment.

Data are presented as mean \pm S.D. The range of the average ratio for the trabecular to compact myocardium for the levels of the mitral valve, midpapillary and apex is shown in brackets.

* $P < 0.05$ vs. all non-human great apes; $P < 0.05$ vs. chimpanzees and bonobos; ‡ $P < 0.05$ vs. gorillas; § $P < 0.05$ vs. orangutans.

Supplementary Table 2. Left ventricular ratio of trabecular to compact myocardium in chimpanzees (*Pan troglodytes*) across age groups. Trabeculation was assessed in accordance with the Jenni Criteria at end-systole, using short-axis echocardiographic images of the LV, in accordance with the 16-segment model recommended by the American Society of Echocardiography. Infant ≤ 4 years; juvenile 5 - 7 years; sub-adult 8 - 12 years; and adult > 12 years of age.

Variable	Infant		Juvenile		Sub-Adult		Adult
