USEFUL KNOWLEDGE.

Vol. II.

These are not the times in which it is safe for a country to repose on the lap of ignorance. If there ever were a season when public tranquillity was ensured by the absence of Knowledge, that season is past. Every thing in the condition of mankind announces the approach of some great crisis, for which nothing can prepare us but the diffusion of Knowledge, probity and the "fear of the Lord."

(Robert Hall.)

Men have done a great deal *here*, in preparing the means to sustain a populous community, round the stone which used to receive the name of a passing ship, and was left in solitude; but this community has not otherwise done much to develope the condition and resources of the strange territory it is placed in; and of those who have been investigating the teeming portions of nature's domain around us, all have been foreign to the land they illustrated.

(South African Quarterly Journal, 1830.)

No. 3. CAPE TOWN: WEDNESDAY, AUGUST 18, 1830. PRICE, { *Five Shillings per Quarter.*

SATIRE AND ITS LEGITIMATE USES.

"As from a diamond globe, with rays condense,
'Tis SATIRE gives the strongest light to sense,
To THOUGHT compression, vigour to the soul,
To LANGUAGE bounds, to FANCY due control,
To TRUTH the splendour of her awful face,
To LEARNING dignity, to VIRTUE grace,
To CONSCIENCE stings, beneath the cup or crown,
To VICE that terror she will feel, and own."

THE sword, the voice, and the pen, have their uses—for defence, for counsel, for admonition, and for censure. Our business is with the latter. Satirical writings must submit to the imputation of ill-nature, though we discover no connection between them. Satire has nothing to do with good-nature or ill-nature. Its office respects the public good alone, and the interests of the community. It is frequently designed to supply the law in those cases which are beyond its jurisdiction. From such courts it appeals to, perhaps, a still higher tribunal—that of public opinion, character, and reputation. In defending satirical writings, let it be distinctly understood, that we confine ourselves solely to such writings as uphold the common cause of wisdom, of truth, and of virtue: without which criticism is malignity, and satire is scandal.

Boileau, as a satirist, is considered the most perfect of all modern writers in true taste and judgment: his sagacity is unerring; he combines every ancient excellence, and appears original even in the adoption of acknowledged thoughts and allusions. He is the just and adequate representative of Horace, Juvenal, and Persius united, without one indecent blemish. Horace Walpole, a stranger, by the-bye, to all serious impressions, and generally bent upon being unsparingly witty upon all solemn things, has made the following just observation on the writings of Boileau:—"He is like an upright magistrate, whom you may respect, but whose public justice and severity, leave an awe that discourages familiarity."* To point out the opposite to such encomium, we need only advert to Voltaire. In spite of the statue of himself, sent to him by the king of Prussia, with the word IMMORTAL engraven on its base, and the diamond box made for him by the empress of Russia, and the homage paid to him by men in power who dreaded his pen, the misery he so largely contributed to bring on his country can never be forgotten. He will be remembered, chiefly, as a terrifying example of the prostitution of the finest talents to the worst of purposes. A spiritless draught of his character, by his own pencil, records him an infidel, and a disclaimer of that common sympathy which brings the whole species under a reciprocal kindness,—a man, by his own confession, looking on the mischief of civil disturbances as a lively amusement.

Perhaps, of all compositions, those of the graphic satirist are the most amusing and imperishable. Hogarth created his art, and used colours instead of language. Amidst all his pleasantry, he observes, the true end of comedy is—reformation: there is always a moral in his pictures. Sometimes he rose to tragedy, not in the catastrophe of kings and heroes, but in marking how vice conducts, insensibly and incidentally, to misery and shame. He warns against encouraging cruelty and idleness in young minds, and discerns how the different vices of the great and the vulgar lead, by various paths, to the same unhappiness. How delicate and superior, in his satire, when he intimates in the *College of Physicians and Surgeons* that preside at a dissection, how the legal habitude of viewing shocking scenes hardens the human mind, and renders it unfeeling! In the print of the *Sleeping Judges*, this habitual indifference only excites our laughter. It is to Hogarth's honour that, in so many scenes of satire or ridicule, it is obvious that ill-nature did not guide his pencil.* His end is the public good, and his reproofs general. Sometimes he touches upon national follies—lotteries, free-masonry, and joint-stock-company bubbles. The spider's web extended over the poor's-box in the parish church; the blunders in architecture in the nobleman's seat, seen through the window, in the first print of Marriage A-la-mode; and a thousand in the Strollers dressing in a Barn, the scenes of Bedlam and the Gaming House,—all—all are inimitable representations. And so are the depictions in the Rakes' Progress,—Bartholomew Fair,—March to Finchley,—The Sleeping Congregation, &c.

But we come to the *broad grins*, as George Coleman has it, and notice the *Caricature* inventors of the day. Most men are familiar with the name of Gilray and his melancholy fate, which had well nigh left his peculiar department of art nearly void. Happily, Cruikshanks *is abroad.* His happy fancy, constant vigour, powerful application, and the not unfrequently elegant, and intellectual subtlety of his design, constitute him the highest of his peculiar order.

It is only in a *free*, but yet aristocratical country, that the art of caricaturing can flourish. In despotisms it is too hazardous to jest at the expense of those who have it in their power to criticise the picture by the sharp physic of the jail; and in democracies, the remedy of tarring and feathering, or lamp-post or guillotine, is too ready in the hands of the omnipotent rabble, for the mulct of the daring artist, who ventures his humour on that most testy of all sovereigns, the sovereign of the people. In Britain, and among her scattered people in the colonies, the art under review, is not only tolerated, but it is welcomed. Party is a sad and gloomy thing in itself, and a laugh at its expense is always so much gained. No harm can result to any side of the question from this light and jocular species of satire, and if it has been abused, as in doubt it has been, the evil has soon corrected itself. It is an impartial agent, equally dividing the modern political terms—Whig and Tory, Ultra or Radical, and it would be more than childish to complain of it, and more than tyrannical to suppress it.

In glancing at the political extravaganzas of former days, it is impossible not to admire and laugh over Gilray's happy delineations of Fox and Sheridan. Both are capital likenesses in face and figure, and yet, by the peculiar genius of successful caricature, they are so managed that an irresistibly comic and laughter-moving appearance is given to two of the most brilliant men of our own times. The inimitable picture of George the III. with Buonaparte in his hand is, perhaps, the most successful caricature ever engraved; and that of Bonaparte making ginger-bread kings, with Talleyrand by his side kneading dough for his master, are beyond all praise in their peculiar department. The sly sarcasm conveyed in the latter, in which, on the shelf, where the little yet unbaked kinglings stand, awaiting the final process of the imperial oven, is capital and Hogarthian. By the way, we learn from an admirable work noticed in one of our succeeding columns—*Bourrienne's private Memoirs of Bonaparte*—the following views which the late ruler of France entertained as to the press: "The free expression of opinion through the press has been always regarded, by those who are not led away by interest or power,

* There is an extremely beautiful edition of Boileau in the South African Public Library—5 vols. 8vo. 1747. The ninth satire of Boileau is considered his master-piece: it is a fine specimen of fanciful *badinage.*

* Vide Lord Orford's character of Hogarth.

SATIRE AND ITS LEGITIMATE USES.

"As from a diamond globe, with rays condense,
'Tis SATIRE gives the strongest light to sense,
To THOUGHT compression, vigour to the soul,
To LANGUAGE bounds, to FANCY due control,
To TRUTH the splendour of her awful face,
To LEARNING dignity, to VIRTUE grace,
To CONSCIENCE stings, beneath the cup or crown,
To VICE that terror she will feel, and own."

THE sword, the voice, and the pen, have their uses—for defence, for counsel, for admonition, and for censure. Our business is with the latter. Satirical writings must submit to the imputation of ill-nature, though we discover no connection between them. Satire has nothing to do with good-nature or ill-nature. Its office respects the public good alone, and the interests of the community. It is frequently designed to supply the law in those cases which are beyond its jurisdiction. From such courts it appeals to, perhaps, a still higher tribunal—that of public opinion, character, and reputation. In defending satirical writings, let it be distinctly understood, that we confine ourselves solely to such writings as uphold the common cause of wisdom, of truth, and of virtue: without which criticism is malignity, and satire is scandal.

Boileau, as a satirist, is considered the most perfect of all modern writers in true taste and judgment: his sagacity is unerring; he combines every ancient excellence, and appears original even in the adoption of acknowledged thoughts and allusions. He is the just and adequate representative of Horace, Juvenal, and Persius united, without one indecent blemish. Horace Walpole, a stranger, by the-bye, to all serious impressions, and generally bent upon being unsparingly witty upon all solemn things, has made the following just observation on the writings of Boileau: —"He is like an upright magistrate, whom you may respect, but whose public justice and severity, leave an awe that discourages familiarity."* To point out the opposite to such encomium, we need only advert to Voltaire. In spite of the statue of himself, sent to him by the king of Prussia, with the word IMMORTAL engraven on its base, and the diamond box made for him by the empress of Russia, and the homage paid to him by men in power who dreaded his pen, the misery he so largely contributed to bring on his country can never be forgotten. He will be remembered, chiefly, as a terrifying example of the prostitution of the finest talents to the worst of purposes. A spiritless draught of his character, by his own pencil, records him an infidel, and a disclaimer of that common sympathy which brings the whole species under a reciprocal kindness,—a man, by his own confession, looking on the mischief of civil disturbances as a lively amusement.

Perhaps, of all compositions, those of the graphic satirist are the most amusing and imperishable. Hogarth created his art, and used colours instead of language. Amidst all his pleasantry, he observes, the true end of comedy is—reformation: there is always a moral in his pictures. Sometimes he rose to tragedy, not in the catastrophe of kings and heroes, but in marking how vice conducts, insensibly and incidentally, to misery and shame. He warns against encouraging cruelty and idleness in young minds, and discerns how the different vices of the great and the vulgar lead, by various paths, to the same unhappiness. How delicate and superior, in his satire, when he intimates in the *College of Physicians and Surgeons* that preside at a dissection, how the legal habitude of viewing shocking scenes hardens the human mind, and renders it unfeeling! In the print of the *Sleeping Judges*, this habitual indifference only excites our laughter. It is to Hogarth's honour that, in so many scenes of satire or ridicule, it is obvious that ill-nature did not guide his pencil.* His end is the public good, and his reproofs general. Sometimes he touches upon national follies—lotteries, free-masonry, and joint-stock-company bubbles. The spider's web extended over the poor's-box in the parish church; the blunders in architecture in the nobleman's seat, seen through the window, in the first print of Marriage A-la-mode; and a thousand in the Strollers dressing in a Barn, the scenes of Bedlam and the Gaming House,—all—all are inimitable representations. And so are the depictions in the Rakes' Progress,—Bartholomew Fair,—March to Finchley,—The Sleeping Congregation, &c.

But we come to the *broad grins*, as George Coleman has it, and notice the *Caricature* inventors of the day. Most men are familiar with the name of Gilray and his melancholy fate, which had well nigh left his peculiar department of art nearly void. Happily, Cruikshanks *is abroad.* His happy fancy, constant vigour, powerful application, and the not unfrequently elegant, and intellectual subtlety of his design, constitute him the highest of his peculiar order.

It is only in a *free*, but yet aristocratical country, that the art of caricaturing can flourish. In despotisms it is too hazardous to jest at the expense of those who have it in their power to criticise the picture by the sharp physic of the jail; and in democracies, the remedy of tarring and feathering, or lamp-post or guillotine, is too ready in the hands of the omnipotent rabble, for the mulct of the daring artist, who ventures his humour on that most testy of all sovereigns, the sovereign of the people. In Britain, and among her scattered people in the colonies, the art under review, is not only tolerated, but it is welcomed. Party is a sad and gloomy thing in itself, and a laugh at its expense is always so much gained. No harm can result to any side of the question from this light and jocular species of satire, and if it has been abused, as in doubt it has been, the evil has soon corrected itself. It is an impartial agent, equally dividing the modern political terms—Whig and Tory, Ultra or Radical, and it would be more than childish to complain of it, and more than tyrannical to suppress it.

In glancing at the political extravaganzas of former days, it is impossible not to admire and laugh over Gilray's happy delineations of Fox and Sheridan. Both are capital likenesses in face and figure, and yet, by the peculiar genius of successful caricature, they are so managed that an irresistibly comic and laughter-moving appearance is given to two of the most brilliant men of our own times. The inimitable picture of George the III. with Buonaparte in his hand is, perhaps, the most successful caricature ever engraved; and that of Bonaparte making ginger-bread kings, with Talleyrand by his side kneading dough for his master, are beyond all praise in their peculiar department. The sly sarcasm conveyed in the latter, in which, on the shelf, where the little yet unbaked kinglings stand, awaiting the final process of the imperial oven, is capital and Hogarthian. By the way, we learn from an admirable work noticed in one of our succeeding columns—*Bourrienne's private Memoirs of Bonaparte*—the following views which the late ruler of France entertained as to the press: "The free expression of opinion through the press has been always regarded, by those who are not led away by interest or power,

* There is an extremely beautiful edition of Boileau in the South African Public Library—5 vols. 8vo. 1747. The ninth satire of Boileau is considered his master-piece: it is a fine specimen of fanciful *badinage.*

* Vide Lord Orford's character of Hogarth.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

as useful to society. But Bonaparte held the liberty of the press in the greatest horror; and so violent was his passion, when any thing was urged in its favour, that he seemed to labour under a nervous attack. Great man as he was, he was sorely afraid of little paragraphs."

Lastly, the political *squibs* of the day, are frequently the *life and spirit of the public Journals*. During the last thirty years, a rich mine has been opened on such subjects. Without taking either side of the questions severally advocated by the party writers, we submit a modern specimen, for the amusement of our readers, from an Edinburgh paper. It is perhaps not the best of its kind, but it happens to present itself to our notice.

LILLIPUTIAN LEDGER.

Lilliput, January 31, 1830.

His Majesty of Lilliput has been heard to sneeze three times during the past week; and his First Lord of the Bedchamber, the Marquis Dew Drop assures us, that no less than three dozen of gossamer *mouchoirs* have been in requisition.

His most transparent Highness the Count De Moon Behm, from Lunaria, had the honour of an interview on *Sun*-day last, when he presented his credentials emblazoned on the wing of dragon-flies, and was most graciously received.

FOREIGN INTELLIGENCE.

FRANCE.

Ministry without method, opposition without argument—people without constancy—constitution without stamina—and a King without any thing particular.

SPAIN.

Rather Peninsular, which is all we choose to say of it at present.

PORTUGAL.

As bad as can be expected.

AMERICA.

Perfectly self-satisfied that she is, and always was, and ever will be, the very first continent on the face of the earth for virtue, valour, refinement, arts, arms, elegance, and liberty. A few of the Niggers, who have dared to set up a march of Intellect of their own, have entered a *caveat* against the universal existence of freedom in the United States, which the independents of said states, consider as a pretty considerable degree of impudence in said Niggers, and say none but the Mother Country poor Old England, would tolerate such march of intellectual genovine nonsense.

HOME NEWS.

Wind—variable.

High Water at a very low spirit shop in town, where adulteration has raised the price of pure element to 2½d. a glass.

Dreadful Fire.—The conflagration at Fairy Town, consumed nineteen houses, extending over the surface of eight square inches.

PROMOTED

A City Nob to the usual annual honour of ephemeral nobility.—Two others to be head gaolers, and first executioners of London and Middlesex; and a score or two of innocent, well-meaning costermongers, have stooped to the dignity of being called common councilmen.

Rather less than 3000 lawyers' clerks and copyists, with full powers of fleecing his Majesty's lieges without let or molestation.

Marriage in High Life.—His Grace the Duke of Glow Worm, will shortly lead to the hymeneal altar, the exquisite and accomplished Lady Serena Sylph.

PRICE OF STOCKS.

Not so cheap as neckloths, particularly hempen ones, as too many Liberals have lately found upon trial.

MARKETS.

Meat has reached the unexampled price of three *millimes* the drachm.

THEATRICALS.

Footes and *Legs* have rendered the public appetites less *Kean* to what was once. *Young Juliets* and *Belvideras* are looking up—Pantomimes looking down—and Elephants, in spite of their teeth, looking out for country engagements.

NATIONAL THEATRES.

Every Evening,
ABOVE PRICE,
And
BELOW PAR!
With the very serious Piece of
CHANCERY.
The latter has much room for curtailment.

MINOR THEATRES.

Every Evening,
RIVAL QUADS,
Or the
ELEPHANTIASIS,
With the Larmoyante Everlasting of
BLACK EYED SUE,
Or,
Any thing but CAY.

SHIP NEWS.

Sailed, for nobody knows where, the Old English Free and Loyal Constitution.

The Wellington, Peel, &c. &c. in trying to get through the straits, spoke with, or were run foul of, by the Grumbler, Warspite, Egalite, Spitfire, Confessor, Maw-worm, and Patriot, marauders, bound on a voyage of speculation.

LATEST NEWS.

The Premier, Marquess of Mignonette, we regret to say, met with a serious accident last night, at Lady Blue Belle's ball, from a fall over a barley corn, by which he broke his left leg.

The Hazel Nut Fleet, commanded by Commodore Chrysalis, were seen all well on the 20th instant, cruizing off the Mole Hill Bay.

That great projector, General Grub, has taken out a patent for enabling three grainers to throw their shot the prodigious distance of *fifteen inches* and three quarters.

BANKRUPTS.

In point of honour and principle, every Seducer of ignorant and unsuspecting Countrymen, to the misrepresented regions of Sierra Leone, Swan River, and other Poyais samples of El-Dorado establishments,

BIRTH.—On the 1st inst. the Lady of Old Time, of the Year 1830—its infancy promises less than that of its immediate predecessors; but if it does not accomplish more, it will naturally be deemed a fausse accouchement.

MARRIED.—The Lawful Religion of the State, for which thousands boiled and bled under the benign administration of Bonner the Bigot and Mary the Mild, to the Dogmas of Roman Dictatorship, the Indulgencies of Inquisitorial Rule, and Jesuitical State Maxims.

DIED.—Many Ill Reports with the late Queen of Portugal.—Much Talent and Eccentricity with the late Sir T. Lawrence—and much Inconsistent Political Consistency with the late George Tierney.

POETS CORNER.

I cannot soil my snowy page
By praising a declining age;
I cannot any good expect
From modern march of intellect;
Nor can I make degen'rate Times
A pleasant subject for my rhymes.
Nor toady fools, nor Fashion's pets,
Dukes, Duchesses, nor dandizettes;
Nor join when critic cant refuses,
Her praise to all but foreign muses;
Nor Thespian Temples in decay
Abuse—one spoiled by Federal sway;
The other doom'd past hope to be,
The endless slave of Chan-ce-ree;
Nor can I smile upon our Church,
Left by her children in the lurch;
As for the State, what can I sing,
Why "God preserve and bless our King,"
And did not Such a subject call
For praise, I would not sing at all.

ADVERTISEMENTS.

LOST—Much time at the Thames Tunnel. More Money by Patriotic Subscriptions to Queen's Plates, &c. and still more Patience in trying to discover the Good Intentions of O'Connell's Harangues, the Disinterestedness of Cobbett's Lectures, or the Worth of Hunt's Puffery.

STOLEN, or STRAYED—The Brains of Irish Conciliators, and the Memory of English Protestants.

WANTED—A few Dozen of really Independent Senators, too honourable to desert the Throne, and too proud to temporise with its secret Undermines.

FOUND—A Thousand and One Stale Jokes in each of the daily Journals, New Mags, and Old Monthlys.

WANT PLACES.

ALL the OPPOSITION—ALL the CATHOLICS—ALL the RATS—and all others equally unfit.

REWARD, not exceeding L. 1,000,000, will be given to know what has become of all the Joint Stock Companies of the 25 years.

CORRESPONDENCE.

Pigmy *is no poet.*—Elfin *may be a fairy, but her copy is not fair.*—Pluck *is a good fellow, but the publication of his poem would place us in a "pucker."—To* Queen Mab *we shall ever pay court.*—Titania's *Tragedy is terrifically tremendous.*—Sprite's *verses are sprightly.*

Edited by Minikin Minion, Esq.; Printed by Typo Nonpariel; and published by Petit Pearl, at the Liliputian Press, No. 1, Catherine-street, Strand.

A DESCRIPTIVE SKETCH.

" 'Tis like—'tis like—
——— Whom?——"

It is one of the privileges of impudent persons, who impose upon society by their readiness of speech, and their barrenness of intellect, to annoy with impunity the good natured and the noble minded. They shoot their weak and malignant shafts at the feelings of those, whose opinions they cannot influence, and whose judgment they cannot suborn. This class of beings may be divided into a variety of species, amongst whom may be reckoned—the scandal-monger, the news retailer, the small politician, and "though last not least," the small, or modern wit. All these are backbiters, whose expressions of praise or censure are formed, like the sand hills of the desert, by whatever wind is strongest. You might as well rely upon the argument of a phrenologist, as upon their "word of *onour*,"— which is entirely

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

dependent upon the circumstances with which they are surrounded. This is their moral character in general; but each species has its peculiar motives and ends, which differ from one another as much as the spheres in which they are found to move. But, leaving the others for future speculation, we shall single out the modern wit, and attempt to give a slight outline of his character and pursuits. It would be difficult, perhaps impossible, to offer any reasonable conjecture as to the exact mode in which he manages to kill time when business hours are over. He is to be found at breakfast in one place, at dinner in another, and at supper in a third. His meals, therefore, are made up of "shreds and patches," which are obtained by halfcringing and by halfblustering. He is never to be seen in the company of persons who aspire to be considered in the light of *thinking* beings. Those who *read* he mortally hates. He generally contrives to get himself snugly placed in the centre of a circle of downright blabbers—and he is ever the first to laugh at a bad joke, or to fill up a gap in the conversation by an obscene allusion, or a scandalous story—

"At every word a reputation dies!"

There he sits! Note him well. Is he not a very impersonation of conceit, and appetite, struggling with natural stolidity and a lurking sense of his insignificance? His eye is dull and *glassy*—his lips quiver—he would utter a stale pun;—but, alas! another of the same calibre has anticipated him, and gained the applause which he had expected was awaiting himself. How the poor fellow writhes! How he longs to expose his antagonist! But, though revenge to him is sweet, *character* is dearer. He dreads the strength of his memory, and is content to "nurse his wrath to keep it warm." The round of existence, which our modern wit, having once assumed a decided character, is compelled to follow, seems to be one of the most anomalous things in nature. He is never at rest, yet he seems to accomplish nothing. He is one of those, who, being entirely taken up with trifles,—which, in the eyes of the modern wit, are always of more importance than matters involving the welfare of himself or of others, allow themselves no quiet either by night or day, while, to the rest of mankind, they seem to enjoy the most perfect ease and contentment, these being the natural concomitants of a careless and callous disposition. No body is more open to the slur of contempt—the sneer of malice—the smile of scorn, or the pity of wisdom. As to the peculiar properties of his wit, they may be summed up in a few words. Utterly destitute of originality, his great ambition is to murder, without mercy, the jokes or the nonsense that have been handed down as the legitimate offspring of the wits of other times. He is a poacher upon the property of others; and is sure to destroy whatever game he acquires, by attempting to *bag* it. His talk is like a fool's jacket, which offends the eye by reason of its many colours, and the unnatural manner in which they are patched together. And he himself is like a grain of chaff on the surface of a troubled sea, too powerless to control his motions, and too insignificant to incur destruction, amidst the lofty breakers of existence.

A. O.

STANZAS.

When Love had left her magic bower,
When Fame's delusive dreams were fled,
When Passion had resign'd her power,
And Hope's bright flame had vanished,—
In other climes I sought to roam
And chase away the fiend Ennui:
The stars my guide—the world my home,
My resting place the dark blue sea!

Of Pleasure's fane, I left the hall,
Nor cast behind one wistful gaze:
Could revelry or festival
Dispel the thoughts of happier days?
Days when my heart was young,—and Love
And Hope, which none e'er wish to sever,
To weave their wreath together strove,—
Oh, halcyon days! gone by for ever!

But Hope once o'er, Love spreads his sails,
And swiftly steers his bark away:
His sister fled—then what avails
The little god, alone to stay?
Together nursed—together born,
They only prosper when united,—
If of fond Hope, young Love be shorn,
His spell is broke—his blossom blighted!

When both are crush'd, then what is left
To man, but dark despair, beside
Of mind—of life perchance bereft,
The maniac, or the suicide?
When love and hope, best boons of heav'n,
From man on earth are torn away—
The welcome grave in lieu is giv'n,
And dust to dust—'there let him lay.'

W.

VAGARIES OF THOUGHT.

So Fancy dreams. Disprove it, if you can,
Ye reas'ners broad awake, whose busy search
Of argument, employ'd too oft amiss,
Sifts half the pleasures of short life away!

Cowper.

I was lately amusing myself with a treatise on the Steam Engine, and the wonderful effects produced by a few gallons of water when converted into steam. I was directed to the subject by some steam apparatus being exhibited on our jetty, and which, it appears, was intended for the Mauritius. This, by a natural progression of thought, led me to reflect on the indestructibility of matter, and the various processes by which it may acquire a new and very different organization. The subject is inexhaustable, affording a pleasing source of speculation to a contemplative mind; and mine was quite absorbed in the train of thought which it had produced.

The book I had been reading was still in my hand; and I begun to reflect on the various metamorphoses it had undergone, before it became a volume of science; turning its progress, *a posteriori*, from paper to linen, and from that to a vegetable; I then reflected, that the plants from which it had been produced were nourished and fed by disorganized animal life, probably by that of my own species, and that all which I beheld around me might have lived and acted, its present state being only a different modification of matter, according to the couplet,

"Imperial Cæsar, dead, and turned to clay,
May stop a hole, to keep the wind away."

From this, it was an easy transition to suppose that the dust of the illustrious, as well as that of the ignoble dead, might have contributed to the production of the paper in my hand. But I carried my reverie much farther, and supposed various kinds of paper, made from the decomposed mass of the different characters mingling with the soil that fed the vegetables from which they were produced. Fancy had an almost boundless range in this romantic reverie; and it would exceed the limits of this paper, were I to enumerate the many varieties conjured up by my playful imagination. Take the following as specimens:

From those in the middle and lower ranks of life, might be formed the papers most useful and in general demand; such as pot, foolscap, and post; these would be produced from the dust of merchants, and industrious, respectable tradesmen. Ingenious mechanics are well adapted for Bristol-board, and the varieties of drawing paper. Sturdy-labourers would form strong brown wrapping paper; and the more feeble might be turned into common grey. There is a close resemblance between soldiers and cartridge paper; while bullies and braggarts seem naturally made for wrapping squibs and crackers, to sputter and fume for a moment, and expire in effluvia. Testy, quarrelsome fellows, and duelists, who seem to breakfast on brandy and gun-powder, are evidently formed for match-paper, ignited by a spark. Fops are gilt, and exquisites embossed paper, for billets-doux. Drunkards and gourmands are blotting-paper, absorbing all which they come in contact, till they become a foul and polluted mass. Misers are paper of tough and tenacious texture, for wrapping up securities, bonds, and dirty old *rix*. Bankers become paper for ledgers and bills of exchange. Ignorance and stupid imbecility, in whatever station, may be turned into coarse pasteboard, for protecting that

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

which is of no more value. Sycophants and flatterers, of every description, are admirably adapted for that soft and spungy paper, which, although in general demand, and daily employed, is always degraded to the most ignoble and vilest purposes, such as those for which the indelicate Rabelais proposed various substitutes.

With respect to the ladies, the greater part of them are well adapted for all papers in general use, and most highly esteemed; although there may be some occasional exceptions. Giddy girls, of whatever age, who devote several hours daily to their toilette, and consulting their mirror, may be turned into hair papers; thereby rescuing some respectable volume from the degradation of ornamenting a head which it failed to inform. Light-headed coquettes may become fancy, coloured, and marble papers, in all their countless varieties. Antiquated spinsters, delighting in lapdogs, monkeys, parroquets, and old china, may be transformed into paper for fans and fire screens, inscribed with rebuses, charades, and other puzzles, and adorned with figures of fanciful absurdities. Other characters may perhaps be mentioned in the list of printing papers. I shall only observe here, that the amiable and modest virgin beauty becomes paper of the first texture, and of such unsullied and delicate whiteness, that none but a sheer fool, or a consummate villain, would attempt to stain its purity, by ought unworthy of being impressed on such precious materiel.

Among printing papers we may find an almost infinite variety. Legislators and "enlightened and independent" judges should be transformed into royal medium, the pages of which should contain Magna Charta, and the British Constitution of 1688, with the subsequent statutes and acts of parliament. The great Chatham, Burke, Fox, and Pitt, with a few others, would constitute an excellent paper for translations of the orations of Demosthenes and Longinus, on the sublime. Preachers would naturally become paper for published sermons and theological subjects; some of a coarse texture, and printed with a small and worn-out type; others a clean but not costly paper, that may be more generally useful; and those for their maginative and higher classes, may be wire-woven, creamed-coloured, and hot pressed. Alexander, late autocrat of Russia, and certain old colonial secretaries, would suit excellently for an edition of Machiavael, while many other odd personages would form paper for bulls and fulminations against the rights of mankind. The dust of John Knox, and those who fell at Pentland-hills and Bothwell-bridge, including the martyrs, who sealed their testimony with their blood, would produce a paper exceedingly well suited for Protestant petitions to the King and Parliament. The ashes of James Watt would form the constituent part of paper for a treatise on pneumatics. Surgeons, physicians, and their high mightinesses of the medical boards, would become bills of mortality. The most eloquent and honourable of our advocates and pleaders at the bar, might mingle with the senators formerly mentioned; while others with the same title, including some attorneys, quibbling and pettifogging lawyers in their various gradations, would afford the basis of paper for tricks of hocus-pocus and the art of legerdemain. Political economists, ultra liberals, metaphysicians, and phrenologists, would constitute excellent stuff for disquisitions on the incomprehensible, effusions of fanciful bombast, treatises on disordered imaginations, and incurable lunacy. Voyagers and travellers might be transformed into periodicals and respectable newspapers. It appears difficult, perhaps impossible, to employ the dust of critics, reviewers, and newspaper managers, with strict propriety;—at one period it would be fit for nothing superior to puffing hand bills for Warren's blacking, at another for the biography of assassins, who stab and murder in the dark; and in some instances it might answer for an excellent work on anatomical dissection. Idle, loquacious tattlers, and tale-bearers, of either sex, would, with great propriety, become scandalous chronicles, and calendars. Professed and inveterate retailers of dull jokes, writings, and punsters, would form papers for jest books, and new editions of Joe Miller. Boasters, braggarts, and dealers in gasconade, famous for shooting with a "long bow," would be equally well adapted for new impressions of Sir John Mandeville's Travels, or the Adventures of Baron Munchausen.

Gallantry, and the innate respect we entertain for the fair sex, compels us to speak delicately concerning them; we may, however, observe, that the virtuous thrifty matron, affectionate wife and tender mother, would form a staple article for editions of the Proverbs of Solomon, Dodsley's Economy of Human Life, and Tansillo's Nurse; while those wives who are for ever miserable if their husbands are absent, whether from excessive fondness, or groundless jealousy, and also those whose tongues, like the pendulum of a clock, are in perpetual motion, would furnish a paper for that witty volume, "The Art of Ingeniously Tormenting." Card-playing ladies might with propriety be metamorphosed into the tools of their favourite occupation. Love-sick maidens, of all ages, including wanton widows, might appear in namby-pamby sonnets, whining elegies, or amorous ballads, according to the prevailing disposition.

From the above specimens, the reader of a lively fancy and fertile imagination may extend the list much farther, almost *ad infinitum*. It might also be applied to living characters, and recent events; but the former might be deemed invidious; and with respect to the latter, some of them are of too serious, and others of too sorrowful a nature, to be touched with playful, although good-humoured levity: therefore the application "will be more honoured in the breach than the observance." V.V.

THE MARINER'S FATE.

KNOWEST thou that spirits at the midnight hour,
Flit o'er the bosom of the troubled deep,
Scaring with hurried dreams
The Mariner asleep.

That where the tempest, with impetuous roar,
Howling off L'Agullus, rends the mast,
He dreams of wife, and home,
And pleasures that are past.

Her voice is in his ear—before his sight
Rises his long-left home—his children play
Beneath the ivy bower,
Fair, innocent, and gay.

The busy hum of bees—the breath of flowers—
Nature in all its purity is there;
They glad his sleep-sealed eyes,
That open to despair.

The vessel gives a sudden reel—he wakes—
And all is dark around him, save the flash
Of heaven which illumes
The waves that o'er him dash.

He rushes on the deck,—the helpless crew,
Lashed to the gaping timbers, fearful stand;
Vain ev'ry frequent pray'r,
They ne'er shall see the land!

A sudden shriek arises—all is o'er!
The Mariner hath found a wat'ry grave,
And sleeps in death,
Lulled by the moaning wave. Z.

CRITICAL NOTICES.

ART. I.—*Private Memoirs of Napoleon Bonaparte, during the periods of the Directory, the Consulate, and the Empire.* By M. DE BOURRIENNE, Private Secretary to the Emperor. 1830.

OWING to the snail-paced reading-methods of certain of the public, we have scarcely been able to do more than glance over a few of the pages of the first of these highly interesting volumes, and secure two or three *random-records*. By the way, it would be well if the readers of such volumes as these, and Moore's Byron, and all works equally popular, would contrive to remember the interests of their neighbours in connection with their own; nor unnecessarily detain a book through idleness, or carelessness, or forgetfulness, or wantonness.

As far as we can judge, M. de Bourrienne has presented to the world a most impartial history of Bonaparte. In fact, his long connection with him as a school-boy and when General, Consul, and Emperor, have enabled him to appreciate the true character of this remarkable man, better than any other writer extant. There appears to be no studied deception in his pages; his remarks are often lively and epigramatic; his sketches generally natural, animated, and striking; and many of the anecdotes exceedingly characteristic of his hero. The Introduction is a well written apology for the work. "I enter the lists," says Bourrienne, "one of the last. I have read all that my predecessors have published. I am confident that all I state is true. I have no interest in deceiving, no disgrace to fear, no reward to expect. I neither wish to obscure nor embellish his glory. However great Napoleon may have been, was he not also liable to pay his tribute to the weakness of human nature? I speak of Napoleon such as I have seen him—known him; frequently admired, and sometimes blamed him." But we proceed to give a few extracts from the work.

Bonaparte's love of Fame.—All his deeds, be they, according to the opinion of mankind, good or bad, mean or great, were performed by him with a view to posterity: that was his favourite idol. His irresistible passion for transmitting his name to future ages powerfully animated him, and gave energy to his physical faculties. That transmission was with him the immortality of his soul.

His favorite phrase, which was every moment on his lips, must not be forgotten.—'What will history say—what will posterity think?'

Madame Bonaparte possessed personal graces and many good qualities. Benevolence was natural to her, but she was not always prudent in its exercise. Hence her protection was often extended to persons who did not deserve it. Her taste for splendour and expense was excessive. This proneness to luxury became a habit which seemed constantly indulged without any motive. What scenes have I not witnessed when the moment for paying the tradesmen's bills arrived! She always kept back one half of their claims, and the discovery of this exposed her to new reproaches. How many tears did she shed which might have been easily spared! When fortune had placed a crown on

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

her head, she told me that the event had been predicted. It is certain that she put faith in fortune-tellers. [The prophetess in this case was an old negress.]

Fall of Venice. — When surrounded with homage and glory, I no longer addressed Bonaparte as I had been accustomed to do. I appreciated too well his personal importance. I made with pleasure, and without regret, the easy sacrifice of the style of familiar companionship, and other little privileges. He said when I entered the saloon, where he was surrounded by the officers who formed his brilliant staff,—'I am glad to see you at last;' but as soon as we were alone, he made me understand that he was pleased with my reserve, and thanked me for it. I was immediately placed at the head of his cabinet: I spoke to him the same evening respecting the insurrection of the Venetian territories, of the dangers which menaced France, &c. 'Care thou nothing about it,' said he, 'those rascals shall pay for it. Their republic has had *its day*, and is done.'

Dandolo and Melzi.—He visited the Borromea islands in succession, and occupied himself on his return with the organization of the towns of Venice, Genoa, and Milan. He sought *men*, and found none. 'Good God,' said he, 'how rare men are! There are 18 millions in Italy, and I have with difficulty found two—Dandolo and Melzi.' In those who have seen the world, the truth of Napoleon's reproach excites little astonishment. 'What has most surprised me since the elevation of my husband,' says Madame Roland, 'which afforded me the opportunity of knowing many persons, and particularly those employed in important affairs, is the universal mediocrity which exists. It surpasses all that the imagination can conceive, and it is observable in all ranks, from the clerk to the minister.' Who does not remember Oxenstiern's remark to his son, who trembled at going so young to the Congress of Munster? 'Go, my son, you will see by what sort of men the world is governed.'

Letters. — During the time when the preliminaries of Leoben suspended military operations, Napoleon was not so anxious to reply immediately to all letters. To satisfy himself that people wrote too much, and lost, in trifling and useless answers, valuable time, he told me to open only the letters which came by extraordinary couriers, and to leave all the rest for three weeks in the basket. I declare that at the end of that time, it was unnecessary to reply to four-fifths of these communications.

Berthier's talent was very limited, and of a peculiar nature; his character was one of extreme weakness. Bonaparte's friendship for him, and the frequency of his name in the official despatches, have unduly elevated his reputation. Bonaparte, giving his opinion to the Directory respecting the generals employed in his army, said, Berthier has talents, activity, courage, character—all in his favour. This was in 1796. He then made an eagle for him; at St. Helena he called him a goose. He should neither have raised him so high, nor sunk him so low. He neither merited the one nor the other.

Bonaparte's Economy.—'No one will accuse him of squandering. He was a rigid economist. He was always irritated at the discovery of a fraud, and pursued those guilty of it with all the vigour of his character. He wished to be independent, and he well knew that no one could be so without fortune. He has often said to me—'I am no Capuchin, not I.'

Invasion of England.—Where did the Scottish historian learn that active preparations were made for the invasion? The business never went beyond official correspondence, inquiries, and conversations. There never were, although the contrary has been often stated, any serious arrangements made, either by Bonaparte or the Directory, for the invasion of England. Sir Walter Scott has, perhaps, exaggerated the danger, to justify the alarm which at that time really prevailed in England.

The East.— Seeing the approaching termination of his labours in Europe, he began to turn his serious attention to the East. He delighted to converse about the celebrated events of that part of the world, and the many famous empires it once possessed. He used to say 'Europe is a mole-hill. There have never been great empires and great revolutions, except in the East.'

Expedition to Egypt. — Shortly after our departure, I asked Bonaparte how long he intended to remain in Egypt? He replied, 'a few months or 6 six years; all depends on circumstances. I will colonize the country; I will bring them artists and artisans of every description; women, actors, &c. We are but 29 now, and we shall then be 35. That is not an old age. Those six years will enable me, if all goes well, to get to India.'

Advice to Youth. — Bonaparte having one day visited a school (at Alexandria), said, on departing, to the scholars, some of whom he had been putting questions to,—'MY LADS, EVERY HOUR OF LOST TIME IS A CHANCE OF FUTURE MISFORTUNE.' In these remarkable words he gave expression to the maxim which formed in a great measure the rule of his conduct; for, perhaps, no man ever understood better the value of time.

Bonaparte at Sea.—One of Bonaparte's greatest pleasures during the voyage was, after dinner, to fix upon three or four persons to support a proposition, and as many to oppose it. He had an object in view in this. These discussions afforded him an opportunity of studying the minds of those whom he had an interest in knowing well, in order that he might afterwards confide to each the functions for which he possessed the greatest aptitude. He always gave out the subjects which were to be discussed; and they most frequently turned upon religion, the different kinds of government, and the art of war. One day he asked whether the planets were inhabited; on another, what was the age of the world; then he proposed to consider the probability of the destruction of our globe, either by water or fire.

ART. II.— *Travels in various parts of Peru; including a Year's Residence at Potosi.* By EDMUND TEMPLE, Knight of the Royal Order of Charles II. 2 vols. 8vo. 1830.

FOR upwards of fifty centuries was this vast continent locked up in mysterious secresy from civilized man. All the operations of nature were carried on, during that long period, beneath the sun and stars of tropical skies,—vast rivers were forming for themselves new channels, and conquering new land from the ocean,—bays were changed to lakes, and lakes to plains,—forests were springing up and crumbling to decay, or falling a prey to the lightning, their ashes supporting the soil of future forests,—and countless generations of the free tenants of these magnificent wilds were coming into existence, and passing away; and of all these transactions, one half of the globe was as unconscious as if they had taken place in a remote planet! And in that hemisphere there was no *poet* to sing of them, no *historian* to record them, no *philosopher* to interpret them.

A little more than three centuries ago, the existence of the American continent was unknown, unless to the amphibious savages of the north-eastern extremity of Asia. The first settlement on its shores was made in 1503. But to our immediate subject.

After the researches of Rocha, and Pitta, and Koster, and Cazal, and Von Spix, and Lindley, and Humboldt, and De Uloa, and Southey, and Maw, and Bonnycastle, and Andrews, and Proctor, and Lyons, and Graham, and Matthison, and Cochrane, and Hall, and Miller, and Caldcleugh, and Brand, and Haigh, and Stephenson, and Luccock, and Head, and Waterton, and Prince Maxamilian, and Miers, and Mollien, and Stephenson, and Hamilton, and Hardy, and Thompson, and Ward,—we had considered all attempts at any very new or additional information on the subject of South America, to be next to impossible, or at least to be a work of supererogation. We had supposed the country so ransacked, through the unwearied zeal and spirit of British enterprise, that nothing had remained undescribed to exercise the *scribendal* industry of any candidate for literary honours. But we have been completely mistaken, and this volume, for we have not read the second, is delightfully pleasant, and well written, and may be fairly estimated as the production of a good and cheerful mind, and an amiable heart. We must banish for ever all thoughts of any excess of description as it regards the New World. Such fears are groundless; for, says our author, quoting the language of Madame de Staël, "I fancied that this country was the image of infinite space, and that it would require eternity to travel through it."

For pretty nearly the same reasons as mentioned in the article Bourrienne's Memoirs, we can only supply our readers with a few extracts from the present publication, and recommend them to a perusal of the book itself.

The author bespeaks the reader's good will in the followng introductory passage:

"Whoever writes, be it much or little, be it well or ill, is sure of incurring the censure of *some one*, and therefore I cannot expect to escape; but on the other hand, like every author, I hope to meet with the approbation of *some one*: for whoever gave his productions to the world without believing that they possessed at least a

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

little trifling something or other to recommend them? For my own part I am *determined* to please, and that ought to go a great way to insure indulgence, since it succeeds through life, nine times out of ten, with those who practise the determination."

The departure of the first division of the Potosi Mining Association, for Buenos Ayres, to which Mr. Templer was attached, is pleasantly described. He finds many amusing incidents to break the monotony of a sea voyage. *Exempli gratia.*

Sharks.—A fox hunter when he first discovers the wily object of his sport, cannot express his feelings with greater glee than that which is manifested fore and aft a ship on discovering a shark. 'A shark, a shark!' What bustling upon deck! it seems as though all hands had gone crazy! 'See, see! don't you see him?'—'What?' 'Why look!'—'Where?' 'Why there!'—'Where?' 'There! here! there he goes! look! look!—My eyes, what a size!'

After observing that there is not a creature of which more extraordinary things are told than that of the shark, the following tale is told:

"Some years ago, in the W. Indies, a British ship of war fell in with an American vessel, which, from circumstances, was supposed to be a lawful prize: but no papers being found on board to condemn the vessel, and her captain *swearing* that all was correct, the British captain, after the detention of a day or two, was induced to relinquish his capture. Shortly after this, a shark was caught by another British ship of war on the same station, and on cutting it up, a tin case containing sundry papers was found in its stomach. They proved to have belonged to the merchant vessel before-mentioned, and had been thrown overboard by the captain when about to be examined by the British cruiser. The fact was soon discovered; the papers were taken to Port-Royal, where the American captain had actually commenced an action for damages against the British captain for unlawful detention. The tables were instantly turned on the astonished Jonathan, whose ship was condemned as a good and lawful prize. The shark was one of the largest size, and the jaws are preserved to this day in the Justice Hall at Spanish Town, to the annoyance of many a *Yankee* captain; who, when *swearing*, &c. is reminded of this extraordinary detection, by some one in court pointing to the jaws of the shark and saying, 'Take care! the truth will out, though from the bottom of the sea.'"

Caution to Servants.—"I gave my servant by agreement 30 guineas a-year, but in Buenos Ayres he learned that he could earn double that sum, and he therefore left my service. He was not aware, however, that in consequence of similar tricks played by many of his profession on their arrival from Europe, the government of the country had very considerately passed a law, making all contracts executed in Europe binding in South America. By virtue of this law, I obtained a degree against him for the £36 which I had paid for his passage."

Ecclesiastical Affairs, &c.—"Christmas Day, certainly the very hottest I ever passed; the Thermometer in the shade stood for some hours at 90. I observed no religious processions, nor any of those ceremonies usually performed at this festive season. Religion here, is no longer what it was a few years ago. With respect to the Pope, the Americans literally care nothing about his holiness. America is as independent of Rome, as Rome is of America: the great body of the people think that they may redress their ecclesiastical grievances, and regulate the forms and duties of their religion, without the necessity of traversing the atlantic ocean to consult the holy see."

Herds of Cattle.—After describing the particulars of a journey across the Pampas, exposed to the frequent and formidable attacks from the "wing'd squadrons of beleag'ring flies," against the stings of which, stockings and trowsers were no protection; the vast herds of cattle are noticed—"I have been credibly informed," says our author, "that their numbers at the present day, bear no proportion to what they were before the devastating havoc of the late civil war; still they appear, to a European eye, in countless multitudes, and leave the traveller no longer cause to wonder that such fine cattle were slaughtered in *thousands* merely for their hides!"

Religious Houses.—"I am inclined to think that the religious houses are fast approaching general dissolution; for although the priesthood have still a strong party here, and to use a significant term of Lady Morgan's, many young 'priestlings' are training up, and may be seen in the streets, and at the doors of convents; yet, when the present inhabitants of these castles of indolence and ease have gone to give an account of all the good they have done on earth, there will be, in all probability, an end of the monkish tribe in Cordova, where, for hundreds of leagues round, they once ruled with uncontrolled sway."

The Press.—"It is worthy of remark, that, at the breaking out of the revolution in this country, for an extent of more than 3,000 square miles, including the cities, towns, and villages of Peru, Chili, and Rio de la Plata, there was but one old printing press, and this formerly belonged to the Jesuits of Cordova. The Spanish government rigidly prohibited that inestimable invention being made available, lest it should, as in other parts of the world, promote the progress of civilization, science, and liberty."

Crossing Rivers.—"I could not consider how our heavy baggage and ourselves were to be conveyed safe and dry across a broad, deep, and very rapid river, in the single hide of a bullock! The boats were constructed in a much shorter time than I require to describe them, although their description may be given in a few words, thus:—Take a dried bullock's hide, pinch up each side of the four corners, put a stitch with a thorn to keep those corners together, and your boat is made. For use, place it upon the water bottom downwards; then to prevent its natural tendency to turn bottom upwards, put one foot immediately in the centre, and let the other follow with the most delicate caution; thus standing breathless in the middle, you are now to shrink downwards, contracting your body precisely in the same manner in which, probably in your childhood, you have *pressed a friar into a snuff box.* This position, however inconvenient, serves to conceal a considerable share of timidity from your companions, though not from the spectators, who line the banks of the river, indulging in loud wild laughter. When crouched down in the bottom, sundry articles are handed in, and ingeniously deposited around you, until the *balsa* (boat) sinks to about an inch, or perhaps an inch and a half from the water's edge. A *peone* (coolie), now plunges into the stream, and taking hold of one of the corners of the *balsa* (which projects like that of a cocked hat), swims away with you to the opposite bank."

Locusts.—In various parts of this work the locusts are noticed as exceedingly destructive. "It is impossible," says the writer, "to convey by description, a true notion of the multitude of these creatures. I have heard it said, that when every vegetable has been destroyed, they will prey upon each other."

Water.—"In Buenos Ayres, rain-water is considered a great luxury, and in some houses tanks are formed for preserving it in the underground stories. A gentleman of my acquaintance informed me that the tank under his house held upwards of 600 pipes of water."

Books — Education.—"Books were rigidly prohibited by the Holy Inquisition; reading, therefore, was out of the question; nor have I yet met with a single book in the house of any private person since I left Buenos Ayres; even in that city, where education has made such rapid strides of later years, and where there is much literary talent, books are not yet generally considered as forming a necessary and agreeable part of the furniture of every house. The rising generation, however, throughout South America, have advantages which their parents had not. A liberal education is now not merely permitted, but imparted to all classes where there are the means of doing good. Books are sought after, and collections will no doubt take place, where, hitherto, even a Guthrie's Geography has been prohibited."

The Cactus.—"We drove for several miles through a forest of the *cactus*, which afforded us a proof of the manner in which trees or plants degenerate when out of their native soil. Humboldt says, 'near Maniquarez (in the Carracas), we measured a cactus four feet nine inches in circumference.'"

A Horse Dealer.—"We have been purchasing some horses for our private use, from the Rev. Doctor ——, head clergyman of Tucuman, who is also, and has been for upwards of forty years, the principal horse-racer, horse-jockey, cock-fighter, general gamester, and *roué determiné* of the province. General P. paid the enormous sum of 5 ounces of gold (£17:10) for his horse, a handsome dark bay; Baron C. paid 12 dollars (£2:8) for his, a haughty, long-backed, long-legged, long-tailed grey; I paid 15 dollars (£3) for mine, *a spiry*, spirited little bay nag; which was, in fact, the property of his Reverences' *niece.*"

An Infant Friar.—About 10 leagues from Francas, where we stopped to change horses, we found the few houses that lately composed the hamlet, in ruins from the effect of the earthquake. A woman of the place was busily employed in making a Franciscan friar's dress for her son, two years old. He had been unwell, and during his illness, the mother vowed to Saint Francis, that if he would have the goodness to restore her son to health, she would make him a friar in his order. St. Francis obligingly interfered, and the child of course recovered. He has now his head shaved in the shape of a tonsure, and is only waiting for his frock, cowl, and sandals, to fulfil his mother's vow."

Compliments.—In South America, as in Spain, ceremonius compliments are too frequently indulged in; offers and promises of *every thing*, without meaning or intending *anything*, are of daily occurrence."

Effects of War.—"Don José Torres at one period possessed upwards of 3,000 head of horned cattle, out of which *only* 8 cows now remain; of all the rest he was despoiled during the course of the late revolutionary wars. Those who grumble to pay war-taxes, and consider them a hardship, would do well to reflect upon the greater hardship that are averted by paying to keep the field of battle out of one's own country; wherever the seat of war is, the armies of friend and foe occasion nearly equal desolation."

Armadillos.—"These are found in plenty; when roasted in their coats of mail, they are considered a delicacy; two which we took were thus served up under a fig-tree, where we stopped for an hour to breakfast."

Potosi.—"The road, as I advanced, indicated the approach of consideration. It was no longer an unfrequented solitude, as I had been accustomed to find it. Peasantry with droves of asses, and flocks of beautiful illamas."

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ART. III.—*Diary of* THOMAS BURTON, Esquire, *Member in the Parliaments of* OLIVER *and* RICHARD CROMWELL. 4 vols. 8vo.

BURTON'S DIARY, which has been published in four volumes, by Mr. J. T. Rutt, from the original autograph MS. abounds with subjects of curious interest. Mr. Burton was Member in the Parliaments of Oliver and Richard Cromwell—from 1626 to 1659. We have selected a few of the particulars which took place during the debates on the question of James Nayler, the fanatic Quaker. James had been a private soldier in the Parliament in 1641, in which he was afterwards made a Quarter-Master, under Major-Genl. Lambert. Naylor was a man of natural talents, but never had followers, except amongst a small portion of the lowest and most illiterate of the people. Naylor did not believe himself to be Christ, but imagined that Christ moved him to what he said or did. It has been remarked, that had Mr. Hume seen some of the accounts of this singular being, he might have enriched his ludicrous description. In some respects, however, he is mistaken on this subject, as well as in numerous other cases of deeper interest. The cruel sentence of the Parliament, contained in the extract subjoined to this article, was carried into effect. He bore his sufferings with great fortitude, and in subsequent years was restored to humility of mind, and soundness of judgment. He died in peace; and about two hours before his close, he spoke these words:—"There is a spirit which I feel, that delights to do no evil, nor to revenge any wrong, but delights to endure all things, in hope to enjoy its own in the end. Its hope is to outlive all wrath and contention, and to weary out all exaltation and cruelty, or whatever is of a nature contrary to itself. As it bears no evil in itself, so it conceives none in thought to any other. If it be betrayed, it bears it; for its ground and spring are the mercies and forgiveness of God. Its crown is meekness, its life—everlasting love; and takes its kingdom with entreaty, and not with contention; and keeps it by lowliness of mind. It doth not murmur at grief and oppression. It never rejoiceth but through sufferings; for with the world's joy it is murdered." Nayler's writings were collected in an octovo volume, and printed in 1716. It is impossible to read his history without execrating that fire-and-faggot system of former days, which refused to leave men to the freedom of their consciences. "The religious opinions of sectaries," observes Sir Walter Scott, "have a tendency, like the water in some springs, to become soft and mild, when freely exposed to the open day. Who can recognize in the decent and industrious Quakers and Baptists, the wild and ferocious tenets which distinguished their sects, while they were honoured with the distinction of the scourge and the pillory."

HOUSE OF COMMONS, 1656.

The case of James Nayler, "charged with divers strange, absurd, and blasphemous pranks."

Major-Gen. Skippon.—This offence is so high a blasphemy, that it ought not to be passed.

Major-Gen. Botelar.—Though my indisposition might plead for my silence, yet I should go out with troubled conscience, if I should not have borne witness against it. The punishment ought to be adequate to the offence. By the Mosaic law, blasphemers were to be stoned to death. The morality of this remains, and for my part, if this sentence should pass upon him, I would freely consent to it. If we punish murder and witchcraft, and let greater offences go, as heresies and blasphemy, for my part, I should never reconcile myself to leave out the latter, and punish the former offences.

Col. White.—If you make the sentence death, I think James Nayler well deserves it. I shall give my Yea.

Sir Thos. Wroth—Seeing Nayler must die, I desire to know what manner of death it must be.

The Master of the Rolls.—The matter-of-fact should be first stated, whether blasphemy or no.

Major-Gen. Whalley.—I am of opinion that this person is guilty of horrid blasphemy.

Major Oudley.—I think there is no man so possessed of the devil as this person is. I am of the same opinion as that noble gentleman who spoke last.

Mr. Drake.—My motion is to vote this offence horrid blasphemy. Did he not suffer himself to be honoured as our Saviour, in his riding through all the towns? I think him worse than all the papists in the world—worse than possessed with the devil.

Lord Strickland.—In all respects I look upon Nayler as a man exceedingly scandalous, proud, and sinful; but to say he is a blasphemer I cannot agree. If you have any rule, I would have you proceed against him as a seducer, and to let none be allowed to come to him: to shut him up as one that has the plague upon him. But for us to judge of blasphemy, unless we were so learned in the original as to define what it really means, lest we be judged abroad whether we be adequate judges in this case.

Lord Whitlock.—I dissent from the last speaker: I think it is an offence of a high nature. It is more than blasphemy.

Capt. Baynes.—If you have laws in being, send him to some of your Courts of Justice.

Lord President.—This business is heavy upon my heart. Many gentlemen have spoken zealously; they were honest men who once called for fire from heaven—but they were reproved. If you hang every man that says Christ is in you the hope of glory (Colos. i. v. 27), you will hang a great many.

Mr. Bacon.—This fellow is not the fairest among ten thousand, as his disciples would have him. It is much controverted here whether a law might be made for a matter, *ex post facto*. Nothing more ordinary in a Parliament. Was it not the case of the Bishop of Rochester's cook? He made broth which poisoned all the family, and the beggars at the gates. Here was a law made, both for the offence and for the punishment. The like in Hacket's case. The like in the Holy Maid of Kent's case, Hen. VIII., who said she had immediate intercourse and letters from the Virgin Mary. Her offence was judged High Treason. ——Resolved that candles be called for. (Two Noes.)

Col. Sydenham.—This offence is not homogenial. It differs from that of the Holy Maid of Kent.

Sir R. Onslow.—My opinion is, as it was, that the offence is blasphemy. There is *officium altior officio*. It is our duty to do something in this business, and that with all possible zeal. My motion is that it be voted horrid blasphemy. Why should you boggle at this?

Mr. Briscoe.—We have no law against blasphemy under the Gospel; yet the *jus naturale* is of force. It is an offence against the moral law. By the light of nature, as divines say, we may know the Deity. If against the judicial law, the equity remains. It is a sin against a greater light, a more transcendent light. If ignorance doth extenuate, so doth knowledge aggravate; and the greater his knowledge, the greater his offence. He owns it knowingly. I vote the matter horrid blasphemy.

Judge Smith—(The House having voted Nayler guilty of horrid blasphemy) said, I have as tender conscience as any man to tender consciences, but what will people say, having come to this vote, if we are at a stand what to do with him. Are we afraid of a precedent? Was not the King justly condemned for tyranny, treason, and oppression? It was a just sentence. The like for the Earl of Stafford, and the Archbishop of Canterbury, Rochester's cook, and Hackett. Six or seven were condemned and hung at Tyburn, for speaking against the Book of Common Prayer,* a slenderer offence than this. I vote that he be stoned to death.

Major-Gen. Disbrowe.—Nayler prophesied his own death, let us make him a liar, by saving his life.

Sir C. Wolsely.—I am for pillory, imprisonment, whipping, or the like.

Major Beake.—I conceive it to be a fit punishment to cut out his tongue, and to cut off his right hand, and then turn him beyond seas.

Lord President made a long speech to extenuate the offence.

Sir R. Piggot proposed that his tongue might be bored through.

Col. Chadwick.—First whip him for the lesser crime, as for being an impostor, and happily that may work him into a sense of sorrow.

Col. White proposed that his hair might be cut off.

Major-Gen. Haines.—That his tongue might be slit or bored through, and that he might be stigmatized by the letter B.

Major Whalley.—Do not cut off his hair, that will make the people believe that the Parliament of England are of opinion that our Saviour wore his hair so.

Mr. Downing.—You ought to do something with his tongue.

Col. Matthews.—Send him three months to Bridewell.

Major-Gen. Goffe.—He is a madman; it is good to physic him. "A rod for the fool's back."

Alderman Foot.—If you send him to Bridewell or Newgate, you will make him worse.

Col. Fitz-James.—The man is distracted already, and if you whip him you make him worse. Let him only do hard labour.

Sir G. Pickering, Lord Whitlock, Sir J. Reynolds, and *Col. Hewitson.*—He has been *a soldier, and it is not proper to whip him;* the word NOBLE speaks his privilege. He is a *Roman.*

Major Andley.—It is an ordinary punishment for swearing. I have known twenty bored through the tongue.

Resolved,—That his tongue be bored through.

Resolved,—That he be marked with the letter B in the forehead.

Major Whalley proposed that his lips might be slitted.

Alderman Foot.—That his head may be in the pillory, and that he be whipped from Westminster to the Old Exchange.

Col. Cromwell.—That he may be whipped through the whole city from Westminster to Aldgate.

Col. Matthews.—That he be branded and bored at the Royal Exchange.

Dr. Clarges.—That he may stand in the pillory in Glassenburg and Wells.

Col. Shapcot.—That his Bridewell may be at York, whence he came.

Mr. Speaker.—He came not from thence. I shall put it upon Bristol.

Mr. Pedley.—That his prison may be the isle of *Scilly.*

Col. Clarke.—If you put him to hard labour, London is the fittest place.

Mr. Bond.—Send him rather into the Orcades, or Scotland.

Sir G. Pickering.—Either be strict in this, or you do nothing; for certainly *Quakerism* is as infectious as the Plague.

Mr. Fuller proposed that he might be sent to Jamaica.

Sir T. Wroth.—To the Isle of *Dogs.*

Sir J. Reynolds.—Send him to *Coventry.*

Sir W. Strickland.—Send him to Bristol.

Mr. Highland.—Those that come out of the *North,* are the greatest pests of the nation.

Mr. Robinson.—I hope that gentleman does not mean by his pests, that all come thence. He does not mean *us,* I hope.

Mr. Bamfield.—I am glad every body apprehends this man to be such an one as that all are

* "Put to death by Elizabeth."

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

weary of him. He came from the North. It verifies the proverb—*ab aquilone nil boni.* I hope it will be a warning to them never to send such cattle amongst us.

RESOLVED,—That James Naylor be set on the pillory, with his head in the pillory, in the New Palace, Westminster, during the space of two hours, on Thursday next, and be whipped by the hangman through the streets of Westminster, to the Old Exchange, London; and there, likewise, to be set upon the pillory, with his head in the pillory, for the space of two hours, between the hours of eleven and one, on Saturday next; in each of the said places wearing a paper, containing an inscription of his crimes; and that at the Old Exchange, his tongue shall be bored through with a hot iron, and that he be there, also, stigmatized in the forehead with the letter B; and that he be afterwards sent to Bristol, and conveyed into and through the said city, on a horse bare ridged, with his face back, and there also publicly whipped the next market day after he comes thither; and that from thence he be committed to prison in Bridewell, London, and there restrained from the society of all people, and kept to hard labour till he be released by the Parliament; and during that time be debarred of the use of pen, ink, and paper, and have no relief but what he earns by his daily labour.

[A Correspondent, whose labours in the field of this Colony's literature for a series of years past, are well known, has been pleased to supply the following contribution towards our Review department. We hope to be favored with the continuation of his remarks in time to present them to our readers in the next number.]

ART. IV.—*Researches in South Africa, illustrating the Civil, Moral, and Religious Condition of the Native Tribes, &c.* By the Rev. JOHN PHILIP, D.D.

IN his Preface to the second edition of Travels in South Africa, Mr. Barrow introduces a maxim, current through Greece and Rome, two thousand years ago, that, "*Africa semper aliquid novi offert.*"

Twenty-six years have glided away, since the date of Mr. Barrow's work, and, during that period, sixteen additional publications, descriptive of the Cape of Good Hope, from the gaudy quarto to the paper-covered pamphlet, have made their appearance. Of these, the greater part possess a considerable degree of merit, and all offer to the reader something, either of new interest "aliquid novi," or of additional amusement. A seventeenth, in 2 vols. octavo, has been lately added to the number, under the title of *Researches in South Africa*, and to this book, thus announced, much of the public attention has been directed.

The character and the political treatment of the Hottentots, a subject of so much late discussion at religious meetings, and in the House of Commons; the important character of the Author, as Superintendent of the Missions of the London Missionary Society at the Cape of Good Hope; his former struggles on behalf of a tribe, which he declared to be degraded below that scale, to which every one bearing the human figure might pretend; his acknowledged talents; his perseverance in the cause; all these circumstances separate and combined, gave birth to an unusual interest on the appearance of the "Researches."—Every man, who prefers his opinions in print, becomes subject by the so doing, to the critical remarks of the public. In availing ourselves of this privilege, we shall avoid all questionable or personal grounds, confining our observations to the book, as a literary production, and in its literary character only. In this spirit, we shall now adventure a few cursory remarks, requesting the continued indulgence of the courteous reader. The Preface, though probably written after the text, as is the case with the Preamble of an Act of Parliament, claims by its position, the first attention, and in the outset we feel pleasure in giving an opinion, that much praise is due to the author, for the manly and unsophisticated English style, which pervades the entire composition. The tale is told throughout without resort to the shewy embellishment of classical quotation, in the plainest and best idiom of our native tongue.

Let the author now speak for himself, and, as a fair specimen of his style, we present the following extract from the preface, (page 7):

"Man, in his individual and collective capacity, is so constituted, that no improvement can take place in any part of the one or the other, without diffusing its influence over the whole man, and over the whole frame of society. The thorough knowledge of one science, requires a general acquaintance with many others. With the improvements of science, the arts and manufactures of a country may be expected to keep pace; the late discoveries in chemistry, for instance, have diffused their influence, and their energies, over every department of science, from its general principles to its most minute details, —from the lofty speculations of the philosopher to the humble operations of the mechanic.

"It is the same, as it respects the progress of genuine religion. With the Reformation arose a thirst for knowledge in general; and to the strength of that desire may be traced the extension of printing, the resurrection of genius, the establishment of schools, the multiplication of books, and the brightest period in the annals of Europe. Without a motive, a thirst for knowledge could not have existed; without printing, that desire could not have been gratified; without schools, education could have never become common; and without a capacity to read, printing would have been a useless discovery, and genius would have languished for want of encouragement, or perished for want of bread. Thus the extension of printing, the establishment of schools, the general diffusion of knowledge, the revival of literature and the late discoveries in science, may all be viewed as springing from the Reformation."

And again, page 23:—

"After having established, before two of His Majesty's Commissioners of Inquiry, my allegations respecting the oppressed state of the natives, and the hostility manifested against the missionary institutions, I was willing to have given up all my proofs and documents to the Colonial Government, had pledges been granted me that the natives should have their freedom secured to them. Since my return to this country (England) I would, at any time before these volumes went to press, have committed the papers they contain to the flames, had His Majesty's Ministers met me with the assurance that they would do justice to the oppressed and deeply injured native inhabitants of South Africa. But the reserve which Government has so long maintained on this point; the official coldness of Earl Bathurst's reply to the memorial of the Directors of the London Missionary Society, and to my report;—the meagre and extraordinary character of the return to Mr. Buxton's motion,—the unsatisfactory nature of what has been published in the Reports of the Commissioners on the Government and Finances of the Colony of the Cape of Good Hope, in relation to the natives;—the manner in which their special reports on this subject have been withheld from Parliament,—and the simple fact that the system laid open in the following pages was still carried on in the colony so late as the date of the last letter I received from it:—have left me no alternative but to lay this subject before the public in all its length, and breadth, or to run the risk of losing the fruit of all my exertions for the natives, and the advantage of all the documents I have collected in their favour; and thus of leaving them where I found them,—in the most oppressed condition of any people under any civilized government known to us upon earth."

Had the author, then in England, availed himself of his accustomed penetration, as to what was doing in the Colonial Office, with reference to the Hottentots, (and there could have been no inducement in the Home Government to have withheld the nature of the proposed relief) he might have learned it, previous to his publication. By his own avowal the discovery of it would have induced him to have committed his manuscript to the flames "in all its length and breadth." The Preface is dated 5th April, 1828, and on the following 17th July, being the lapse of a little more than three months, the Ordinance No. 50, suddenly, like the soldiers of Cadmus, started into life and action at the Cape. Of this Ordinance we quote the second clause:

"And whereas by usage and custom of this colony, Hottentots and other free persons of colour, have been subjected to certain restraints as to their residence, mode of life and employment, and to certain compulsory services to which others of His Majesty's subjects are not liable: Be it therefore enacted, that from and after the passing of this Ordinance, no Hottentot or other free person of colour, lawfully residing in this colony, shall be subject to any compulsory service to which others of His Majesty's subjects therein are not liable, nor to any hindrance, molestation, fine, imprisonment, or punishment of any kind whatsoever, under the pretence that such person has been guilty of vagrancy or any other offence, unless after trial in due course of law;—any custom or usage to the contrary in anywise notwithstanding."

This complete overthrow of a system, with which our author waged an interminable war, could not, in the existing

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

situation of things, have been hazarded by the Lieut.-Governor, without the previous approval of the Home Government, at least of the principle.—It must have been in train and progress, for otherwise it could not have been conceived and brought to the birth, at the Cape, between the 8th of April and the 17th of July, except by magic, and was probably completed the very 5th of April, when our author dipped his pen in ink, and asserted his readiness to burn his books, were he assured that was to be done, which was probably then perfected, and which he might have known on inquiry.—Be this as it may, the Ordinance No. 50 has done tardy justice to the inhabitants of colour; and the Hottentot stands, upon South African land, free as the air he breathes.

The important benefits consequent on the freedom of the "Aborigines," so emphatically and eloquently predicted in the "Researches," are now to follow, (preface, page 29):

"Let the advocates of religion and humanity, use their efforts to put a period to the slavery of the Aborigines within the colony of the Cape of Good Hope, and they will, by that single act, do more for the promulgation of the gospel in South Africa, than all the funds of the London Missionary Society could effect, while things continue in that colony as they now are. Under the present system, the labours of the missionaries must be limited to the missionary institutions; and their efforts, even at them, are like the attempts which may be made to rescue from the ocean a small portion of the beach, which is liable to be swallowed up by the next spring tide. But if we can procure for the people their civil rights, we may gradually withdraw the funds now employed in supporting our missionary institutions, and employ them in diffusing the gospel on a more extensive scale. Excepting a few missionaries at the drostdys or towns, who may be employed among the coloured population of every class on the sabbath, and preaching at farm-houses in the neighbourhood on week evenings, the natives may then be left to the provision made for the religious instruction of the colonists."

The first chapter explains the condition of the native tribes in 1652, when the Dutch took possession of the Cape, and presents a curious account of the primitive manners of the Hottentot natives. Their moral conduct is described to be such, as to have gained for them the appellation of "the good men." Whilst their ignorance of a Supreme Being, and of every religious ceremony, has placed them in a lower class than the savage natives of the South Seas, as described by Captain Cook, (page 7):

"I never have been able to discover from my intercourse with the natives, or from any other source, that this nation had ever attained any distinct notion of a Supreme Being, or that an idea of a future state of existence had at any period prevailed among them. Africaner, the most intelligent savage I have ever met with, declared that, previous to his acquaintance with the missionaries, he had no idea of a Spirit, Creator, or Supreme Ruler. In his intercourse with the colonists, he had heard, as he observed to me, 'that they had a God; but he never saw him in the winds, in the thunder, in the lightning, in the heavens, nor in any of his works; and so contracted were his views on this subject, that, by the God of the white people, he only understood something under that name which they might carry about with them in their pockets.'

"Being asked if it never occurred to him to inquire how the world was made, or who formed the sun, and the stars, and clouds? his reply was, 'I was always so engaged with my cattle and my wars, that I never lifted my thoughts so high; or if, at any time, a question arose in my mind on these subjects, the difficulty of solving it was so great, that it no sooner presented itself than it was dismissed.'"

The journal of the Landdrost Joh. Sterreberg Kupt, in the second chapter, offers a faithful picture of the country at that period. He left the Cape in October, 1703, to barter for cattle for the Dutch Honorable Company, and gives an interesting account of the manner of bartering, and of the barterers. The chapter concludes with the slaughter of a lion near Elephant's River, after an interesting nocturnal campaign between that valiant animal and his foes, so well narrated, that it cannot be here omitted:

"Our waggons, which were obliged to take a circuitous route, arrived at last, and we pitched our tent within musket-shot from the Kraal; and after having arranged every thing, went to rest, but were soon disturbed; for about midnight the cattle and horses which were standing between the waggons, began to start and run; and one of the drivers to shout, on which every one ran out of the tent with his gun. About thirty paces from the tent stood a lion, which on seeing us walked very deliberately about thirty paces further, behind a small thorn-bush, carrying something with him which I took be a young ox. We fired more than sixty shots at that bush, and pierced it stoutly, without perceiving any movement. The south-east wind blew strong, the sky was clear, and the moon shone very bright, so that we could perceive every thing at that distance. After the cattle had been quieted again, and I had looked over every thing, I missed the sentry from before the tent, Jan Smith, from Antwerp, belonging to the Groenekloof. We called as loudly as possible, but in vain,—nobody answered; from which I concluded that the lion had carried him off. Three or four men then advanced very cautiously to the bush, which stood right opposite the door of the tent, to see if they could discover any thing of the man, but returned, helter skelter, for the lion, who was there still, rose up and began to roar. They found there the musket of the sentry, which was cocked, and also his cap and shoes.

"We fired again about an hundred shots at the bush, which was sixty paces from the tent, and only thirty paces from the waggons, and at which we were able to point as at a target, without perceiving any thing of the lion, from which we concluded that he was killed, or had run away. This induced the marksman, Jan Stamansz, to go and see if he was there still, or not, taking with him a fire-brand. But as soon as he approached the bush, the lion roared terribly, and leapt at him; on which he threw the fire-brand at him, and the other people having fired about ten shots, he retired directly to his former place behind that bush.

"The fire-brand which he had thrown at the lion had fallen in the midst of the bush, and favoured by the strong south-east wind, it began to burn with a great flame, so that we could see very clearly into and through it. We continued our firing into it; the night passed away, and the day began to break, which animated every one to aim at the lion, because he could not go from thence without exposing himself entirely, as the bush stood directly against a steep kloof. Seven men, posted on the farthest waggons, watched him, to take aim at him if he should come out.

"At last, before it became quite light, he walked up the hill with the man in his mouth, when about forty shots were fired at him without hitting him, although some were very near. Every time this happened, he turned round towards the tent, and came roaring towards us; and I am of opinion, that if he had been hit, he would have rushed on the people, and the tent.

"When it became broad daylight, we perceived, by the blood and a piece of the clothes of the man, that the lion had taken him away, and carried him with him. We also found, behind the bush, the place where the lion had been keeping the man, and it appeared impossible that no ball should have hit him, as we found in that place several balls beaten flat. We concluded that he was wounded, and not far from this. The people, therefore, requested permission to go in search of the man's corpse, in order to bury it, supposing that, by our continual firing, the lion would not have had time to devour it. I gave permission to some, on condition that they should take a good party of armed Hottentots with them, and made them promise that they would not run into danger, but keep a good look out, and be circumspect. On this seven of them, assisted by three armed Hottentots, followed the track, and found the lion about half a league farther on, lying behind a little bush. On the shout of the Hottentots, he sprang up and ran away, on which they all pursued him. At last, the beast turned round, and rushed, roaring terribly, amongst the crowd. The people, fatigued and out of breath with their running, fired and missed him, on which he made directly towards them. The captain, or chief head of the kraal, here did a brave act in aid of two of the people whom the lion attacked. The gun of one of them missed fire, and the other missed his aim, on which the captain threw himself between the lion and the people so close, that the lion struck his claws into the caross (mantle) of the Hottentot. But he was too agile for him, doffed his caross, and stabbed with an assagai. Instantly the other Hottentots hastened on, and adorned him with their assagais, so that he looked like a porcupine. Notwithstanding this, he did not leave off roaring and leaping, and bit off some of the assagais, till the marksman, Jan Stamansz, fired a ball into his eye, which made him turn over, and he was then shot dead by the other people. He was a tremendously large beast, and had but a short time before carried off a Hottentot from the kraal, and devoured him.

"I have been thus tedious, because I do not remember to have heard of such audacity in a beast; and the bravery of the Hottentot is also remarkable.

"The corpse of the man, as we found, had been griped by the lion with his left paw on the left side of the head; and being taken by the shoulder in the lion's mouth, was thus carried away. Both the thighs and the left shoulder were devoured. We brought both the corpses to the tent, and buried the man in the place from which he had been carried off. The lion was also put under ground, to prevent the cattle being frightened by the scent of him."

The surprise of a sentry with a cocked musket at the door of a tent of travellers by a lion, who marched him, unnoticed, to a neighbouring

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

bush; his quiet removal just at break of day in the jaws of the captor, a method of travelling so new, and so unusual, that no passenger can enjoy it a second time, is not an every day occurrence; but may be thought to place the name of J. Sterreberg Kupt, nearly in a rank with that of Baron Munchausen.

The third chapter contains the system of the Dutch government for the extermination of the Hottentots and Bushmen, and an extended description of the barterers. These latter, on an expedition, advanced to the kraal of Captain Snell, who became their leader and guide, and then proceeded to the attack of various kraals. After fourteen days journey, they came to those of the Gonaquas, which at break of day they surrounded, firing at the inhabitants, who fled; leaving 2,200 head of cattle, and 2,500 sheep, a prize to the so called barterers. Such is the posthumous fame of Capt. Snell, that he remains to this day a standing toast with the boors at their convivial meetings. To these inflictions on the persecuted natives, were added the ferocious attacks of the Commandos, sanctioned by the Dutch government, in order to effectuate the general destruction of the Bushmen. The first Commando, in 1774, in 8 days shot 96 Bushmen, and the women and children were divided amongst the captors;—second Commando took 118 prisoners; third Commando killed 142 Bushmen in the Bokkeveld; but Van der Merwe, who commanded, more humane than the government, made peace with the Chiefs, which the Dutch government resented, and cashiered the Veldcornets who concurred in the measure. The journal of Van Jaarsfeld, the leader of a Commando in 1775, after various adventures and petty murders, too trifling to be mentioned, recites that near (page 46,)

"About midnight the spies returned, saying they had seen a great number of Bushmen there, when I immediately repaired thither with the Commando, waiting till day-break, which soon appeared; and having divided the Commando into parties, we slew *the thieves*, and, on searching, found one hundred and twenty-two dead; five escaped by swimming across the river.

"After counting the slain, we examined their goods, to see whether anything could be found whereby it might be ascertained that they were plunderers; when ox-hides and horns were found, which they were carrying with them for daily use."

"The ideas entertained by this Commandant of the nature of his expedition, are sufficiently illustrated by the tone of his journal. It was to extirpate the *thieves;* but he has failed to record a single fact to shew how they merited this title. The ox-hides and horns found among them after the massacre afford no proof of their guilt, as these might have been the produce of their own flocks before they were plundered by the colonists, or they might have been honestly obtained from the frontier boors or Hottentots."

Thus it is, that, by a perversion or reversal of terms, it appears in the vocabulary of a Dutch Commando, that the Bushmen and the Hottentots, the original proprietors of the soil and of the cattle, were accounted the "*thieves*," and the Commando, who stole both the soil and the cattle "the honest men;" and in order satisfactorily to prove, beyond contradiction, that a party of Bushmen were plunderers, it was determined by the same law *first to put them to death, and then to inquire whether they were thieves or not!* Does not this remind the reader of the fusillade at Lyons during the French Revolution? This system was carried on with spirit in 1779; and, as late as 1792, an expedition was undertaken between Tulbagh and Salt River, and the following report was made to government, (page 51):

"In 1792, an expedition was undertaken against the Bushmen, occupying that district of the country which lies between the Tulbagh district and the Zak River, under the command of Van der Walt. The following is a copy of the report to government of his success:

"27th September.—Attacked the first kraal; killed seventy-five Bushmen, took twenty-one prisoners. Found one hundred and fifty wethers, thirteen head of cattle, and one musket.

"15th October.—Discovered another kraal; killed eighty-five Bushmen, took twenty-three prisoners; one hundred and twenty-four wethers.

"20th.—Discovered a third kraal; killed eleven; three prisoners.

"24th.—Discovered a fourth kraal; killed seven; four prisoners."

It is in the genuine and conscientious feeling between right and wrong, that the author brands with deserving infamy the ferocious and disgusting barbarities of the Boers towards the Bushmen; the more atrocious and cowardly, because practised by those in the use and possession of discipline and fire-arms, against almost naked savages, able to make little or no effectual defence, (page 58):

"Yet this oppressed and persecuted people were daily rendering the most essential services to the colonists. The protection of their numerous herds and flocks was entirely committed to their care. In deserts infested by wild beasts, and on plains where not a tree or shrub could be found to protect him from the vertical rays of the sun, or to shield him against the frosts and snows of winter, the faithful Hottentot wandered with his charge in search of food or water, a task which, but for him, must have devolved on his ungrateful master, and his slothful children. But the Cape farmer had already got a taste for slaves, which, once being excited, speedily stifles every idea of natural justice.

"No attempts had been made to improve their moral condition, to restrain their passions, or to refine their appetites. In this respect they have evidently degenerated since their intercourse with Europeans. But they still retained their characteristic and apparently unconscious adherence to truth, which is generally the first of the virtues that disappears before the frown of an absolute master; and that generosity, which is never satisfied so long as a morsel of food remains undivided among his companions, still distinguished the simple and improvident Hottentot. As for religion, it was considered a serious crime to mention the subject to a native. They were not admitted within the walls of the churches. By a notice stuck above the doors of one of the churches, '*Hottentots* and *Dogs* were forbidden to enter.'"

To the greater part of the above we can subscribe, and that it might be considered as a serious crime to mention the subject of religion to a native; but we cannot put such a strain upon our credence, as to admit the belief that notice was affixed to the doors of a church, "Hottentots and Dogs were forbidden to enter." Such a placard attached to any place, presupposes the power of reading in the parties forbidden; and we would ask, which was the language readable by a Hottentot at that period, or understood by a dog since the days of Æsop?

Arrived at this stage of our remarks, we must acknowledge, that up to this point, we partake in the disgust our author manifests at the continued outrages authorised by the colonial authorities. No shade can cover, no excuse can palliate the systematic enormities, practised against the Hottentots and Bushmen, during the occupation of the Dutch government. Happy is it, that their descendants have adopted that mild and just line of conduct which is now so evident, both in their private affairs and their public duty, and so completely at variance with the actions of many of their progenitors.

In the year 1795, the Cape of Good Hope fell into the power of the English.

LITERARY EXTRACTS.

THE ADVANTAGES OF SCIENTIFIC RESEARCH IN THE COLONIES.

Extracted from the speech of Mr. Frankland, at the formation of the Van Diemen's Land Society.

MANY persons there are who consider scientific research merely as the appropriate occupation of a particular class of men who are supposed to devote their time and minds solely to theoretical speculations, unconnected with practical advantages; but upon better consideration they would perceive that not only the principal changes in the relations of the world, but also most of our ordinary pursuits, and most of our comforts are the result of scientific discoveries, and *that* reflection should induce every resident in a new country, where the field for discovery is of course great, to turn his attention to such subjects as he may have the opportunity of investigating.

Our very residence in this island may be termed the offspring of science, for it was the progress of astronomy and navigation which led to its occupation. Without that progress, the navigators of Europe would still be creeping timourously along the western shores of Africa, dreading every gust of wind that might drive them out of sight of the known land marks.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

That ideal barrier, the torrid zone, would still be deemed an insurmountable obstacle, and the fables of ignorance would still paralyze every effort towards geographical discovery. But the progress of science induced far more glorious results; it rendered the most ungovernable elements the very will of man. Bold spirits, armed with those powers with which science supplied them, launched forth, and discovered New Worlds! The great promontory Southern Africa, was passed, and the vast regions of the east were at once opened to the flow of European adventure and European industry.

The amelioration in the state of those nations of India, which have become subject to England, is perhaps the most beautiful illustration of the practical effects of science that can be cited. Those great countries which from time immemorial had been a prey to every species of intestine rapine and confusion, are now, by the introduction of our institutions, resting in peace and security under the magic shield of their influence, and may, I think, be considered as gradually though slowly approaching the great era when they will embrace Christianity.

These, among others, may be classed with the advantages which, as regards India, have sprung from the culture of science. Would that it were possible to trace her steps with equal satisfaction to this naturally favoured little island!

Science led to its discovery, but its discoverers instead of bringing blessings in their train, have heaped ruin and destruction upon those children of misfortune, the Aboriginal owners of the soil—a people naturally amiable and intelligent, who with better treatment on the part of those who have come in contact with them, might have been rendered valuable friends, and have continued a happy nation! However, I should hope that there is yet time to restore that harmony which, but for the brutal inhumanity of white men, have never been broken; and surely no more glorious object could this Society propose to itself than that of acquiring a more intimate acquaintance with this much wronged people, with a view of ameliorating their condition, and of saving them from being extirpated from the face of that earth on which the Almighty had placed them!

THE DUTCH AND FRENCH LANGUAGES.

THERE are few feelings stronger in Holland, than that of contempt for the language of France. Its prevalence in Belgium is likely to be an insuperable bar,—if others were wanting, which assuredly they are not,—to any thing like a cordial co-operation between the northern and the southern states. Of the abhorrence with which the Dutch regard the French tongue, the following lines of Bilderdyke [the illustrious poet of the Netherlands, and possessing a mastery over his language,] are an amusing example:

Maar weg met u, ô spraak van basterd klanken
Waarin Hijeen en valsche Schakals janken;
Verloochnares van afkomst en geslacht,
Gevormd voor spot die met de vaarheid lacht:
Wier staamlarrij bij eeuwig voordverbreken,
In't neusgehuil zich zelf niet uit durft spreeken:
Verfoeilkij Fransch! alleen den duivel waard,
Die met uw aapgegrijns zich meester maakt van de aard.

TRANSLATION.

Begone, thou bastard tongue!—so base—so broken—
By human jackals and hyenas spoken;
Form'd for a race of infidels, and fit
To laugh at truth—and scepticize in wit;
What stammering, snivelling sounds, which scarcely dare,
Bravely through nasal channels meet the ear,—
Yet helped by apes' grimaces—and the devil,
Have ruled the world, and ruled the world for evil!

(The Foreign Quarterly Review.)

CHIEF CITIES OF THE WORLD.

A VERY ingenious calculation is given in a late German publication, of the hundred most populous cities in the world. These are—Jeddo, in Japan, 1,680,000 inhabitants; Pekin, 1,500,000; London, 1,300,000; Hans Ischen, 1,100,000; Calcutta, 900,000; Madras, 817,000; Nankin, 800,000; Congo Ischen, 800,000; Paris, 717,000; Werst Chana, 600,000; Constantinople, 597,000: Benares, 530,000; Kio, 520,000; Su Ischen, 500,000; Houng Ischen, 500,000; &c. The fortieth in the list is Berlin; containing 193,000; and the last, Bristol, 87,000.—Among the hundred cities, two contain 1,500,000; two upwards of 1,000,000; nine from 500,000 to 1,000,000; twenty-three from 200,000 to 500,000; fifty-six from 100,000 to 200,000; and six from 87,000 to 100,000. Of these one hundred cities, fifty-eight are in Asia, and thirty-two in Europe, of which four are in Germany, four in France, five in Italy, eight in England, and three in Spain; the remaining ten are divided between Africa and America.

SIGNIFICATION OF COLOURS.

1. *Yellow.*—Honor, height of spirit, which, being never separated from virtue, of all things is most jealous of disgrace, and may not endure the least shadow of reputation. 2. *White.*—Signifieth innocence or purity of conscience, truth and upright integrity without blemish. 3. *Black.*—Wisdom and sobriety, together with severe correction, of too much ambition, being mixed with yellow; or with too much belief or lenity, mixed with white. 4. *Blue.*—Faith, constancy of truth in affection. 5. *Red.*—Justice, or noble worthy anger, in defence of religion, or the oppressed. 6. *Green.*—Good hope, or the accomplishment of holy and honorable actions. 7. *Purple.*—Fortitude with the discretion, or a most true discharge of any trust reposed. 8. *Tunnis* or *Tawny.*—Merit or desert, and a foe to ingratitude. 9. Ermine (a rich fur, with curious spots.)—Signifieth religion or holiness, and that all aims are not divine objects. Now, from these colours and their mixtures are derived many dishonorable colours, as carnation, orange, popengie, &c. which signify craft, pride, and wantonness. *(Werner.)*

GLEANINGS.

THE late Doctor Parr once asked a friend, who had been hearing him preach for *an hour*, how he liked his discourse. "Why, to speak the truth," frankly said the other, "there were four things in it I did not like to hear." "State them," replied Parr, eagerly, "Why then," replied his friend, "they were the four quarters of the church clock which struck four times before you had finished it."—The Hulsean prize (Cambridge) is adjudged to T. Myers of Trinity College; subject, "The extent of the knowledge which the Jews had of a future state, at the time of our Saviour's appearance. The subject of the present year is, "The futility of attempts to represent the Miracles recorded in Scripture, as Effects produced in the ordinary course of Nature."——M. St. Hilaire has been employed in investigating the litigated fact whether the mole sees.——The temperance societies of Glasgow and other cities have prospered beyond the most sanguine hopes of their founders.——It appears from a calculation in the last number of the Edinburgh Review, that the people of England, though only half as numerous as the people of France, consume at an average about five times as much sugar as a Frenchman.——There are now one hundred and one establishments in France for the preparation of sugar from beet-root, and another hundred in preparation.——The silk manufacture of England is stated to be at this moment, twice as extensive as in 1821, 1822, and 1823.——The importation of gloves from France into England, has decreased during the last six months to the amount of 22,328 dozen. ——*Chemistry.* The simple substances at present known (exclusive of light, heat, electricity, and magnetism,) constitute fifty. By the union of these fifty bodies with each other, all the compounds of which the globe consists are formed.—*Bleaching.* Before the middle of the last century, the business of bleaching was in the hands of the Dutch. About the year 1760, Dr. Hume of Edinburgh, proposed to substitute sulphuric acid for the sour milk which had been hitherto used by the Dutch bleachers. The suggestion was acted upon, and the consequences was, the immediate reduction of the time of bleaching from nine months to three. About the end of the last century, chlorine began to be substituted for exposure to the sun on grass; and this substitution, after immense investigation, has been brought to complete perfection. The most extensive bleaching houses in Glasgow, are now situated in narrow lanes, where neither sun nor grass is to be met with; and it is no uncommon thing to receive unbleached goods on the morning of one day, and to return them bleached and ready for the market on the evening of the next! —— *Craner.*—This distinguished prelate, who, though admirable in his religious feelings, was almost always wrong in his political conduct: so dangerous is it to mingle politics with piety,—the great and busy world of man with all the nobler objects of his higher destiny.—The Cherokee Indians are able to read their own and the English language. A newspaper, partly in English and partly in their own language, has been published, which is characterized by decency and good sense.—By means of the intended Bath and Bristol Rail-road, it is estimated that the distance between the two cities will be performed in twenty-two minutes.——*Dear Dinner.*—When the Allied Sovereigns and their satellites honored the British Metropolis with their august presence in 1814, they were entertained, as some of us recollect, by the Corporation of London, with a truly regal feast, the precise cost of which has only now transpired, £20,347. 5s. 2d.——When the celebrated and laborious missionary Dr. Van der Kemp first introduced a printing press into the interior of this colony, a farmer was anxious to know its uses. On being explained to him, he seemed much pleased, and by way of encouraging the newly-introduced art, immediately gave an order for a folio bible with plates, to be ready the next morning.——One subject of congratulation is afforded in the last news from Lisbon: Miguel, unable to obtain money from other quarters, has ordered a levy to be made on the monastic orders, amounting to £150,000.——The North American Medical Journal says, that not only burns but blisters are best healed by the application of finely carded cotton; half an inch or more in thickness This dressing, it is added, gives no pain, and will generally ensure a new cuticle in two days.—The same journal states, that apples may be preserved

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

fresh and plump till the next summer, by placing them in dry sand as soon as gathered.——A good fire, on a winter's day, at a mere trifling expense, is of importance to a poor man. One penny-worth of tar, or rosin water, will saturate a tub of coals with triple its original quantity of bitumen, (the principle of heat and light.) and, of course, render one such tub of three times more value than it was unsaturated.——The number of the trading vessels of Great Britain, exclusive of the Royal Navy, is upwards of 24,280. The capacity of these vessels is two million five hundred and fifty-three thousand and six hundred and eight-five tons; and they give employment to upwards of one hundred and sixty-six thousand men and boys. —— *The mole.* — M. Flourens, a French Naturalist, has late made some interesting inquiries into the organization of the mole, and has found that it is not exclusively, if it is essentially carnivorous. It dies very soon if it be kept only upon vegetables; and though it is known to destroy roots of all sorts, it is not for the purpose of eating them, but to seek for worms and insects, and particularly for the eggs of insects. If kept upon any animal substance, it will live a long while. Ten or 12 hours is the maximum of the time which it can live without nourishment; and, like all animals which exist upon blood and flesh, it always drinks with great avidity.——The first book printed in the English language was in 1471.—— *False Economy.*—Many fathers there are, that so love their money and hate their children, that lest it should cost them more than they are willing to spare to hire a good school-master for them, rather than choose such persons to instruct their children as are of no worth—thereby beating down the market that they may purchase a cheap ignorance. It was therefore a witty jeer which Aristippus bestowed on a sotish father, by whom being asked what he would take to teach his child, he answered a thousand drachms. Whereupon the other crying out, "O Hercules! how much out of the way you ask, for I can buy a slave at that rate." "Do then," said the philosopher, "and thou shalt instead of one, purchase two slaves for thy money—him that thou buyest for one, and thy son for another."—— *Well-educated Princes.* The Sons of the Emperor of Austria have all been taught some trade; the hereditary Prince being an excellent weaver, and his brothers good carpenters and *cabinet*-makers.

MISCELLANEA.

The South African Institution.—At the Monthly Meeting of the South African Institution (28th ultimo), Messrs. Nisbet and Borcherds, and Dr. Bailey, of Cape Town, were elected ordinary Members, and Lieut. Biddulph, R.N., Bathurst, was elected a Corresponding Member of the Institution.

There were read—I. A continuation of "Remarks on the Geology of South Africa," by the Rev. Dr. Thom, of Tulbagh,—pointing out the localities of a particular class of fossils found in the older rocks, and giving their characters.

II. A continuation of the "History of the Cape Colony," by the Rev. M. Borcherds, of Stellenbosch, describing the second year of Van Riebeck's government.

There were laid on the table—A Register of the Weather at Algoa Bay, during the year 1826, and six months of 1823, transmitted by Capt. Evatt, Commandant of Algoa Bay; and also a Chart of the Harbour at Port Natal, forwarded by Mr. Frances, Port Captain, Algoa Bay.

Port Beaufort.—A Reading Society is commencing at this place, under the superintendance of Mr. Dunn, the Government Resident. The books, from the list which we have seen, appear to be judiciously selected. A *Correspondent* from Port Beaufort, writes—"We are desirous of erecting a small Windmill, but in the absence of many of those advantages which are possessed by the residents of Cape Town, we require some instruction. *Mr. Marsh*, of Saldanha Bay, is said to have built one which combines utility with strict economy. Could we be favoured with the plan, it would be a public good to these parts."

Mr. Dunn also writes—"I have found water where I now reside, but it is about 11 feet under-ground. Port Beaufort having been destitute of that necessary article, this discovery is of great public advantage; but I wish to be informed by any of your readers, or others, of the best and *cheapest* method of applying it to the purposes of irrigation, &c. &c. A rope Suspension Bridge would, it appears to me, be applicable to the Breede River. What say your Correspondents on this subject?"

Graaff-Reinet.—Extract of a letter. "The receipt of the first number of the *Cape of Good Hope Literary Gazette*, was hailed here with the most ardent good wishes for its success. It has given a stimulus to our exertions in endeavouring to promote the best interests of the Colony. Within the last three weeks our Library has been renovated, and its scale much enlarged. More than *forty persons* have been enrolled as subscribers, and a large Reading Room is now being fitted up in the most convenient style."

Robben Island.—A very interesting survey of this island, with its buildings, pier, &c. has been taken by the Commandant, Lieut. Pedder, and is now in Cape Town. The marine view attached to it, and the distant mountain scenery, coloured from nature, constitute it an agreeable picture.

Cape Almanack.—Mr. Stapleton proposes to publish a neat *Pocket Almanack*, for 1831, which is to embrace every topic of colonial interest. The price not to exceed Half-a-crown. Mr. S. intends to continue at the same time, his *Sheet Almanack*. The price not to exceed one shilling and six-pence.

The Yam.—A traveller of respectability assures us that this vegetable, which was introduced by Capt. Johnstone, of the *Thorne*, with a view to its naturalisation in the Colony, is now flourishing in the garden of Capt. Harker, of Plettenberg's Bay.

Literary and Scientific Institutions.—In a discourse pronounced at the extraordinary sitting of the Imperial Academy of Sciences of St. Petersburgh, held last November, by Baron Humboldt, which comprehends a general view of the Scientific researches in the Russian Empire, we find the following passage:

"It is to *Scientific bodies* which are renewed without interruption; it is to *Academies*,—to *Universities*,—to different learned societies in Europe, in the two Americas,—at the Southern extremity of Africa,—in India, and in that Australasia lately so uncivilized, and where there has already risen a temple of Urania, that we must look for regular observations; to measure and to watch, as it were, whatever is variable in the economy of nature."

In reference to the Temple of Urania in Australasia, Dr. Brewster, from whose Journal we have taken the above extract, appends the following notice.

"This Observatory was the work of our eminent countryman, Sir Thos. Brisbane, whose fate it seems to be to have his labours every where praised, and even the observations which he established, published without the mention of his name."

Literary Notice.—Dr. Howison, the talented author of Sketches of Canada, &c. announces for immediate publication, a work entitled *Tales of the Colonies*. It consists of four stories; the scene of the first is laid in the Brazils; the second, entitled the Island, opens in Ireland, and is transferred to Vera Cruz, and the adjacent islands; the third, Sable Grove, is placed in the island of St. Thomas; and the fourth, which is understood to be of very commanding interest, continues throughout the Colony of New Holland.——The volumes which are to follow this publication, *may* probably refer to the Cape of Good Hope.

Mr. Burchell, the Traveller.—Mr. Burchell has at length returned to England, after an absence of nearly six years. In this period he has explored those vast inland provinces of Brazil, into which no European traveller, at least of modern times, has ventured to penetrate. Provided with the finest set of mathematical instruments that could be made, his observations in South America, may be supposed even more accurate than those made by him in Southern Africa; while his zoological and botanical collections are immense.—(*Spectator, May* 22.)

LITERARY AND SCIENTIFIC NOTICES.

The following works of interest are announced in the London Journals of the 30th of May, to be nearly ready for publication:

I. The Doom of Devorgoil; a Melo-Drama.

II. Auchindrane, or the Ayrshire Tragedy; by Sir Walter Scott, Bart.

III. Literary Recollections; by the Rev. C. Warner, 2 vols. (26*s.*)

IV. A Practical Treatise on the Cultivation, Medical Properties, and History of Tobacco; by Jas. Jenkins, Esq. (5*s.* 6*d.*)

V. The second volume of the Life of Lord Byron; by Thomas Moore, Esq.—To be ready in May.

VI. The Present Condition and Prospects of the Greek or Oriental Church; by the Rev. G. Waddington, Author of a Visit to Greece. (6*s.*)

VII. A Letter on the present Neglect of the Lord's Day, addressed to the Inhabitants of London and Westminster; by the Rev. C. J. Blomfield, D. D. Bishop of London.

N.B. Bishop Blomfield's zeal on this all-important subject, appears to be in no degree less than that of his illustrious predecessor, the late Dr. Porteous. In the course of the last year, the Bishop of London gave an audience to a deputation from the Dissenting Ministers of the Three Denominations of London, who waited on his Lordship to confer with him on the growing neglect of the Sacred Day—hitherto the bulwark of our common christianity, and deservedly hallowed by our pious ancestors.

TO CORRESPONDENTS.

A Friend will not be forgotten.

However felicitous many of the expressions in the verses of *Mary*, they are, nevertheless, not quite the thing.

The "Elegy on a Cow which died a board the ———, Indiaman, on a voyage to the Cape," is too sportive for a *grave subject*. That part of it, however, which is the *cream* of the argument, we record for the benefit of the public. The poet (the reader must premise), having promised to see the Cow decently interred, receives the following grateful acknowledgment:

"Great thanks, great thanks!" the Cow replied,
Before she fell down *dead*—and *died*.
"And for this I shall impart,
A secret that will cheer your heart;
I leave it you——as Codicil
To this my last and only Will.
First take of almonds half-a-pound,
Their jackets off—let 'em be ground
With white sugar a double weight;
These with water care*ful* treat,
Adding by degrees ——— until
The vessel to the top you fill;
This do:—and I'll maintain
You will not want for milk or cream."

Printed and published by W. Bridekirk, Heeregracht, Cape Town.

The Cape of Good Hope Literary Gazette,

DEVOTED EXCLUSIVELY TO

LITERATURE, CRITICISM, SCIENCE,

AND THE ADVANCEMENT OF USEFUL KNOWLEDGE.

No. 4. CAPE TOWN: WEDNESDAY, SEPTEMBER 15, 1830. PRICE, { *Five Shillings per Quarter.*

PARAMOUNT CLAIMS.

We are indebted to a correspondent *(Ludim)*, for reminding us of the existence of "*The Ladies' Benevolent Society*, for the relief of the destitute, and instruction of the children of the poor" in Cape Town. Such a hint is well timed. The poor are frequently overlooked in the midst of that bustle and rage for *new things*, which are so characteristic of modern times. Almost every day, bears witness to some new scheme for raising money in Cape Town. Pleasure and Vanity are always on the alert, and even Folly assuming Religion's garb, has been lately on a begging tour, with *sounding* pretensions.

In the ancient world, there were many poor, but no *paupers*,—taking that term in the signification of it adopted in our economical and law language, as meaning those indigent persons whose relief is the object of certain political regulations and enactments. In the free cities of Greece, a large share of the inhabitants existed in the servile state; and this was the case also in Rome, though she too boasted of her liberty. There, a great part of the lower orders was actually the property of the rich, who, it may be presumed, generally took the necessary care of them; and thus would of course supply the place of legislative arrangements. During the existence of ancient slavery, therefore, both the laws of the nations and the works of their historians, are silent on the subject of such provisions; and we have no recollection of more than one instance to the contrary. We allude to its having been customary at Rome to send such slaves as were sick, into an island in the Tiber, without medical aid, merely because *Esculapius* had a temple there; and Dio Cassius tells us, it was enacted by the Emperor Claudius, that all who thus recovered their health, was set at liberty.

The provisions that were made for the poor under the Jewish dispensation, are too well known to require comment; and in the same spirit, Christianity, softening the rugged nature of man, enjoined him to feel and care for his fellow-creatures. Thus we learn, that among its early disciples, weekly contributions were "laid down at the Apostle's feet, and distribution was made unto every man according as he had need." The wealth of the Catholic Church, in latter ages arose from the grants of the pious, and the dying. Accordingly the gates of monasteries were daily frequented by numerous poor, who were supplied with a liberal hand. Turner, in the account of his embassy to Thibet, tells us, that the Lama feeds daily several hundreds of the poor of his own religion; and that he maintains also many Mussulman supplicants, though these are heretics as to him, thus setting no bad example to many who draw their morals from a purer source. The consideration of a provision for the poor leads to two questions of not a little importance on this subject. First, To what extent ought the poor to be relieved, or in what degree of *comfort* ought they to be kept? And, secondly,—Ought assessments to be at all resorted to, or should the poor be left entirely to the operation of voluntary benevolence?

Montesquieu has remarked, that, "the state owes to every citizen a certain subsistence, a proper nourishment, convenient clothing, and a kind of life not incompatible with health." It is difficult to hit the just medium in doing this; but the safe side to err on, even for the ultimate advantage of the general body of the poorer people themselves, is, we apprehend, rather to keep under than to be above the mark. A premium will be otherwise afforded to pauperism, which will naturally attract adventurers; and this will happen to the great annoyance of those on whom they are a burthen, while they themselves will be far less happy than they would have been, had regulations of a different kind forced them to depend more on their *own exertions*. For the writer already quoted justly says, that "a man is not poor because he has nothing, but because he does not work." Whatever contributes both to the habits and opportunities of industry, must enlarge the sphere of individual comfort and happiness. All means ought therefore to be adopted to enable men, not only in the mean time to maintain themselves and their families, but to lay up somewhat against *bad times, the day of trouble, sickness,* and *old age;* and as the aid which *charitable societies* and *savings banks* give towards that object, are of the greatest importance, every *assistance*, every *publicity*, and every fostering *encouragement* is due to them.

Again, that the poor have a RIGHT to relief, is founded in the nature of things. To prove this would, an age ago, have been deemed quite superfluous; the new school has, however, ventured to contradict this Right, and in no very hesitating terms. Mr. Malthus, for instance, has asserted, that such have "no claim of right to the smallest portion of food." The subject is too extensive for our limits—it should supply *materiel* for the columns of a *daily* paper, or become an ample theme for discussion, should any of our young collegians be inclined to establish a *forum*, in imitation of the distinguished public characters of ancient and modern times. In such a case we recommend the following authorities, in contradistinction to the reveries of Malthus:—*Moses, Grotius, Puffendorf, Locke, Paley, Burn, Johnson*, and *Dwight*,—to which might be added many more of deserved reputation.

We now return to the question with which we commenced this paper—*The Ladies' Benevolent Society*, at the Cape. Here we have no poor-laws, and there is no specific for the evils attendant on human life but through the exertions of those who come forward with their voluntary contributions. The

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

poor, who are *members* of the Reformed Colonial Church, appear to be well taken care of,—the collections on Sundays and holidays providing the means. This is according to the method adopted in Scotland, and which, in the midst of much public calamity, has generally proved efficient for all the exigencies of the times. But, in a colony like our own, where the population is daily increasing, and where there are thousands who are *not* members of the church in question, it must of necessity occur that there are very many who look up to the hand of disinterested charity for relief, and who have no legal means of obtaining assistance but through the casual benevolence of the public, and the praiseworthy exertions of "The Ladies' Benevolent Society." Without such aid, we would ask—What are to become of the infant poor, the sick poor, and the aged poor? We leave such as are rich in this world's goods, and those who are blessed with a competency, to answer the question. In the mean time, we wish every success to the quiet labours of the society which we have been endeavouring to recommend. To be a conspicuous member of some popular institution, the splendid successes of which are among the memorable events of the age, is oftentimes in itself a powerful stimulus to our weakness and our vanity. But to labour steadily in a contracted sphere; to make a few obscure individuals the objects of our solicitude; to toil in the humble details of unostentatious duty, doing a little good in a little way, though not perhaps without as much anxiety and exertion as are usually called forth by the most enlarged operations of public benevolence, present a trial of christian patience, from which many an individual has shrunk who would perhaps have figured with great applause in a more bustling and stimulating scene. Those who would try their own spirits, let them engage actively in the unambitious details of some minute local charity, (similar to that of *The Ladies' Benevolent Society*) the success of which, when it most succeeds, is not on a scale sufficient to gratify personal vanity by calling forth the notice of the busy world; and if they can endure the discouragements incident to such a sphere of benevolent operation, they may conclude that they have in their hearts that true spring of charity which never faileth.

THE CAPE OF GOOD HOPE.

AFRICA has always been considered the least hopeful division of the world; but it has been said, and WE BELIEVE, that the moral wilderness shall yet *rejoice and blossom as the rose.* As far as it regards the Southern portion of it, we think we can discover in the signs of the present times, some proof that the colony is making very rapid strides in *Knowledge and Wisdom.* We have a host of correspondence on this subject, and we only wish the Right Honourable Secretary of State for the Colonies, could just cast his eye over our round table, and examine the communications of correspondents from the interior of the country, and beyond the frontier, during the last month. Human improvement, it must be acknowledged, however, is only commencing in the colony: that we live in times well calculated to carry it on, to an indefinite extent, cannot be doubted. Whatever hindrances to the advancement of knowledge still exist among us, they are not of the number of those great obstacles which, in former times, limited or interrupted the progress of improvement. And such hindrances are all in the way of being overcome by the natural course of events, and the exertions of voluntary associations. Indeed, nothing short of the power of such, can carry into anything like successful operation, all the means which are necessary for civilization,—means which lie far beyond the reach of any individual. With the improvement of public opinion, governments must also improve. The more free the government, the greater is its influence. We must all readily enough admit, that our own colonial government is endeavouring to accommodate itself to the views of the colonists, at the present moment, to an extent altogether novel in the history of the settlement. We mean no reference to *politics*, but as simply connected with the advancement of knowledge. Much of the literature of the present age, appears in reviews, magazines, and even newspapers, and our government is most liberal in the transmission of such to all parts of the colony. At the same time, we could point out a few improvements of beneficial tendency. We could wish all restrictions on the press removed. As we have no barbarism now existing in our councils or our courts,—at least, in this angle of the colony,—and no conscious feebleness in either, that is afraid of the light of day, why should a single shackle remain to remind us of times that should be forgotten, or lost in the "oblivious pool?" Again, a stamp duty on newspapers might be dispensed with. Its existence militates against the wider extension of our language, and acts as a preventive to the enactions of the home government, that there shall be *one community of language* in the colony. The same may be said of almanacks for the people,—the duty on which might be repealed, or considerably diminished. But we leave these things to the conductors of the newspaper press, and throw out a hint by the way, that in their department we could wish a *change for the better.* The improvement of many thousands of our population is a sacred deposit, and should be duly estimated by every man of influence. There is a germinant feeling abroad,—and it is the duty of the press, and rulers, and judges, and magistrates, and ministers, and missionaries, and school-masters and others, by a kindly breath, to awaken, unfold, and nourish it. We have been induced to throw out these hasty hints, because we have observed a greater degree of respect manifested towards the colony in the public journals of Europe, than formerly. There is an importance ascribed to it, which formerly did not exist. The bare mention of the Cape a few years since, provoked a sneer, or an ebullition of that home-bred arrogance, which is so peculiar to some of our countrymen. In forming an estimate of the colonists, they should have considered, that, in a great many instances, their views were naturally limited by the lowness of their position. The moral horizon gradually widened, as the *means* of instruction were provided. It should be the anxious study of the people of the colony, that they continue to merit the new character which they have happily attained.

But without multiplying reflections, we hasten to present our readers with a few gleanings, which more or less bear on South Africa.

PICTURE OF AFRICA.

The name of Africa is fraught with many topics of powerful interest. Its rivers have their birth in impenetrable solitudes; the principal part of its inhabited regions lies beyond deserts which daunt the spirit of adventure or enterprise; and its forests, that are populous with the wildest creations of nature; its mountains, that are clothed with the gloom and mystery of ancient fable; and the whole mighty

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

extent of the continent, embracing the remains of empires glorious in the history of the earth,—rendering the name of Africa a sort of spell-word for conjuring up strange images, and those grand, but obscure shadows, which hang about the objects or countries that repel us by their magnitude or distance. Africa is neither so ancient as Asia, nor so venerable for its history, but it is wrapped far closer in obscurity: there are darker spots in its vast surface for the imagination to dwell on, and the legends and traditions, accordingly, which belong to this quarter of the world, are of a wider and gloomier character than those of Asia, or either of the modern continents.

Southern Africa has many claims to our regard; it has been pointed out to us as an advantageous situations for large colonies of our countrymen; several missionary stations have been established there; and an intercourse has been thus commenced systematically with the natives, which may be expected to produce important consequences.—*Monthly Review.*

AFRICAN DISCOVERIES.

We do not know of any enterprize, connected with Africa, of which we should hear with greater pleasure, than the appointment of a mission, whose object would be to traverse and describe that continent, from the boundary of our settlements in the north, to the sources of the Nile in the east, and the banks of the Niger in the opposite direction. For this purpose, persons should be chosen, if possible, from the Cape of Good Hope, who are accustomed to some, at least, of the African climates. It is quite unnecessary to select these pioneers of discovery from the ranks of professional learning or bravery. Men of plain sense, who can note down whatever they may observe that is worthy of being recorded; who can endure privation, and accommodate their tempers to the strangers whom they mingle with, would sufficiently answer every useful end which a *preliminary mission* could be required to attain. If they play on musical instruments, and do not despise now and then a little buffoonery, they may go where they like without danger of molestation. Lander tells us that that a fiddler, provided he was not blind, might travel, not only with safety, but with universal applause from Badagry to Bornou.—*Ib.*

THE HORTICULTURE, &c. OF THE CAPE.

Extract of a letter to the Conductor of the Gardener's Magazine, dated Cape Town, Nov. 2, 1829.

An interesting society, by the name of the "South African Institution," has been established here. I sent you two of our newspapers, which will give you a brief account of their proceedings: we are, however, too poor to carry into effect every object of the Institution; but it is highly necessary to the improvement of the colony, of whose resources and value Europe is as yet partially ignorant. A spirit of improvement is prevailing among us, but the mass of the population from their confined education do not permit of much domestic change as yet. That you may judge of the deplorable state of husbandry which is practised here, I sent you the copy of the *Calendar*, originally written 130 years ago, and the proof sheets of a revision for the year 1830, which I have given, but I do not permit my name to be attached to such an imperfect production. I am in hopes that a botanic and experimental garden will be established in a short time. I shall give you early notice the moment the thing is formed. The wilful and scandalous neglect of this colony by the British government has been continued in a most unparalleled degree, and that against its own interests. The present governor, Sir Lowry Cole, gives general satisfaction; but his hands are tied in many respects, which may be ascribed to the reports of the commissioners, who were misled by false evidence, and worse conclusions while here; it would lead me too far into political discussions to point out those mis-statements, but I could do it, and completely and effectually confound those persons, whose interested evidence was given in expectation of individual reward or special favour from the late governor.

I am happy to inform you that your various publications have a place in THE PUBLIC LIBRARY here, but as yet little attention has been paid to them; they would, however, claim attention, were you to give us some broad hints respecting the Cape, and indeed it is for this reason I send you the *Calendar*, and shall be glad to answer any queries you may be pleased to send.

A *Quarterly Journal* of the Institution will be printed, of which I shall send you a copy; there may be some food in it for your *Magazine of Natural History*. Whether my papers will be printed I do not know; but they are of a local nature, and consequently uninteresting to Europe.

I have refrained from sending you any communications on the Cape botany as yet, as I hardly know where to fix my attention to what might be generally useful. But my unwelcome detention so long in Cape Town has allowed me to observe the habits of various plants deserving attention, and which I shall put into form at some favourable opportunity.

In your *Encyclopædia of Plants*, which I have seen in the public library, I perceive some errors which I did not expect; but a singular one is, the placing of Crássula quadrangulàris of Burrmann among the *Euphorbiáceæ*. I am the only person at the Cape who knows the plant, and I believe the European botanists are unacquainted with it. It is not at present within my reach.

It is not only with surprise, but also with regret, that I find a plant of mine has been called Clívia nóbilis, while the name published by Dr. Hooker is the only authorised one. It was only a few days before I left England that I refused to name the plant to any person but Dr. Hooker. I must say that I am much displeased at the whole transaction.

This colony is slowly improving. The settlement at Swan River has already been of benefit here to the farmers. Persons emigrating to the new settlement would do well to purchase their stock of cattle, horses, sheep, pigs, and poultry, &c., at the Cape; which they can do at one fifth of the cost in England, independently of the expense of transport, the voyage from the Cape to Swan River is about one month, perhaps less. We have not yet heard thence, but expect to hear every hour, and are anxious to learn how they get on. Mr. Drummond and family resided in the same house with me, and left this in excellent health; the short stay he made here enabled him to take with him some of our fruit trees, and at a season for having every chance of success.

We have had a cold winter, and abundance of rain; much more corn has been sown than at any former period, and we anticipate an abundant harvest.

I wish you could persuade one of the English nurserymen of your acquaintance to send on trial a few one-year headed-down or maiden fruit trees, placed in a tin case and closely soldered down. I would thankfully return, to the value of £10, South African seeds and bulbs. An experiment made here of confining fruit trees, soldered down for four months, has succeeded.

We want the Orleans Plum, Green Gage Plum, Moor Park Apricot, Swan's Egg and good Keeping Pears, good Keeping Apples, Morello and other good Cherries.

I shall write to you again as soon as possible, but I hope you will favour me with a few lines as soon as you receive this; and, if you can persuade any person to send plants on trial as above, I will send to the value as mentioned, whatever state the trees may arrive in, whether good or bad. I wish the experiment to be made, and will publish the result. They should be marked "Fruit Trees," and sent by one of the Cape traders.

I have been so frequently disappointed in receiving good kitchen-garden seeds from England, that I have declined sending positive orders for more; but if any seedsman of your acquaintance would send to the amount of about 5*l.*, I would immediately return Cape seeds and bulbs for them; they should be packed in brown paper, or canvass, and marked garden seeds. The following are the most wanted:—Cauliflower, York Cabbage, Red Cabbage, Radish of sorts, Royal Dwarf Peas, Prussian Peas, Scorzonera, Dutch and Stone Turnip, Curled Parsley. The Cauliflowers, Turnip, and Radish are the most essential. If directed to me by any of the Cape traders, they would be sure to come safe. With best wishes I remain, Sir, &c. J. B.

NOTICES OF THE CAPE, &c.

From the brief Memoirs of the late Dr. JAMES, Lord Bishop of Calcutta, by EDMUND JAMES, M.A. 8vo. 1830.

The Colony of the Cape is not included as part of the widely-extended diocese placed under the charge of the Bishop of Calcutta; but as the Church *arising* there, had never hitherto enjoyed the benefit of any episcopal visitation, which was felt to be much wanted, the Right Hon. Secretary for the Colonies thought it advisable that the Bishop James should be charged with a special commission from the crown, to commence his *episcopal* functions at that place. Accordingly, after receiving the visits of the chief officers of the government, his first and most anxious wish was to take measures for calling a public meeting of the inhabitants, with a view to raising subscriptions for building an English church; next, to make arrangements for holding a confirmation, of which he had previously given notice by a letter from England to Mr. Hough, the Colonial Chaplain; then to visit the free-schools, the hospital, and other establishments; and to make inquiries into the means adopted for extending the benefits of religious instruction in the colony, and into some special matters, which had long wanted inquiry, and were now committed to his charge."

The following is an extract from the Bishop's speech at a public meeting for promoting the building of an Episcopal church in Cape Town:

"We are all Christians, and are bound, as a proof of the love we bear to our common Master, to *love one another*. We, indeed, have more especial reason to make such acknowledgment in this town, where we have received the kindest testimony of this Christian feeling from the Presbyterian Ministers, and the whole body of the Dutch Reformed Church, who have ever been forward to afford us a place of devotion, by accommodating us within their walls as brothers in Christ." * * * "I have come amongst you with no power, no jurisdiction; I come on a mission of charity and of peace; and if in the course of this day I have spoken of *our* proceedings—if I appear to have identified myself, more than I was in strict reason entitled to do, with the concerns of the colony, you will forgive the expressions, which have arisen only from the warmth and sincerity with which I have felt your cause. * * * I shall quit your shores with regret, I carry a pleasing remembrance with me withersoever I may go."

While he was at the Cape, the Bishop found an opportunity of sending a pastoral letter to the islanders of Tristan

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

d'Acunha. The following is an extract:

"My Christian Friends,

"In passing through this quarter of the globe on my voyage to India, I could not but feel anxious to hear something relative to the conduct and happiness of those of my countrymen who are so far separated from the rest of the world as the settlement at Tristan d'Acunha. I could gain here little or no intelligence of you that was of a late date; but I have heard, with sincere pleasure, that you zealously promote the observance of the Lord's day among you: and let me hope that so sacred a zeal may meet with no relaxtion; let me hope that your children, when *baptized by yourselves*, will be brought up, as you yourselves were brought up, *in the nurture and admonition of the Lord*. So may they be a blessing to their parents, and live long to inherit the land.

"Receive the assurance of my prayers for your welfare both here and hereafter, from

"Your sincere friend,

"J.T. CALCUTTA."

Copy of a letter to Mrs. James, College-Green, Worcester:

"Government House, Cape Town,
"Oct. 24, 1827.

"My dear Mother,

"I have scarcely had one moment to myself since I landed, and have not been able to go out to see any thing, except that once, on a public meeting being put off, we went in the Governor's carriage to visit Constantia farm: however, all people seem in good humour, and that is amends enough for any trouble. * * * I have now finished my official letters, and take up my pen for you. Marianne is gone to see the laying of the foundation stone of the Scotch Presbyterian church. I heartily wish it was ours. Had the English church, for which we have now set on foot a subscription, been began one year ago, no Scotch church would have been thought of; [the contrary is the fact,] they would have been well content to have joined us. However, one cannot but feel that they did right. At four o'clock, I go to meet the Imaun, or head Mahometan Priest of this place, who defers to my authority, as a "man of God," as he says, to compose the differences between himself and some of his followers;—curious enough. I hope to establish a friendly feeling with them now, and trust, by the blessing of God, I may be able to draw something better from the occasion by and by; at any rate it is a very singular occurrence. Almost all the slaves here are Mahometans. * * * *

"Believe me always,
"My dear Mother,
"Your affectionate son,
"J. T. CALCUTTA."

Extract of a letter from the Bishop to R. W. Hay, Esq. Colonial Office, Downing-street:

"We all enjoyed our eleven days at the Cape extremely. * * * I shall, I am sure, always feel great interest in every thing that concerns the welfare of that place; and am indeed, glad to think that a better system for the natives is likely to be adopted under certain regulations. * * * *The people* were highly delighted with *Lord Goderich's* kindness with regard to the building of the church; the public meeting held on the occasion, being a novelty, was extremely well attended, and I have to thank his Lordship for placing me in so agreeable a situation. They seemed much gratified by the arrangement made for an Episcopal visit, and in consequence I received a handsome letter of thanks at my departure, and was accompanied by the chief inhabitants in a body to the beach, on the morning of my embarkation."

The Bishop's memorandum book contain the following observations on the winds, written soon after leaving the Cape.

"There is no doubt but that the winds blow according to certain fixed laws, and if these were known, we might ascertain when the wind would be favourable, and when not; perhaps one day this may be known. It appears that even a heavy gale or storm seldom covers a space of more than from three to five degrees at once; and that a ship sailing 100 miles distant from another, unless in the trade winds or the Monsoons, seldom has the *same* wind, either as to strength, or as to the exact point of the compass. Now, if from the return at Loydd's an account were furnished of all the winds encountered by all the ships on one day, or succession of days, we might be able to learn something of this matter; for it is certain they act on a system of compensation as to one another; and that whenever a westerly gale has prevailed long in a certain space, it must have occasioned a gale or gales to the east, or at least *easterly*, in another space; and doubtless this must all be according to some fixed law."

Bishop James died at sea, August 22. 1828. How tranquilly, how familiarly he had accustomed his thoughts to dwell upon the approach of death, may be seen from the following reflections, found in his pocket-book.

"As for death, no one who has, in the course of his life, from illness or any other cause, once made up his mind to contemplate it calmly and religiously—no one who has ever resolutely regarded the hour of his dissolution as at hand, ever loses the calming and soothing influence which that hour has once produced on his soul: he will feel, because at such an hour he *has* felt, how unsearchable are the ways of Him that ruleth over all; he will believe, because he *has then* believed, that there is a saving mercy beyond the grave, and that faith in the Redeemer is the only thing that can bring a man peace at the last. And that feeling once attained, the sting and the pain of death are gone, and the joy in believing is full."

PROSPECTS OF SOUTH-EASTERN AFRICA.

According as unfettered commerce shall be generally extended throughout the eastern seas, adventurous individuals will probably seek those more obscure channels in that interesting part of the globe, in which wealth has heretofore been supposed to abound. Amongst those channels, are the coasts extending from the Cape of Good Hope to the Red Sea. By the aid of information from various sources, we think a few data of considerable moment may be established, relative to the present condition, and growing civilization of Eastern Africans, with whom we are fast hastening to communicate. In this point of view, the inquiry appears to be peculiarly full of interest, and of animating hopes. The capacity of the African for civilization, which is one of these data, is, in fact, already proved; and it only remains for the governments England, of France, and of Portugal, to pursue a wise course in reference to their respective interests in Mozambique, Bourbon, Mauritius, and the Cape of Good Hope, in order to promote, probably in our time, one of the most remarkable revolutions known in the history of the world. The time seems to be come when the objects hitherto fatal to African improvement, may, in some spots, be renewed for ever: and looking at the past for lessons only to guide our new steps, we are justified in hoping that future rectitude will afford, if not an unvarying career of prosperity and peace, at least one in which exertions will meet an early and a great return. The frontiers of the *Cape of Good Hope* in particular seem, at this moment, to present to the British statesman an opportunity of achieving one of those never-dying victories of peace, which should be wisely purchased at a great price; but which, perhaps, can be proved to be now offered with the rare premium of an immediate pecuniary gain. This point we propose to speak of more at large in a future paper, recurring to it briefly only, here, when noticing what seems to be obscuring the prospects. For the present, also, we pass by the long-existing controversy upon the extent of knowledge which the ancients, or the Arabs, possessed of Southern Africa. We do not, however, consider the question to be exhausted. Strong as the reasoning of Dr. Vincent is, and admirably clear as is his summary of a great many of the known materials upon the old navigation from the Red Sea towards the Mozambique channel, we think the time may be approaching, when even more light will be collected to illustrate the obscure, and by many considered, settled points of the subject. Nevertheless, we can now only allude to it, although we may properly express gratification that the *literary sources, well known to be considerable at the Cape of Good Hope*, are begun, *post tot pericula*, to be drawn into forms, which promise due attraction to such points.*

* * * * A somewhat intimate acquaintance with the politics of the Caffer frontier of the Cape, and of the sentiments of the border tribes, induce us to assent that the time is come for great good to be effected there. The materials lie fully prepared for the hand of a competent architect, who may build up a social edifice, which will do him infinite honour.—*Oriental Quarterly Review.*

* *The South African Institution*, and *Cape Literary Society* of 1829.

ART. I.—*Researches in South Africa, illustrating the Civil, Moral, and Religious Condition of the Native Tribes, &c.* By the Rev. JOHN PHILIP, D.D.

(SECOND NOTICE.)

IN the last number of the Cape of Good Hope Literary Gazette, we offered our remarks upon the "Researches in South Africa," up to the year 1795, at the close of which, the colony of the Cape of Good Hope was subjugated by the British arms.

The author has, up to that period, told his tale of oppression, so as to have left no doubt upon the mind, that cruelty had reached its height, and that Hottentots and Bushmen, driven from the abode of man, had been hunted, like the beasts of the field, into the deserts, rocks, and mountains of a country, of which they were the natural possessors.

Suddenly a ray of hope, that last, best gift from Pandora's box, beamed upon the natives. The immediate occupation of the colony by the English, a nation free itself, and by natural consequence, a foe to the oppression and slavery of others, afforded an expectation of better times. General Dundas found it absolutely necessary to repress the fiery spirit of the border boers, who were ready to assert their independence, and, with feelings ad-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

verse to the English cause, were not inclined to desist from these scenes of violence and blood, so familiar to them, both in principle and by practice.

The Moravian brethren had formed an institution at Swellendam, in 1792, with the consent and protection of the Government of that day; and in the year 1798, the London Missionary Society sent Missionaries to the Cape colony. It cannot be denied, that, to the combined efforts of these two institutions, is to be ascribed that particle, that speck of amelioration and improvement in the Hottentots, which, creeping on, became more observable in the early part of the present century, and which sown by them, like the grain of mustard seed, has sprung up, and is now spreading its branches over the whole land. The system was encouraged by the Governor General Dundas, during the occupancy of the English from 1795 until 1802, and was ably enforced by the zeal and perseverance of a highly gifted individual, whose energies and shape of mind, nature had moulded for the crisis, and who appeared at this time in the character of a Missionary in South Africa.

Page 63.—"It was about the commencement of the year 1798, that the attention of the Directors of the London Missionary Society was called to South Africa. as a promising sphere for Missionary labours, and suitable instruments seem to have been provided in Doctor Van der Kemp, and his coadjutors. The circumstances, the talents, and the character of this remarkable individual, naturally pointed him out as the fittest person for being placed at the head of this Mission. His reputation for literary attainments stood high, he had studied at the Universities of Leyden and Edinburgh, and having in his youth chosen the army as a profession, he had attained the rank of captain of horse. After being sixteen years in the service of the Prince of Orange, and with the highest promotion within his rank, a personal misunderstanding with the Prince, with whom he was intimate, induced him to resign his commission, and to make choice of another profession.

"With the infidel notions then fashionable on the continent, Doctor Van der Kemp did not imbibe the sentiments respecting civil government with which they were generally associated. He was a warm admirer of monarchy, and was shocked by the French Revolution. It was not till he embraced christianity, that he saw the share that his favorite philosophy had in producing the crimes connected with that event.

"From the errors of scepticism, into which he had been drawn, by the delusions of a false philosophy, he was awakened by a dreadful domestic calamity, namely, the upsetting of a boat, by which his own life was placed in the greatest jeopardy, and his wife and child were drowned. Under such circumstances, the consolations of infidelity have often been tried, but they have always been found unavailing; the need of some remedy, in the hour of affliction, is confessed by all, but infidelity offers none. It subverts other systems, but it substitutes nothing satisfactory in their place.

"An address published by the Directors of the London Missionary Society, was the means of leading him to offer himself as a Missionary. And after they had made the necessary inquiries respecting his character, and received the most unexceptional testimonials, they accepted his offer, and he sailed for Africa in the beginning of December, 1798."

The measures and views of Dr. Van der Kemp continued to receive the approbation and support of Gen. Dundas, and in February, 1801, the plan of an institution at Graaff-Reinet, together with an admirable code of regulations for its government, was submitted to General Dundas, shewing, that if Missionary Institutions grow into receptacles of disorder, idleness, and iniquity, it must be in defiance of the rules and principles adopted by Dr. Van der Kemp, which directly and surely lead to regularity, to industry, and to a sense and practice of religious and moral duties.

Page 72. "The chief object and aim of the Missionaries, under whose direction this Settlement shall be established, ought to be to promote the knowledge of Christ, and the practice of real piety, both by instruction and example, among the Hottentots and other heathen, who shall be admitted and formed into a regular society; and, in the second place, the temporal happiness and usefulness of this society, with respect to the country at large.

"Into this society only, those ought to be admitted who will engage themselves to live according to the rules of the institution.

"The actual admission and expulsion from this society, shall entirely depend upon the judgment of the Missionaries; but it seems necessary, that of those who shall have lived in the families of colonists, none shall be considered admissible but such as shall produce a written declaration of their admissibility, signed by the Landdrost of the district in which they have lived.

"As we by no means wish to counteract, but, on the contrary, to promote as much as possible the labours of our Moravian brethren, we are resolved not to admit any individual belonging to their institution, unless it be with their express permission, and at their request. We hope to be equally cautious in respect to other Missionary institutions, which may in future times be formed within this colony.

"As we are of opinion that the rule laid down by Paul, '*that if any would not work, neither should he eat*,' ought to be strictly observed in every Christian society, our intention is to discourage idleness and laziness; and to have the individuals of our institution, as much as circumstances shall admit, employed in different useful occupations, for the cultivation of their rational faculties, or exercise of the body, as means of subsistence, and of promoting the welfare of this society, and the colony at large.

"These occupations may be referred either to agriculture and farming, the management of cattle, or mechanical arts, and little manufactures, such as soap-boiling, candle-making, spinning of thread, manufacturing of paper, tanning, pot-making, brick-making, turnery, &c.

"Good order and domestic discipline shall be maintained by the Missionaries themselves. The settlers are to be divided as Christians, catechumens, and hearers. By the last, we understand, heathens who will flock to us to hear the word of God.—By catechumens, heathens who are more particularly under our inspection and care, instructed in the doctrines of the Gospel, and who submit to ecclesiastical discipline.—Christians are those who shall bring forth fruits of conversion, and be by the baptism initiated as members of the church.

"We have no severer punishment than excommunication from the church and expulsion from the society. If we shall be compelled to proceed to this last step, we shall think it our duty to inform the Landdrost of the fact, that justice may be administered by the court to whose cognizance the crime belongs, *and no malefactor find a shelter within our walls*."

All this passed in 1801; but it does not appear from "the Researches" that during the English occupation, there was any abatement of rancour or decrease of actual warfare between the boers, the Hottentots, and the Caffres, notwiihstanding the mediation of Dr. Van der Kemp. The institutions continued to be an object of hatred to the boer colonists, accused by reason of their protection of the Hottentots, of standing in a dangerous connexion with the plundering Hottentots and Caffers, and as being the refuge of robbers and murderers. In this state of affairs, the peace of Amiens took place in 1802, and it was stipulated, that the Cape should be delivered up to the Dutch.

The chapters which follow, abound in important remarks on the state of the boers and Hottentots, and finally detail the struggles and contentions, in which Dr. Van der Kemp and the Missionary institutions were unceasingly engaged with Governor Janssen, until 1805, when the Missionaries were summoned to Cape Town, where they were detained nine months. Wearied with a disgusting inactivity, Dr. Van der Kemp had determined to leave the colony; but, on the 4th January, 1806, the English fleet appeared in Table Bay, and on the 20th the town was surrendered to the British. In continuing his Researches after this capture, the author, under the harsh title of "Unworthy conduct of the English," remarks:

Page 185,—"When the English first took possession of the Cape, the Hottentots hailed their arrival before they knew any thing of the character of their deliverers; and the story of their sufferings made a strong impression on the minds of a people who entertained a great aversion to their first oppressors, and who had, as yet, no interest to serve by enslaving them. The English found that the Hottentots could be trusted: they received from them the most efficient assistance in suppressing the insurrections of the boers, and, therefore, whilst the boers continued to be disaffected to the Government, the Hottentots enjoyed the smiles of the British Authorities. But when the boers, finding that the English were likely to retain permanent possession of the Cape, became reconciled to their new masters, the services of the Hottentots were forgotten, and their interest sacrificed at the shrine of this union," &c.

In 1809, Dr. Van der Kemp writes to the Secretary, Capt. Smith, for the information of the Lieut.-Governor:

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Page 118,—"The institution has been erected upon a most simple plan, at the invitation, and under the auspices of General Dundas, who condescended to give immediately the orders necessary for its management, in relation to the peace and tranquillity of the country, without the intervention of the Landdrost, or the Commandant of Fort Frederick.

"Under the government of Genral Janssens, it was gradually more and more oppressed, and subjected, first, under the orders of the officer commanding at Algoa Bay, and afterwards under the Landdrost, which proved a source of many complaints respecting the injuries under which our Hottentots groaned.

"At the restoration of the British government, we naturally expected that the restrictions under which the institution was placed, would be removed. Notwithstanding this, the Landdrost continues to exercise an almost arbitrary power over the members of the institution.—By a series of acts of injustice towards our Hottentots, he has alienated the affections of our people, not only from himself, but from the government in general; insomuch, that when the obligations they have to government, as their protectors, are represented to them, the common reply is—"*they are not the same English that they were under General Dundas.*"

And, page 121,—"While I am writing this, the Landdrost has ordered six Hottentots to be taken from each Field Cornet's district, to work at the Drostdy; and, considering the institution as a kind of extraordinary Field Cornetship of itself, ordered me, also, to command six of our people to that same work.

Here appears to commence a system, which gave rise some years after, to bitter and acrimonious complaint.—Lord Caledon had arrived at the Cape to administer the government, in May, 1807, and in April, 1809, Colonel Collins was deputed to visit the frontiers, as His Majesty's Commissioner. Various communications took place between Dr. Van der Kemp and the Commissioner, not always of an amicable nature; and to the questions—whether he would agree to send over Hottentots from Bethelsdorp, whose services might be required by the Landdrost, Dr. Van der Kemp answered (page 125,) in the negative.—Being requested to state the grounds on which he rested his objections, he remarked—

"That to apprehend men as prisoners, and force them to labour in the manner proposed, was no part of his duty."

"To a question—'whether he did not consider it his duty to compel the Hottentots to labour?' he replied—'No, Sir; the Hottentots are recognised to be a free people, and the colonists have no more right to force them to labour in the way you propose, than you have to sell them as slaves.' Being asked why he would not obey the order of the landdrost, in calling in the Hottentots who were among the farmers, when they were required by the landdrost,—'Because, sir,' said he, 'that is the duty of the landdrost himself, and he is paid for it.'"

After this, a correspondence of a determined hostile nature, was continued between the Local Authorities and Dr. Van der Kemp, previous to his death, which took place in December, 1811.

We estimate the character of Dr. Van der Kemp, and the entire biography of that important Missionary, to be the most powerful and masterly effusion from the pen of our author. The history of Dr. Van der Kemp affords a parallel to that of Bartholomew Las Casas, the intrepid assertor of the rights of the native Indians, after the discovery of the New World.

(Page 684.—"The court of Madrid, awakened by the representations of the virtuous Bartholomew Las Casas, and by the indignation of the whole world, became sensible at last, that the tyranny it permitted was repugnant to religion, to humanity, and to policy; and resolved to break the chains of the Mexicans. Their liberty was now only constrained by the sole condition that they should not quit the territory where they were settled. This precaution owed its origin to the fear that was entertained of their going to join the wandering savages to the north and south of the empire.

"These institutions, which totally changed the condition of the Indians of Mexico, irritated the Spaniards to a degree not to be conceived. Their pride would not suffer them to consider the Americans as free men, nor would their avarice permit them to pay for labour, which, hitherto, had cost them nothing. They employed themselves successively, or in combination, craft, remonstrances, and violence, to effect the subversion of an arrangement which so strongly contradicted their warmest passions; but their efforts were ineffectual."

We must add the description our author gives of Dr. Van der Kemp, at his introduction to Commissary De Mist, on his arrival at Algoa Bay, in page 93:

"On the day of our arrival at Algoa Bay," he writes, "the Commissary General received a visit from Van der Kemp. In the very hottest part of the morning we saw a waggon, such as is used in husbandry, drawn by four meagre oxen, coming slowly along the sandy downs. Van der Kemp sat upon a plank laid across it, without a hat; his venerable bald head exposed to the burning rays of the sun. He was dressed in a thread-bare black coat, waistcoat, and breeches, without shirt, neckcloth, or stockings, and leather sandals bound upon his feet, the same as are worn by the Hottentots.

"He descended from his car, and approached with slow and measured steps, presenting to our view a tall, meagre, yet venerable figure. In his serene countenance might be traced the remains of former beauty; and in his eye, still full of fire, were plainly to be discerned the powers of mind which had distinguished his early years.

"Instead of the usual salutations, he uttered a short prayer, in which he begged a blessing upon our chief and his company, and the protection of heaven during the remainder of our journey. He then accompanied us into the house, when he entered into conversation freely upon many subjects, without any superciliousness or affected solemnity."

It has been our fortune frequently to have witnessed accusations of hypocrisy, attempted to be fastened on the character of the missionary.—Is it for the mere exercise of hypocrisy that a man would pass his life amongst the wild and untaught tribes of South Africa,—and forbear from all social, all personal enjoyments, in the view of teaching moral and religious habits and conduct to the savages of the desert? Is it for the luxury of being a hypocrite, that family, friends, the enjoyment of "Home, sweet sweet Home!" with all its delights, are abandoned; and not in order to fulfil what such a man considers to be a paramount duty—to instruct the heathen in the christian religion, and in christian habits?—Common sense must reject an accusation grafted on so weak a stock, and let us at least have the justice to bestow on these individuals, the praise of acting from motives of conscience and of virtue.—We have now arrived at a chapter in the "Researches," to which we cannot refrain from applying the strongest expressions of dissent and astonishment.

Surely it is most inconsistent, after seven long chapters overflowing with reproaches of oppression and tyranny practised on the Hottentots during 150 years, for the author to turn round in the eighth, and severely to impugn the first measure professed by Government to be brought forward for their relief; and claiming, it might be thought, on that single ground, were there no other, a freedom from the reproachful remarks of the author. He states it to be a measure "to perpetuate and screen, under the cloak of law, every pre-existing abuse." Much annoyance appears to have arisen from the circumstance that the Proclamation of 1809, had been classed by an anonymous writer—The "Magna Charta" of the Hottentots, whilst the author declares it to have placed them in "a most wretched state of servitude, and entirely left at the disposal of the colonists."—We do not feel sufficiently bold, nor is it requisite for us to enter the lists in defence, or in justification of every clause, in Lord Caledon's benevolent proclamation of 1809, but we lightly estimate the objections of the author, and believe many of the articles in that proclamation to be in strict analogy with the Laws and Customs of England; and all calculated, more or less, to amend the situation of the Hottentots, labouring at that day, under dreadful cruelties and oppression. Much has been said on the subject of "Passes," but every Englishman must have observed the carts of one parish *passing* parents and children, to another. And some of the author's objections apply more to the manner of the execution than to the law itself. However, the benefit of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the proclamation was immense; it saved the tribe; it shewed that the Hottentots had gained the attention of Government. It gave them "a local habitation and a name," and proved that they were in a degree the "*publica Cura.*" We do not argue the Hottentots' Magna Charta to have been perfect. After the Barons of England had forced Magna Charta from King John, that famed Charter itself was found not to secure all that was required for English liberty. It was succeeded by the Petition of Right, by the Habeas Corpus, by the Bill of Rights, and in these latter days, by the Act of Settlement.

The Hottentot Magna Charta of 1809, did not act upon the conduct of the Colonist with sufficient force, so as to insure and effect the security and liberty of the Hottentots, but *it did much.* It is now strengthened by Ordinance 50, which *has done all.*

The reader, after perusing the "Researches," must have remarked that the qualities ascribed to the Hottentots under the authority of Sparman, Barrow, Vaillant, and of the author, embrace industry, honesty, attachment, gratitude, fidelity, veracity, mildness of disposition, and a love of justice; if this be so, we have hitherto rarely had the good fortune to be acquainted with mortals of equal moral calibre. There are others, and in great number, who impute to them unconquerable idleness, perpetual drunkenness, the love of plunder, instability, and the uncontrolled indulgence in every thing odious and filthy. It will soon be practically ascertained, whether the loose habits and thievish propensities, still said to be in force, arise from the excitement of "new-born liberty," or to be regarded as rooted to a degree, never to be eradicated, except by the gradual influence of order, of knowledge, and of religious education now rapidly progressing through the colony of the Cape of Good Hope.

The Proclamation of Lord Howden in 1812, authorising the apprenticeship of Hottentots born upon the soil, when 8 years old, until they arrived at 18 years, is the next article open to the censure of the author. In the instances of profligate parents, or of abandoned children, it may have proved beneficial, but in principle, it cannot be defended.

The wisdom and justice of the legislature has now put an end to all the unfair distinctions between Hottentot and Colonist, and this and such like enactment, will only be remembered as gross errors of the Government, and as beacons to warn the future lawgivers of South Africa. Having now remarked upon many of the important parts of the "Researches," we do not hold it to be imperative upon us, to conduct our reader through the remaining chapters. All of them display many interesting circumstances and valuable information as to the state of the country, the temper and feelings of the inhabitants, and, throughout, afford an amount of entertainment, and a knowledge of the tribes around the colony, too voluminous for the comments of a review. It must with regret be added also, that the whole publication overflows with bitter reflections on the Functionaries and the Government. This pertinacity of reproach, this determination that nothing shall be approved, recalls to the memory four doggerel lines of a most ungallant rhymster:

> "The men, they say, have many faults,
> The women have but two;
> There's nothing right they ever say,
> And all is wrong they do."

In an early part of his book, the author tells us: "I consider myself as personally responsible for all the statements contained in these volumes;"—and again, "I have found it necessary to confine the proofs of my allegations from facts and documents in my own possession, and to what has come under my own observation." — This was a prudent intention, as the scenes were still standing, and the actors not off the stage. Had he strictly adhered to this wise determination, the public would have been relieved from an abundance of '*Old Wives' fables,*' which too much *overspread*, and depreciate the work. Credulity, where a Hottentot is concerned, is the "besetting literary sin" of the author, otherwise we should be at a loss to understand how, upon such slender evidence, or indeed upon none at all, but the mere hearsay of an individual, many improbable tales, or proofs as they are called, of cruelty to Hottentots have been admitted into the work. However, we conclude by strongly recommending these two volumes to the perusal of the reader. They afford a valuable insight into the customs, manners, and feelings of the wild tribes of South Africa; and, if the reader will be at the trouble of winnowing the chaff from the wheat, he will find himself amply rewarded for his perseverance.

It is beyond all controversy, that the author has established his case,—Tyranny and oppression have been proved — proved home — against the Dutch and English,—but, by an act of the law, THE BONDS ARE BROKEN, THE FETTERS HAVE FALLEN OFF, AND THE HOTTENTOTS ARE FREE.

ART. II.—*The Bengalee; or, Sketches of Society and Manners in the East.* London: Smith, Elder and Co., Cornhill, 1829, pp. 466.

[*From a Correspondent.*]

—"THE HINDOOS in Cape Town!".... "THE HINDOOS!"....exclaimed we, interrupting a young lady, whom we met at a happy evening *at home,* in CapeTown, —"Yes, Sir, THE HINDOOS: but as you seem to be surprised at finding any of the followers of Brahma in Africa, I must explain to you that THE HINDOOS is a sobriquet applied by the local residents to all visitors from India,—whether they be Koeehies from Calcutta, Mulls from Madras, or Ducks from Bombay. To be sure you might with equal propriety, in return, style the English inhabitants Hottentots, and the Dutch colonists Caffers: yet you must not be offended—I perceive you smile—though I dare say that you, as a stranger from the City of Palaces on the Ganges, would prefer to be called a Bengalee. By-the-bye, Sir, have you seen THE BENGALEE, a work lately received in our Public Library, which you HINDOOS applaud so highly, and patronise so liberally on all occasions?"

At the instance of our fair informant we have obtained a sight of the little volume, and read it with a joyousness but seldom experienced on meeting an old friend with a new face.

THE BENGALEE continues, we observe, to maintain his anonymous character; but although, with our gallant author, "sooner shall the Blackamoor be washed *White*" than he discover himself, (if we may be allowed to pun on his name,) still, with all his candid efforts at concealment, he has failed to preserve his incognito entire; as we of the critical genus who were, in Hindoostan, permitted "to gain admittance behind the scenes" [p. 1], can in verity allege. Many of his papers, he says, "originally appeared in the Calcutta periodicals," [p. 4,] in which we had the pleasure of perusing them, and to these he has added several interesting articles in poetry, as well as in prose, the greater part of them "lightly written, as a relaxation after many a busy and fatiguing hour of official duty," [p. 5.] Some essayist has

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

waggishly insisted that to penury more publications owe their origin, than to any other source; but in India, to illness and solitude, must be attributed more literary productions than to any other extraneous causes. And how gratifying to find an officer of talent, as in the present instance, devoting to the enjoyment of intellectual pursuits, those leisure hours which most military men command in the interior of the country, instead of mis-spending his time in the indulgence of dissipation, at secluded stations or outposts, where the mind ought, on the contrary, to be made to depend on its own energies and resources for reasonable recreation, since at all periods, and in every region beneath the vault of heaven,

"Mind is its own place, and in itself
Can make a heaven of hell, a hell of heaven!"

THE BENGALEE, in his second chapter, entitled—*Fate of accomplishments in India*,—has depicted in their truest colours the failings of some of the married ladies of the British eastern possessions; who, after entering the state of matrimony, neglect their "harps, pianos, and crayons." But more deplorable would have been his portraiture had he, in addition, delineated the foibles—shall we not say the vices—of some of the unmarried gentlemen in the services, who, after their removal from the Presidency to the Provinces, sometimes are apt to forsake all attention to those branches of a liberal education, "Greek, Latin, and French," the acquisition of which had cost, at school and at college, so much coin. To this picture, however, there are, of course, numerous exceptions, as the case of THE BENGALEE, for example, happily illustrates. And generally it may be affirmed that at the present era, the claims of literature, occidental as well as oriental, are encouraged, in a high degree, among the first circles of the British community throughout India; while, as a necessary consequence of this improvement in society, the "Life" of the olden days finds few advocates, and fewer promoters. But as a proof of the fatal results of dissolute extravagancies in the Moofussil, or Interior, THE BENGALEE has well described [p. 239,] the career of "The Cadet: a Tale of the East;" which, we recollect, he published, separately, some years ago, under the more appropriate designation of "Ruin."

As a specimen of THE BENGALEE'S style and power of description, we shall cite a passage relating his introduction to the late venerable and venerated Marquess of Hastings, at a private audience. The scene is drawn to the life, and to its genuineness we could almost bear our own testimony from ocular demonstration in the presence of that most noble Governor-General.

"On entering the Government residence at the park, and ascending the stair-case, I was met by a gentlemanly young officer, who very civilly led me to the centre room, and begged me to be seated, until he should proceed to his Lordship's study, or writing apartment in the north-west wing of the building, and ascertain if the Marquess was at leisure.

"Perhaps there are few things less enviable than those moments of anxious suspense and trepidation, experienced by a doubtful suitor to patronage, when on the very point of introductory speech, and nervously planning the best mode of prefacing the wished-for subject,—how devoutly the suitor wishes himself with Captain Parry at the North Pole, or with Mr. Buckingham at Jericho, or any where, rather than in his present situation of most uncomfortable nervousness. As for myself, I had seen his Lordship but once at a Levee; was known to him publicly, it is true, but still too slightly for so serious an intrusion. However, my state of suspense was not allowed to be very tedious; the Aide-de-camp returned to present me, and in a moment I found myself standing before the Governor-General in person. His lordship had risen at my entrance, and moved slightly forward to receive me; politely pointing to a chair near himself for my reception. My eye glanced for a moment upon the Governor-General,—on the noble ruler of British India, the late conqueror of it's central empires! How little is sufficient to soothe and tranquillise the heart of a suitor; how intimately the eye scans, in a single glance, the very mind and feeling of it's patron! I felt at once assured that I was in the presence of kindness and condescension!

"I soon became myself, and capable of observing; his Lordship had on a plain silk undress coat, having relieved himself from his wouted general-officer's uniform, for the purpose of writing more at ease. On the table before him were several boxes containing papers or despatches, with some large thick quarto letter paper for his personal writing. Some of the boxes were open; and at his right hand was one closed, but with a narrow opening in it's lid, like a post-office panel for the admission of closed and sealed letters. Various Secretaries' consultation boxes, containing recent reports, minutes or despatches in circulation for the perusal of the members of Government, were on a side table, awaiting their early turn for consideration. The punkah was moving by some simple mechanism, so as to obviate the intrusion of a servant, and the whole scene betrayed the study and retirement of an indefatigable, ardent statesman, but one necessarily systematic and methodical in the otherwise overwhelming magnitude of his public business."

There is one passage, and only one, against the humanity and taste of which we feel disposed to oppose a strong dissent, and to urge a decided remonstrance,—the passage is supposed to be an extract from a letter by an "Old Civilian;" but we are very certain that no civilian, old or young, will be found to entertain such opinions as the subjoined paragraph conveys:

"Since I arrived here, measures have been also in agitation, which, in my younger days, never would have been dreamt of. It was then a received opinion, that the *wisdom* and *power* of authority could not be publicly called in question, without the estimation, in which every Englishman stood in the country, being brought down in the eyes of the Natives. Now, it is not only openly resisted, but the Natives are called on, to lead and to lend their aid, in withstanding it! Be assured, Sir, from one, who has been long on habits of the closest acquaintance with the Native character, that such amalgamation, as we have lately seen, is madness itself; it is absolute suicide. No native, however high his rank, ought to approach whithin a yard of an Englishman; and every time an Englishman shakes hands with a Baboo, he shakes the basis on which our ascendancy in this country stands. Two such meetings, as I have lately seen, would do more to subvert our power, than two Burmese wars, in which we should chance to be unsuccessful. From them, and their evil effects, we may expect to recover; but when the English Merchants sit down, and hob-nob with the Bengalee Sircars;* and when the Gomastahs† of the Burrah Bazar‡ are found seconding resolutions of the Barristers of the Supreme Court, then depend upon it you are playing the game of your enemies. You are losing the 'vantage ground, on which you have all along stood; and this ground, once lost, cannot be regained."

As students of Drs. Lumsden and Gilchrist, we might be allowed to cavil at the mistakes of THE BENGALEE, when using Persian and Hindoostanee words; but we are inclined to think that many of them may be considered errors of the press, rather than of the gallant writer: still we shall notice a few of the blunders in the native languages. "Chit," says THE BENGALEE in his Glossary, is a "corruption from Persian Khut, a letter or note;" now, "Chit" is merely an abbreviation of the Hindoostanee word Chit-hee, and Khut is Arabic, and not Persian. Again—"Sendladar" does not, we believe, signify a "native civil officer," though Sirishtuhdar does; and for "Cuwab" he should use "Kubab:" for "Hatkee," Hat-hee; for "Gomarlah," Goomashtuh; for "Chobedur," Chobdar; for "Kinghaub," Kimkhab;—but as *the schoolmaster is abroad*, we need not pursue our train of corrections and emendations.

We now dismiss THE BENGALEE—the limits of the Cape Literary Gazette, precluding more extensive quotations; but we cannot rise from our review, without recommending THE BENGALEE as an agreeable and amusing writer, who has, with a combination of ability and judgment, furnished these "Sketches of Society and Manners in the East," to the readers of the European public. R.

ART. III.—*A Memoir of the Rev. ALEXANDER WAUGH, D.D. &c. with selections from his Epistolary Correspondence, Pulpit Recollections, &c.* By the Rev. Messrs. HAY and BELFRAGE. 8vo. pp. 586. 1830.

tains at the same time, so many pictures of by-gone days, and pourtrays so faithfully, a race of estimable men connected with our early recollections, and hallowed in such remembrance, that we have at once a pride and a pleasure in recommending the volume, —especially to that portion of our readers who may not have *bowed the knee to Baal*, and who still treasure up grateful reminiscences of *their own country, and their father's house.*

To form any thing like an accurate idea of the Memoirs of the late Dr. Waugh, it is quite requisite for the reader to consult the work itself, as scarcely any notion of its general merits of composition and description, can be considered in a few necessarily brief extracts. It is, perhaps, necessary for us to observe, for the information of those who had not the good fortune to be acquainted with the subject of this Memoir, that he was the son of a small farmer in the parish of Gordon, in Berwickshire, one of that strictly-devout and rigidly-conscientious race, of whom "Douce Davie Deans," was a genuine representative, and of whom we hope a worthy remnant still remain as the salt of the earth. Being early devoted by his parents to the ministry, he was sent in his twelfth year to the grammar-school of Earlstoun, in the adjoining parish. In reference to this period, he remarks—

Though the progress we made in the Latin language was slower than what is usually made in the grammar-schools of larger towns or cities, yet the simple and innocent manners of the place, the regard to the duties of religion, which was universal, and the wild and pleasing scenery of that part of the country, brought advantages to my heart which in many other places were not to be expected. I cannot recollect the manners of that happy village, and the innocent pursuits of former days, especially when I compare them with the far, far other manners which prevail in London, without sighing and longing for the past. Goldsmith has, in his Deserted Village, touched these days with so happy a pencil, that it needs little more but to change the names, to make his poem a description of Earlstoun, with this difference, that it is not yet, and I trust never will be, a "deserted village." But Goldsmith's minister, school-master, and publican, were the minister, school-master, and publican of Earlstoun when I first knew it.

Dr. Waugh was, for nearly half a century, minister of one of the Presbyterian Churches in London, and during that period was one of the most active and able leaders in those religious and philanthropic associations which are the glory of the British metropolis. As a preacher, for we have had opportunities of judging, he possessed the happy and singular faculty of conveying argument in the form of narration, and presenting events in such a shape, that they suggested to every understanding the inference which ought to be drawn from them. He exemplified the art of giving to mere historical deduction all the effect of laboured reasoning. Amid the apparent simplicity of narrative, he displayed the substance, without the pedantry of logic. No dry and barren explications marked the method of his discourses; no metaphysical *discussions* or *talkings*, were placed in the stead of those *well-prepared* addresses to the heart and the conscience, which generally keep a congregation *awake*. He was decidedly opposed to that dry system of barren generalities, and that philosophical strain of reasoning which, of late years, has unfortunately crept into certain Scottish pulpits,—disdaining even the use of scripture phraseology. Not that he was backward in endeavouring to convince and enlighten the *judgment* of his hearers,—quite the reverse: but he considered the surest way to reach *it*, was through the *heart*. He was a great advocate for earnestness and zeal in the pulpit, and public duties. We once heard him illustrate these points by a reference to the following historical anecdote. "Conscript Fathers," said an old Roman in debate, (in reply to an antagonist,)—"Believe him not, for the *cold manner* in which he argues the cause." It is strange indeed, that any man even of the most common-place mind, should be callous when performing the elevated duties of the christian ministry. And yet, lamentable to think, there are men whose languid, cold, formal habits are enough to freeze, rather than warm the heart; and what is equally deplorable, whose emollient and legal divinity is, perhaps, more injurious than rank heresy, as, indeed, it covers the spiritual sore without healing it. But we are forgetting the work before us. Professing, as we do, a deep interest in the character which it attempts to pourtray, and believing there are very many of our readers, to whom the late Dr. Waugh was known and respected, we trust the length of the following extracts will be more than excused.

One great cause of his universal popularity among the people of Scotland in London, was his enthusiastic nationality; and

The following remarks, by a member of his congregation, exhibit in a striking point of view the talent which he possessed of arresting the attention, or touching the affections of his hearers, by occasional animating appeals to their national or local reminiscences:—

"His congregation, though originally almost exclusively from the North, was composed of a population of considerable diversity.--Scottish Highlanders, Lowlanders, Borderers, and a few natives of the north of England; but so well was he acquainted with his hearers, that he knew from what part of the country every family or individual came; and, as his knowledge of Scotland, its general history, local traditions, remarkable scenery, and distinguished characters, was very extensive, he was enabled to avail himself of the feelings and predilections of his people, and of Scotchmen in general, in a manner peculiarly his own. In the illustration of his discourses, the most beautiful and vivid passages appeared to be frequently suggested at the moment, by his catching the eye of some attentive listener, and thence suiting his address, as it were, more directly to *his* immediate apprehension, yet in a manner highly interesting to all. The Highlanders he would arouse with the stern and striking imagery of the torrents, lakes, craggy cliffs, and lonely heaths of their mountain land;—and that not in the vague terms of general allusion, but by calling up the hills, and streams, and glens by name before them,—Ben Lomond, Ben Nevis, Glengarry, the Spey, the Tay, &c. To the hearts of the Lowlanders he would appeal with the softer pastoral recollections of Teviotdale or Lammermuir, of Cheviot or Pentland hills, of Nithsdale or Stitchell-brae. To the English borderers he would recall the field of Flodden, the Till, Otterburn, the feudal days of Percy and Douglas, &c. Often, in this manner, has every member of his congregation had the scenes of his youth and his early associations, as connected with his religious feelings and moral duties, brought vividly to his recollection in illustration of the subject on which his pastor was preaching or lecturing. And thus he could make of importance the little hill or brae, the silent rock or bosky burn, which, unnoticed by all the world beside, gave character and life to the tender reminiscences of many a poor man and woman, whose days of joyous childhood had been spent among such scenes. They felt it of importance that their brae or their burn should be known to their minister, and wondered that he should be able to describe them with a fidelity so correct, and to enter into their feelings with all the enthusiasm of a companion of their youth,—and even to draw forth beauties in those scenes, by his picturesque sketches which had scarcely ever before attracted their notice. To persons long absent from their native land, but who cherished, even in old age, sentiments of ardent attachment to it, may be imagined how touchingly affecting this mode of illustration often proved."

Of his domestic character, a graphic account is given, delineated with great beauty and simplicity by one of his daughters, but it is too long for our columns; and the following account of his nationality, by one of his sons, suits us better:—

My sister has noticed his propensity to escape in imagination to Scotland, and to solace himself, after his ministerial labours on the Sabbath, by conversing of the friends and scenes of his youth. So much was this the case, that had a person from a distant land been suddenly placed in our domestic circle after my father's return from church on a Sunday evening, and listened to his conversation for half an hour, he might have imagined himself seated beside the pastor of some remote country congregation, by Tweedside, perhaps, or the banks of Loch Leven; so habitually and entirely did his mind revert to Scotland and its interests. On such occasions, he loved to talk of the simple piety of his father's household, as it has been described

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

at the commencement of his Memoir,—of the surviving relatives and friends at a distance with whom he had held sweet counsel in the fear of God,—of his brethren in the ministry, whom he had loved in youth, or laboured together with in riper years,—of the sober, sagacious, and religious peasantry of Scotland;—and, above all, of the manner in which the public ordinances of the house of God, and especially the celebration of the Lord's Supper, were attended and performed in that privileged land, particularly in country places

In his ministerial visitations also, his nationality was often strongly displayed (and that with most beneficial effect) both in sentiment and language. When, without adequate cause, any of his hearers had failed to attend public ordinances so regularly as he could have wished, and would plead their distance from the church as an excuse, he would exclaim, in the emphatic northern dialect, which he loved on familiar occasions to employ,—"What? you from Scotland! from Melrose! from Gala Water! from Selkirk! and it's a hard matter to walk a mile or two to serve your Maker *one* day in the week! How many miles did you walk at Selkirk?" "Five." "Five! and can ye no walk two here? Man! your father walked ten or twall out, and as many hame, every Sunday in the year, and your mother too, aften. I've seen a hunder folk and mair, that aye walked six or seven, men and women, and bairns too; and at the sacraments, folk walked fifteen, and some twenty miles. How far will you walk the morn to *mak half-a-crown?* Fie! fie! But ye'll be out wi' a' your household next Sabbath, I ken. O, my man, mind the bairns! If you love their souls, dinna let them get into the habit of biding awa frae the kirk. All the evils amang young folk in London arise from their not attending God's house. Such remonstrances, it may easily be imagined, were not often urged in vain.

In order, however, to enable *English* readers better to appreciate his feelings respecting the performance of religious ordinances in his native land, a few explanatory remarks may be here expedient. The churches of the Secession were, in his youth, very thinly scattered over that part of the country in which he resided; and the sacrament of the supper was observed in some places twice, and in others only once, in the year. The people of the various congregations had, however, opportunities of partaking of this ordinance more frequently, by reciprocally attending at its celebration in adjoining congregations; and the consequence was, that no church or meeting-house could contain the number of communicants or hearers who usually assembled on these occasions. There was, therefore established an auxiliary pulpit service, which, in summer, was performed out of doors, in a small field or plot of ground attached to the place of worship, or on some open brae or green bank near it; and this service consisted of prayer, singing, and preaching. By this means the whole of the assembled people were engaged at one and the same time; for while these services were going on in the church or meeting-house, they were also carrying forward at the *tent*, at it was called; and when the sacrament had been administered to those within the building, they withdrew to the services at the tent, the tables were again filled from without, and again similarly vacated, and replenished, until the whole of the assembled communicants had commemorated the dying love of their Saviour. The number of communicants was often very great, and the services took up seven or eight hours. They were conducted by four or five ministers from other congregations, who were called upon or invited by the presiding pastor to aid him in the work.

The nature of this sacred ordinance, its extreme solemnity, the fervid earnestness of the ministers, and the deep reverence of the hearers, conjoined with an extended and important part the service being performed in the open air, at the foot of a mountain, or on the banks of a stream, and in the pastoral country, were circumstances calculated to make an impression on the sensitive mind, which could never be effaced. To those who subsequently removed to large towns or cities, and who retained their integrity, the retrospect must have been attended with emotions almost indescribable. And the writer may state, from his own experience, that when he has fallen in with some of his northern friends, who had forgotten the God of their fathers, and made shipwreck of their faith, he has in more instances than one, compelled them to acknowledge, with tears in their eyes, that in pursuing the pleasures of the world, and its business and interests, these solemn and affecting scenes have come back upon their hearts in all their sacred loveliness, and have given for the time to worldly feelings and conduct, such a powerful check as neither the operations of conscience, nor the splendid service and ritual of another church, had ever been able to effect.

On such themes my venerable father loved to dwell. They often furnished topics for his conversation on Sabbath evenings, and especially on the evenings of sacramental Sabbaths. On these latter occasions he was usually much exhausted; and it was not till after supper that he did more than make general and brief references to the services of the day. When he had supped, his strength returned, and he would converse cheerfully (for he was no gloomy or morose Christian) on the great subject on which we had all been engaged; and then he would add, "To-day they have been celebrating the Lord's Supper at Kelso," or "at Hawick," or at some other place, which he would name; for he generally knew the days on which the sacrament was administered in the different congregations in the southern parts of Scotland. In a softened mood he would continue,—"I shall never again break the bread of life to my countrymen in my own land, nor myself commemorate there the Saviour's dying love. O the solemnity of those tent-preachings!" "But, father," some of us would say, "you would still make an effort to go to Stitchell Brae!" "To Stitchell Brae!" his eyes kindling, and his soul lighting up with hallowed enthusiasm,—"to Stitchell Brae!—ay would I! I should rejoice again to preach from that tent at its base, and to see the hundreds of God's redeemed people sitting on the face of the hill, above and around me, drinking in with joy the glad tidings of salvation. O that I could again sit among them, and hear good old Mr. Coventry give us as much sound divinity in one sermon as is now found in ten volumes! It was a scene on which God's eye might love to look. Such sermons—and such prayers!—none such to be heard now-a-days. What are your cathedrals and your choirs, and your organs? God laid the foundations of *our* temple on the pillars of the earth; our floor was nature's verdant carpet; our canopy was the vaulted sky—the heaven in which the Creator dwells; in the distance the Cheviot hills; around us nature in all the luxuriance of lovelinesss,—there fields ripening unto harvest,—here lowing herds in all the fulness of supply for man; on the banks of that little rivulet at our feet, lambs, the emblems of innocence, sporting in the shade, and offering to heaven the only acknowledgment they could, in the expression of their happiness and joy; the birds around warbling praises to Him who daily provides for all their wants; the flower and green fields offering their perfume; and, lovelier still, and infinitely dearer to him, multitudes of redeemed souls, and hearts purified by faith, singing his praises in 'grave sweet melody,'—perhaps in the tune of 'Martyrs.' 'Martyrs' so sung on Stitchell Brae might almost arrest an angel on an errand of mercy,—and would afford him more pleasure than a' the chanting, and a' the music, and a' the organs, in a' the cathedrals o' Europe."

ART. IV.—*Notices of Brazil in* 1828 *and* 1829. By the Rev. R. WALSH, Author of "A Journey from Constantinople," &c. 2 vols. 8vo. 1830.

WE cordially welcome two other volumes from the pen of Dr. Walsh, and we rejoice to observe in a writer so highly qualified to be useful, no indication whatever of exhaustion or lassitude, but an opening rather of new stores, and a putting forth of fresh vigour in his progress. We much regret that our limits will not permit us to enter into a full analysis of their contents, and to dwell longer on many interesting topics. Before we proceed to the selection of a few extracts from the work itself, we are desirous of submitting to our readers in the first place, the following testimony in behalf of the sons of Africa.

We have always maintained that African regions were as susceptible of improvement from cultivation as any other race of men. Dr. Walsh, who appears to be of the same opinion, had scarcely set his foot on shore at Rio de Janeiro, than he had a remarkable opportunity of putting this opinion to the test, by observing the Negro under four different aspects of society, clearly demonstrating that his character in each depended on the state in which he was placed, and 'the estimation in which he was held.' He saw the negro first as a slave, despised, and 'far lower than other animals around him.' Next, the poor African appeared advanced to the grade of a soldier, 'clean and neat in his person, amenable to discipline, expert at his exercises, and showing the port and bearing of a white man, similarly placed. Thirdly, our author had occasion to respect the negro as a citizen, remarkable for the respectability of his appearance, and the decorum of his manners. And fourthly, to admire him as a priest of the living GOD; and, says Mr. Walsh, 'in a grade in which moral and intellectual fitness is required, and a certain degree of superiority is expected, he seemed even more devout in his impressions, and more correct in his manners, than his white associates.' This is valuable testimony in favour of the Negro character.

Dr. Walsh thus describes an interview which he had with Don Pedro:

'I found the emperor standing in the middle of a room inside. When I had seen him before on the steps of the throne, with his little boy beside him, he looked to me a tall and portly man; but when I now approached, and we stood close together, I perceived his person was below the middle size, and remarkably thick and sturdy. The face was full, and appeared deeply pitted or bloched. His hair was black, and thick about his forehead, with large whiskers, and his countenanee rather coarse and forbidding. His manner, however, though dry, was affable and courteous. When I approached him, he said to me in French, "I am much obliged to you for the books you sent me by the Marquez d'Arncaty."—"Your Majesty does me too much honour. I trust you found in them something to approve of?" "Oh! as to that, I have not had time yet to read them; besides, I do not understand English well." "I have been informed your Majesty speaks it fluently?" "No! I was learning it from father Tilbury, but he is ill, poor man. How did you find the interior of the country through which you travelled?" "Oh! the country is very superb, it only wants inhabitants." "What do you think of OUR BOTANIC GARDEN: we hope to make something of it?" "It will be highly

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

useful, when the indigenous plants are scientifically arranged." After a few more similar observations, I made my bow, and was conducted out by the marquez; and I have transcribed for you, verbatim, what passed; as, perhaps, you would wish to know in what manner the emperor converses.'—vol. ii. pp. 457, 458.

The Emperor's general habits are said to be very active and temperate.

'He rises every morning before day, and, not sleeping himself, is not disposed to let others sleep. He usually begins, therefore, with discharging his fowling piece about the palace, till all the family are up. He breakfasts at seven o'clock, and continues engaged in business, or amusement, till twelve, when he again goes to bed, and remains till half-past one; he then rises and dresses for dinner. The Brazilians, as far as I have observed, are neat and cleanly in their persons; and the emperor is eminently so. He is never seen in soiled linen or dirty clothes. He dines with his family at two, makes a temperate meal, and seldom exceeds a glass of wine, and then amuses himfelf with his children, of whose society he is very fond. He is a strict and severe, but an affectionate father, and they at once love and fear him. I heard Baron Marechal, the Austrian minister, say, he one day paid him a visit: he met no person at the door to introduce him; so, availing himself of his intimacy, he entered without being announced. He found the emperor in an inner room, playing with his children with his coat off, entering with great interest into all their amusements, and like another Henry IV.; was not ashamed to be found by a foreign ambassador so employed. At nine he retires to bed.

'His education was early neglected, and he has never redeemed the lost time. He still, however, retains some classical recollections, and occasionally takes up a Latin book, particularly the breviary, which he reads generally in that language. He wished to acquire a knowledge of English, and to that end he commenced, along with his children, a course of reading with the Rev. Dr. Tilbury, an Englishman, who has taken orders in the Catholic church, and to whose courtesy and information on several subjects, I am very much indebted. After having made some progress, he laid it aside, and began to learn French, in which he sometimes converses. He has an English groom, from whom also he unfortunately learned some English. This fellow, I am informed, is greatly addicted to swearing and indecent language, and the emperor, and even the late empress, adopted some of his phraseology, without being aware of its import.

'In his domestic expenses, he is exceedingly frugal. The careless profusion of his father, and the total derangement of the finances, had involved the country in such difficulties, that he found it necessary to set an example of frugality in his own person, by limiting himself to a certain expenditure. In his speech to the constituent assembly, he announced this determination. "The king's disbursements," said he, "amounted to four millions; mine does not exceed one. I am resolved to live as a private gentleman, receiving only 110,000 milreis for my private expenses, except the allowance to which my wife is entitled by her marriage contract." This, at the rate of exchange before we left Rio, would not have amounted to more than £10,000 per annum. His present allowance, as fixed by the chambers, is 200,000 milreis for himself, and 12,000 for his children. To make this answer, he engages in various profitable pursuits, and adopts, in every thing, the most rigid system of economy. He lets out his fazenda at Santa Cruz, for grazing cattle passing to Rio, from the Minas Geraes, and receives so much a head from the drovers. His slaves cut capim, and sell it, on his account, in the street, where they were pointed out to me distinguished by plates on their caps. He derives also a revenue, I am told, from several caxas shops, of which he is the proprietor, and thinks, like Vespasian, that the money is not at all affected by the medium through which it passes. In his domestic expenses, he is rigid even to parsimony. He allows a very small sum to his cook, of the expenditure of which he exacts a minute account, and is very angry if this trifling sum is exceeded on any occasion; and it is said that this was one cause of his disagreement with the late empress, whose free and careless bounty he never could restrain,' vol. ii. pp. 459—462.

ART. V. — *The Daya-Crama-Sangraha; an Original Treatise on the Hindoo Law of Inheritances.* By P. M. WYNCH, Esq. Calcutta: Hindostanee Press.

A Correspondent of colonial birth, has pointed out to us, that in the list of authors at present at the Cape, as noticed in a former journal, we had not inserted the name of the author of Daya-Crama-Sangraha. In making an acknowledgment of this unintentional omission, we feel obliged to our correspondent for putting us in possession of several particulars of the work in question. The attention which has been paid to the literature of India since the period at which the English acquired the dominion of the country, has been, upon the whole, highly creditable to their power; and if not so remarkable as to have altogether screened them from the reproach of having done less than might have been expected, it ought to be remembered, that not only is the harvest abundant, but the labourers are also few. The labours of Mr. Halhed, Sir Wm. Jones, and Mr. Colebrooke, in the department of Hindu and Mahomedan Law, have procured for them the highest reputation as Asiatic scholars. In works of taste, Mr. Wilkins, Mr. Wilson, and Mr. Robertson, have eminently distinguished themselves as Translators, and as Poets, as well as Grammarians; while to Dr. Gilchrist, Dr. Lumsden, and others, in the department of Philological Science, the world is indebted for a variety of works, which bespeak at once the zeal and the talents of these Orientalists.

The work by Mr. Wynch, relates to a subject of immense importance in the jurisprudence of Hindostan. There is no branch of Hindu law, on which it is of more consequence to be well informed, than on the Law of Inheritance; and none, it is understood, presenting greater difficulties, from the inconsistent provisions that are laid down in the text of *Menu* itself, and the very opposite expositions given by different Commentators of these provisions.

No one, in any degree acquainted with the mode of administering justice in the native courts of India, can be insensible to the difficulties under which the Judge necessarily labours; it is, therefore, well remarked by Mr. Wynch, in the preface, that "should the English judicial officers, through its aid, be better enabled to determine the accuracy, and in consequence more readily detect the fallacy of an opinion delivered by the Pundit of his court, the time devoted to this publication will not have been spent in vain."

In conclusion, Mr. Wynch has executed the work in question, in a manner which has established his reputation as a Sanscrit scholar of deserved celebrity.

ART. VI.—*Swaving's Tienjarige Militaire Loopbaan.* Door Hemzelven beschreven. Met het Portret des Auteurs. Te Dordrecht: bij Blusse en Van Braam. 1830.

ART. VI.—*Swaving's Military Career during Ten Years.* Written by Himself. With a Portrait of the Author. Dortrecht: Blusse and Van Braam. 1830.

WE had confidently hoped this publication to be the work of fiction, and *Swaving*, the mere hero of the author's imagination. The preface, however, soon undeceived us, for it bears the following *stamp* of authority:

"*Cape of Good Hope, Nov.* 1, 1829.
J. G. SWAVING."

With regard to all the classes of self-describers who refer to a contaminated life with the most ingenious effrontery, and even consider their delinquencies as essential to their fame, and as connected with the *doctrine of Fatalism*, one could wish there was some public special mark and brand of emphatical reprobation to reward this tribute to public morals. Men that court the pillory for the pleasure of it, ought to receive the honour of it too, in all those contumelious salutations which suit the merits of vice grown proud of its impudence. Shame burn that man's face as black as a cinder, who could write as this person has done!

Page 13,—"It has been remarked, more than once, that in my volume of Travels and Adventures, I have written in a spirit of by far too much candour in reference to my errors and false steps, which should have remained concealed under the thickest veil of night; not only as it respects myself, but for the honour of my nearest relatives and dearest pledges. But, gentle reader, why should I keep *that* secret from a sense of false shame, which, taken in a religious point of view, is simply the fulfilment of my Fate, written in the great book of Predestination. Why should I feel ashamed to make an open confession of events, which were, consequently, not in my power to prevent?"

The wicked tendency of the above representation is so obvious, that it is quite unnecessary to point it out to our readers. He that does well his part in Time, is entitled to expect,—and cannot divest himself of the expectation,—that his present fidelity will hereafter be crowned with honour;—and he who has failed in his trust, also feels, that, in that failure, he has an earnest of a yet greater failure which he must incur. This is the unquestionable language of that *Religion*, whose fair side this scribbler has attempted to stab. It is moreover confirmed by all the sentiments of the human heart, and by the whole analogy of human affairs; it is, also, the common christianity of all the Protestant and Catholic churches at home and abroad.

THE CAPE OF STORMS.

Written at Sea.

SPIRIT of Gama! round the stormy Cape,
Bestriding the rude whirlwind as thy steed;
The thunder cloud, thy car,—thy spectre shape
Gigantic; who upon the gale dost feed
And drink the water spout;—thy shroud, the skies;—
Thy sport, the South and vast Atlantic sea;—
Thine eye, the light'ning's flash! — Awake! arise
From out the deep, in dread and awful sov'reignty!

Now hast thou risen! By heaven it is a sight
Most God-like, grand, and glorious to behold;
Three elements contend, and fierce in fight
As those who warr'd with mighty Jove of old.*
Oh, God! if any doubt thy being, or rate
With vain and impious mind, at nought thy pow'r,
So may it be such daring sceptic's fate
To pass the Cape of Storms, when angry tempests lower.

Do'st note the gath'ring clouds, as on thro' heav'n
They speed their midway flight 'twixt sea and skies?
Like to the first-born by the Archangel driv'n
On earth, with flaming sword from Paradise.
Do'st mark the spirit stirring of the deep,
As onward sweeps the stormy hurricane;
Rous'd like a roaring lion from his sleep,
That wildly stares around, and shakes his shaggy mane?

Nor doth he wake in vain. From his abode
Hath ocean risen in terrible array,
Magnificent as when the voice of God
Call'd forth the world, from chaos, into day!
'Tis night; and now the tempest shrouded bark
With surge lash'd crest, upborne aloft, doth ride
Upon the heaving billows, vast and dark—
And braves, as did the Patriarch's ark, the whelming tide.

Oh, God! it is a fearful sight! and all around
Is dismal, drear, and dark, both near and far,—
Save, when to make the darkness more profound
And visible, some pale and twinkling star
Peeps for an instant forth, and then, as 'twere,
In fear recedes,—or the phosphoric dash
Of wild long sweeping waves, with horrid glare,
Lights up the dread abyss, and shines along the splash,

And waste of waters, like to the pale horse
Whom death shall ride upon that awful day,
When sun, and moon, and stars have run their course,
The world and time itself be swept away!—
And now the waning moon would fain forth shine,
And thro' the heav'ns pursue her wonted track;
But three wild warring elements combine
At once in unison, and drive her rudely back!

Did'st hear that crash—tremendous as the roar,
Which burst on Sinai's summit, touching heav'n,
When by the Lord, on that all-sacred shore,
To man in thunder were his mandates giv'n.
Did'st mark of that destructive element
Promethean nam'd, the fork'd and lurid light,
With vivid flash, from heav'n directly sent,
Like the lit flame which struck the apostate Saul in night!

Hark to the rending of the storm split sail,
And mark the reed-like quiv'ring of the mast;
List! list, ye to the howling of the gale,
Dreadful as the Archangel's trump its blast!—
On such a night, the twelve Disciples cried
In fear, and rous'd the Saviour from his sleep!
Jesus arose, the elements to chide,
'Silence, ye angry winds, and peace, thou troubled deep!

So spake the Son of God! and thus allay'd
The storm which howl'd upon the Assyrian shore;
Prompt at his call, the tempest's rage obey'd;
The winds were hush'd—the waters ceas'd to roar!
When Royal Canute once, with scepter'd hand,
And rob'd in pride of earthly majesty,
Forbade the sea to dare to lave the land,
The wild waves rose in sport, and roll'd all heedless by!

Jehovah! what is man compar'd with thee—
Or son of man—in mockery of sense,
That he should dare assume the Deity?
Oh, Man! would'st learn to know thine impotence,
Thy littleness, and inferiority,
Come hie thee to these regions of the storm,
Behold the face of God upon the sea,
And worship in the gale, his dread Almighty form!

But see the darkling spirit of the night,
That brooding sate upon the wat'ry plain;
Flies at the approach of thee, Ethereal Light!
Awaking now the universe again!
The sea-boy wet, rude nursling of the blast,
Whose sleep was cradled in the dashing spray,
And rock'd upon the high and giddy mast,
Regardless of the storm—unseals his eyes with day!

Ye who would further seek to know of Light,
Go read it as recorded in the page*
Of that immortal bard, bereft of sight
Himself—the god-like Homer of his age!
Oh! for one spark of that celestial flame,
That inspiration once to Milton giv'n,
Which lit his way to never dying fame;
The fire—'the pomp, and prodigality of heav'n!'

In dread magnificence, the lurid sun
Now pierces thro' the tempest troubled sky,
And drives the thunder clouds dark rolling on,
As Satan and his rebel tribe were seen to fly
Before the red right arm of God!—No streaks
Of orient purple tinge, announce his rise,
In solitary splendour he awakes,
And seizes, as by storm, at once on all the skies!

Did'st mark the whale that dash'd along the deep,
'Hugest of all the ocean born that roam'†
Like that Leviathan, whom once asleep,
The mariner (as on through Norway's foam
He steer'd his rude and shatter'd skiff) at night,
Mistook for land, so vast and still he seem'd,
And anchor'd thus—then rose in wild affright,
When morning's dawn upon the mighty monster beam'd.

Again he comes! gigantic as the beast
Of old, that God in mercy sent to save
The prophet Jonah, from the foamy yeast
Of waves, his else unknell'd—unshrouded grave!
Three days and nights, the slimy monster sped
His way, as thus the chos'n of God he bore,
By 'raging floods' and 'seas encompassed,'
Then cast him all unscath'd upon the Syrian shore!

Hark to the sea-mew's wild and piercing shrieks
As ronnd the strong ribb'd bark they hover nigh,
Now o'er the waves white foam they skim their beaks—
Now far away they speed, and seek the sky!
—But mark the might and majesty of motion
Of him,‡ who sweeps cloud cleaving from the height
Of heav'n—it is the Condor of the ocean,
So nobly doth he soar aloft—so bold his flight!

The aspirations of this bird arise
Above those eagles that are seen afar,
O'er Chirombazo, loftiest in the skies—
Of Andes, 'Giant of the Western star!'
From mountain on to mountain let them urge
Their narrower flight, and habitations change,
His resting place the South Pacific surge—
All heav'n his Eyrie, and Immensity his Range!

Against the conquest crown'd Dictator's sway,
From Sardis, when the noble Cassius drew
His legions forth, in battle's stern array,—
E'en such a bird it was, that hov'ring flew
Upon his 'former ensign,'—then would feed
From out the soldier's hands, and flapping fly
His broad extended wings, that seem'd to lead
The embattled Romans on to certain victory!

But at Philippi sought, he then was gone—
And vultures, crows, and kites, were seen instead
For those whom hope of conquest had flush'd on,
Now vanquish'd lay, the dying and the dead!
—'Twas such a bird, all wild and young that rose,
When Swedish Charles, with 'soul of fire' went forth,
And 'frame of adamant,' 'mid polar snows,
To plant his standard on the steeple of the north.—

But when the fickle fortune of the war,
As history tells, on dread Pultowa's day
Forsook the warrior king, and woo'd the Czar,
The bird had wing'd his eagle flight away!—
On daring pinion borne—'twas such that o'er
The modern Hannibal was seen to fly,
Above Saint Bernard's Alpine snows, to soar
To Fame's proud Temple, and 'unutterably high!'

There were, who said o'er Lybia's arid waste,
And chief the Pyramid's dim solitude,
The self-same bird, his flight had boldly trac'd,
And once before on Lodi's bridge been view'd—
To sweep Marengo's field, he left the Alps,
A laurel wreath inscrib'd he waved on high,
Then gain'd with nobler speed, their 'snowy scalps,'
The wreath enroll'd, Napoleon and Victory!

By Danube's darkly rolling tide, and o'er
The field of Austerlitz—on Eylau's plain
At Friedland—Jena—Berlin—Ulm—once more,
All splendid did he re-appear again!
On Moscow's conflagration—when the sun
Turn'd ghastly pale, and sicken'd at the sight,
The eagle saw his race of Glory run,
He tried in vain to soar—then shriek'd and sunk in night!

Oh! haste and look upon yon glorious zone,
The bow of God, which girdles half the sky,
The heav'nly arch, by the Almighty thrown
In vast and infinite variety
Of tints most beautiful,—th' Immortal's span
To mortal sight display'd in time of yore
The great Creator's covenant with man,
That whelming waters should o'er land prevail no more!

Thou pledge redeemed of the Deity!
To man below, in consolation sent,
Thou fairest, brightest vision of the sky,
I hail thee! Dolphin of the firmament!
For each succeeding varied change imbues
Thee with a magic colour, that doth shine
More splendid than before—till all thy hues
Proclaim the God at once,—like him, thy form divine!

And if on earth thy beauty be extreme,
When view'd o'er mountain height, or level plain;
Far, lovelier far, thy variegated beam,
Expanded o'er the surface of the main,
With either horizon thy resting place,
Thou mak'st the sea the mirror of thy light;
The ocean back reflects thy radiant face—
Like lovers, each belov'd—both gazing with delight!

Jehovah! with thy name commenc'd my strain!
Jehovah! with thy name it shall conclude,
By those alone who track the dark blue main,
The grandest of thy wond'rous works are view'd;
I envy not the man, whose inward fire
Of soul, expands not, riding o'er the deep,
Whose mental aspirations soar not higher
With the wild waves, 'ere night behold him laid in sleep!

For me! whatever dangers yet may lower
Upon my life, or errors be my fate—

* The Titans.

* Milton, Book iii. † Milton, Book i.
‡ The Albatross.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

So shall it soothe me, in my latest hour,
That once, at least, I tried to celebrate
Thy praise; and in Thy temple of the sea,
Its canopy, the clear and cloudless sky,
That thus I struck the lyre, and bent the knee,
Oh, God! in homage to Thy pow'r and majesty!

With love of fame, my dawn of life awoke,
And hopes of honours that ambition fired;
Too soon the demon disappointment broke
Upon the day-dreams which those hopes inspir'd.
And be it so—yet, haply, if I dare
Uplift a suppliant's voice to heav'n 'twould be,
That God in mercy migh accord my prayer
To die a hero's death in planting Freedom's tree!

I little reck' what soil it be upon,
So danger lead, and point to glory's star
In fighting on the plains of Marathon,
Or 'neath thy banners, noble Bolivar!
For since young Freedom's standard is unfurl'd,
On Atho's crags, and Pernambuco's shore,
Alike to me, the east or western world,
So that my soul escape amid the battle's roar!

When life from selfish joys is disallied—
If callous gloom succeed to cherish'd hope—
'Twere nobler far to fall by Freedom's side,
Than on to live a moody misanthrope,
Or die a heartless suicide——If life
Hath ceas'd to please—what higher aim can be
Than in the glorious rapture of the strife
To breathe our last upon thine altar—Liberty?

But 'circumstance' is, aye, one's blight and curse,
It mars our best and brightest hopes—since then
It may not be my lot to spur my horse
In Freedom's ranks, and aid my fellow men
(Embattled in her sacred cause,) in rending
A tyrant's chains, a bigot's iron crown—
The patriot's and the martyr's laurel blending,
And dying, strike some Selim, or Pizarro down.

Perchance the grandest boon to be betow'd
By heav'n on man—the shortest, best relief
From all his mortal sufferings, and load
Which life entails of misery, and grief—
The termination of his woes, might be
As now he braves the billows of the Cape,
To grapple with grim Death upon the sea,
The whirlwind for its courser, and the storm its shape,

So might the bark become his coffin's shell,
The murky cloud enshroud him as his pall,
The roar of distant thunder ring his knell,
The lightning's flash illume his funeral!
His winding sheet the wild white curling wave,
The rolling billow as his bier, be lent,
The rain his tears! the ocean for his grave,
The Cape of Storms itself his mighty Monument!

Cape Town. W.

LITERARY EXTRACTS.

IRELAND.

(Traits and Stories of the Irish Peasantry, 2 vols. 12mo.)

We have a very full and particular account of a hedge school, that peculiarity of Ireland, with which so few have an opportunity of becoming familiar. The master and the establishment having been elaborately depicted, the author introduces us to both in the full tide of business.

"Come, boys, rehearse....(Buz, buz, buz.).... I'll soon be after calling up the first spelling lesson—(buz, buz, buz)—then the mathematicians—book-keepers—Latinists, and Grecians, successfully (Buz, buz, buz.)....Silence, there below! your pens? Tim Casey, is'nt this a purty hour of the day for you to come into school at; arrah, and what kept you, Tim? Walk up wid yourself here, till we have a confabulation together; you see I love to be talking to you."...."Sir, Larry Brannigan; here, he's throwing spits at me out of his pen."....(Buz, buz, buz.)...."By my sowl, Larry, there's a rod steeped for you."—"Fly away, Jack—fly away, Jill; come again, Jack—." "I had to go to Paddy Nowlan's for tobaccy, Sir, for my father."....(Weeping, with his hand knowingly across his face—one eye laughing at his comrades)...."You lie it was'nt." "If you call me a liar agin, I'll give you a dig in the mug." "It's not in your jacket." "Is'nt it?" "Behave yourself; ha! there's the masther looking at you—ye'll get it now."...."None, at all, Tim?—and she's not afther sinding an excuse wid you?—what's that undher your arm?" "My Gough, Sir."....(Buz, buz, buz.) "Silence, boys. And you blackguard Lilliputian, you, what kept you away till this?"—"One bird pickin',—two men thrashin',—one bird pickin',—two men thrashin'—one bird pickin'—" "Sir, they're stickin' pins in me, here." "Who is? Briney." "I don't know, Sir, they're all at it." "Boys, I'll go down to yous."...."I can't carry him, Sir, he'd be too heavy for me: let Larry Toole do it, he's stronger nor me; any way, there he's putting a corker pin in his mouth."....(Buz, buz, buz.)...."Who-hoo-hoo-hoo. I'll never stay away agin, Sir; indeed I won't, Sir. Oh, Sir, dear, pardon me this wan time—and if you ever cotch me doing the like agin, I'll give you lave to welt the sowl out of me."....(Buz, buz, buz.) "Behave youself, Barny Byrne." "I'm not touching you." "Yes you are; did'nt you make me blot my copy." "Ho, by the livin', I'll pay you goin' home for this."...."Hand me the taws." "Whoo-hoo-hoo-hoo-hoo-hoo—what'ill I do, at all, at all! Oh, Sir dear, Sir dear, Sir dear—hoo-hoo-hoo." "Did she send no message, good or bad, before I lay on?" "Oh, not a word, Sir, only that my father killed a pig yestherday, and he wants you to go up to-day at dinner time." (Buz, buz, buz)...."It's time to get lave, it is'nt, it is, it is'nt, it is," &c....."You lie, I say, your faction was never able to beat our's; did'nt we lick all your dirty breed in Buillagh-battha fair?" "Silence there."....(Buz, buz, buz.) "Will you meet us on Sathurday, and we'll fight it out clane?" "Ha-ha-ha! Tim, but you got a big fright, any how: whist, ma bouchal, sure I was only jokin' you; and sorry I'd be to bate your father's son, Tim. Come over, and sit beside myself at the fire here. Get up, Micky Donoghue, you big burn't-shin'd spalpeen you, and let the dacent boy sit at the fire." "Hullabaloo-hoo-hoo-hoo—to go to give me such a welt, only for sitting at the fire, and me brought turf wid me." "To-day, Tim?" "Yes, Sir," "At dinner time is id?" "Yes, Sir." "Faith, the dacent strain was always in the same family."....(Buz, buz. buz, buz.) "Horns, horns, cock horns: oh, you up wid them, you lifted your fingers—that's a mark, now—hould your face till I blacken you."...."Do you call thim two sods, Jack Lannigan? why, 'tis only one long one, broke in the middle; but you must make it up to-morrow, Jack; how is your mother's tooth; did she get it pulled yet?" "No, Sir." "Well, tell her to come to me, an' I'll write a charm for it, that I'll cure her....What kept you till now, Paddy Magouran?" "Couldn't come any sooner, Sir." "You couldn't, Sir—and why, Sir, couldn't you come any sooner, Sir?"...."See, Sir, what Andy Nowlan done to my copy."....(Buz, buz, buz, buz.) ...."Silence, I'll massacree yees, if yees don't make less noise."....(Buz, buz, buz.)...."I was down with Mrs. Kavanagh, Sir."...."Masther, Sir, spake to Jem Kenny here; he made my nose bleed." '—pp. 167—169.

This may be regarded as a winter scene—for in the warm weather the site of the school varies to suit, as we presume, the convenience of master and scholars.

'During the summer season, it was the usual practice for the scholars to transfer their paper, slates, and books, to the green which lay immediately behind the school-house, where they stretched themselves upon the grass, and resumed their business. Mat would bring out his chair, and, placing it on the shady side of the hedge, sit with his pipe in his mouth, the contented lord of his little realm, whilst nearly a hundred and fifty scholars of all sorts and sizes, lay scattered over the grass, basking under the scorching sun in all the luxury of novelty, nakedness, and freedom. The sight was original and characteristic, and such as Mr. Brougham would have been delighted with—"The schoolmaster was abroad again." As soon as one o'clock drew near, Mat would pull out his *Ring-dial*, hold it against the sun, and declare the hour. "Now boys, to yer dinners, and the rest to play." "Hurroo, darlins, to play—the masther says its dinner time!—whip-spur-an'-away-grey—Hurroo—whack—hurroo." "Masther, Sir, my father bid me ax you home to yer dinner." "No, he'll come to huz—come wid me if you plase, Sir." "Sir, never heed them; my mother, Sir, has some of what you know—of the flitch I brought to Shoneen on last Aisther, Sir." This was a subject on which the boys gave themselves great liberty, an invitation, even when not accepted, being an indemnity for the day; it was usually followed by a battle between the claimants, and bloody noses were the issue. The master himself, after deciding to go where he was certain of getting the best dinner, generally put an end to the quarrels by a reprimand, and then gave notice to the disappointed claimants of the successive days on which he would attend at their respective houses. "Boys, you all know my maxim; to go, for fear of any jealousies, boys, wherever I get the *worst* dinner; so tell me now, boys, what yer dacent mothers have all got at home for me?" "My mother killed a fat hen to-day, Sir, an' you'll have a lump of bacon, and 'flat dutch' along wid it." "We'll have hang beef and greens, Sir." "We tried the praties this mornin', Sir, an' we'll have new praties, an' bread and butter, Sir." "Well, it's all good, boys; but rather than show favour or affection, do you see, I'll go wid Andy, here, and take share of the hen an' bacon; but, boys, for all that, I'm fonder of the other things, you persave; and as I can't go wid you, Mat, tell your respectable mother that I'll be with her to-morrow; and with you, Larry, ma bouchal, the day afther."'—pp. 181—183.

The following is another humourous specimen of the business of an Irish school:

"Pierce Mahon, come up wid your multiplication. Pierce, multiply four hundred by two—put it down—that's it, 400
By 2

"Twicet nought is one." (Whack, whack.) "Take that as an illustration—is that one?" "Faith, masther, that's one an' one any how; but, Sir, is not wanst nought, nothin'; now, masther, sure there can't be less than nothin'." "Very good, Sir." "If wanst nought be nothin', then twicet nought must be somethin', for its double what wanst nought is—see how *I'm* sthruck for *nothin'*, an' me knows it—hoo! hoo! hoo!" "Get out, you Esculapian; but I'll give you *somethin'*, by-and-by, just to make you remimber that you know *nothin'*—off wid you to your sate, you spalpeen you—to tell me that there can't be less than nothin', when it's well known that sporting Squire O'Canter is a toousand pounds worse than nothin'."

"Paddy Doran, come up to your Inthrest.' Well, Paddy, what's the inthrest of a hundred pound, at five per cent?

"Do you mane, masther, *per cent per annum?*

"To be sure I do—how do you state it?"

"I'll say, as a hundher pound is to one year, so is five per cent per annum."

"Hum—why—what's the number of the sum, Paddy?" "'Tis No. 48, Sir." (The master steals a glance at the Key to Gough.) "I only want to look at it in the Gough, you see, Paddy—an' how dare you give me such an answer, you big-headed

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

dunce, you—go off an' study it, you reascally Lilliputian—off wid you, and don't let me see your ugly mug till you know it."

"Now, *gintlemen*, for the Classics; and first for the Latinaarians—Larry Cassidy, come up wid your Asop. Larry, you're a year at Latin, an' I don't think you know Latin for *frize*, what your own coat is made of, Larry. But, in the first place, Larry, do you know what a man that teaches classics is called?" "A schoolmaster, Sir." (Whack, whack, whack.) "Take that for your ignorance, you wooden-headed goose, you—(whack, whack)—and that to the back of it—ha! that'll tache you—to call a man that taches classics a schoolmaster, indeed! 'tis a Profissor of Humanity itself, he is—(whack, whack, whack,)—ha! you ringlader, you; you're as bad as Dick O'Connell, that no masther in the county could get any good of, in regard that he put the whole school together by the ears, wherever he'd be, though the spalpeen wouldn't stand fight himself. Hard fortune to you! to go to put such an affront upon me, an' me a Profissor of Humanity. What's Latin for breeches?" "Fem—fem—femina." "No, it's not, Sir; that's Latin for a woman." Femora—" "Can you do it?" "Don't strike me, Sir;—don't strike me, Sir, an' I will." "I say, can you do it?" "Femorali"—(whack, whack, whack,)—"*Ah*, Sir! *ah*, Sir! 'tis fermorali—*ah*, Sir! 'tis fermorali—*ah*, Sir!" "This thratement to a Profissor of Humanity—(whack, whack, whack, whack, kick, kick, kick, thump, thump, thump, cuff, cuff, cuff—drives him head over heels to his seat.)—Now, Sir, maybe you'll have Latin for breeches, again, or, by my sowl, if you don't, you must strip, and I'll tache you what a Profissor of Humanity, is!"

THE RIVAL TOWER BUILDERS.

In the vicinity of Edinburgh, not a hundred miles from Duddingston, there lately lived two old gentlemen, who cherished an unconquerable antipathy to one another. They took every opportunity to thwart the projects of each other when they had it in their power. No two persons, however, could have possessed more opposite temperaments. Captain D——, the one, had mixed in the world, and in his youth had been so improvident of his affections, that in his old age he had not a grain of feeling to bestow upon the fair sex. He kept none but man-servants, and in fact he never saw a woman without expressing feelings of the utmost horror and disgust. He once kicked a poor beggar woman right down stairs, without at all troubling himself about her business, whereas, had a man been in the case, he would in every probability have sent him away rejoicing. Mr.——, on the other hand, had long been a widower, and in his old age he always exhibited a very great regard for the sex, to the exclusion of male animals of every description. Not that he was by any means a misanthrope,—the only man he thoroughly detested was Captain D——, He was likewise a quiet, sober, steady fellow, willing to pass through the world without molesting any body; but nevertheless, he would have stretched a point to annoy the captain, who was a blustering, and consequently a troublesome antagonist. It so happened, that in the very centre of Mr. M—'s property there was a piece of ground which did not belong to him, and which was offered for public sale. Whether with a mischievous intention, or for the sake of adding to his possessions, we do not know; but certain it is that the captain became the purchaser of the piece of ground aforesaid. When this came to the ears of Mr. M——, he was thrown into a state of the utmost tribulation. Here was annoyance with a vengeance! Captain D—— located in the very core of his property! The identity of his estate destroyed, and its territory infringed by a noisy foreigner! All these alarming circumstances burst at once upon his bewildered mind, and he became sorely troubled in spirit. It was plain, at least for a time, that the genius of the Captain overmastered Mr. M.——, and that the star of his glory had been eclipsed. In his dilemma he was so imprudent as to make overtures to the gallant Captain, with an offer to take the property off his hands at the same money which he paid for it. Such a message from his inveterate foe tickled the hero to the very soul; he had not met such a triumph since the taking of Seringapatam, when he was amongst the first to mount the walls. The Captain, like an expert general, did not return an immediate answer to the distressed Mr M——. He rather preferred keeping him in a state of suspense for a day or two, during which time he meant to luxuriate over the agonies of the enemy. In this he succeeded to the utmost of his desires—for ere a day elapsed, another message arrived from Mr. M——, with the proposed sum increased to one-half—which he humbly offered for the piece of territory of which Captain D—— had become possessed. The very civility of Mr. M——'s notes afforded a high treat to the mischievous Captain, who returned for answer that he had examined the property, and was determined not to part with it for any money. This settled the matter in the meantime; and Mr. M—— could only watch for the next step of his opponent. In a week afterwards, a number of diggers and masons, with spades, wheelbarrows, stones, and lime, arrived upon the spot, which by lawful purchase, and without dispute, belonged to the Captain. Mr. M—— was on the very tiptoe of expectation, and he employed himself exclusively in observing the operations of the workmen. By degrees a circular shaped wall appeared above the ground, which, day after day, assumed a more definite appearance, till at length it actually burst forth upon the astonished eyes of Mr. M—— in all the hostile splendour of a castellated tower! This at once decided the intention of his adversary, and he immediately resolved upon frustrating, so far as he could, the annoying efforts of the captain. The tower at length was finished, and its proprietor was daily seen on the top under the very nose of Mr. M——'s bed room. Revelry and riot were also nightly heard from the adjoining protuberance. At length Mr. M—— thought he had discovered a means whereby to stop the proceedings of the captain, and at the same time render his boasted watch-tower utterly valueless. He sent for the person who had been employed in erecting the bottle-looking edifice over his grounds; and, as there were only a few yards of space betwixt the wall and his own property, Mr. —— conceived the idea of blocking up the building and excluding it from the light of day altogether. The builder found no difficulty in assuring Mr. M—— of the perfect practicability of his scheme. Measures were therefore immediately taken to commence operations; and before another month had elapsed—lo and behold!—the elegant tower of Captain D—— had disappeared, and nothing but a dead brick wall in a circular form could be seen. This was a metamorphosis infinitely astonishing to the villagers. But the fact soon became apparent, for in the course of another week the interior building peeped out from behind the brick walls, and intimated the existence of the Captain's Tower. No sooner did Mr M—— perceive this than he ordered an additional quantum of brick and lime to be placed upon his erection, and once more the Captain's tower became invisible. Yard after yard was added to the buildings, the tower being at one time lord of the ascendant, the dead wall at another, till ultimately the builder averred that the edifices would stand increase of height no longer. In their furor the octogenarians—for they had both passed their grand climacteric—declared they would await such a crisis, and ordered the builder to continue his operations—so that he had only to commence to the tower when he had finished the walls, which he did again and again. This retributive sort of work might have been carried on *ad infinitum*, had not that fell monster death interposed his icy hand, and put a stop at once to the existence of Captain D—— and Mr. M—— in the very midst of their building hostilities—the effects which remain to this hour as a lasting proof of the absurd length to which human beings will sometimes carry their rivalry and hostility.

THE PRESS IN THE SOUTH SEA ISLANDS.

(Polynesian Researches. By W. Ellis, 2 vols. 8vo.)

The author of these volumes had learnt the art of printing before he left England upon the mission, and types and a press had been sent out with him, in 1816, before the religious revolution which had taken place could be known in Europe. The printing office was erected in Eimeo; that mighty engine for good and evil was never anywhere more needed, nor more beneficially employed. In four families, where all were scholars, there was but one book; but many hundreds who had learned to read were without one. Many had written out the whole spelling book; others, who could not procure paper for this purpose, had prepared pieces of native cloth with great care, and then, with a reed, dipped in red or purple dye, had written out the alphabet, spelling and reading lessons on these pieces, which were made of the bark of a tree. Others had written portions of scripture, and texts, which they had heard preached from, on scraps of paper, or fragments of such cloth. Pomare, who, in his desire of promoting the improvement of his people, has not been surpassed by any of those princes who have rendered themselves deservedly illustrious for that merit, was exceedingly delighted when the press arrived, and furnished every assistance for erecting the printing-house; and requested that he might be sent for when every thing was ready to begin. Accordingly he came, accompanied by a few favourite chiefs, and followed by a large concourse of people. Mr. Ellis took the composing-stick in his hand, and seeing with what curious delight the king was looking at the new and shining types, asked him if he would like to put together the first alphabet. His countenance brightened at the proposal, and he set up the capital and smaller alphabet, to which the few monysyllables composing the first page, were afterwards added. Pleased at seeing this page in the types, he was yet contented to wait till the whole sheet should be ready, before he saw it struck off. Meantime, he visited the missionaries almost daily; and, when they were ready to print the first sheet, came, with only two chiefs, but followed by a numerous train, who had heard that the work was about to begin. Crowds had already collected round the door; they made way for him, and when he and his two companions had been admitted, the door was closed, and a window was darkened, by which he might have been overlooked; for he wished to prevent this. He examined minutely, and with great pleasure, the form as it lay on the press; and, as he prepared to take off the first sheet ever printed in his dominions, charged his companions, good naturedly, not to look too closely at him, nor laugh at him if he should not do it well. Mr. Ellis instructed him how to use the ink-ball, then placed the paper, and directed him to pull the handle. The sheet was well printed, for there could be no failure; Pomare took it up, looked first at the paper, and then at the types, with ardent admiration; then handed it to one of the chiefs, and, while he struck off two more copies, the first was shown to the crowd without, who set up a general shout of approbation and joy. There were few days in which he did not come to watch the progress of the work. Observant of everything as he was, he counted several of the letters, and seemed surprised to find that, in sixteen pages of this spelling-book, there were more than five thousand of the letter A. Two thousand six hundred copies of this book were printed; then a Tahitian catechism; a collection of Scripture extracts; and St. Luke's Gospel. Paper for fifteen thousand

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

copies of these, was all that remained, when a supply from the Bible Society arrived in time to double the impression; and that Society has furnished paper for every portion of the Scriptures that has since been printed in these islands.

'O, Britain, land of knowledge, was the frequent exclamation of those who crowded to the doors and windows of the printing office. Multitudes arrived from every part of Eimeo, and even from other islands, to see the work, and to procure books. The excitement is likened to what the English felt at witnessing, for the first time, the ascent of a balloon, or the movement of a steam-carriage. The beach was lined with canoes; the houses of the inhabitants were crowded with guests; and small parties pitched their temporary encampments in every round-about. For several weeks before the first portion of the Scriptures was finished, the district in which the printing-house stood, resembled a public fair. In order to preserve the books, it was necessary to put them in some substantial binding, before they were delivered: Mr. Ellis had learned how to do this in England; his materials, indeed, were scanty, but supplies, or substitutes were found. A good pasteboard was manufactured from bark-cloth; old newspapers were stained with a deep purple dye for covering the sides; and, when the few sheep-skins which had been brought out, were consumed for backs and corners, leather became in great request, to the cost of cats, dogs, and goats. The march of intellect was a sore evil to these poor animals, which had hitherto lived in undisturbed ease and freedom; they were hunted now for their skins. Sometimes the people brought the tough skin of a large dog, or of an old goat, with the long shaggy matted hair and beard attached to it, or the thin skin of a wild kitten, taken in the mountains. When they were instructed how to dress them, they did it at their own houses, and no object was then more common than a skin stretched on a frame, and suspended on the branch of a tree, to dry in the sun. The elementary books had been gratuitously distributed, and continued to be so. But for this, a larger and more important book, it was thought best to require such a payment as might just cover the expense of paper and printing materials, that the people might not undervalue it, as a thing of no cost. A certain small quantity of cocoa-nut oil was the price fixed; this was what they could most easily procure, and it was cheerfully paid. Incessant, and, at times, exceedingly oppressive, as the labour was, of printing and binding these books, in a tropical climate, and at a season when the sun was vertical, Mr. Ellis says that it was one of the happiest parts of his life.—*(Quarterly Review, May*, 1830.*)*

CHURCH IN DANGER—AND THE MEANS OF SAFETY.

At a meeting in Edinburgh, to take into consideration certain overtures from the last General Assembly, on the subject of the education of clergyman, Dr. Chalmers said—Of late years there had been a prodigious growth in all the branches of education; and, it was highly expedient, that those intended for the ministry, should keep pace with the progress of improvement. It would be well for society at large, if clergymen, physicians, and lawyers, were as much looked up to for superior learning, as they were a hundred years ago! Certain it was, that the homage paid to rank, *wealth, and official station*, was fast wearing away; and he was not sure that this boded well to the commonwealth. The only remedy for this was to compel men to pay, not a servile homage, but that homage which was naturally given by the bulk of the community, to men more enlightened than themselves. He was not an alarmist on the subject of popular education; he would allow it to go on indefinitely, and only propose to meet it, by their taking a higher ascent themselves. If the base of society was more elevated, they must, to preserve the due proportions of the fabric, raise loftier minarets.

In conclusion, Dr. Chalmers complained of the want of spirit on the part of the present Administration. He reprobated the system of economy and retrenchment which marked its policy, and that spirit of the present age, in which every thing was made a question of finance, and vulgarised to the common standard of the counter and the counting-house. When he (Dr. C.) knew, that that great national undertaking, the trigonometrical survey of our islands, hinged on one vote, he trembled lest the old spirit of gothic barbarity was returning among us. When he thought that this noble enterprise was within a hair's breadth of being quashed, he had great reason to fear that any support from government, for the better improvement of theological education, could hardly be expected. Theology was too refined a subject to receive encouragement in this age of little men and little measures. However, he was not over anxious to make any establishment dependent on endowments, for it was notorious, that *gratuitous education was seldom a vigorous, or a thorough education.*

THE SECRET REVEALED.

You ask me the secret by which we contrive
On an income so slender so fairly to thrive,
Why the long and the short of the matter is this,
We take things as they come, and thus nought comes amiss;
My sons are no sluggards, my daughters no sluts,
And we still keep an eye to the main and *'Tis Buts.*

Neighbour Squander's grand treat—*'tis but* so much, he says,
And his wife's fine new gown—*'tis but* so much, she pays;
'Tis but so much the fan, *'tis but* so much the play,
His child's gew-gaws too—*'tis but* that thrown away;
But each *'tis but* grows on, till they run on so fast.
That he finds *'tis but* coming to want at the last.

Now something occurs, and he says, like a ninny,
I'll buy it at once, for *it is but* a guinea;
And then something else, and he still is more willing,
For *it is but* a trifle, *it is but* a shilling;
Then *it is but* a penny, *it is but* a mite,
Till the 'Tis Buts at last sum up—*Ruin outright!*

(Edinburgh Post.)

LONDON CORRESPONDENCE.

To the Editor of the Cape of Good Hope Literary Gazette.

If your publication be in existence, the plan of which you hinted in your last letter, a little of the literary, and other chit-chat of this metropolis, may, for aught I know, afford a degree of interest to your journal. In looking in at *Richardson's*, almost daily, I often find many Cape friends whose coterie I enjoy. Good Sandie McDonald and Dan. Dixon are frequently of the party. The one loves Plato, and the works of Ossian (in the original), as much as ever. The other thinks Todd's *Johnson* to be as necessary for your merchants as it was, previously to the *sowing of the legitimate seeds of prosperity* among you. They are great friends to the Cape interest, and are not a little gratified by being called up before the House of Commons on East India trade matters. Why the London merchants are all *Esquired* in the Minutes of Evidence which have been printed, and our two friends not thus distinguished, I cannot tell. But even in the somewhat *perfected* state of things at the Cape, you are at fault sometimes. And in the affair of the *distinctive appellation* which some men sigh after, and are provoked to the quick if they do not obtain it, I discover occasional displays of inconsistency. For instance, when it is the good fortune of individuals among you to be Gazetted, i.e. clerks, and others, they are all *Esquires*,—but if an individual of the medical profession, whose education is that of a gentleman, and who is often a graduate in one of our Universities, or a Member of a Royal College, happens to be appointed to a station in the colony,—he is simply a plain *Mister*. But I must leave it to your local press to point out domestic errors, and just advert to some of our own novelties.

The bulletins of His Majesty's health have created a great stir. They have afforded all the world employment during the last month. St. James's has popped in just in the nick of time to give a new impetus to the fashionable world. Thousands go daily to inspect the bulletins, or as we should say, to stroll through the royal apartments of the palace. All the shops of London and Westminster put us in mind of a general mourning. The drapery-ones invite us to secure *great bargains* in those manifold varieties which designate death's heraldic costume.——The anniversary dinner of the Literary Fund was well attended on the 24th. There must have been nearly 200 present; 40 of whom were booksellers, about 100 authors, and the others artists, patrons, and other indescribables. The Duke of Somerset is by no means a lively chairman; but we suppose it is something to have a Duke at the head of a Literary Society. He did not say twenty words out of the beaten track. Croly, the delightful author of Salathiel, spoke pretty. He was by far the best speaker who opened mouth. East India Buckingham was most unmercifully coughed down; it was in vain that "order" was called; hob-a-nobbing fairly silenced the orator, who, nevertheless, contrived to stand upon his legs somewhile about 15 minutes. Hobhouse was heard with some attention. Mr. Sotheby, now the venerable, spoke well, and modestly about his own merits. Lockhart, the clever writer, but apostate in religion, was present, but he did not speak. Allan Cunningham, and *Bulwer*, author of Pelham, Disowned, Devereaux, and Paul Clifford, and almost every writer of note, were to be found among the company.——The exhibition at Somerset House has just opened—it is rather poor. The greatest attraction is the King in the Highland costume, by Wilkie. The best portrait is that of L. E. L. The likeness is admirable. But as for the sickly sentimentality of her poetry, who cares for it. Half-a-dozen verses of that delightful woman, Felicita Hemans, is worth a whole volume of Miss Landor's sing-song. Apropos—Pringle has just given us a new sonnet—here it is.

OLITUDE.

Doth peace of mind, or slumber undisturbed
By lonely springs or silent grottoes dwell?
Or is there medicine for a mind perturbed,
O, Solitude! within thy secret cell?

Could'st thou, meek goddess, of their stings disarm,
The scorpion cares which prey upon my life?
Or sink the memory with oblivion's charm,
Sweeten the passions, or compose their strife?

To thee, disdainful of the world and fame,
I'd fly,—and bid their vanities depart;
And hide with thee an unremembered name,
A wounded spirit, and a broken heart.

The Annual Meetings of Religion have gone off pretty well. They have by no means declined in interest this year, and it is not the least pleasing feature of them, that oratory, splendid imagery, and human compliment, have been felt not to be the objects of such assemblies, but infinitely higher and purer aims. Lord Bexley presided at the annual meeting of the Parent Bible Society. Many of the Bishops addressed the assembly. The Dissenters have complained of the exclusion of their friends from the platform. They term it a piece of direct worldly policy. Leander van Ess has been dismissed by the society. Let us hope Andrew Thompson will celebrate the victory with becoming prudence. The receipts of the Society for the year, have amounted to £84,982.——The Church Missionary Society's meeting was crowded to excess. There is a talk of sending

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

two young ministers, in connection with it, to South Africa. The receipts of the past year have been £47,328.——At the WESLEYAN MISSIONARY SOCIETY, Earl Mountcashel presided. Annual income—£55,565.——THE LONDON MISSIONARY SOCIETY'S annual funds have amounted, as stated at its thirty-sixth Anniversary, to be £48,226. Mr. Bennett, lately a visitor at the Cape, and whose Travels are in the press, gave a pretty lengthened account of his visits to the several missionary stations throughout the world. The venerable Rowland Hill, now 86 years of age, was as talky and good humoured as ever.——THE ANTI-SLAVERY MEETING was a splendid one. The nail is at length hit on the right head. The meeting came to the resolution of petitioning Parliament, that an *early day* might be fixed by it, after which all children that may be born of slave parents, may be declared free. The spirit of o'erwearied nature crieth out AMEN! The meeting was addressed by Messrs. Wilberforce, Buxton, Lord Milton, Lord Calthorpe, Rev. Dan. Wilson, Mr. Brownlow, Mr. Brougham, Mr. Drummond, Mr. O'Connel, Mr. Denman, Dr. Lushington, &c. Christian philanthropy was at its height on this occasion. How blindly perverse some people are on this subject. Misled by the hireling press, they do not see that the West India flesh-dealer, by means of his influence in Parliament, keeps £10 per ton more duty on East India, than on West India sugar; £28 per ton more on East India than on West India coffee; 11*s.* 6*d.* more on East than on West India rum, and such like duties on various other articles. Yet, notwithstanding this restrictive system, the imports to Asia (so great is the desire for our cotton and other manufactures,) have increased beyond all example. Even if the charter of the East India Company be not renewed, we shall experience much less advantage than ought to be the case, whilst the West India interest continues to keep the East India productions almost out of our reach. There are about sixty-three members of both Houses of Parliament, who own West India property, and maintain that they have derived, from an Act of Parliament, authority to buy and sell the bodies of their fellow men! These, by strange anomaly, are sitting among the representatives of the free people of Great Britain, and are the very cause of our manufactures being excluded from the markets of Asia. But as it regards the declaration or wish that all children be born free after a particular period,—it is not likely that the West India proprietors will ever listen to the proposition, unless *Philanthropic* Societies, similar to yours of the Cape, come *forward* and *buy* the little creatures upon the same magnificent scale of prices as we understand you are able to afford. I am sure the slave-holders ought to be very much obliged to you all.——You should read the last number of the Edinburgh Review, which contains a complete exposition of the pretensions of Robert Montgomery, the presumptuous author of *Satan*, and other poems. "This poem," say the Reviewers, "was ushered into the world with the usual roar of acclamation. But the thing was now past a joke. Pretensions so unfounded, so impudent, and so successful, had aroused a spirit of resistance. In several magazines and reviews, accordingly, Satan has been handled somewhat roughly, and the arts of the puffers have been exposed with good sense and spirit." The nuisance of puffery will, doubtless, be abated—most men have now their eyes open to the tricks of this base system, and that our literature should be taken out of the hands of quacks and brokers, is the desire of every well-wisher to its interests ——At page 209 of Moore's Byron, vol. 1, occurs an account of an affair which took place between Lord Byron and Col. Carey at Malta. Since the publication of the volume, Moore has been satisfied that he has fallen into error. He has written a letter to the Colonel, and wishes that the utmost publicity should be given to his retraction.——The Council of the University of London, have come to the resolution of granting a diploma in medicine. This diploma will enable the person who gains it to put five capital letters after his name, M.M.S.U.L. signifying Master of Medicine and Surgery in the University of London. Mr. Hume has withdrawn from the council of this public school.——Godwin's Cloudesley has been translated into French. It is not generally known that Godwin began his career as a Dissenting Clergyman, and published a volume of sermons at an early age.——A great noise was created last year about the probable exhaustion of the coal mines. Of course this would be attributed to the *steaming* practices of the day. Well, now, after an investigation of the Durham and Northumberland coal-fields alone, it is calculated that these contain no less than *six thousand millions of tons of coals!* or about as much as will do, according to the present average consumption, for the next *seventeen hundred and twenty-seven years.*——A new Society, to be called "The London Geographical Institution," is to be forthwith established. Its object is to be the same with that of Paris;—namely, to collect and register all the useful facts comprehended under the divisions—physical and political geography. ——The Geographical Society of Paris has offered its gold medal, value 1000 francs, to the author of the best memoir upon the Origin of the Race of Asiatic Negroes. ——The outlay of the Zoological Society of London, annually, is estimated at £70,000;—the receipts last year amounted to £14,000.——The best proof of the progress of improvement in England, is the fact, that Mr. Littleton, in presenting a petition to the House of Commons the other night, from a place in Staffordshire Potteries, signed by 9,000 persons, stated that there was not one *mark's-man* (a man unable to write) amongst all the petitioners. A few years ago, more than half of the population of that district were mark's-men.——You will discover from most of the periodical journals how much the Church of England is attacked from all quarters. This is not a bright picture of the times. Amid all the opposition, the cloven foot appears. It is not the Establishment so much, as its doctrines. But let us take courage: thousands of its sons are faithful to their charge, and have not succumbed to the modern doctrines of expediency.

"Long be our Father's temple ours—
Woe to the hand by which it falls;
A thousand spirits watch its towers,
A cloud of angels guard its walls!
And be their shield by us possessed!
Lord, rear around thy blest abode,
The buttress of a holy breast,
The rampart of a present God!"

THE SOUTH AFRICAN INSTITUTION.

ON Wednesday, the 1st instant, the Ordinary Monthly Meeting of the South African Institution was held in the Rooms,—F. Watermeyer, Esq. in the Chair. There was admitted a Member, Mr. J. Gie, Ms. of Cape Town.

There were read—1st, a continuation of *Remarks on the Culture of Exotic Vegetables*, by Mr. Bowie, describing the proper methods of rearing the Curcuma longa, Turmeric, Bori, the Ginger, and Arrow-root Plants; concluding with the remark "that the recommendation of these plants to a more extensive culture than they meet with at present, arises rather from a wish to add to the domestic comforts of the community, than to render them articles of exportation; but in either case it will prove the resources of the colony, and form a pleasing and useful amusement to those who may devote their leisure hours to such wholesome recreations." The author then described the culture properties of the Chesnut and Walnut Trees. There was read—2d, Extracts from the Journal of Mr. Andrew Bain, kept during a visit to some of the interior tribes of Southern Africa, describing the author's visit to Toovan, the chief of the Barolongs, with illustrations of the practices of his people, and the incidents of his journey over the Ba-Marootzie Mountains, to meet the chief Sibigho, residing at Soloqualaly, the capital of the Ba-Wanketzie, and his reception by this tribe.

DIED,

AT Windsor Castle, June 26th, 1830, HIS MOST GRACIOUS MAJESTY GEORGE-AUGUSTUS-FREDERICK, THE FOURTH, King of the United Kingdom of Great Britain and Ireland, and King of Hanover, Defender of the Faith; Duke of Lancaster, Cornwall, and Edinburgh; Marquess of the Isle of Ely; Earl of Garrick and Eltham; Viscount Launceston; Baron of Renfrew; Lord of the Isles, and Great Steward of Scotland; Sovereign of the illustrious Orders of the Garter, of the Bath, of the Thistle, of St. Patrick, of St. Michael and St. George, and of the Royal Hanoverian Guelphic; Knight of the Russian Orders of the Black Eagle, of St. Alexander Newski, and of St. Anne; of the Polish Order of the White Eagle; of St. Esprit, in France; of the Golden Fleece, in Spain; and of William in the Netherlands: born on the 12th August, 1762; succeeded to the throne (having previously exercised the sovereign authority as REGENT) upon the demise of his father, KING GEORGE THE THIRD, on the 29th January, 1820; crowned in the Abbey Church of St. Peter, Westminster, on the 19th July, 1821.

His Majesty is succeeded by His Royal Highness the DUKE of CLARENCE, now KING WILLIAM THE FOURTH.—His present Majesty was united to her Majesty, Adelaide Louisa Theresa Caroline Amelia, eldest daughter of the late, and sister of the reigning Duke of Saxe Meiningen, the 11th of July, 1818, when the King was in his 53d year, and his consort in her 26th. The issue of this marriage was the Princess Charlotte Augusta, born and died the 27th of March, 1819, and the Princess Elizabeth Georgiana Adelando, born 10th of December, 1820, died on the 4th of March, in the following year. The Earl of Errol, the Hon. John Erskine Kennedy (second son of Earl Cassilis), Mr. Philip Sydney (the Member for Dye, and only son of Sir James Sydney, Bart.), and Lieutenant-Colonel Charles Fox, of the 24th Regiment of Foot, stand in the relation of sons-in-law to his Majesty, having married the Misses Elizabeth, Augusta, Sophia, and Mary Fitzclarence, the King's daughters. Col. Fitzclarence, of the 7th Fusileers, married, in 1821, Lady Augusta Boyle, daughter of the Earl of Glasgow; and Col. George Fitzclarence is son-in-law to the Earl of Egremont. Capt. Adolphus Fitzclarence, R.N., and the Rev. Augustus Fitzclarence, Rector of Maple Durham, are unmarried.

The Cape of Good Hope Literary Gazette,

DEVOTED EXCLUSIVELY TO

LITERATURE, CRITICISM, SCIENCE,

AND THE ADVANCEMENT OF USEFUL KNOWLEDGE.

No. 1. Vol. II.] CAPE TOWN: MONDAY, JANUARY 2, 1832. PRICE, { 20 *Shillings* per *Annum*.

A FEW WORDS TO OUR FRIENDS.

This is the commencement of a New Year, and with it the introduction of our Volume the Second. We suppose, according to Editorial custom, we must say something, although it should be to remind our good-natured friends that we have already produced a series of the best possible *Literary Gazettes*, and to assure them, that we are on the very eve of producing a better. It is no unusual case that this prophesied amendment is all that the reader ever sees:—It is truly "a flourish of trumpets, and enter Tom Thumb." We can only say at a word, that we have lost none of our intellectual contributors, that we have gained several new ones,—and that having added very considerably to our readers, we are in the highest good humour imaginable, and therefore consider ourselves entitled to the good will of our subscribers in general. As we gave no pledge to our constituents in the first instance, neither do we offer any at the present time. We still continue as untrammelled as the winds; and, as we have not yielded to the miserable restrictions of any literary *coterie*, whether of church or state, civil or professional, it is scarcely too much to expect, that our labours will be received in good faith, as the result of an anxious desire to promote the welfare of the colony, in the spirit of independent criticism and free inquiry.

In conclusion, we may be fairly entitled, from a review of the past, to raise the shout of victory. When the present publication was undertaken, several friends smiled at what they were pleased to term our *credulity*, in supposing the colony *ripe* for a Literary Journal in the *English language*. Having made the experiment, and witnessed the favourable results, we apprehend we may be allowed to take some credit to ourselves in rightly estimating, by the exercise of a correct *second sight*, the growing intellect of this most interesting of the *British Colonies*.

Finally,—with the hearty old wish of "a happy New Year" to our friends in town and country—to our subscribers and correspondents—as well as every body else, we proceed to the business of 1832—but not till we have drank, in a bumper toast, (we hope no offence to the Temperance Society)—

—"England for ever! and the Land, Boys! we live in!"

COMMERCIAL REVIEW.

Whilst we congratulate our readers on another season of *plenty*, in the bountiful harvest which the kindness of Providence has again presented to the land, we may be expected so to do, as it regards another of our public interests—the *Wine Trade*—and the abandonment of certain proposed duties on the part of the government at home. We are sorry that we cannot conscientiously join with the majority in lauding this act, because, we humbly conceive, that instead of the amelioration of our wines, a bounty is offered for the continuance of those wretched qualities which has made the Cape a bye-word and a reproach among all nations. We certainly do think, that the advocates for free trade at the Cape, are scarcely consistent with their own principles, in crying out for those protecting duties which are at once at variance with the doctrines of the *free school*. Are they desirous to limit trade and industry, as formerly to Burgher Senates or Corporations? Do they wish it to be confined to chartered companies and monopolies? The truth is, this country cannot afford to be in arrear of any other colony in the progress of human improvement; it dare not stand still, whilst others are improving in science, in industry, in freedom, in every thing which contributes to increase the power of empires, and to multiply the means of comfort and enjoyment to civilized man. We have heard it argued—"how monstrous would be the injustice of giving encouragement to a man to vest his capital (as in the case of the wine grower,) in a given direction, and then imposing on him a heavy tax in the shape of duty." Ridiculous! The progress of society cannot stand still to foster this man in his bad habits. It may be often necessary in a moral, as well as in a physical point of view, to pluck out a right eye, to cut off a right arm. Besides, when a man enters upon commercial speculations he does so with his eyes open; he does so, fully aware of the truth of Dr. Johnson's sentiments, thus expressed—"Commerce, however we may please ourselves with the contrary opinion, is one of the daughters of *fortune*, inconstant and deceitful as her mother; she chooses her residence where she is least expected, and shifts her abode when her continuance is, in appearance, most firmly settled." Now, in cases of national or colonial suffering, deprivation of trade or commerce, or whatever other emergency may happen—the *mind* of man has been often *greatly* formed. Formed, renewed, and made vigorous under the pressure of conflicting difficulties. This quality is intimately associated with the history of our species. It is this quality of action, or rather decision, that has brought about the most wonderful changes on our globe. It levels hills, and raises up vallies. It built the Chinese wall, and the pyramids of Djezza. It stood unconquerable at the matchless fight of Albuera, and triumphed in the formation of roads over the mountain passes of the Cape of Good Hope.

When the news of the government intention to raise the character of our Wines, first reached the Cape, we shall never forget the sudden fit of despondency which seemed to affect all ranks. *Ruin-a-tion* was the pass-word of the day. Of this philosophy we have something like a sample in the Silk Trade at home. All that was thought necessary on the part of the advocates of prohibition, was to assume, as incontrovertible, that the silk manufacture of the country would necessarily be ruined, root and branch, by the then pending change in the law. Here was the *theory* of practical men, merchants as well as others. That theory once admitted, the inferences were not difficult to draw. Those instances were stated as so many undeniable facts; the total of a capital

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

amounting to many millions sterling; five hundred thousand industrious people, women and children, deprived of all means of subsistence, and we know not how many other horrible consequences. But in spite of all this, the Parliament wisely resolved to abide the consequences; and the result of a free competition was, that our manufacturers set to work in down-right earnest; became fearless of the rivalry of France, undersold *Monsieur* even in his own market, competed with the *Hindoo* in his Bandana articles, and now weaves silk handkerchiefs in England, for the purpose of being sent out to the Indian market!

Again, let us look to the undaunted spirit of the Americans. For a series of years they found an ample supply of whale fish on their own shores. But the whale thought fit to abandon them without the least intimation of his cruel design. Thousands had embarked their all in the trade! What was to be done? did they sit down in despair, and implore, and petition, and cry? No:—the Americans entered the field of exertion with redoubled ardour—they carried their fisheries into northern and southern oceans. Their enterprise at this day is beyond precedent. It commenced in the days of Burke, who, in his famous speech on American affairs in 1774, adverted to it as follows:

"As to their wealth," said he, "which the colonists have drawn from their sea by their fisheries, you had all that quarter open at your bar. You surely thought these acquisitions of value, for they seemed to excite your envy, and yet the spirit by which that enterprising employment has been exercised, ought rather, in my opinion, to have raised esteem and admiration. And pray, Sir, what in the world is equal to it? Pass by the other parts, and look at the manner in which the New England people carry on the Whale fishery. While we follow them among the trembling mountains of ice, and behold them penetrating into the deepest frozen recesses of Hudson's and Davis's Straits; while we are looking for them beneath the Arctic Circle, we hear that they have pierced into the opposite region of polar cold; that they are at the antipodes, and engaged under the frozen serpent of the south. Falkland Island, which seemed too remote and too romantic an object for the grasp of national ambition, is but a stage and resting-place for their victorious industry. Nor is equinoctial heat more discouraging to them, than the accumulated winter of both poles. We learn that while some of them draw the line, or strike the harpoon on the Coast of Africa, others run the longitude, and pursue their gigantic game along the Coast of Brazil. No sea but what is vexed with their fisheries. No climate that is not witness of their toils. Neither the perseverance of Holland, nor the activity of France, nor the dexterous and firm sagacity of English enterprise, ever carried this most perilous mode of hardy industry to the extent to which it has been pursued by this recent people; a people who are still in the gristle, and not hardened into manhood."

And this brings us to a single glance at our shipping interests. We dislike to dwell on the dark side of any question; but the vessel has sprung a leak, and the source of the evil must be probed. We hear a vast deal about colonial distress, and taxation, and stagnation of trade. The latter may be true; indeed it cannot be otherwise—every man keeps a shop—almost every second house in CapeTown is a Winkel; it is so in the country. We want consumers; we require an adequate population; the country is impoverished and *kept down*, and *particular interests promoted*, rather than the full tide of *emigration* should flow to our aid. This is a vital question, and they would deserve well of the colony who might direct their attention to it—draw up a plan, and submit it to a general public meeting

But our shipping. Aye, the shipping. What on earth has caused the desertion of ships from the bay, and made us to lose *cast*, as it were, with all the world? Is it the great expenses of our harbour-dues, or the heavy charges of the Cape Town agents? In no country in the world is there purer water, with ampler supplies of meat, poultry, and vegetables; and as for the plague, there is no fear of it in this climate of famed salubrity. But we must put a *home* question, and we address the *council of five*, who sit in monthly divan on commercial affairs, and in doing so, we trust we do not interfere with the *private interests* of any *select class*.

Gentlemen! pardon the enquiry, but in the course of all your discussions on Customs, Duties, Taxes, Warehousing, Break-waters, Steam Vessels, High Salaries, Legislative Assemblies, Wines, Brandies, Ball Rooms, and Masonic Lodges, did it never occur to you that a FREE PORT would be worth asking for; and would, if obtained, introduce a cluster of advantages to the colony; that it would revive trade, stimulate industry, multiply the means of enjoyment, enlarge the sphere of happiness, procure a return of business to the custom-house, and replenish the empty Treasury Chest? We humbly think that a *Free Port*— the liberation of trade from shackles and impediments, would do all this—and much more.

THINGS THAT WERE;
OR,
GREAT CRY AND LITTLE WOOL.

"Because it had no root, it withered away."
Bible.

[We have given insertion to the following *Bagatelle*, because we believe the writer to be a sincere friend to the *true* interests of *voluntary associations*. He has, however, enumerated a list of fallen institutions according to his own peculiar method—without, perhaps, tracing the evil to its original source. A correct history of the Rise and Fall of the various societies which have existed in the colony, would, we think, prove interesting, and serve as a beacon to such as do prosperously exist, or remain in a tottering condition. It would at the same time, we suspect, argue very little for the *consistency* of human conduct, much less for the boasted dignity of human nature. The writer of such a work would, we think, have to pourtray much of the pride, vanity, and fickleness of his species, and perhaps arrive at the conclusion, that the prosperity of any society depended solely on the zeal and decision of character on the part of its committee of management. Let us just glance at a *returned*, but *unfit* member of a new society. One day, the duty of his new office is begun, and under the burning eye of a new and strong apprehension, carried on vigorously, to the bond of its allotted season. On the second, the same is done with a small abatement of spirit. An interruption occurs on the third, which is accounted necessary, and the man is not displeased. The fourth brings the recurring duty; but as the conviction is now rather remembered than felt, there is a corresponding want of ardour; and it is decided that a determined hour, or allotment of time is inconvenient; the mind revolts at restraint, and would rather measure the season by its own zeal; and so the duty to justify the decision, is this day lengthened. Next day it is greatly abridged. On the next, there is a settled indifference, and eventually, a final abandonment of public duty. Thus do the unsteady mock themselves. Their lives are marked at little intervals, by short courses of good; which, had they been put together in continuity, might have carried them forward, till the habit had been confirmed of progressive strength; but broken off at first, at short stages, there is no onward way,—no accession of moral strength,—nothing remaining but the characteristics of a weak mind, or rather the very weakness itself. But we proceed to the details of "*Great Cry and little Wool.*"]

1.

To waft our Wines from "Indus to the Pole,"
And *make* the Nation's drink our *generous* grape;
To win our way to Fortune's happy goal,
And from life's studded varied ills to 'scape,—
Amalgamate—*A Wine Committee.*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

2.
To outvie India's silks of Tyrian dye,
And turn the tide of wealth into our bay;
To gain a deathless name and destiny—
Certes, the prize is ours—without delay,
Web together—*A Silk Committee.*

3.
To improve the breed of cucumber and pumpkin,
As well the *hearts* of cabbage, white and red,
In spite of jibe or jeer of Tony Lumpkin,
Or whatever else is sung or said,—
Plant—*An Horticultural Society.*

4.
To pour a flood of light into the dark'ned mind,
And bless the Gentiles with the rays of Heav'n,
To cheer men's sons--of every hue and kind,
By the best book—in kindest Mercy giv'n,—
Unite in bonds of love—*A Bible Society.*

5.
To speed our way o'er "cloud capped" mountain roads,
And twang our horn 'mid nature's still retreats,
To welcome friends afar, in distant lone abodes,
And feel the pulse of Commerce—how it beats!—
Put-to—*A Mail Coach Committee.*

6.
To make dull Afric' venerate our ways,
In ploughing, sowing, treading out the mow;
To cause each year,—associate-farm displays,
And every now and then a cattle show,—
Odd's, Zur—*An Agricultural Society.*

7.
Now for the staple export of our land,
Wool! Wool's a very profit-*able* thing;
And this should ever be our constant loud demand—
How much *per shent* will the spec'lation bring?
Bah! bah!—*A Merino Society.*

8.
To bring our wives and daughters oft together,
And cherish all "sweet love and harmony;"
And find in every man *a friend and brother!*
Whether from Dutch-land, France, or *Jarminy,*—
Take a share, sir, in—*The African Club House.*

9.
To chase away the glamour of the night,
And *blaze* like *St. George's* elegant ar-*ray;*
To make the pitchy darkness heavenly bright,
And with an effulgence walk in light of day—
Light up! light up!—*A Lamp-lighting Society.*

ILLUSTRATIONS.

No. 1. This society started into public life some time in 1826 or 1827. It promised to do wonders. It expired most suddenly in 1830. It appeared necessary to hold a coroner's inquest on the body of the deceased; when, after the examination of several impartial witnesses, it was determined that the case was one of confirmed Epilepsy. The deceased had long laboured under constitutional weakness. A suspension of the muscles of voluntary motion becoming every day more apparent, the patient, it appears, fell at length into a state of morbid insensibility, and expired without a struggle.

No. 2. There was a grand public meeting on this subject in 1828,—when silk-worms, cocoons, and mulberry-leaves, were the leading articles of Cape conversation.

No. 3. This society enjoyed a gentlemanly existence in 1828 and 1829. The secretaries, we remember, wore long swords and *cockit* hats.

No. 4. The Cape Bible Society was greatly in *fashion* in 1824 and 1825, and figured away in the columns of the *Government Gazette.* All the *constituted authorities,* especially the clergy, thought it, at that time of day, a most excellent institution. In 1829, 1830, and 1831, an individual could not procure for a destitute part of the colony, half-a-dozen copies of the Scriptures in the *English language,* for love or money, whilst cart-loads of Bibles, in a foreign language, are continually arriving at the Cape from a foreign country. What! in a colony like this, where the comers and goers are so numerous, and when the annual income of the British and Foreign Bible Society is about £100,000, shall the Cape be without a depot for the circulation of the Scriptures? What! the Bible and School Commission of the Cape lending out money at interest! O fye, for shame! The money-lending system, as especially connected with churches, schools, or commissions, has been long the curse of this colony. It has introduced a cold, worldly, secular sinister policy into the very temple of God, and it has begot a race of money-changers—devotees to the mammon of lucre, who in the shape, very frequently, of church officers, or secretaries to societies, are the bane of religion, and a hindrance to the success of benevolent institutions. At this moment, it is understood that many of the colonial schools are perfectly destitute of supplies of the Scriptures, as well as uniform editions of elementary works in our language. The great *usefulness* of Bible Societies, in a worldly point of view, is too often overlooked. They promote early instruction by supplying prize-books and cheap reading; they facilitate the acquisition of our language, by providing for the public wants a familiar text-book; they hand round to all the families of mankind the earliest records of the human race; they accustom the benevolent to associate for common purposes; they prepare for mutual tolerance, and they found and maintain printing presses all over the world.

No. 5. This was an extremely well-intentioned affair, and failed for want of good management. There was too much of splash and dash at the first onset. A well-built post-wagon, instead of a light jaunting coach, would doubtless have succeeded. However, as it is, the following is placed to our *credit*—"They have succeeded at the Cape with the mail coach, and the gas-lights!"—*Croly.*

No. 6. This society, like water on a duck's back, has been *on* and *off* for a series of years. At present, we believe, it enjoys a good sound sleep.

No. 7. This society was established many, many years ago, and a book was published on the subject. It was never *intended* to succeed. Sheep's-tail-fat carried the day against the wool-pack.

No. 8. Sold off the other day, 'cause it didn't bring in 10 per cent. clear profit!

No. 9. A most public spirited beginning—and failed for the want of a lamp-lighting genius at the Cape. The man who had the mechanical direction of the affair, and who pretended to a knowledge of the art, deserved a sound ducking through a horse-pond The success of the first attempt in St. George's-street, would have *fired* the whole town, and dispelled the gloomy darkness of a Cape Town winter's night.

CALLS FOR PAYMENT;

OR,

EXCUSES MADE EASY.

For the advantage of all sorts and conditions of men.

PART I.

1st Call.

What! you've brought my account, have you? Well, I shall look it over and ascertain as to its correctness.

2d Call.

I have had no time to look over the account, call again another day.

3d Call.

I am extremely busy just now—you must look in the next time you are passing this way.

4th Call.

I have unfortunately mislaid or lost the account, favour me with another copy, eh?

5th Call.

(Servant.)—Master's gone to the country.

6th Call.

(Servant.)—My master is sick.

7th Call.

(Servant.)—My master has got *plenty company.*

8th Call.

(Servant.)—You have called too soon. Master don't transact business till 11 o'clock.

9th Call.

(Servant.)—You've called too late; master never pays money after 4 o'clock.

10th Call.

O lieve tyd! This account not yet settled! bring change for Rds. 500, and receipt the bill.

11th Call.

On looking over the account, I find a considerable error. The third article, Rds. 14, I never had,—my good lady says we have never had such a thing in the house.

12th Call.

This is post day—pray call to-morrow.

13th Call.

I am just going to the Meeting for *Reform,*—really it is quite a bore to be troubled with such a trifling affair. I shall call myself and pay it. I have things of importance to attend to at this moment.

14th Call.

I find there's an account between Mr.——, and myself. We shall settle it together.

15th Call.

None of your impertinence, Sir,—I shall not pay *you,* depend upon it.

16th Call.

What!—a Dun at last!—Well, it is a most rascally affair— perfect cheating. Charges monstrous—things twice entered.—Do you suppose I'll ever deal with——any more? No, never. Nor my friends if I can help it. There—take the money and give a receipt in full.

PART II.

Calls for Payment; or, Excuses made easy in reference to Subscriptions for periodical Publications, or public Charities, &c.

1st Call.

The subscription can't be out—I only subscribed the other day.

2d Call.

Why, dear me, I must have paid this subscription—I can produce the receipt, and will examine my papers for it.

3d Call.

Why, I find I never subscribed at all. Who put my name down? It must be a hoax.

4th Call.

I am paying to every thing—really it takes a little fortune to live in Cape Town. No, no, can't stand this any longer.

5th Call.

A receipt, for what? Why, I never saw the publication—I may have had two or three numbers—that's all.

6th Call.

Why, I took my name out of the list a long time since.—Don't belong to the society.

7th Call.

Subscription, indeed! Why, I disapproved of the thing at its first commencement. Ridiculous articles! The Editor should be changed. Don't approve of his spirit. Can't-a-bear *satyr.* Besides, he interfered with our office.

8th Call.

My name down in my own writing! Well,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

what of that? I merely put down my name to set it a-going—out of pure *perliteness*.

9th Call.

There, take your money, and scratch my name out of your list.

THE REMINISCENT.—No. II.

(By HERMES.)

STAGE COACH CRITICS.

I remember being one of a party of a *six inside* coach, which plied between the Cross Keys, Gracechurch-street, and Dulwich in Kent. With the exception of myself the company were all apparently citizens on their way out to their *suburban villas,—high-way-side retreats*, and were doubtless indebted to roast-beef and plum-pudding for their portly shapes, which wedged us well to our seats. English like, we were taciturn to a man, nor was the dumb and ofttimes nodding silence broken, until we came in sight of a large tract of *common*, undergoing the act of enclosure. At some distance, a new house was discovered of handsome appearance, but in a bleak situation. The business of criticism now commenced.

1st. Traveller. How provoking to find men spending their money in building in such a horrible situation.

2nd Traveller. More money than wit, Sir.

3d Traveller. I don't know *that*. I understand the owner is only an old ship's carpenter.

4th Traveller. Yes, but I hear he has feathered his nest pretty well.

1st. Traveller. Be that as it may, I have no patience to see such an instance of bad taste and folly. The front view commands a northern aspect Is'nt that enough to call for a statute of lunacy?

Reminiscent. But surely, gentlemen, the owner has a right to exercise his own judgment? and—

Omnes. No—no—not at all.

1st Traveller. Look at the fences—all from old casks and ship timber.

After many more severe remarks from the company, the coach made a full stop at the gate of the new mansion, and the coachman opened the door and let down the steps. A kindly-looking individual who had sat very quietly in a corner of the stage, and had taken no part in the discussion, now left his seat and was handed out by the coachman. Preparatory to his departure, he thus addressed us passengers.—Gentlemen! I am the owner of this Estate, I regret exceedingly that its situation, and my taste, meets with your disapprobation. Still, your condemnation only extends to the *outside* of my house. I flatter myself it possesses a few comforts *within*, and should you feel inclined, gentlemen, at any time to ascertain this fact for yourselves, no one will feel happier than myself to offer you a welcome reception. And I can conscientiously do this, for believe me, my property is the produce of my own industry,—all honestly come by,—not a penny of dirty money. Here is my card—gentlemen, good bye to ye—a good journey and safe return." It is needless to observe, that we were all speechless.

THE ALGERINES AND THE BELGERINES.

SOME time in the month of September, as long ago as 1831, I met a *ci-devant English* officer (I heartily wish he had been of any other country,) and asked him the news of the day. "Why" said he, with great *sang froid*, "the news is very remarkable—Prince Leopold is to be king of the *Algerines*. French policy, no doubt, to keep a footing in Africa."—The next day I was accosted by my friend, who said he was anxious to correct an error of yesterday. "Prince Leopold," said he, "is not to be king of the *Algerines*, but he is for certain, to be king of the *Belgerines*."

WM. PITT, THE DOG-TAX, AND DR. DUNCAN.

IN spite of all the efforts of our worthy Police to put down the growth of dogs, I am often disturbed by their howlings at night. During these midnight interruptions my inventive powers are often in lively exercise, and I have generally come to a conclusion, that a dog-tax would be a good thing. Pitt took his notion of a dog-tax from a small dissenting minister of the name of Duncan. He was a plain good man, and so much of the patriot, that he was always devising ways and means for the good of the state. In company with the late *Col. Patterson* I once met with Duncan, who came to offer hints on the subject of the public roads in Dorsetshire. He was then Dr. Duncan. And his *degree* happened in this way. Pitt wrote to thank his correspondent for his suggestions on the dog-tax, and desired him to name any moderate request which might be in the minister's power to comply with. Duncan simply hinted to the premier in reply, that *Divinatatis Doctor* was no bad handle to a man's name. Pitt laid out two or three pounds for the title at a Scottish University, and with the diploma, forwarded at the same time a *brass plate* for the doctor's door. But some of the ill-behaved inhabitants of the village interpreted the D. D. in their own way. Duncan being a short thick man, they determined that the D. D. meant *Daddy Dumps*. If I mistake not, Dr. Duncan became in after life Lord Duncan, in his own right.

THE HON. R. B. SHERIDAN AND THE KING'S TAILOR.

I WAS invited by the late R. B. Sheridan in 182—, to accompany him to Southampton. We travelled post, and Sheridan amused himself on the journey with reading Southey's rhodomontade poem the *Kurse of Kehema*. It was a quarto edition, and he inserted in the book many extremely witty marginal notes. On our arrival, we became the guests of the Ogles, and the next day enjoyed a very pleasant *pic-nic* at Netley Abbey. Among the company were Mrs. Orby Hunter, Mrs. Nat Ogle! the Hon'ble Mrs. Wallop, Mr. Atherley, Dr. Middleton, Rev. Mr. Knight, Peter Moore, and several juvenile young ladies and gentlemen. In the course of our wanderings among the ruins, we came in contact with a group of females who had just alighted from a splendid carriage and four. Sheridan recognized the elder of the party to be Mrs. B—z—l—tte, the lady of the King's Tailor * in London, who was then passing the summer at a splendid residence in the suburbs of Southampton. Sheridan had but recently performed a notable transaction with the tailor on behalf of the Prince Regent. He had induced him to strike off *ten thousand pounds* from his general account with one stroke of his pen, as a necessary preliminary to a final settlement. Mrs. B. was a kind-hearted little woman, and greatly attached to her children. She was the daughter of S——, a German tailor in London, and was not unacquainted with the nature of business. "Ah, Mr. Sheridan," she said, "how d'ye do? I should not have expected to meet you here! Dear me, how you have *cut* down my husband's income. To lose ten thousand pounds all at once, is really too bad—a sad *renu-meration*, sir, for *public services*."

THE FONDNESS OF THE UNLETTERED FOR HEBREW AND LATIN.

IT is curious enough how fond ignorant persons are of hearing and talking about what they do not understand. I was acquainted, some years ago, with the Rev. Mr. L——, a minister of present eminence among the Independent Dissenters. When a young man, he was placed over a very small congregation in a country village. He possessed great powers of eloquence—still the meeting-house did not fill. The people were extremely ignorant and bigotted—and vowed they would *stick to mother church till they died*. The young minister hit upon an expedient which brought together the whole country, and eventually established the fame of the *meeting*. He gave notice by the *bell-man*, (country folks could not read *hand-bills* in those days,) that on the following Sunday he would repeat the Lord's Prayer in Hebrew! The place was crowded to excess, and the people went away well satisfied that the minister was a *larnt* man.

How is it," said farmer Gubbins, of Botley, in Hampshire, to the excellent young curate of the church on Monday morning, "that you don't give us a bit of Latin now and then in your *sarmons?*" "With pleasure," said the curate, "I would do so, provided I thought it would edify and be agreeable to my parishioners." "*Sartenly, sartenly*," replied the farmer, "we pays for the best, and ought to have the best."

In the by-gone days of pedantry, Latin and Greek formed no inconsiderable part of the pulpit discourses. Because the great and truly learned Pocock adopted the plain and more useful manner of preaching, a miserable village in Berkshire (Childrey), formally complained against him that he was no *Latiner*.

* A Corsican by birth, but who was always called "The Frenchman."

ORIGINAL CORRESPONDENCE.

THE CASE OF THE MERCHANTS' CLERKS.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—A short time since I was visiting the neighbourhood of Wynberg, and after church on Sunday, had hoped to enjoy my book amid the calm retreat of the woods, Conceive, Sir, my astonishment, when in the course of my studies, and on a day set apart for the special purpose of *religion*, to hear the wood-land echo of tumultuous merry-making—the ho hoop! the hurrah! the loud holloa! and every other demonstration of jollity and revel. On a nearer approach, I discovered a large number of our white natives of a remarkably genteel appearance, in all the hey-dey of prank and amusement. One fine looking youth came near enough to be questioned as to the objects of the meeting, and of what country and class. "Sir," said he, "we are *Merchants' Clerks*; who, fully occupied during the week in the business of our employers, have come to the resolution of meeting together in these woods on Sunday, because we have no time during the week days." Now, Mr Editor, I have much respect for the Merchants' Clerks of the Cape, and think, taking them altogether, they form a respectable, good looking, and well-behaved body of young men. It is no part of my intention to wage war with my young friends, especially as I know they are great *dabs* at the pen, and could

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

flourish their *arms* over my head with all the *dash* imaginable; but still I think their Sunday's revels extremely unbecoming, and suggest that the colonial Chaplains or the Missionaries, should visit the spots where they are held, and endeavour to convert the young men to christianity. Should this appear impracticable from the probability that the gentlemen in holy orders are busily employed in attending to the coloured heathen population, I beg leave to suggest that an Ordinance be prepared forthwith, obliging the Merchant to give Saturday as a day of *uitspan* to his clerk, so that he may be able to attend church on the morrow. This is not an unreasonable hint,—look at the attention paid to the Slave-labour of the colony,—and more especially in the West Indies, where the Saturday is given for recreation. I am, Sir, Yours, &c.

A WELL-WISHER TO EVERYBODY.

THE WINE MERCHANTS *versus* THE WINE FARMERS.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—It has been a matter of much surprise to many, that notwithstanding the distress of the Wine Trade, and the present ruin it carries with it to all classes of the colony, so little appears to be really understood of its causes; although, unfortunately, its effects begin to be felt so severely.

The Wine farmer, who would seem materially interested in the investigation, will tell you when asked, that the low price of the Wine is to be attributed principally to the cupidity of the Merchant,—that there is no use for him to improve his Wines, the same price being paid for bad as for good Wine, and that a much greater quantity is produced than necessary; indeed, a memorial was intended to be drawn up, and for all I know, may have been presented to his Excellency, praying an Ordinance prohibiting the planting of more Vines. The farmer having brought his mind to this conclusion, begins to abuse the Wine Merchant, erects a Depot, entering into competition with the former purchaser of his produce, and forestals his market; the greatest evil is, however, his ignorance of the different markets he attempts to serve, fixing a stigma, by its unsuitableness, that years will not remove, and thus grasping at the profits of the Merchant, like the foolish Boy with the Goose and Golden Eggs, he not only labours in vain, but materially cripples the means of his former customers. The merchant, on his part, who has embarked his capital in the trade, views with alarm the slippery foundation upon which it is based, with regard to the duties in England, preventing men with the means from entering upon a speculation so hazardous, depending at present upon the breath of the ministry. The Wine itself, instead of improving in quality, is notoriously retrogading; in fact, a Merchant asserted a few days back, that he had rejected several Farmer's Wines this year from their inferior qualities, a measure he never before had recourse to. These causes, coupled with the constant complaints of the Wine Farmer, and the little trust that can be reposed in him, renders the trade so unpleasant and unsatisfactory, that many Merchants have been induced within the last year either to withdraw entirely, or otherwise considerably reduce their former speculations and trade in this commodity. Thus, the Wine Farmer is hung up with his goods, and reduced to the very verge of ruin; the Merchant flies with the wreck of his capital, if any, to some other business; and the Shop-keeper, who formerly looked upon the Wine season as his harvest, laments the badness of the times, and the general Merchant or Commission Agent must sacrifice his own property, or that of his constituents, to make sales or returns, and the public functionary will soon complain, still more loudly than formerly, at the delay in the payment of his salary; for the revenue, it is obvious, cannot be collected, and must considerably fall short of the present government expenditure. Having thus presented you with my gleanings of the ordinary feelings and statements of the Farmer and Merchant, I proceed to give you the opinion of a very respectable Merchant in Cape Town, differing materially, in many points, from the above:—At the time the demand was considerable in England, Cape Wine was found an advantageous remittance; the want of knowledge, however, in the purchaser, with his desire to obtain the cheapest article, gave great latitude to the Merchant, and threw into the market a prodigious quantity of trash, which, although meeting a sale, produced an impression of the general bad quality of our produce, which years will hardly overcome; add to this, that every one who could muster a few rix-dollars invested it in Wine, reversing the adage—that all trades required an apprenticeship, but more especially in matters of taste—the quantity, also, excepting this last year, had been so small in comparison with the demand, that the Merchant had no opportunity of rejecting the bad and inferior Wines—he began by picking his qualities, but eventually was obliged to fill his vats or casks with the inferior descriptions. The Farmer with bad Wine, had only to hold back, and give a little extra credit, to obtain the price of the very best Wines in the market, and thus all encouragement was apparently withheld; and hence the complaint of the Farmer. It may here be observed, and at first sight would be allowed, perhaps, that in case the quantity had been so small, the price must, consequently, have risen—in answer, however, we must look to the article as coming into consumption merely from its cheapness—above a certain price it becomes quite unsaleable; neither can the quality generally shipped enter into competition with middling Sherries or Madeiras. It is true, that some Cape Wines have been preferred to the foreign Wines above mentioned, and we hear of Wines occasionally seized by the Customs in England; this certainly shews what care and attention *might* do, but it does not alter the common quality and character of the Wine;—another reason for the uniform price of bad and good Wines may be traced to the present method of sale; each Farmer has what is called his "*vaste klandisie*," or certain purchasers to whom he brings his Wine for the highest price, to be determined afterwards; thus it happens that however great the demand for his Wine, there is no competition to produce a corresponding ratio in the price, and the Merchants are all necessarily leagued to make the highest price, (as it is termed), as low as possible. The recommendation of the Wine Committee, had it been followed, would have certainly obviated this last evil; having, as it would appear by their advertisements, procured the sanction of the commercial body to open the room every Wednesday and Thursday, between 12 and 2, for the sale and exhibition of the Farmer's Wine; prejudice and private interest were, however, too strong to carry so salutary a measure, and it perished like most other suggestions that have had the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

improvement of the Farmer or his produce for their object; it has been proposed as an alleviation to the Farmer, to allow him to ride his Wines up at all times of the year, and it certainly appears a hard case that he may not do as he will with his own, and bring his produce to market the same as hides, fat, corn, or other merchandise; this was conceded to him about 1813, but soon resumed, and under circumstances, I believe, somewhat similar — the Farmers having large stocks of old Wines on hand. In all other Wine countries, however, the Farmer is restricted even from gathering his grapes prior to notice having been given to the government surveyor, who first inspects them, and without whose permission he is not allowed to commence his vintage, and it strikes me very forcibly, that perhaps such an addition to our present regulations might be very salutary;— it is perfectly unnecessary at the same time to add, that this trade should be relieved of the heavy taxes placed upon it, amounting in one demand even to 17 per cent. on the raw article as it enters the Cape Town barrier; a measure, in fact, so obviously prejudicial, as to induce the *home government to recommend its abolition as soon as some taxable substitute can be found.* It has been asked very sillily, but not without some plausibility, what business have you to relieve the Wine trade at the expense of other produce? The answer would, however, be clear by putting another question—shew me any other raw material of the colony so taxed, and a reason for thus unjustly and disproportionably loading the Wine Farmer. I have also heard a desire amongst the Wine Merchants to obtain a reduction in the price of their licence, upon the plea that on the present free trade system they have no business to pay more than a buyer of rice or sugar. *(I wonder what the Temperance Society would say to this!)* It would be a pity, however, to see so legitimate a source of revenue, in the present dearth of untaxed articles in this colony, abolished; a measure which tends, indeed, to the respectability of the trade, and acts as a salutary check in many instances to the increase of petty dealers. If the trade will not pay the licence or tax, at present or in perspective, the Merchant had better relinquish so bad a speculation entirely, and it is so material to prevent experimentalists from dabbling, and to keep the dealers in this staple branch of our commerce as select as possible, that of the two it might be a question, whether an increase, even to the present high licence, would not be preferable to a reduction.

Allow me to conclude, Sir, by expressing a hope that out of the abundance of Wine, and diminished demand, the inferior and low priced may now be consigned to the still, leaving only the prime qualities as Wine; let us hope that through this our trade may, in time, be retrieved under more permanent auspices, and instead of *imitating* other Wines, we may produce a *character of our own;* let us hail the dawn of fresh enterprise in the colony in the erection of steam engines and stills. We must, indeed, look to distillation as our sheet anchor in the Wine trade, and which, under the protection and fostering hand of our present Governor, may not only produce a superior spirit for our Wines, but eventually form a large export, and no despicable rival to French Brandies.

A SUBSCRIBER.

PHILANTHROPIC PROPOSAL.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—Most men I imagine wish well to the colony, and many are the schemes afloat for amelioration. You gave us in your miscellany some time since, certain undenial proofs of the growth of luxury among us in the enumeration of its varied articles. Now, in my humble opinion, these things are an evil, especially under the present depression of trade. If we be really patriotic, as most of us profess to be, let us start a society pledging ourselves to drink no foreign wines or liquors; in short, in eatables and drinkables, to use none but such as are the production of the colony. This would, I apprehend, work a complete reform, and add much to colonial prosperity.

A COLONIST.

LITERATURE.

CROCKER's EDITION OF BOSWELL.

The Life of Samuel Johnson; by Jas. Boswell. A new Edition, with numerous Additions and Notes. By J. W. Crocker, LL.D. F.R.S. 5 vols. 8vo.

A work already entertaining, instructive, and useful to mankind, Mr. Crocker has made much more so, by his industry and research; and by his tact of annotation, he has saved it from the chances of decay, and from the dangers of misinterpretation. In its present shape, Boswell's Life may be considered as one of the most complete and interesting publications in our language. Without further remark, we shall close this notice with one or two extracts from the work itself.

It is well known that Johnson sometimes indulged his personal prejudices in the definitions which he gave to words in his Dictionary. Thus "pension," he defined, (before he received one himself however,) "an allowance made to any one without an equivalent. In England it is generally understood to mean pay given to a state hireling, for treason to his country." His hatred of the Scotch breaks out in his definition of "oats,"—"a grain which in England is generally given to horses, but in Scotland supports the people." Some family circumstances, which Mr. Croker has traced with his wonted perseverance, and from which it appears that Johnson's father, who had been a tanner at Lichfield, had been treated or threatened with severity by the Excise authorities, were manifestly in the great Lexicographer's mind, when he explained the word "Excise," as "a hateful tax levied upon commodities, and adjudged, not by the common judges of property, but *wretches* hired by those to whom excise is paid." Boswell relates, that the Excise Commissioners being greatly offended by this severe reflection, consulted the then Attorney-General, Mr. Murray, (afterwards Lord Mansfield,) upon the propriety of prosecuting its author, and though he correctly states the purport of the opinion given by that eminent lawyer, he expresses his disappointment that, "the secrecy of office" did not permit him to obtain a copy of it. Mr. Croker has been enabled to supply this defect, through the kindness of Sir F. H. Doyle, now Deputy-Chairman of the Board of Excise, who gave him a copy both of the case and opinion, which we insert as a remarkable literary curiosity.

'"Case for the opinion of Mr. Attorney General.

'"Mr. Samuel Johnson has lately published a book entitled '*A Dictionary of the English language, in which the words are deduced from their originals, and illustrated in their different signification by examples from the best writers. To which are prefixed, a History of the Language and an English Grammar.*'

'"Under this title, EXCISE, are the following words:

'"'EXCISE, *n. s.* (Accys, Dutch; Excisum, Latin.) A hateful tax levied upon commodities, and adjudged not by the common judges of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

property, but wretches hired by those to whom excise is paid.

'"' *The people should pay a ratable tax for their shoes, and an excise for every thing which they should eat.*—HAYWARD.

'"' *Ambitious now to take excise*
Of a more fragrant paradise.—CLEAVELAND.

'"' *Excise.....*
With hundred rows of teeth, the shark exceeds,
And on all trades, like cassawar, she feeds.—
MARVEL.

'"' *Can hire large houses, and oppress the poor, by farmed excise.*—DRYDEN'S *Juvenal, Sat.* 3d.'

'"The author's definition being observed by the Commissioners of Excise, they desire the favour of your opinion.

'"*Qu.* Whether it will not be considered as a libel, and if so, whether it is not proper to proceed against the author, printers, and publishers thereof, or any and which of them by information, or how otherwise?"

'"I am of opinion that it is a libel. But under all the circumstances, I should think it better to give him an opportunity of altering his definition; and, in case he do not, to threaten with information.

'"29th Nov. 1755.

'"W. MURRAY."'
—vol. i. p. 281.

GROTIUS.

In the course of some recent rambles among the mountains of the colony, we sojourned at a farm-house, and discovered the Family Library to consist of two Bibles and three Psalm Books in *Dutch*, and, to our surprise and welcome, the Life of Grotius, in *English*, by Charles Butler, Esq.

Hugo Grotius, if his memory deserve not exactly all the distinction which Bayle has assigned to him, 'l'un des plus grans hommes de l'Europe,' was, at least, one of the most remarkable, wisest, and most virtuous characters of his age. If he had been merely the author of the treatise, 'De Jure Belli et Pacis,' he would be entitled to the lasting respect of mankind, as the founder of the doctrine of natural and international jurisprudence, and, through it, in some measure, of the modern sciences of moral philosophy and political economy. His treatise is no longer, perhaps, an authority in the study of the law of nature and nations, for it has been, itself, superseded by the more correct development of the principles which it first suggested. But it must ever remain a monument of prodigious erudition, as well as of benevolent argument. Mr. Butler has not, we think, discriminated its enduring merits, by his citation of Sir James Macintosh, quite so happily, nor so briefly, as he might have done from the estimate of another philosophical critic. "Even now, when so different a taste prevails," says Mr. Dugald Stewart, in his first dissertation, "the treatise, De Jure Belli et Pacis, possesses many charms to a classical reader; who, although he may not always set a very high value on the author's reasonings, must, at least, be dazzled and delighted with the splendid profusion of his learning." But the theological writings of Grotius, and especially his book, 'De Veritate Religionis Christianæ,' have procured for him, by the universal assent of all orders of Christians, a well-merited celebrity, of rather a different kind from that promoted by his political works; and the share which he was led to suffer in the religious quarrel between the Arminians and Calvinists of the United Provinces, identifies his fortunes with all the history of that famous controversy. His fame for political wisdom, is mingled with the great diplomatic transactions of Europe, during his times; and, lastly, in his career merely as a distinguished writer, his life affords a highly interesting piece of library biography.

Hugo *de Groot*—for it is to this barbarous Dutch cognomen that we must refer his celebrated latinized appellation of Grotius—was born at Delft, in the year 1582, of a family of distinguished rank and hereditary talents. All his biographers agree that he discovered, from his earliest years, astonishing indications of the genius, of which so illustrious a reputation has descended to our times. He devoted himself to the law, and pleaded his first cause with signal honour, before he was seventeen years old! His brilliant success procured him considerable promotion; and before he was twenty-four years of age, he was chosen advocate-general for Holland and Zealand, and some years afterwards pensionary of Rotterdam, a high station in the republican constitution, which was followed by the attainment of a seat in the States General. During this prosecution of his fortunes, he married Mary Reygersburgh, of an illustrious house in Zealand; and the union proved one of much happiness.

Thus far his political career had been most prosperous; and his ambition of literary fame had been already gratified, by the publication of several of his earlier works, which, though now not in so much esteem as his later productions, were, at the time, universally admired, and circulated the renown of their author throughout Europe. But a period of reverses was at hand. Some accidents of his education, and the natural temper of his mind, had made him favourable to the Aminian doctrines in theology; and he was intimately connected with the Grand-Pensionary, Barneveldt, the leader of the party in the United Provinces which professed these opinions. On the well-known triumph of the opposite party, which produced the iniquitous execution of Barneveldt, Grotius was involved in the fate of the Grand-Pensionary, and sentenced in 1619, with an equally flagrant disregard of justice, to imprisonment for life. The story of his escape from his captivity, in the spring of 1621, through the agency of his exemplary wife, has been often related, and may be familiar to most readers; but Mr. Butler has invested the particulars with so much animation and interest, that we are tempted to repeat his narrative:

'At first, his confinement was very rigid: by degrees it was relaxed: his wife was allowed to leave the prison for a few hours, twice in every week. He was permitted to borrow books, and to correspond, except on politics, with his friends,

'He beguiled the tedious hours of confinement by study, relieving his mind by varying its objects. Ancient and modern literature equally engaged his attention: Sundays he wholly dedicated to prayer, and the study of theology.

'Twenty months of imprisonment thus passed away. His wife now began to devise projects for his liberty. She had observed, that he was not so strictly watched as at first; that the guards, who examined the chest used for the conveyance of his books and linen, being accustomed to see nothing in it but books and linen, began to examine them loosely: at length, they permitted the chest to pass without any examination. Upon this, she formed her project for her husband's release.

'She began to carry it into execution, by cultivating an intimacy with the wife of the commandant of Gorcum. To her, she lamented Grotius's immoderate application to study; she informed her, that it had made him seriously ill; and that, in consequence of his illness, she had resolved to take all his books from him, and restore them to their owners. She circulated every where the account of his illness, and finally declared that it had confined him to his bed.

'In the meantime, the chest was accommodated to her purpose; and particularly, some holes were bored in it, to let in air. Her maid, and the valet of Grotius, where entrusted with the secret. The chest was conveyed to Grotius's apartment. She then revealed her project to him, and, after much entreaty, prevailed on him to get into the chest, and leave her in the prison.

'The books, which Grotius borrowed, were usually sent to Gorcum; and the chest, which contained them, passed in a boat, from the prison, at Louvestein, to that town.

'Big with the fate of Grotius, the chest, as soon as he was enclosed in it, was moved into the boat. One of the soldiers, observing that it was uncommonly heavy, insisted on its being opened, and its contents examined; but, by the address of the maid, his scruples were removed, and the chest was lodged in the boat. The passage from Louvestein to Gorcum took a considerable time. The length of the chest did not exceed three feet and a half. At length, it reaches Gorcum: it was intended that it

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

should be deposited at Gorcum. But, when the boat reached the shore, a difficulty arose, how the chest was to be conveyed from the spot, upon which is was to be landed, to Bazelaer's house. This difficulty was removed by the maid's presence of mind; she told the by-standers, that the chest contained glass, and that it must be moved with particular care. Two chairmen where soon found, and they carefully moved it on a horse-chair to the appointed place.

'Bazelaer sent away his servants on different errands, opened the chest, and received his friend with open arms. Grotius declared, that while he was in the chest, he had felt much anxiety, but had suffered no other inconvenience. Having dressed himself as a mason, with a rule and trowel, he went through the back door of Bazelaer's house, accompanied by his maid, along the market-place, to a boat, engaged for the purpose. It conveyed them to Vervic, in Brabant: there, he was safe. His maid then left him, and, returning to his wife, communicated to her the agreeable information of the success of the enterprise.

'As soon as Grotius's wife ascertained that he was in perfect safety, she informed the guards of his escape: these communicated the intelligence to the governor. He put her into close confinement; but, in a few days, an order of the States General set her at liberty, and permitted her to carry with her every thing at Louvestein, which belonged to her. It is impossible to think without pleasure of the meeting of Grotius and his heroic wife.—pp. 118—122.

NATURAL HISTORY.

As we intend to bestow a little more pains on this department, we must be indulged with a few preliminary remarks on the subject. Man is not alone the proper study of man. From the moment of his birth, to that of his death, he is continually making advances in the knowledge of external objects, and that in a much greater degree than with respect to the constitution and workings of his own mind. The acquirements of the savage are nearly limited to the knowledge of natural objects around him, and with these he is, in general, much better acquainted than the civilized countries. The Bushman on our borders will distinguish the tract of the wolf from that of the dog, while the European can perceive no difference; and the American Indian, and the Kalmuck, will trace a man or an animal by foot-marks, which we should utterly fail in discovering. The distinguishing characters, the qualities, and the indications of natural objects and phenomena, are also more impressed upon the mind of the inhabitant of the forest and desart, than upon that of the inhabitant of the cultivated plain or the populous city. Among ourselves, what are the objects that attract the attention of the child most forcibly? are they not the flowers of the field, the birds of the air, the pebbles and shells of the sea-shore? Whatever may be the proper study of man, his most natural study is assuredly nature. All men are, indeed, lovers of nature, from the sentimental enthusiast—who, in fancy, roams the realms of creation, seeing things that are not to be seen, and picturing forth the vain imaginings of his own idle and imbecile mind, as the existences of a well organized system, to the sober artisan, who, with delighted sense, makes his weekly excursion to the green fields on the borders of his place of abode.

But all do not derive from the contemplation of nature, the pleasures which it is so well calculated to yield. When natural history is mentioned, men are apt to imagine an interminable string of hard names and unintelligible terms, and to look upon it as a science which arranges the objects of nature, and teaches their appellations, and describes their appearances, without affording any other than a rugged and winding path to the knowledge of nature, to which, after all, it cannot truly lead.' Natural history is the science which makes us acquainted with the objects of nature; and he who looks upon, examines, and admires these objects, is a naturalist, just as truly as he who collects and compares, and arranges and describes them. Instead of frightening our readers with the more than Babylonic confusion in which men, in their premature attempts to simplify this science, have involved it, we would invite them simply to the delightful study of natural objects and phenomena; and without following any regular plan, and keeping clear of dry and uninteresting descriptions, we would present to them some of these objects and phenomena, such as we have seen them ourselves, or such as others have seen them who love to draw their fellows to the contemplation of nature, not forgetting the more striking, of the discoveries which are daily made in all parts of the world. For the present, enough has been said upon the subject; but we shall resume it at a future opportunity, and in the mean time pass to the notices, which we present as our occasional gleanings from the field of nature.

Cape Beetle.—We have often been amused with a species of beetle at the Cape, vulgarly, but expressively, called the *Tumble-dung;* and directed more particularly to the peculiarities of this species, by a recent peregrination to Green Point.

This insect deposits its ova in a small round mass of cow-dung, which it buries in the ground. Their instinct, which leads them to find out the proper material, often assembles thousands of them round the same lump. A spectator would imagine that they were working in combination, whereas each is eager only about its own separate interests, cutting away first the fragments which it wants, then, by a dexterous management of its head and legs, kneading it into a globular form, which it instantly sets about removing to a considerable distance, preparatory to its being lowered into the earth. But how is the insect to effect this removal of a substance larger and heavier than its own body? Nature, not having given it the physical strength, which would enable it to lift the ball from the ground, has taught it a mechanical contrivance, which serves instead. It rests its tiny head and fore legs on the ground, and pushing with its hind legs against the precious fragment, now containing its ova, moves it progressively onward, the insect itself walking backward, until it reaches the chosen spot, where it makes a hole some inches deep in the sand, and trundling it in, covers it over. This is the course of the honest and industrious *Tumble-dung* (Scarabœus sacer): but they have their thieves among them, like communities of a higher order,—fellows who, without any fair exertions of their own, seek to appropriate to themselves the well earned acquisitions of others, and become affluent at their expense. It often happens that a virtuous and painstaking beetle, while rolling his burthen homeward, is assailed by a bandit, who had been perhaps all the day on the wing, marauding, instead of working peaceably like his neighbours. Beholding a beautifully formed ball, the possession of which would save him a longer journey and a great deal of trouble, down he pounces upon the earth, without the smallest fear of consequences, and, having folded his wings under his sheath, pushes strait for the prize. But the lawful owner of the property, already on his guard, posts himself on the top of his ball, and as soon as the enemy comes near enough, is enabled, by his advantageous position, to give him a chuck under the chin, which sends him, heels over head, to the distance of some ten or twelve inches. If the battle be renewed, it generally terminates according to justice, in favour of the real owner, whose prior possession gives him a superiority in the means of defence, which the invader seldom overcomes; and he finally walks off, like a coward dog with his head under his tail.

Botanical Garden, Calcutta.—This establishment has been placed on a footing surpassing any thing of the kind known in Europe. The spot of ground is no less than five miles in circumference, and upwards of 300 gardeners and labourers are employed in the charge of it. Gardens in connection with it, have been formed in other remote parts of the Indian possessions and collectors have been sent to discover new and especially useful plants.

Botanical Collections.—In India the labours of the Botanist are peculiarly severe; and to these are added the difficulties which attend the preservation of dried plants. Besides the common insects which prey upon the vegetable itself, there are ants always ready to devour both the specimen, and the paper in which it is wrapped. To guard, in some measure, against the dangers, the cabinets are usully insulated, by setting the feet upon which they stand in troughs of water. But so rapid is evaporation under an Indian sun, that it was the entire office of a Hindoo, under Dr. Wallich, at Calcutta, to go round the room and replenish these troughs with water as fast as it evaporated.

Viper's Grass.—Experiments which have been recently made in France, shew that Viper's Grass is quite as good as mulberry leaves for the subsistence of silk worms.

Cape Bulbs.—The Cape bulbs are now cultivated with great success in Europe, and the demand for such is brisk. They succeed in England with no other protection than a mat

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

in severe weather; or the bulbs may be taken up in autumn, kept dry through the winter, and be planted out again in spring.—*Hooker.*

A Basket of Flowers.—In a late visit to the country, I was much struck with a bed of spring flowers. The frame work of wire, is covered with honey-suckle; the border is of violets; and the inside of lily of the valley. All were in perfect healhth and beauty, and the effect of the whole deligtful.—*Louden.*

NEW BOOKS.—No. 1.

"Books are a real world, both pure and good,
Round which, with tendrils strong as flesh and blood,
Our pastime and our happiness may grow."
Wordsworth.

It is much that books, the records of the thoughts of men in the former, as well as in the present age, are able to impart to us. For many of the hap piest moments of our lives, for many of the purest and most exalted feelings of the human heart, we are indebted to them. Education is their province; we derive from them civilization and refinement; and we may affirm of literature, what Otway has said of woman,—"We had been brutes without you" It is thus that the acquisitions of the wise are handed down from age to age, and that we are enabled to mount, step after step, on the ladder of paradise, till we reach the skies.

But after all, is conversation to be preferred to books? This is an exceedingly befitting question for our Cape *literati*—whether of the South African College or our public schools;—the scientific folks' meeting in *Mustard*-street, those of the Literary in Loop-street, and "last, though not least," our good friends of the *Chasse Ennui* Club. We may observe by the way, that Montaigne, who is fond of paradoxes, maintains that conversation is to be preferred to books, and so did Plato before him. "The study of books," says the former, "is a languid feeble motion that does not warm; whereas conversation at once instructs and exercises." We differ with him. Writing, in our opinion, is the only means by which a philosopher can converse with all those who deserve to hear him. His friendly circle must always, in a great measure, be collected around him by chance; he cannot choose who shall be his brothers; seldom who shall be his friends. Besides, be his intimates ever so well disposed to hear him, he cannot be always speaking; he must sleep, eat, meditate, be idle,—die. Nothing, however, can stop the mouth of his book, which can always be made to speak to as many as deserve it, at once, and at all hours. Though no one who is indisposed needs hear it, it is always eloquent; is subject to no sickness, no want, no old age. It is an immortal oracle. But our business is, in the present instance, to commence a series of brief inquiry into the merits of the *new works of the day*, and to record such opinion as we think their intrinsic merit entitle them:—either to our esteem or our condemnation. In the spirit, then, of free inquiry (the leading principle of this Journal,) we proceed to notice—

I. GALT'S LIVES OF THE PLAYERS, 2 vols.—Mr. Galt has the *modesty* to introduce these volumes to the world, by assuring it that "they will probably be among the most amusing books in the language." We differ with the author, and care very little about play-actors,—their profession being only adopted, in most instances, as a *dernier resort*; those who follow it, are a set of adventurers alternately raised to the summit of prosperity, or plunged in the abyss of despair. For our own parts, we never see a poor de'il of a shabby genteel player off the stage, and apart from tinsel, without feeling that, of all mankind, he is most to be pitied.——II. A MEMOIR OF SEBASTIAN CABOT; WITH A REVIEW OF THE HISTORY OF MARATIME DISCOVERY. 8vo. pp. 133.—The author of this interesting volume has proved, most satisfactorily, that Cabot was the first European discoverer of America, although fame has hitherto most unjustly denied him the honour of having executed that great achievement. It would appear clearly enough from the evidence before us, that Cabot was born at Bristol, and that the discoverer entered upon his career in 1499, favoured in some degree by a patent from Henry the VIIIth. Cabot entered into the service of Spain in 1512, having in vain solicited further encouragement from the crown of England. The present work is one of the most chivalrous enterprises on behalf of the great cause of historical truth, that it has been for some years our fortune to encounter.——III. THE CLUB-BOOK, BEING ORIGINAL TALES, &c. BY VARIOUS AUTHORS. 3 vols. 8vo.—Here we have the contributions of Messrs. James, Galt, Power, Picken, Jerdan, Lord F. L. Gower, Cunningham, Hogg, Moir, and Ritchie. We are disappointed in the general execution of this work, and think the volumes present a vast deal of mediocre ability. One of the writers, Mr. Power, may be remembered here some dozen years ago, when travelling in the colony, and wandering on the banks of the Great Fish River. Power is, we believe, the only Irishman now on the stage, who has become the idol of the play-going world.——IV. SPAIN IN 1830, BY H. D. INGLIS. 2 vols. 8vo.—The volumes are full of minute and useful information, interspersed with judicious reflections, and written throughout with great spirit and brilliancy.——V. SELECTIONS FROM THE POEMS OF WORDSWORTH. 8vo.—A precious volume, compiled by the intelligent editor with a view to the instruction of youth—to open, enlarge, and strengthen his mind—to awaken in him a sympathy for all truly desirable things—and to produce a clearer perception of all moral and religious, all virtuous principle. And it will do so: it contains the precious lifeblood of a master spirit—the characteristic elements of whose genius and power, are truth and love.——VI. PARIS AND LONDON, 3 vols.—We hardly know what due punishment could be inflicted on the author and publisher of such an abomination as the above *new novel of the season.* The style is, like its subject, loose and vicious,—and we trust no father of a family will suffer this noxious book to find a place in the family circle.—VII. LIFE OF DR. MIDDLETON, BISHOP OF CALCUTTA, 2 vols. 8vo.—Mr. Le Bas, his biographer, says that he was unquestionably an ambitious man, animated by an ardent passion to be distinguished among the wise and the good. This characteristic is conspicuous in all his writings and actions; indeed, too much so, considering that worldly fame is one of the last things which a truly spiritual mind would be desirous of possessing. In literature he was particularly attached to the Greek prose classics, for which his admiration was enthusiastic. His favourite pursuit, however, was ecclesiastical history. He seems to have been warm and generous in his affections, charitable and benevolent, single hearted and high minded. In India he was, however, not very popular. His manners were not polished or conciliating, and in this respect he sunk in the comparison with his successor, the elegant and accomplished Heber. Mr. Le Bas does not in terms tell us this, which we have heard from another quarter, but his duty of impartiality compels him to acknowledge that, 'by many in India, his personal demeanor was thought to be rather too deeply stamped with official solemnity and rigour;' a fault which he excuses by imputing it to the novelty of the Bishop's situation, 'which demanded inflexible firmness and unwearied vigilance.' 'Under these very peculiar and trying circumstances,' he adds, 'it would not be surprising if the posture of dignity, which he often felt himself compelled *defensively* to assume, should, gradually and imperceptibly, have given to his manner an air of constraint and reserve, very far from natural to the man.' In two words, the episcopal dignity sat uneasily upon his shoulders, and deprived his manners of that simplicity which is the charm of life in every situation. An official gentleman, we believe Mr. Bayley, chief secretary to government, writing to one of his friends in England of the Bishop's death, says, in language which cannot be misunderstood, that "his influence was unfortunately weakened by a defect in his own character; his notions of his office led to the assumption of a formal and rather haughty manner; and he was, in consequence, thought pompous, repulsive, and too acutely alive to any supposed want of respect on the part of others." Nevertheless, it would be unjust not to admit that his zeal in the discharge of his duties was unquestionable; if his personal pride and ambition had been less, he must have been deemed one of the greatest ornaments of the protestant church in modern times.——VIII. ESSAYS AND ORATIONS, DELIVERED AT THE ROYAL COLLEGE OF PHYSICIANS, BY SIR H. HALFORD, Bart. M. D.—The duty of a physician at the melancholy hour of dissolution, is thus explained by the author:

"And here you will forgive me, perhaps, if I presume to state what appears to me to be the conduct proper to be observed by a physican in withholding, or making his patient acquainted with, his opinion of the probable issue of a malady manifesting mortal symptoms. I own I think it my first duty to protract his life by all practicable means, and to interpose myself between him and every thing which may possibly aggravate his danger. And unless I shall have found him averse from doing what was necessary in aid of remedies, from a want of a proper sense of his perilous situation, I forbear to step out of the bounds of my province in order to offer any advice which is not necessary to promote his cure. At the same time, I think it indispensable to let his friends know the danger of his case the instant I discover it. An arrangement of his worldly affairs, in which the comfort or happiness of those who are to come after him is involved, may be necessary; and a suggestion of his danger, by which the accomplishment of this object is to be obtained, naturally induces a contemplation of his more important spiritual concerns, a careful review

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

of his past life, and such sincere sorrow and contrition for what he has done amiss, as justifies our humble hope of his pardon and acceptance hereafter. If friends can do their good offices at a proper time, and under the suggestions of the physician, it is far better that they should undertake them than the medical adviser. They do so without destroying his hopes, for the patient will still believe that he has an appeal to his physician beyond their fears; whereas, if the physican lay open his dangers to him, however delicately he may do this, he runs a risk of appearing to pronounce a sentence of condemnation to death, against which there is no appeal—*no hope;* and, *on that account*, what is most awful to think of, perhaps the sick man's repentance may be less available.

"But friends may be absent, and nobody near the patient in his extremity of sufficent influence or pretension to inform him of his dangerous condition. And surely it is lamentable to think that any human being should leave the world unprepared to meet his Creator and Judge, 'with all his crimes broad blown!' Rather than so, I have departed from my strict professional duty, and have done that which I would have done by myself, and have apprized my patient of the great danger he was about to undergo."—pp. 81—83.

IX, The Speeches of the Honorable Mr. Huskisson, 3 vols. 8vo. — Mr. Huskisson was a self-taught man; was not indebted for his education to a university; hence the uncooped views which he was enabled to take with ease of the most complex political subjects, and hence too the difficulty which he laboured under, of explaining those views with the facility and logical order of those who have early in life had the advantage of academical discipline. The fact of a man being self-taught implies more than ordinary vigour of understanding, at the same time that it disposed him to be arrogant, and hasty in jumping to a conclusion. The native modesty of Mr. Huskisson's temper, and the fortunate accident of being early accustomed to measure himself by high standards of senatorial eminence, saved him from the too common defect of self-taught men of talent, without impairing the energy of his intellect.

Mr. Huskisson had not a particle of the *mens divinior* of oratory in his composition, but he was an effective debater. His voice weak and unmusical, his elocution cloggy, his sentences generally clumsy and verbose, and his manner unengaging; still, as he warmed with his subject, you forgot all in admiration of the soundness and comprehensiveness of his general principles, and of his extraordinary command of facts to illustrate them. His "practical" opponent he overwhelmed with details upon details, all bearing upon the point, while he delighted the economists with his long-sighted views of the national advantages of acting upon the enlightened doctrines of Adam Smith and Mr. Ricardo.

Every body knows that Mr. Huskisson was what is called a "free trade theorist," and every body ought to know—and some fine day of the school master, A. D. 2001, perhaps will know, that if he was not, he would not deserve to be the theme of the eulogy of the most enlightened man of modern times. All that senseless clamour and vituperation which has been heaped so lavishly on the doctrines of free trade, by pert babblers who knew not the meaning of the thing they chattered about, has passed away; and men begin to see through the mist of ignorance and prejudice which so long obscured simple facts, that in the words of Adam Smith, not only "in every country it always is and must be, the great interest of the people *to buy whatever they want of those who sell it cheapest*," (the best definition of free trade that has been given,) but that the defects which still cling to parts of our commercial policy, are not the consequence of free trade principles being pushed too far—but of these principles not being pushed far enough. It is true—and no man was more alive to the truth than Mr. Huskisson, that a prefect freedom of trade is a philosophical vision, which, under the existing relations of the kingdoms of the earth, can never be realised this side the millennium. All that can be done is to make it a general rule—the exception only to be those of uncontrollable circumstances.

Referring the reader to the speeches themselves, particularly that on the silk trade in 1826, by far his greatest effort, and indeed the most effective speech on the subject ever delivered in parliament, for the data on which Mr. Huskisson triumphantly justified his change in our commercial system.—We will quote a passage from a pamphlet of Mr. Huskisson's on the currency, published in 1810, as in the first place a most favourable specimen of his powers of composition, and in the next place, as indicating how early he saw the national advantages of free trade principles:—

"The mind and faculties of man are constantly engaged in pursuit of his own happiness, and in multiplying the means of subsistence, comfort and enjoyment. Trade, which effects the exchange of a part of the production of the toil, industry and talent of any country, against those and the soil, industry and talent of other countries, is the great excitement of multiplying these means. By the aid of this exchange, not only those natural productions which Providence has distributed in abundance in one portion of the globe, and refused to some other, are rendered common to all: but the soil of every country, and of every portion of every country, is left at liberty to be cultivated principally, or wholly, if necessary, in rearing those productions for which it is best calculated and adapted; those which by experience it has been known to afford of the best quality, in the greatest abundance, and at the least expense of capital and labour. Labour and capital employed in manufactures is enabled to avail itself of local situations and natural advantages, (for instance a stream or a coal mine), and to adapt itself exclusively to those pursuits in which, from any peculiar country, or any particular part of them, may excel. The advantage derived from the division of labour is well known. What is effected by the operation of that principle, for a *single undertaking, is, by the aid of commerce, effective for the whole world.* Commerce enables the population of each separate district to make the most of its *peculiar advantages*, whether derived from nature, or acquired by the application of industry, talent and capital; to make the most of them for its own consumption; leaving at the same time the greatest possible remainder to *be given in exchange* for any other commodities produced *more easily, more abundantly or of better quality*, in other districts of the world. It is thus that a country is enriched by commerce."

SCIENCE.

ACCOUNT

Of an Aërial Voyage made in a Balloon on Saturday, the 30th of April, 1831, by T. Forster, M.B. F.L.S. &c

On Saturday, April 30, 1831, Dr. Forster, who had long been desirous of pursuing his observations on the clouds in the lofty regions of the air, engaged to ascend with Mr. Green's balloon; and at half-past five o'clock in the evening, the air being calm and fine, and the barometer standing at 29.29, thermometer 63°, wind variable and gentle, the aëronauts proceeded to the gardens of the Dominican Friars at Moulsham near Chelmsford, and at a quarter before six they left the ground, amidst the huzzas of hundreds of spectators. The balloon, which was forty eight feet in vertical and thirty two in horizontal diameter, and filled with carburetted hydrogen from the gas-works, rose at first with a gentle motion and was carried by a mild easterly-breeze over the village of Writtle. At the elevation of about a thousand feet they hung out the anchor, which is found to give additional steadiness to the car; in a few minutes more they perceived the balloon checked in its velocity, and a change of current was evident; by this current they were carried nearly back again, the balloon still ascending and proceeding, though very slowly, in a remarkably gentle S.W. current: when they had got beyond the N.E. end of Chelmsford, and at the elevation of probably about four thousand feet, when nearly over the Convent of New Hall, the current again changed; they threw out some more ballast, and the balloon began to mount rapidly in a sort of irregular spiral course, but so gently as to be scarcely perceived to move; till at length, at the altitude of nearly six thousand feet, it became perfectly motionless, and so remained for almost a quarter of an hour. Dr. Forster describes the sensation, at this period, to be most delightful;—balanced in the air, under a floating and inflated bag, in a perfectly calm and tranquil region, among the grotesque forms of evaporating clouds, and viewing in delicious tranquillity a vast and apparently concave panorama of country, bounded on one side by the sea, and everywhere interspersed with towns and villages, and the yellow and varied tint of the fields, the aërial travellers enjoyed a temporary repose from the noise and bustle of the world, with is seldom felt on the surface of the earth. More ballast being thrown out, the balloon again rose, and Dr. Forster now felt one disagreeable sensation, like pressure on the tympanum of the ears, just like what Garnerin, MM. Charles and Roberts, and others have described; in consequence of which he determined to open the valve, and they rapidly descended again into an inferior current, which carried them to Broomfield, where they eventually landed at twenty minutes before seven o'clock.

During, and subsequently to this aërial voyage, Dr. Forster made and recorded the following observations:

1st. That the balloon, when rising gently, gyrated in the same direction as the earth and planets do in their diurnal rotatory motion, that is from right to left: this motion was however so gentle, that it was only to be ascertoined by observing objects below; in coming down the balloon oscillated in the same direction.

2ndly. The currents of air which they successively met with in ascending, came down during the next day in the same order of succession: the S.W. wind for example, into which they got, came down first on the following morning, and brought the rain. From repeated experiments, Dr. Forster has reason to believe this to be the case with most of the upper currents of air.

3rdly. The wavy cirrocumulus clouds are far beyond the reach of all balloons, and even when the clouds are seen from the greatest altitudes they seem as much above the ordinary clouds as they do above the earth.

4thly. Dr. Forster in comparing his elevation in the balloon to what he recollects of his Alpine ascents over the high Swiss mountains, is induced to account for the less degree, and in his own case absence, of giddiness experienced in balloons, to the idea of complete insulation: as when a person hangs over precipices, or sits on pinnacles, the notion of unsafe terrestrial attachment is the cause of the giddiness. Dr. Forster noticed, during the voyage, the manner in which clouds subside in an evening: he has also made some observations on the peculiar effects produced by different circumstances of sailing in boats at sea, and has compared them with those produced by aërial floating, which he purposes, before long, to communicate to the public; as also some physiological observations on the sea sickness which some persons feel; and on the very peculiar deafness experienced at great elevations, in diving bells, in mines, and on change of weather, when the barometer rises or falls rapidly. One remarkable observation which Dr. Forster made, was, that

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

on the occasion of descents from mountains, the deafness felt has always been accompanied by a sense of fullness about the ears; but this very unpleasant accompaniment of the difficulty of hearing was not felt after the descent from the balloon; the deafness in the latter case being simply dullness of hearing. In both cases it soon goes off. The sensation which is experienced when up in the higher regions of the air is not actually deafness, but a snapping in the ears; which goes off as one begins to descend; and the deafness which comes on in descending still lower, and which is worse on arriving at the ground, seems to be a sort of counterpart to the sensation experienced aloft. This very curious subject deserves further investigation.

With respect to giddiness and the fear of any danger from the sudden falling of the balloon, Dr. Forster observes, that having been accustomed to mount to very great altitudes, he felt neither of these disagreeable annoyances; but observed that on looking directly down, at the grapple hanging below, and on the ground beneath, he felt a disagreeable sensation, scarcely amounting to vertigo; but such as would have become so in persons not accustomed to great heights; and he therefore recommends aërial travellers to keep their eyes on the horizon rather than the ground directly below them, particularly if the car be large enough to admit of the choice.

The basket in which Dr. Forster ascended was a small one constructed for the purpose of lightness; but he is constructing a light circular willow basket capable of holding a proper set of instruments, in order to be ready, should a fit opportunity for another ascent occur.

P.S. Two parhelia were seen at five o'clock on Monday evening, May 9th, at Chelmsford.

BAKEWELL'S BRICK-MAKING MACHINES.

1. *Machine for Preparing the Earth.*

Into a process heretofore carried on by machinery of the simplest, sometimes rudest character, Mr. Bakewell has introduced some contrivances distinguished by considerable refinement of mechanical talent. There are several varieties of means for causing the tempering roller to traverse in succession the whole of the bed on which the earth is cast for the purpose of being ground. In the first of these contrivances the radial bar which carries round the tempering roller is lengthened and shortened by an assistant turning it on its axis by means of a short cross lever, whereby the screw on the inner extremity of the bar works through the nut in the head of the centre pin. By another contrivance the assistant effects the elongation or decurtation of the radial bar by means of a pinion and winch in the head of the centre pin, and a rack upon the inner end of the bar. In other modifications of the mill the roller is made to approach to or recede from the center pin, by sliding itself upon the bar, which is set out of the direction of a radius to the great circle by being centred upon a pin in an arm projecting from the centre post, thus placing the carrying bar in the direction of a tangent to a smaller circle in the centre. As the inner end of the carrying bar is placed on one or the other side of the centre pin of the great circle, the tendency of the tempering roller is to slide inwards or outwards on the bar. The carrying bar is set out of the radial direction in one case by a sector and pinion, one in another by barrels and chains or ropes.

These mills, no doubt, will grind more uniformly, and temper more completely, the materials employed in brick-making than those in common use about London, where, with greater parade of preparation, they produce unquestionably a more fragile and less durable brick than was made ages ago in the infancy of the arts, and is still made with the least artificial means in the most obscure corners of this kingdom. Mr. Bakewell's mills too, it is stated, will accomplish more work, with the same power, than the ordinary brick mill; and hence their general adoption would lessen the cost, as well as improve the properties, of the bricks prepared by their means.

2. *Machine for Consolidating the Bricks.*

The great imperfection of bricks is their porosity, which renders them liable to be broken in throwing about, to be crushed under pressure, and to absorb moisture. This fault arises either from insufficient working of the material, or, as in the London made bricks, from the intentional admixture with the earth of a foreign matter, which, being combustible, is burnt out in the kiln, and leaves the brick spongy, light, and little able to resist pressure. In stuccoed buildings, all the imperfections of the bricks are screened from the eye so soon as they escape from the hand of the bricklayer; but for many purposes it is essential to have a solid, sound, hard brick, which will not be crushed under a load, and will resist durably the destructive efforts of fire and time. To provide such a brick from duly prepared materials, Mr. Bakewell has introduced an admirably-contrived press, of unlimited power in its action, of practical facility and rapidity in its use, and so simple and solid in its structure, as neither to be liable to derangement nor demolition in the rude hands for whose employment the machine is destined. By a very skilful combination of levers, Mr. Bakewell has produced a press which at its ultimate point of action is of infinite power; and the result of its operation is the compression of the clay into the greatest compactness and the utmost accuracy of form. The specimens which we have seen, show that bricks may, by the aid of pressure, applied to a good material duly tempered, be made as solid, and regular to size and form, as have ever been produced either by the Romans or by any other nation of antiquity, whose buildings still exist to attest the superiority with which some of the most important arts of life have been practised in times and places that could not pretend to so much knowledge as is within reach of the artisans of our own age and country.

3. *Spring Bricks Mould.*

By this mould, which opens on a hinge at one of its angles, and closes by a spring latch, bricks may be moulded of a stiffer clay, and consequently they will shrink less in drying, and be more solid and durable when burnt, than such as have been manufactured from a more diluted material. This mould also promises to expedite the manipulation of that part of the process of brick-making which calls for the use of such an implement.

We consider the paraise generally bestowed on Mr. Bakewell's inventions to be extremely well merited. Neither is it to be denied, that the art of brick-making is in a deplorably imperfect state in England; and it is a matter of unmixed reproach to our brick-manufacturers, that they do not make such good bricks as were produced of old by the Romans and other nations of antiquity, when men "could not pretend to so much knowledge as is within the reach of the artisans of our own age and country." It is by no means from not knowing how as good bricks can be made as ever were made, nor even from the want of machines for the purpose (for there have been several such invented before these of Mr. Bakewell, and perhaps quite as good), that the art remains in so backward a state amongst us.—*Mechanics' Magazine.*

LITERARY EXTRACTS.

REVELATION.

In *Fraser's Magazine* for August, under the head *Rationalism*, (page 63,) there is an article of considerable interest, which pourtrays, with great accuracy, the Kanto-platonic system of German theology. Dr. L. of Oxford, speaking of the German school to his pupils, once said in his usual quaint way—"Your *Jarman* metaphysicians,—your *Jarman* Commentators,—your *Jarman* Critics,—I would that they were all at the bottom of the *Jarman* ocean! The following is an extract from the Magazine in question:

"These written books (the Scriptures,) are the *word* of revelation.—they *express* the revelation which was manifested to their respective authors. But they are *not the revelation itself;* and the word is dead (as is proved by experience,) and powerless, unless the correlated thing be awakened in the heart of the reader. Until interpreted by the spirit, the scriptures are meaning-less—nay, often a subject of derision to the profane; but thus interpreted, by the sympathy of the reader, how glorious are they with life, how instinct with quickening truth! We have said that this principle of interpretation is not a fact of historical knowledge—but a form of the human being; and it is of ab olute being that it reports. But this report is of a being equally beyond the apprehensions of sense and the grasp of human understanding.

"To no class," says Coleridge, "to no class of phenomena or particulars can it be referred, itself being none: therefore, to no faculty by which these alone are apprehended. As little dare we refer it to any from of abstraction or generalization: for it has neither co-ordinate nor analogous! It is absolutely one, and that it is, and affirms itself TO BE, is its only predicate. And yet this power, nevertheless, is! In eminence of Being it is! And he for whom it manifests itself in its adequate idea, dare as little arrogate it to himself as his own; can as little appropriate it either totally or by partition, as he can claim ownership in the breathing air, or make an inclosure in the cope of heaven. He bears witness of it to his own mind, even as he describes life and light: and, with the silence of light, it describes itself, and dwells in *us* only as far as we dwell in *it*. The truths, which it manifests, are such as it alone can manifest, and in all truth it manifests itself. By what name, then, canst thou call a truth so manifested? Is it not REVELATION? Ask thyself whether though canst attach to that latter word any consistent meaning not included in the idea of the former? And the manifesting power, the source and the correlative of the idea thus manifested—is it not GOD? Either thou knowest it to be GOD, or thou hast called an idol by that awful name! Therefore, in the most appropriate, no less than in the highest, sense of the word, were the earliest teachers of humanity *inspired*. They alone were the true Seers of GOD, and, therefore, prophets of the human race."

PUNISHMENT OF DEATH.

It is obviously the very first principal of natural and social justice, that no man should forfeit life, for conduct which has not been denounced as deserving death, by a law open, positive, and too clear to admit misconstruction.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

The year 1794, however, witnessed in this country an attempt to deprive more than a dozen enlighted and worthy men of life, by subtle and state inferences from laws so obsolete, obscure, tortuous, and inconsistent, that it required a speech of nine hours in length to persuade a jury that those laws had given a clear and and plain warning that the conduct of the accused was criminal, and to be punished by the gallows. This mode of getting rid of political opponents, constructively, roused the indignation of even the Lord Chancellor Thurlow, who, though impervious to humane feelings, could not help decrying the attempt to deprive his fellow-creatures of life, by "wresting the laws to authority." When the stern, deistical Chancellor heard that the pious Attorney-General had addressed the jury for nine hours, to persuade them to hang their fellow-men, he exclaimed with wrath,—"What! speak for nine hours; then by G—d, there is no treason in the case!"

Captain Brenton relates, that for the mutiny, as it was termed, in our fleet, more than five hundred of the finest men in the world, suffered death—that is to say, they were hanged for asking, in the most decorous and submissive manner, for objects which were afterwards granted as essential to humanity and justice, and indispensable to the good of the service. Nothing can be more useful than to refer to these facts, as illustrations of national history, and as beacons to warn us into the channels of better conduct.—*Life of Sir Thos. Lawrence.*

A TORTOISE-SHELL TOM CAT.

Among the covetors and collectors of specimens of feline curiosities, this was, and perhaps is, deemed an animal of great consequence. Under this date, less than five years ago, we find one obligingly proffered for sale, by public advertisement.—

"A HANDSOME TORTOISE-SHELL TOM CAT to be DISPOSED OF, on reasonable terms. Apply at Mr White's, 5, Swinton Place, Bagnigge-wells-road." *The Times*, 17th of July, 1826.

A *male* cat of tortoise-shell color is esteemed a rarity, and was formerly worth a considerable sum.

A whimsical letter to the Secretary of the Horticultural Society in the "Comic Annual by Thomas Hood, Esq., 1830," may enable speculators to determine whether the value of "the article" is increased or not, by this singular information:—

"Sir—I partickly wish the Satiety to be called to consider the Case what follows, as I think mite be maid Transaxtionable in the next Reports:—

"My Wif had a Tomb Cat that dyd. Being a torture Shell and a Grate faverit, we had Him berried in the Guardian, and for the sake of inrichment of the Mould I had the carks deposited under the roots of a Gosberry Busch. The Frute being up thill then of the smooth kind. But the next Seson's Fruite after the Cat was berried, the Gozberris was all hairy—and more Remarkable the Catpilers of the same bush was All of the same hairy Description.

I am, Sir, your humble servant,

THOMAS FROST."

COCKNEY EFFUSIONS.

Who that sees but must hadmiar
The hyes of my most sweet Sophiar!
Like the star.wen day is dawning
To light the world in the mawning.

Ven I vakes I shakes my ed,
A vishing that I now vas ded,
Or baskitting within the skies
Of my sweet Sophiar's hyes.

I vishes little Mista Imen
Voud you and me together tye mem.
Or that eaven voud this decree,
That my sweet Soph vas fast to me!!

FILL UP THE GLASS.

A Lay for Drunkards.

Fill up the cup, the bowl, the glass,
With wine and spirits high,
And we will drink, while round they pass,
To—*Vice and Misery!*

Push quickly round the draught again,
And drink the goblet low:
And drink, in revelry's swelling strain,
To—*Reason's overthrow!*

Push round, push round, in quickest time—
The lowest drop be spent,
In one loud round to—*Guilt and Crime,*
And *Crime's just punishment!*

Fill, fill again!—fill to the brim;
To—*Loss of honest fame!*
Quaff—deeper quaff—while now we drink—
Our wive's and children's shame!

Push round, and round, with loudest cheers
Of mirth and revelry—
We drink to—*Women's sighs and tears,*
And—*Children's poverty.*

Once more! while power shall yet remain,
E'en with its latest breath,
Drink! *to ourselves*—DISEASE AND PAIN,
AND INFAMY AND DEATH!

TENTH WAVE.

THERE is a common affirmation, that the tenth wave is the greatest and most dangerous. This is noticed by Sir Thos. Browne, as averred by many writers, and plainly described by Ovid. In Maturin's Sermons, the idea occurs in the figurative expression—"the tenth wave of human misery." His volume travelling across the atlantic, caused the subject to be discussed in America, as appears by the public papers.

This notion of the tenth wave has long been entertained by many persons conversant with the sea-shore: I have often heard it when I was a boy, and have repeatedly watched the waves of the sea, when breaking on the shore (for it is to this particular motion that the tenth wave, as far as I know, applies), and can state that, when the tide is ebbing, no such phenomenon as the tenth wave occurs; but when the tide is flowing, some such is often observable; it is not, however, invariably the tenth wave: after several smaller undulations, a larger one follows, and the water rises. This is more distinctly seen on a sandy or smooth muddy shore, of more or less flatness.—*Hone's Year Book.*

JOHN BULL'S CRITICISM.

On the 29th of April peace was proclaimed, and *Cobbet*, an American bookseller, in Pall Mall, wrote to a noble lord to request a guard of soldiers, to preserve his windows from demolition, "as he did not intend to *illuminate*." The noble lord very sensibly remarked to this journalist, that, if the King's subjects in general were equally obstinate, it would be a matter of some difficulty to *protect* them ALL.

On this occasion, I remember, Mr. Bull made a lamentable mistake, from having left his spellingbook at home, when he started to visit M. Otto, in Portman-square. His preparations for display were critically examined, and by daylight. He had selected the expressive word "CONCORD," which had been executed in the first style of vitreous proportion—but never was there a choice so unfortunate; it was voted to be an *insult* and a *lie*—for "France had NOT *conquer'd* England!" M. Otto, finding that he had offended the sovereign people, though for his soul he could not conceive how, came out, at last, to put either himself or them right; he soon discovered, that the *Schoolmaster* had not yet been abroad, whatever might be expected; and finding that they all of them reprobated his motto as *hostile*, he condescended to put them up "AMITY" in the place of CONCORD, a very satisfactory substitute. What remained now was trifling—the two letters G. R. were discovered, by some sailors, to have no *crown* over them; and they insisted that the Republican Plenipo should *have* one, in respect to his Majesty, the King of England. An excellent precedent, which was recollected in America, while on the stage, by George Frederick Cooke, who ordered the band in the orchestra to play "God save the King," to astonish the wondering Yankees; and took off his own hat to teach them how to honour George the Third, their lawful sovereign.

MYNHEER AND HIS CHEESE.

A Dutchman, it is well known, adheres tenaciously to the manners and customs of his ancestors. He wears the same style of dress his grand-father and great-grand-father wore before him, smokes his pipe in the same way that they did, and travels the same old roads in spite of the modern inventions of canals and turnpikes. This trait of character is exemplified in the following incident, which a friend of ours used to relate of one Hans Van Vogarman.

Among other points which Hans prided himself upon was that of cutting his cheese in a smooth, even shape, so that none of the precious article should be crumbled or wasted. The Van Vogarmans had all cut their cheese in the self same way, and the art had been handed down from sire to son, from the earliest generation. When Hans at length became the father of a family, this delicate operation was always performed by his own hand, though sometimes by way of instruction, his eldest boy was permitted to supply his place.

Hans had a mortal antipathy to the Yankees, but it so happened that one of these daring interlopers had purchased a piece of land in the vicinity, of which Hans was desirous of becoming the possessor. Hans accordingly invited the Yankee to dine with him, hoping before they parted to conclude a bargain for the land. Among other dainties provided by Hans, was one of the identical cheeses his grandfather had brought from Holland, and which were set on the table only upon great occasions. His guest soon fell to work on the choice treasure, hacking it away, chip by chip, as though it were a mere block of wood.

Hans—poor Hans!—looked on for a long time, in silent grief and consternation. Such a sight his eyes had never before witnessed, so cruel a fate had no cheese suffered under his roof. His sense of propriety, his feeling of ancestral veneration, were violated, shocked, profaned. The portraits of his fathers seemed to frown down upon him, the ghost of the departed cheeses appeared to rise up before him and demand expiation for so sacrilegious an offence. Hans could refrain himself no longer, he laid aside his knife and fork, swallowed a mouthful of food unmasticated, and with tears trickling to the very promontory of his nose, thus addressed the Yankee:

"Mynheer Van Yankee!" said he, "here vat I tell you, I have perrit my fader—I have perrit my modder—I have lost two of my shildren—I have had many troubles and afflictions in my life time, put I tell you I have never suffered any thing so horrible as to see you murder mine sheese."

The Yankee apologized, the Dutchman refused to accept of any apology, and the bargain for the land was never concluded.—*Calcutta Literary Gazette.*

Public Inns.—Hotels and Public-houses have a phraseology of their own. At an inquest held some years since on the body of a gentleman who died suddenly at a London Hotel, one of the witnesses, Mr. Boots, deposed, that the chambermaid desired him to run for a doctor, as "*Number four* was in a *fit!*"—And at one of the suburban tea-gardens, a waiter, loaded with a tray containing tea and muffins for twelve, who observed a bolt before the bill was paid, roared out to a brother attendant—"Run, run, Bob, there's *two teas and a glass of brandy and water* escaping over the paling; catch 'em."

THE QUESTION OF REFORM.

(From the Englishman's Magazine.)

It is wholly untrue, that the literature of the country is against reform. The political literature, the only literature by which the question has been or can be discussed, is almost entirely in its favour. Of the four *Quarterly* Reviews, the *Edinburgh*, which was a man before the *Quarterly* was breeched, is for reform—the *Westminster* is for reform—the *Foreign Quarterly*, as far as its plan admits, is on the same side. Of the magazines we can oppose the *New Monthly* to *Blackwood;* the *Metropolitan* to *Fraser;* while the "*Englishman*," without competitor or peer, like Richard at the lists of Ashby, surveys the *mêlee*, in which weaker spirits are toiling, and only puts his lance in rest, when tyranny threatens to trample on right. The *Quarterly* doubts if the daily newspapers are a branch of literature. The value of the branch may be variously estimated, but no one can doubt of its making part of the tree. The daily press is, with hardly an exception, on the side of the reformers. The respectable part of the weekly press is wholly reforming!—the *Spectator*—the *Atlas*—the *Examiner*—the *Literary Gazette*—the *Sunday Times*—the *Athanæum*—nay, even the *Court Journal*, the text-book of the fair, the mirror of frivolity and fashion, are all for the bill. Of the church of England clergy, the bill has at least a third, as the poll books of Cambridge, at the late election, sufficiently testify; of the other clergy in the kingdom it has four-fifths. Among men of business we are not aware that its most strenuous opposers have much right to be classed. We never heard of Sir Charles Wetherell being a man of business, nor Sir Richard Vyvyan, nor Lord Stormont, nor Mr. Mackworth Praed, nor Mr. Sadler of Leeds, nor the valiant Colonel Sibthorp, nor Mr. George Dawson, nor Mr. Wilson Croker. The only men of business in the House that are opposed to the bill, are the lord of see-saw, Mr. Alexander Baring, and the chosen of Boroughridge, Mr. Matthias Attwood. With respect to property, why Lord Grosvenor is generally looked on as a person of considerable fortune, so are the Duke of Bedford, the Marquis of Stafford, Earl Fitwilliam, Earl Spencer, Earl Derby, the Marquis of Cleveland; Sir Francis Burdett is well to do, so are John Smith, Sir Ralph Lopez, Mr. Russell, Mr. Portman; the Cavendishes, the Pelhams, the Throckmortons, the Maberleys, the Whitbreads, the Ponsonbys, the Petres, the Dundases, the Barings, of Sir Thomas' house, are all pretty *warm*. These are reformers, and many more than these. But why speak of individuals?—The rental of the counties and towns of England, which have returned members pledged to the bill, is, according to the Income tax returns of 1815, above forty-seven millions; while the rental of all the anti-reform electors, amounts, by the same standard, only to two millions and a half! So much for an argument, which, though slipped over in a couple of sentences by the reviewer, is, in reality, the only argument that he has to rely on.

Anecdote of Abernethey.—A little sporting butcher, well-known in Fleet-market, but possessing a delicate constitution, and frequently unable to attend to business through illness, was advised by his friends to take the opinion of Abernethey as to the nature of his complaint. On obtaining admission to the doctor's house, he met with Mr. Abernethey in the hall, who rudely accosted the butcher with "What do you want?" "Your advice, Doctor," said the butcher in a very submissive style. "Pray, Sir, who told you that I was a doctor?" asked Mr. Abernethey. "All our market, Sir," replied the butcher—"the people—everybody—all the world!" "Then, Sir, your market knows nothing about it," answered the doctor, quite in a rage, "the people, or everybody as you say, are fools; and the world's a liar!" the doctor hastily making for his parlour-door. "Stop, Sir, if you please," said the butcher, "you have forgot—" "What have I forgot?" replied the doctor impetuously—"Your fee, Sir!" said the butcher, bowing, and holding out the guinea to him. The doctor surprised, and, rather off his guard, observed, "Your head appears to be screwed on the right way—follow me." The little butcher having entered the parlour, the doctor said, "Who are you?" "I am," replied the little man, "one of the cutting-up tribe—a sticker—a kill-bull, according to the common slang of the day; but, after the old style of expression, I am nothing more nor less than a humble butcher at your service." "Indeed!" said the doctor, with a sort of grin on his countenance, "you are cutting me up, I believe—What is your complaint?" "I can't get rid of my grub, Sir," answered the butcher. "What!" replied the doctor, laughing outright—"not get rid of your grub, when the streets are so crowded with beggars!—you are a strange sort of fellow." "No, that is not what I mean—every thing I eat gets no further than here; it stops by the way;" said the butcher, (putting his finger up to his chest,) "the victualling-office, as we call it, is out of repair." "Oh, I understand you," answered the doctor,—"indigestion is your complaint." "Yes," replied the butcher, "that is the word you physical gentlemen name it." "Read my book," observed the doctor. "Perhaps that is more than I am able to do, as I am but a very indifferent scholar, and have been more engaged with beasts than with men," answered the butcher, "The first school-boy you meet with, tell him to read to you page —, and listen to it with attention; follow it as closely as an informer sticks to an Act of Parliament, and your victualling-office will soon have a free passage through it, and your grub will no longer be a burden to you," said the doctor, ringing his bell for the servant to show the butcher out. "I'll book it at all events—it is as good as gold to me," replied the butcher; "and now, Mr. Doctor, or whatever you may be, I wish to behave handsome in return—I will send you the primest rump of beef in all our market, that you may cut and come again; and when you are tired of cutting it, send for another—" "John!" the doctor calling out "open the street-door; this butch— gentleman wants to be gone." "What a nice man I don't think!" observed the butcher in a sort of whisper, and winking his eye towards the servant, "there are stranger fellows to be met with than the doctor, if you know where to find them." Then raising his voice, "If you should want a steak at any time, Sir, don't mention it, I shall always be grateful—I am not particular to a shade—" "The door I say, John!" urged the doctor; and the servant almost elbowed the little butcher into the street.

Greenwood and Dry Wood.—A countryman driving a load of wood into Providence with an oxteam, and staring about upon every side of him, chanced to observe the name of Greenwood on one of the signs; and taking it in the literal sense, he thought there might be an opportunity of disposing of his load of dry wood at the same place "Whoa haw?" said he, "come up here, Buck—haw to, Berry! why don't you come along here? didn't you never see a grocery afore? What the darn are ye afeard on, you tarnal fools, you! Whoa-a-a! I say—there stand, will ye, till I go in and ax." With that he stept up to the door and knocked smartly with his long hickory gad—"Holloa! Mister—holloa! the store."—Out comes the storekeeper. "Cant I trade with ye to-day—what'll ye gi' me for this load o'wood—good dry wood as ever was cracked—say, what'll ye gi' me for it?"

"I'm not particularly in want of wood," said the storekeeper."

"Why, 'tis true," said the countryman pointing to the name on the sign, "I observe you've got *Greenwood* here, and didn't know but you'd like a little *dry* to burn with it."

RAMMOHUN ROY IN OLD ENGLAND.

(Extract of a Letter, 10th Sept. 183L)

We remained in Liverpool a week during which Rammohun Roy was visited by every person of distinction in the place and *lionized* in, I can't tell, how many parties, morning, noon, and night. He was much struck with the busy scene which the river presented, the magnificent docks, and the substantial comfort of an English Hotel; the word "comfort" he said, he for the first time understood after he landed in Old England; but the railroad to Manchester was the thing which excited the highest degree of admiration which he could only express by an occasional exclamation. I assure you it produced a similar effect upon myself. In order that he might be enabled to judge from actual experience of the nature of this most stupendous work, the Managers including the Croppers made a party for us to Manchester by this new and expeditious mode. We started at 7 o'clock in the morning, and reached Manchester (a distance of 30 miles) in an hour and 21 minutes. In starting from the yard of the proprietors, the Steam carriage is not immediately hooked on, but the train (consisting of five, six, or more carriages, double bodied and treble bodied all attached to each other according to the number of passengers) proceeds a distance of some hundred yards merely moved by its own weight down a gently inclined plane; the machine is then hooked on, and off you go with a speed, compared to which the flight of Mazeppa's horse was a snail's pace. But you do not form any adequate idea of the actual velocity, until one of the trains on the opposite tack passes, when the speed of of both being generally accelerated for the sake of effect, they are going at the rate of 30 miles an hour!! Try to conceive; it is impossible to *describe* the effect. You are told that another train is approaching—you cast your eyes in the proper direction—you endeavour to distinguish the persons who are on the other train—you cannot even see the details of the machinery, or distingnish one vehicle from another; you hear a *whish!* like the hiss of a serpent—a dense mass intercepts your view for a second—no not even that—and the train is past! In order to convey an idea of the impression this novel and wonderful example of the power of machinery produced upon his mind, when the excitement subsided, he declared that these things indeed might be deserving of, or at least receive the credit of being miracles, as it seemed difficult to believe that mere human agency produced them. Once or twice indeed when the trains were passing he turned away with an expression almost of alarm in his countenance, as well he might! The rail road itself too excited his astonishment; in some places cut down 60 feet deep through the solid rock, in others made through a mere morass, a tog or moss as the Lancashire peoble called it. At the gate of the Company's yard at Manchester, there were heaven knows how many Omnibus's waiting for the passengers by the trains, and those vehicles with the eager competition of their drivers afforded fresh cause of wonderment. One of them conveyed us all to the Royal hotel and we afterwards proceeded to inspect several of the manufactories, the Lancasterian school, &c. In some places we were obliged to walk, and then the scenes that occurred was most amusing; every idle man, women, and boy in the city, to say nothing of many who left their employment, crowded round us, all staring and shouting, and many of the women, resembling in appearance the Naiads of Billingsgate, would insist on shaking hands with the King of *Injee* and the "young Prince," as they called them. Rammohun Roy deemed it necessary to stop and address them courteously, which only increased familarity and gave them for additional numbers to display it. I expected some of the nymphs would have been for hugging him at

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

once. At the gate of one of the factories where he was thus stopped he urged the crowd to support the Reform Bill at which they cheered most vociferously. At length we got back to the Royal Hotel where Rammohun Roy was so much exhausted as to be obliged to go and lie down; for his knee, owing to the accident he met with on board ship at the Cape, still occasions some lameness and was painful owing to exertions in going up and down the stairs of the different factories. At length, after some rest, we proceeded back to the train and reached Liverpool in the same time in which we had come to Manchester. The average rate is 24 miles, but we were several times going 27½, determined by the watch. The average of passengers per day, going and coming, is 2000 at 5*s.* and large quantities of goods are also conveyed by trains for that purpose. The manner in which *these* are brought from the docks at Liverpool to the railway yard, a distance of a mile and a half, is another astonishing feature of this vast undertaking. They are brought the whole distance through a tunnel underground, by a rope worked by steam round a barrel; the other end of this rope is attached to the trains on their return from Manchester and brings them up from the point at which the Steam Engine is cast off, to their places in the yards; performing when necessary both offices at once!

After remaining altogether 9 days in Liverpool we proceeded to London in one of the stages taking the whole inside, and places for the servants outside. Whenever we got out or got in a dense crowd assembled, through which we found it difficult to make our way; indeed the coach was surrounded at every place where it stopped even for two minutes. At Birmingham we slept and proceeded on next day. Rammohun Roy was greatly delighted with the country, which exhibited in the fields, trees, and hedges, the bright and lively green of a forward spring. The rich variety of hill and dale, woodland and down, canals, rivers, bridges, the beautiful country seats, the indications in short, in every direction of a fertile, highly cultivated country and a wealthy people, drew forth frequent burst of admiration from Rammohun Roy, who pointed out to young Rajoo with exultation, these proofs of the superiority of England, to his own absolutely governed and priest-ridden country. He was very much struck with the enclosures which mark out the exact limits of every field in the country. At a place called Market Street, where we dined at a wretched Inn, the host addressed him in bad French and although answered in English of course, still Mr. Boniface continued to style him "*Mounseer*," and I heard some of the people say, that he must be *Tippoo Sahib* or rather *Tippoo Sabe*. At length we reached this dingy mart of Law, wealth, and commerce at about 8 at night and were put down at the Bull and Mouth in St. Martin's le Grand from whence we forthwith proceeded to Osborne's excellent Hotel in the Adelphi, where we got into highly respectable quarters. On the next day but one Rammohun Roy was installed in commodious Lodgings (125 Regent Street,) where, I should suppose, up to this date, that upwards of 200 persons at least, of distinction, have called upon him; but he has not yet been able to return many visits, for I am sorry to say that he has been indisposed with severe cold, besides being troubled with his lameness. The venerable Jeremy Bentham called at the Hotel the second day after Rammohun Roy was gone to bed, but would not allow him to be disturbed; he left however a characteristic note; addressed "Jeremy Bentham to Rammohun Roy." I wish I had it to transcribe. Of course the note was answered and Rammohun Roy passed the next evening tête à tête with this excellent and wonderful old man, who had not I believe for 15 years called upon any one. Mr. Crawford, I have of course seen as often as possible and am perfectly amazed at his labours in the good cause in which he is engaged, of the trade, 1,500*l.*; or twice as much per annum would hardly be too much for him—his published pamphlets afford no idea of what he accomplishes. The very first day I went to his lodgings, I met there Peter Gordon, no longer the eccentric Peter who moved for an order to "unhinge the doors of the Council Chamber," but sobered down into a clear headed, intelligent, methodical witness: Peter spoke out and spoke well before the Committee, and on the whole was of immense service and floored the Bully of the Court ——— more than once. Mr. Crawford has in the press another pamphlet, embodying I believe all the replies of the Indigo planters, &c. to the circulars (of course omitting names) in illustration of the Agricultural condition of the country and the purposes to which capital may be with advantage applied to it. I got from him the proof sheets with his corrections, and have despatched them to you for the Hurkaru Press; the preface and introduction are not yet ready. The work is to appear with his name. I dont exactly know what Buckingham is about as I have not yet met him, for he is rarely in town a day at a time being busy with his canvas for Woodstock, in representating which place, it is said he must *ultimately* succeed.

I should not omit to mention, that Rammohun Roy's young protegé Rajoo, when walking in the Park, saw the Queen, who immediately sent to call him, and conversed for some time with him, asking numerous questions about India, Rammohun Roy, &c.

N.B. Rammohun Roy was introduced to His Majesty, King William, on the 20th Sept.

CAPE OF GOOD HOPE.

OUR PERIODICAL PRESS,—1831-32.

(By Vivian.)

"The Press is indifferently the passive instrument of Evil and Good: nay, there is some good in its evil," observes Mr. Coleridge. And this is explained by Milton. "Good and Evil in the field of this world grow up together almost inseparably: and the knowledge of Good is so intervolved and interwoven with the knowledge of Evil, and in so many cunning resemblances hardly to be discerned, that those confused seeds which were imposed on Psyche, as an incessant labour to cull out and sort asunder, are not more intermixed. As, therefore, the state of man now is, what wisdom can there be to chuse, what continence to forbear, without the knowledge of Evil?"

In the affair of Printing, a wonderful progress has been made at the Cape within the last seven years, and the Press is at this moment in full operation, either for the purposes of *good or evil* Seven years ago, who thought of Newspapers, Reviews, Magazines, Pamphlets, Catalogues, Hand-bills, &c.? Such was the *decent order of things*, that none dared disturb the monopoly of the Government Press—this was the only organ of communication by means of its *Gazette*, for a population of upwards of one hundred and twenty-three thousand people! We shall just take a cursory view of the present state of the Press in this colony.

No. I. The Cape Town Gazette,—1806-32.

Was first published in *English* and Dutch, Jan. 25th, 1806. It formerly contained articles of news, and occasionally, useful papers by Mr. John Barrow, and various other contributors. After an existence of about one-and-twenty years in this form, the Lieutenant Governor, General Bourke, *closed its columns*. In an unfortunate moment, the Editor *carried his heart on his sleeve*, and offered a few words on the "full influence of free publication on the minds, manners, actions, and habits of men in social life." He even adverted to the "lively appeals of Reviews, Journals, and Newspapers." This was not to be endured, especially at a time when the free press of the colony was interdicted. The consequence was, that all light was immediately flung out of the *Gazette*, and advertisements, as at the present time, only tolerated. It is now printed by Mr. Bridekirk, and enjoys, as it ever did, the patronage of many town, as well as country readers. Indeed, it is quite the oracle of some people, and the country farmer would, of all men, be the most miserable, were he to lose the delight of luxuriating over the market prices of *Koorn*, dry goods, and *Tabak*; and of pondering well, *all what follows* under the important heads—Getrouwd and Gedoopt: and the *graves-end* news under that of Overleden. What a blow would that be to the pleasures of country life, to read no more *Proclamatien, Advertentien en andere Officiele Berigten door het Gouvernement van de Kaap de Goede Hoop!* We cannot harbour thoughts so distressing.*

No. II. The South African Commercial Advertiser,—1824-32.

This Paper was brought forth three minutes past the half hour of six, on the morning of Wednesday, Jan. the 7th, 1824. Its early cry was—"The mass of the people must be barbarous where there is no printing." In the days of its infancy it promised to behave well—to *hurt nobody by word or deed*, to *submit* itself to all *governors*, teachers, pastors, and masters, and to *behave reverently* to all its *betters*; "feeling *no inclination*," as it said, "to canvass and criticise the measures of government." But it would be unfair to the *Advertiser*, to trace with an unkindly spirit, the follies, or *deviations*, or weaknesses of its youth. We were once *children* of the *go-cart* ourselves, and, like the *Advertiser*, sickly in *constitution*.

As it regards the *style* of the *Advertiser*, we confess that some years since it was not to our mind. His short-winded asthmatic sentences, as easy to be understood as impossible to be remembered, never gave us much pleasure. They acquired, however, a momentary poignancy from their affected point, and commanded an attention from a certain class of readers. But, perhaps, this is a mere matter of taste—and after all, style does not always await the beckon of genius There is, however, some *charges* which we have heard advanced against the *Advertiser* which appear of a *serious* nature. We merely repeat them as they have reached us.—There is a *Warburtonian* arrogance about the *Advertiser*, which betrays him into the fault of a proud and petulent omission of the virtues or talents of a cotemporary. He is too much in the habit of ascribing weakness of intellect or want of taste and sensibility, or hardness of heart, or corruption of moral principle, to all who deny the truth of his sentiments, or the sufficiency of evidence, or the fairness of the reasoning adduced in their support. He would establish a government of

* From particular observation, we have observed in the country districts, that if the three Cape Newspapers be presented to a farmer, he invariably makes choice, in the first place, of the *Government Gazette*. He considers the advertisements in the Gazette to be *genuine*.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

his own—that government *the Press*—from which there must be *no appeal*. He would wield the pen instead of the sword,—and break *hearts* instead of *heads*. He would supersede the courts of law and justice, and make the *Advertiser*, the *Alpha* and *Omega*, the *Star Chamber* of civil and religious Institutions. He publishes his sentiments on law and justice as if the law itself was delivered—that is, "in thunders and lightnings," and applies to his own productions, instead of the sacred mount, the menance—"*There shall not a hand touch it, but he shall surely be stoned or shot through.*" So much for the opinions of sundry Cape Critics.

Now, it might be considered unfit in *us* to decide on the merits of this question. We are scarcely impartial censors, and our verdict if delivered, might be suspected in either of the articles—envy, hatred, malice, or uncharitableness. Let us therefore *nothing extenuate, nor set down aught in malice*, as it regards this paper. Let us away with every little selfish passion, and, on public grounds, speak of it according to its deserts. Those who know any thing of our principles, will scarcely suspect us of flattery to any party—much less would we cringe for protection from the critics frown, though that critic should be the *Advertiser* himself.

We consider the *Advertiser* taking it all in all, a public blessing to the Cape Colony. Far distant be the day, when the labours of its virtuous, enlightened and independent Editor shall cease. He has fought the battles of the colony, nobly, fearlessly, and single handed. And the most meritorious part of his integrity is, that in the midst of local prejudice, party interests, and persuasive temptations, he has defended the *rights of man* of every colour, kindred, and clime. And he has done this at much expense to himself—he has sacrificed home, and country, and fortune, and literary fame; for the true interests of the comparatively poor people of the Cape of Good Hope: and he has done all this, in all the best and most unadulterated feelings of British loyalty. We confess that the *Advertiser* is not all that we could wish in some things, but we say to the Colonists at this critical moment of *party feeling*,—remove the *Advertiser* and where are you? Your return to barbarism is certain—the Goths and Vandals will be upon you, the night of ignorance will return,—the days of primitive rudeness, oppression, monoply, usury, and torpid ignorance; for honesty tell us, who is there that would devote half as much anxiety and patience to your public interests, (even in the midst of ingratitude and rebellion,) as the Editor of the *South African Commercial Advertiser?*

No. III. Het Nederduitsch Zuid-Afrikaansch Tydschrift. 1824-32.

We have a family interest in this work—having become its *Uncle Toby* in 1825. Its approaching death was formally announced when we stepped forward and having adopted the means prescribed by the *Humane Society*, successfully resuscitated *Mynheer Tydschrift* to vigorous life. It is maintained, we believe, by a joint-stock association—the Editor not avowed.

No. IV. De Zuid-Afrikaan. April, 1830-32.

Suppose, reader! a return to barbarism at the Cape of Good Hope. Imagine that the blindness of the colonists had preferred darkness to light—the establishment of a *Legislative Assembly* upon the principles recommended by the *Zuid-Afrikaan*,—the banishment of Missionaries, the dissolution of voluntary associations, and the putting down every other press but its own, (for that we suspect would be its aim,) what think you would be the consequences? We will suppose the following to be a picture of things as drawn by the faithful historian of some fifty years hence.———The activity which now remained at the Cape, was the activity of corruption, in the prostrate colossal carcass of Liberty. The first retrograde movements from civilization to barbarism had been made, and cruelty, cupidity, selfishness, and all the other original stains of the savage, which had been for a while *concealed* by *artful design*, were beginning to make themselves awfully visible. The *brutal* was in *arms* against the godlike part of our nature, and hurrying on those dreadful processes, by which reason was at length dashed from its pedestal, and cast into the foul den of superstition and bigotry. Every man hastened to do evil; the slave-trade was revived in all its horrors, and the chief business of the people was the Slavery and Commerce of the Human Species!—The dealing in Human Flesh!! The waves of the moral deluge were beating against the outworks of civil society and operating its ruin. The *combining* principle had lost its power. The elements of society began to separate themselves from each other, or to run like a scattered globe of quick-silver, into numerous smaller spheres, each having a centre of *its own*. There was no *community of sentiment*, no vast mass of *opinion* irresistible from its dimensions; no generous soul, no *loyalty*, no *love*, no *patriotism*.

Of the *real* editor of the *Zuid-Afrikaan* we know nothing, nor are we acquainted with any of its contributors; and it is most likely, that we know as little of its share-holders. We have heard, that many of them are excellent men, and that others are of inferior grade. But as we have to do simply with the *literary* qualifications of their paper, we can have no concern with their walk in life, their professions, their persons—

"By whom beloved, or by whom begot."

Were our respect for a vast number of the colonists less than it really is, we might have taken little notice of this unworthy print: but truly attached to the colony as we are, and especially to its country people, we are bound in duty to lift up the warning voice, and beseech them, as they value their true interests, not to enter into league with, or be guided in opinion by, a paper which would lead them into error, only to *desert them in the hour of difficulty*. What a Patriot of the *true blood!* What a lover of "our dear country!!" There is no single subject which this miserable print has handled, which does not become a mass of inconsistency and absurdity. Its articles on the Wine Trade and Cape Brandies, are evidently the production of besotted ignorance. They tend to crush all improvement, and ruin the Wine Trade altogether.

We have heard the shout of triumph raised on account of the extended circulation of the *Zuid-Afrikaan*. But we are thankful that this is no proof that its sentiments are generally welcome. Its price, it should be recollected, is better suited to the pecuniary circumstances of the colonists than that of the *Advertiser*. Three pounds per annum is too great a demand on the pockets of the *country* people for a newspaper. Again, the force of public opinion is to be estimated, not merely by the show of hands, but rather by the *quality* of the suffrage that is given That the *Advertiser* does not represent the general sentiments of the public we are ready to admit:—hence we have invariably recommended two distinct papers for the colony,—in which, however, if there be an inclination to differ, the war should be carried on with good and honourable feeling on both sides.*

As a literary composition, both in *Dutch* and *English*, the *Zuid-Afrikaan* is wretched to a proverb. Its notable article on putting down voluntary associations, and abridging the *liberty of the subject*, caused one burst of indignant expression among all ranks of society. And when the thing mouths out the *hack* expressions, *cant* and *hypocrisy*, can any thing equal its own barefaced cant and hypocrisy,—for instance, in reference to the erection of a Brandy Still at Stellenbosch. With regard to drunkenness, it is impossible not to be struck with the physical and moral degradation which is spreading over the colony. The licensed houses are increasing in all directions—acting like the simoon of the desert—scattering destruction and misery all around. To a virtuous and independent public writer, the triumph of the demon of distillation at Stellenbosch would awaken no inconsiderable emotions of regret. To the *Zuid-Afrikaan*, the affair is hailed with every demonstration of fulsome contratulation. And then, as a *finale*, he calls upon the "*Divine blessing*" to prosper the Brandy Still at Stellenbosch, "for the benefit of the public in general!!!"

Nor is this all—we are bound to consider this viperous Journal as dealing out Profaneness, Hate, Fury, and Disaffection throughout the land. And this, too, among a people of oftentimes *misdirected* and disproportionate cultivation—a people hitherto of limited understanding, suddenly roused, not into *free inquiry*, but compelled by their leaders, by popular clamour and party spirit, to examine *only* that side of the question which darkens and deforms the subject.

In conclusion, we are bound in finally summing up, to declare, that the paper in question has thrown down all fence and bulwark of public decency. Every feeling that binds the citizen to his country, and the spirit to its Creator, has been undermined—not by reasoning, for from that there is no danger, but from reviling and scoffing with impunity. Were we frequently to contemplate the evils of a rank and unweeded press only in its effect on the manners of a people, and on the general tone of thought and converation, the greater the love, which we love to literature, and to all the means and instruments of human improvement, the more should we wish for some *Ithuriel* spear that might remove from the eye and ear of the public, and expose in their own fiendish shape those creatures, which *inspiring venom and, creating illusions as they list*.

———"Thence raise
At least *distempered*, discontented thoughts,
Vain hopes, vain aims, inordinate desires."

No. V. The South African Quarterly Journal. 1829-30.

We noticed in terms of deserved commendation, this Journal of Science, in our first Number of last year. It enjoys the patronage of a respectable body of subscribers, but unfortunately there has been considerable delay in the publication of the 5th Number, only four having made their appearance. What the assignable causes of the suspension of this work are, we know not; but we submit that the subscribers and friends of the *South African Institution*, are fairly entitled to an explanation.

No. VI. The South African Christian Recorder. March, 1831-32.

This little publication might have been eminently useful to the colony. As it is, we think it a decided failure, both in the tact of management, as well as of composition. We regret extremely that the *association* engaged in its support should have countenanced for a single moment the theological discussion which occupied so many pages of the *Recorder*. Surely we have enough of the spirit of strife in the colony, without making *Religion* a party concerned. Besides, the work—a professedly *christian* work—was *pledged* that it should be conducted "on the broad and liberal basis of our common faith, without being the organ of any one religious denomination in particular, and that to the *exclusion* of Controversial Theology." Again, (without entertaining the

* As it is at present conducted, we consider no respectable Merchant, (unless driven by necessity,) would venture to advertise in the *Zuid-Afrikaan*.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

any sympathy with the peculiar views of the Unitarians,) we regret the spirit and style of the arguments, if arguments they may be termed, which have been advanced against this religious body of men. As we have much at heart the advancement of the English language in all its purity, we must guard our young readers against the pleonasms and inverted phraseology of the controversial papers in question. The construction of some of the sentences it would be difficult to bring within the rules of parsing. This ambitious and pedantic diction is at variance with true simplicity, and at once opposed to true taste, and the genius of our language. The writer, not contented with placing an idea before us in broad day-light, colours up his language, till the effect is like that of the sun-shine through stained glass, gorgeous but dim. But enough of this. Our last remark must be, to express our deep regret that the No. 9 should have seen the light of day. The paper entitled *Pictures of Human Nature*, are by no means adapted to family reading; in fact, it is an insult to the virtuous understanding of the reader—being replete with disgusting detail. We are quite sorry that our worthy friend, Mr. Tredgold, should have any hand in vending such *stuff*.

No. VII. THE SOUTH AFRICAN ALMANACK AND DIRECTORY, FOR THE YEAR, 1832. By GEORGE GREIG. Cape Town.

JUST at the moment of publication, we obtained a copy of Mr. Greig's periodical for 1832. It seems to us, to possess this year, no ordinary attractions, and we suspect it will be a great favourite with the public. Such an Almanack as this, is not only an indispensable acquisition to the Counting-house, the Public Office, Private Families, and the "Stranger within our gates,"—but is, from its mass of statistical research, a valuable contribution to our Libraries. Completeness and impartiality as to its details (as far we can jndge,) are not the only merits of the Directory:—its embellishments are at once as honorable to the "graphic skill of the artists," as the whole of the work itself is, to the public spirit and industry of the proprietor.

The beautifully engraved *Map of the Colony* by Major Mitchell which accompanies this work, is an extremely valuable New Years gift. The Lithographed *Plan of Cape Town* is quite a *desideratum*. *St. Andrew's Church* is unfortunately passed over in the plan, but there is a compensation in the beautiful view of this Church which appears in the Directory. In addition to this, there are views of the following Churches—*The Lutheran*—*The Reformed*—and the *Roman Catholic*. It strikes us, that the drawing of the *Lutheran Church* is not according to the architectural proportions of height and breath—i e the ratio of measure. But we may be mistaken.

SOCIETY OF FRIENDS.

CAPE TOWN has been recently visited by two respectable individuals, J. Backhouse and G. Walker, members of, and forming a deputation from, the Society of Friends in England. These gentlemen have, through the hands of the Rev. Dr. Philip, been pleased to present the *Public Library* with a handsome donation of Books. The Society of Friends paid a liberal attention to the *Public Library* in the year 1822. We copy the following from the Government Gazette.

"The Society of Friends (Quakers,) having heard of the formation of a *Public Library* in Cape Town, have sent the Directors a collection of books, &c. It is scarcely necessary to say, that the Directors have duly appreciated this mark of attention from that most respectable and amiable community;—and they will take care to make such a record of it, as shall tend to perpetuate the memory of a circumstance so complimentary to this colonial Institution."—*July 6th*, 1822.

THE PUBLIC LIBRARY.

IN addition to the above donation, Mr. Buyskes, now of the Island of Java, has been pleased to present the Public Library with a collection of books, connected with the sciences and natural history of the East, and printed at Batavia. We are glad to find in many of the transactions of the Batavian Society for Arts and Sciences, that the *English language* is introduced. We have also to record a third and fourth instance of liberality. Mr. GADNEY, of Cape Town, has been pleased to present the Library with a copy of the Holy Scriptures, printed at Canton in the Chinese language. And Mr. WOODCOCK has added to the Biblical collection by presenting a copy of the famous "Breeches Bible," printed by Barker, the King's printer, in 1610. This Bible has been usually denominated by the above title from the 7th verse of the 3d chapter of Genesis reading thus:—"And they sewed fig leaves together, and made themselves *Breeches*." Attached to this copy of the Scriptures is a valuable Tract, upwards of two hundred years old, entitled—"*The True Way to Happiness, leading to the Gate of Knowledge*."

ST. ANDREW'S CHURCH.

THE following official notice from the English papers of July, illustrates the descrimination of those at the head of East India Affairs at home.

"The Directors of the East India Company have nominated the Rev. James Adamson, Minister of St. Andrew's Church, Cape of Good Hope, to be Professor of English Literature, &c. in the Anglo-Indian College of Bengal."

In consequence of this arrangement, it is understood that the Scottish Community at the Cape, will in due time, and in its own right, fill up the vacancy, This is as it should be. With much unwearied exertion, St. Andrew's Church was built,—unaided by a single subscription from Scotland,—its clergy, and religious bodies having maintained a strict neutrality in the matter of its pecuniary interests.

NEW CLUB.

A Club has just commenced at No, 15, Heeregracht consisting of about 100 members at the rate of 3 Rds. per mensem. It is understood to have been started in the first instance by several respectable *B*, *Bs*, and the subscribers are to be provided with *Beer*, *Billiards*, *Brandy*, *Bitters*, and *Beds*, *&c.*

We are sorry that the Society in the election of new members, should have had recourse to the old system of *black-balling*. The consequence has been, that several respectable individuals connected with commerce, &c. have been discarded, merely to gratify the silly pride or secret spleen probably, of some of the little-minded of its members. Perhaps our readers will accept (in lieu of a better,) the following explanation of the

Origin of Black-balling. The Thracians had a custom of marking all their happy days with black ones; which they cast, at the close of each day, into an urn. At the person's death the stones were taken out; and from a comparison of the numbers of each complexion, a judgment was made of the felicity or infelicity of his course of life. The Romans had their *atra dies*, which denotes a fatal day whereon they received some memorable defeat. (The word literally imports a black day; a denomination taken from the colour.) The *dies atræ*, or *atri*, were afterwards denominated *nefasti* and *posteri*. Such in particular was the day when the tribunes were defeated by the Gauls at the river Allia, and lost the city; also whereon the battle of Cannæ was fought, and several others marked in the Roman calendar, as *atræ*, or unfortunate. From these customs is most probably derived the present mode of ballotting with black and white balls, and wherein the candidate, who is so unfortunate as not to succeed, is said to be *black-balled*.

NOTICE.

Persons desirous of subscribing to the *Cape of Good Hope Literary Gazette*, are informed, that Subscription Lists are open at the Commercial Hall, Public Library, the Office of Mr Greig, and at the Publisher's—Mr. BRIDEKIRK.

TO CORRESPONDENTS.

Several Letters on the Temperance Society, *pour et contre*, have been received, and will be placed in the hands of *The Colloquists*.

Oh! Oh! on the *New Fair*, is under consideration.

Nemo, of Sir Lowry's Pass, has been received. Should the Communication not appear in print, it must be attributed to the paleness of the ink, which at present makes part of it unintelligible.

Recent Rambles among the Mountains in our next.

As this Publication is wholly independent of any Public Institution or Society—*the Editor* alone must be addressed,—*to the care of the Publisher*,—without the least reference to personal names.

Errata.—A word is unnecessarily introduced in the *Note*, page 228.——For *Philanthropic Proposal*, page 230, read *Patriotic Proposal*.

Printed and published by W. BRIDEKIRK, Heeregracht, Cape Town.

RECOLLECTIONS OF RAMBLES AMONG THE MOUNTAINS.—No. I.

(By Orlando.)

A few words by way of Introduction.

In order to excite the young gentlemen and ladies of Cape Town to extend their rides *beyond* the *toll*-house on the Rondebosch road, I shall submit a few plain reasons why travelling is necessary, simply on the score of one's *health*. An important effect of travelling is the influence which change of air exerts on the blood. In various diseases, change of air, when that change is only from one part to another, a few miles separated, is productive of the most salutary effects. Nay, it is proved beyond all doubt, that the change from what is considered a good, to what is thought a bad air, is often attended with marked good. Hence it is very reasonable to conclude, that the *mere change* of one kind of air for another, has an exhilirating or salutary influence on the animal economy. It is true that we have no instruments to ascertain in what consists this difference of one air from another, since the composition of the atmosphere appears to be nearly the same on all points of earth and ocean. But we know from observation, that there are great differences in air, as far as its effects on the human body are concerned. Hence it would appear that the human body, confined to one particular air, be it ever so pure, *languishes* at length, and is only bettered by a *change*. This is supported by analogy. The stomach, (we trust we do not in the least interfere with the *practice* of our esteemed friend Doctor Henry Macartney,) we say that the stomach, if confined to one species of food, however wholesome, will in time languish, and fail to derive that nutriment from it, which it would do if the species of food were occasionally varied. The ruddy complexion of travellers and of those who are constantly moving from place to place, does not solely depend on the mere action of the open air on the face, but also on the influence which change of air exerts on the blood itself in the lungs. Thus much on the advantages of colonial travel.

In recording our *Recollections of Rambles*, we must premise to the reader, that we intend to describe things as we found them, and to give the exact truth, and the *whole truth*, in every part of our varying Rambles, with as much impartiality, as human infirmity, unperceived by itself, but adhering to us all, will allow. We do not anticipate, that we shall at all times please or amuse the reader; but if Dr. Johnson's opinion be authority, no man is so obscure, or so stupid, but he may relate *something* deserving to be remembered, if he will speak with truth, simplicity, and frankness; if he will describe his real feelings and undisguised opinions. It is our pride and boast, to pretend to no opinion which we do not feel, and to be ashamed of none which we do feel. Ours, such as the last seven years have taught us, shall be laid open with the fearlessness of good faith, in the order which they happen to recur to memory.

STAGE THE FIRST.

It is scarcely necessary to notice, that after leaving the improved road leading from Cape Town to Rondebosch, which we did on the morning of the 24th of October, every thing on the approach to Stellenbosch (the first Cape Village as far as it regards population,) wears a rude sterile aspect. There are no signs of cultivated nature:—dreary wastes, sandy and oft times trackless roads, puzzle and provoke the traveller, who derives no assistance from the hand of man—*direction-posts* being unknown in Southern Africa. On the present occasion the scene was miserably dull, occasioned by the extreme coldness and dulness of the morning—the numerous pools of water which had been filled by the rains of the previous day, and the obscuration of the lofty outline of the distant mountains now enveloped in clouds. The country however, generally provokes an appetite and at an half-way *uitspan* place, we did not fail to do honour to our basket of stores. Of these two *stray* Englishmen partook. They had lost their way and were rambling with their toil-worn horses in quest of the *right road* to Stellenbosch. Vain attempt for the travelling noviciate! During our sojourn at this spot, we botanized a little, and gathered of the flowers—*Les Liliacées*, a great variety of the *Gladiolus*, the *Ixia tricolor*, the *Amaryllis*, and the fragrant *Abuca Minor*.

STELLENBOSCH.

We arrived at Stellenbosch in the afternoon—the weather had cleared up, the sun was shining, and all nature appeared in the liveliest mood. Still these things did not dissipate that sort of melancholy gloom, which the traveller generally feels as he enters this formal village. We love trees, but they must be kept at a *proper distance*. They must not encourage and nurture damp in our houses. Their roots must not endanger the foundation of our buildings, nor must their foliage shut out the light of Heaven's blessed sun, or its exhilirating purity of air. We love water, but not the street water which runs before the door, from whose exhalations arise

"——— Joint-tort'ring Gout,
And ever gnawing Rheum."—

For these reasons, we could never consent to take up a residence in this questionable place. It possesses, however, one or two advantages in its medical attendants. The district surgeon, Dr. O. F. is highly skilled in his profession, and is *given to hospitality:* and the English school has for its head a well educated teacher, and very many of the youth of both sexes have acquired a correct knowledge of our language. By the bye, there is

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

an importance attached to a knowledge of the *English* language in this colony, which in one point of view, has been overlooked. He whose good fortune it is to know *English*, possesses an air of gracefulness in his deportment which is not the case in one destitute of such acquirement. There is a sheepish, clownish, uncivilized look in the man un-Englished, whilst on the other hand, there is a polish of manners, and a refinement of sentiment in the person whose privilege it has been, to have been taught in an English school. Moreover, there is an anxiety in the possessor to know more of the world we inhabit—not only in the contemplation of the beauty and grandeur of external nature on the earth and in the heavens,—not only in the culture of the benevolent feelings and the *perusal of books* on general subjects, but in knowing something about labour, —productive and unproductive—division of labour—value—exchangeable value—price of commodities—capital —employment of it—production—distribution—consumptive stock—rent—freedom of and restraints on trade—circulating medium—opening of ports —and all other branches of political economy. On the subject of *books*, we think a wide distribution of Mason on *Self Knowledge* would be of great use at Stellenbosch. For some other parts of the colony Mrs. Hamilton's *Cottagers of Glenburnie* would appear desirable. Again, as to the *Stellenbosh* school, we could not correctly ascertain as to its *present* condition, the teacher being confined to his room by headache; but this we know, that in times past, this school *bore the bell.* We have gazed with delight on the blooming countenances of a largely assembled school—*honest lads and bonny lasses*, now grown out of knowledge, but walking worthily we trust, in those various paths of life "in which God hath been pleased to call them." And the most meritorious part of the Teacher's conduct was, that he had to struggle with innumerable difficulties. An ignorant *Commission* was placed over him in the shape of those petty authorities which *then* existed. Authorities, perhaps, puffed up into mysterious consequence, from finesse, management, and intrigue. Its members knew nothing of Books or even the *language* of the school, in the progress of which, they would often sit in judgment. In school examinations also, the teacher would be often humbled before his pupils by this *Commission.* The lowest state of education was more appreciated by it, than that of an advanced order. The "broken soldier" or the *razor-grinder*, (good men probably in their own line,) were sure of approval when *their* schools were examined, whilst the English school in which classical education was also taught, was *kept down* by every species of affront and annoyance. In speaking of *authorities*, we mean no disparagement to the many good men in the colony holding official office. Such we respect, as we do their office. Our loyalty, our patriotism, our religious duty are all concerned in the obedience we owe to the laws. But as historians, we have not failed to glance at the past, and gibbet the *Caput mortuum* as a warning to future transgressors.

It is Shenstone we believe, who has said

> "Whoe'er has travelled life's dull round,
> Where'er his stages may have been,
> May sigh to think he still has found
> The warmest welcome at an *inn*."

Not so at Stellenbosch. Mine host of the frosty countenance, guards his portal like a member of an Austrian police, and, with a kind of sinister asquint of the eye, examines you from top to toe.

Your name is then asked—who and what you are—from whence you came —and whither you are going. And should your replies to a long string of other interrogatories prove highly satisfactory, the joyful words '*Komt binnen*' greet your ears. You then enter a sepulchral kind of house, silent as death, and solemn as the grave. You hear the clicking of the clock at hand, and the crowing of the cock in the distance. You wander about the rooms, whose walls are thickly beslabbered with white-wash, which very soon bedaubs you and all your concerns. No spruce, prettily-spoken, curtseying landlady consults or compliments you, and "hears your tale of symptoms, and blames the weather for the disorder of your nerves." No blossom of beauty, in the shape of a *Mary the maid of the Inn*, awaits your nod, and studies your comfort. No *waiter* to cry '*coming, Sir*,' no *boots* to take off your *leggens*, and no *John the Ostler* to *help in with the gentleman's luggage*. You observe no one in earthly existence, but a stupid male attendant, playing the *game, or rule of contrary* with every request you make, and every direction you give. As to your meals, you must abide the time and pleasure of some automaton behind the scenes. If it be *dinner*, you must put up with a tough, stringy, tasteless *baked* chicken, whose life has been taken an hour or less before the repast. Of *greasy* accompaniaments there is a *quantum sufficit*, and these with pigmy, waxy, *pared* potatoes, and Cape wine well soaked in villainous Cape brandy, and possessing all the earthly sensual *smaak* so peculiar to Stellenbosch, make up a Stellenbosch inn-dinner.

And as for breakfast, you must drink essence of tea, or coffee, completely drowned in milk. Mutton chops dripping with sheep's-tail, good bread, but stale butter, and cold eggs, cooked before you are out of bed. It is but justice, however, to observe, that these things, together with the high charges attached to them, derive considerable compensation in the cleanliness of the house, and comfort of the beds.

During our stay at Stellenbosch, we of course preambulated the village in quest of the *lions*. In his usual *Heeregracht* costume, we met the worthy chief magistrate, and enjoyed a dish of chit chat with him under the trees. He was lamenting the severity of the laws as it respected the unfortunate slave-owners. It had been his provoking "duty to fine a master £10, just for licking the back of an impertinent huzzy of a slave-girl with a little bit of a switch who richly deserved it,—being at all times abominably dapper *wid* her tongue." We paid some agreeable visits to several private families, and partook of their well-known hospitality. The most entertaining sight which we saw, was a *ci-devant* functionary flying a *kite* on the green. It might be (as there were no children with him,) that his mind was rapt in the contemplation of physical science, looking for *castles in the air*, or with the immortal Franklin, conducting the lightning in its forked course, and bringing down philosophy from heaven! We must not omit the notice of a very agreeable visit to Mr. J. G. G. Lindenberg. Here we found an extremely well chosen collection of books, and every publication of the Cape Press for the last twenty years. On leaving the tastefully arranged dwelling of this gentleman, a thought came all at once in our head. It was, to imagine ourselves His Excellency the Governor for *one day*. Not that we are in the least discontented with the gallant and generally esteemed Chief who bears rule

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

amongst us. Quite the reverse. 'But,' as a friend once said to us, "suppose, now, you were governor for a day, what would *you* do more than has been done?" Why, sir, we would appoint Mr. Lindenberg to a situation of at least £300 per annum. We would increase the public revenue by advancing the cost of *annual licences* for vending spirituous liquors. We would suffer no *slave* to act as canteen-man. We would call for certificates of character from every *canteen-keeper*, and oblige the *real* owner of such to put his name over the door. And we would seriously take into consideration the propriety of re-establishing the old *Pacht* for Cape Town. Again, as we have a day granted to list as we like, we will exercise our privilege to its fullest extent. We would send the *Butchers' Shambles* out of town, and introduce to the building—Green Grocers, Fruiterers, Poulterers, Seedsmen, and Dairy-men. Or we would cover in a proportion of *Market-square* for these purposes. As friends to *Church and State*, we would either recommend or provide *church means* for the *unprovided* surplus of the population of Cape Town,—amounting to thirteen thousand two hundred and fifty souls! We would look especially to the religious instruction of that good-natured race of men—the *Free Black* or the *Prize Negro*. We would send to the Brazils for ministers of religion; "for here," observes the Rev. C. S. Stewart, of the *Vincennes* frigate, "I have met individuals of high office in the army, and others, *ordained* to the service of the priesthood, of as jet a skin, and as *pure African blood*, as any of the country." We would repeal the *Marriage Laws*, and make the business of a marriage union extremely simple, and attainable, without the necessity of journies, and the glaring, gazing, giggling impertinence of Matrimonial Court Inquisitions; and of coming in contact with thieves, rogues, and vagabonds.

And we would, *as soon as opportunity should arise*, look to the distant labourers in God's vineyard. In the equitable distribution of church affairs, we would bring the esteemed men, our *Murray's*, our *Smith's*, our *Morgan's* (and all others of equal worth,) nearer the seat of our government. We would say—long have ye borne the heat and burthen of the day, amidst many privations, in the distant part of the land. Long have ye witnessed a good profession before men, in all fidelity, and patriotism. Now take the reward, in that nearness to your more immediate friends, which your own merits and righteous justice demand. And we determine this, because we have never discovered you under any *suspicious* circumstances, *i.e.* within the *purlieus of the Colonial Office*. Not only this, viewing the great progress of *our language* in Cape Town, and looking to the Pulpit as a powerful auxiliary in its favour, we have not failed to assist the public schools of the Cape, by causing an English service in our churches in which ye, or some one else, can so efficiently sustain a part.

Moreover, we would with His Majesty's Commissioners of Inquiry, encourage Missionaries and others to "apply for government assistance" in affording the "means of instruction and religious communion to the coloured inhabitants and the Hottentots." Again, we would establish an Asylum or Lodge in Cape Town for the visiting Hottentots. A cruelly persecuted race of people at the present moment! The derision of *professed* christians, the bye-word, the reproach, the sport of the *half-and-half* friends of Civil Liberty and Free Trade at the Cape of Good Hope! Dearly are the poor things paying for their just rights awarded to them by the noble act of British Legislation. And subject to every calumny, insult, and opposition, are those individuals, who plead on behalf of humanity and public justice.

And the inquiry naturally suggests itself, what hath divided man from his fellow? What hath

"————Raised high passions, anger, hate,
Mistrust, suspicion, discord——"

We answer the Press—the rank, the unweeded Press,—the unworthy, prostituted joint-stock-company *Zuid-Afrikaan* Press. This is no *hear-say* evidence on our part. We testify of that which we know, —of that which we have seen; and we impeach the unqualified baseness and criminality of this "*Mammon of unrighteousness.*"

We confess that we feel an alarm, lest the false principles of this paper should lead to untoward issues. We cannot deceive ourselves by the received notion, that truth is mightier than falsehood, and that good *must* prevail over evil. Good principles enable men to *suffer*, rather than to *act*. Think how the dog, fond and faithful creature as he is, from being the most docile and obedient of all animals is made the most dangerous, if he becomes *mad*; so men acquire a frightful and not less monstrous power, when they are in a state of *moral insanity*, and break loose from their *social*, and *loyal*, and *religious* obligations. We must remember, too, how rapidly the plague of diseased opinions is communicated, and that if it once gain head, it is as difficult to be stopt as a conflagration or a flood. Crushed and beat down by fair argument, as the scribblers in the *Zuid-Afrikaan* have been,—they are too callous to feel ridicule or exposure, and their friends are too stupid to discover their partisans *laid low in the dust*. Besides the *leading* characters of this anti-colonial paper,—*The Zuid-Afrikaan*, have *nothing to lose*, and they can use intrigue and artifice to shield themselves, to which honourable men never condescend. In looking out for fair and *lawful* protection against the abuses of a *hireling* press, we have often thought, that the only plan would be, to impose on the critic, the necessity of subscribing *his own name* and description, to his *Editorial* censures, or those of his correspondents. This, in nineteen cases out of twenty, would destroy the sting, because, it would bring with it the *detection of the motive*, or would shew the *insignificance or rasculity of the hand from which it came.*

WEEPING WILLOWISM;

OR,

PARTING TIME ANTICIPATED.

An Impromptu Farewell, on hearing the decision of the Council of five, *that my Garden was to be taken away, and appropriated to the uses of a* FREE MASON'S LODGE. *With Notes and Comments.*

1.

Adieu my loved Garden, so dear
To my heart, in each pensive moment,
Let me *weep* for my *Willow* a tear,
And *hang up my harp* in lament.
"*Hail, Masonry! thou Craft divine!*"

2.

Adieu, my companions—sweet flowers,
Your perfumes so grateful to sense;
No more shall ye gladden my hours,
The mandate is—*get thee-gone* hence!
"*Hail, Masonry! thou Craft divine!*"

3.

Adieu all my friends of each hue,
From climates—the eastward and west;
Dear *Heart's-Ease*, thou bonnie *true-blue*,
Tri-Color—I love thee, the best.
"*Hail, Masonry! thou Craft divine!*"

4.

Sweet Marjorum! old English flower,
And *Sage*, *Mint*, and *Thyme*, truly dear,
We must *part*—for the fast coming hour,
Shall lay thee all low on the *bier*.
"*Hail, Masonry! thou Craft divine!*"

5.

And thou, "*bonniest gem*," 'neath the skies,
Lovely *golden-eyed* thing, fare-thee-well;
But the *Daisy*-flower, it '*never dies*"—
L'Embleme d'espèrance immortelle.
"*Hail, Masonry! thou Craft divine!*"

6.

And we too must part, *Sugar-Cane*,
But no Negro shall hail thy downfall,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

For thou grew up in *Freedom's* domain,
Next door to famed *Liberty Hall.*
"*Hail, Masonry! thou Craft divine!*"

7.

Convulvulus-*Major*, to you!—
My sympathy's offered in vain,
To thy *cup*, and thy *velvetted* hue,
Adieu, charming *Major*, adieu!
"*Hail, Masonry! thou Craft divine!*"

8.

And emblem of England—fair flower—
Thou *Rose*—of perfumers the chief!
Thine incense and sensitive power
Must wither and *fade as the leaf.*
"*Hail, Masonry! thou Craft divine!*"

9.

Helianthus, proud flower, so tall,—
On whose gold-disk the sun loves to dwell;
The Master determines thy fall—
Then, emblem of riches—farewell!
"*Hail, Masonry! thou Craft divine!*"

10.

And thou, *Cherianthius Cheiri*,
Old friend of the mouldering tower,
Thy pompous, imperial eye,
Must *go to the wall—Wall-flower!*
"*Hail, Masonry! thou Craft divine!*"

11.

And thou, *Amaranth* the divine,
Sung by *Milton*, the Prince of the Lyre,
Must yield to "*War, Women*, and *Wine*,"
And the fumings of *'bacca* on fire.
"*Hail, Masonry! thou Craft divine!*"

12.

And *last, though not least*, little flower,
Of *Constancy's* emblem so true;
The *Revellers* grim worldly power,
Shall soon doff thy *bonnet so blue.*
"*Hail, Masonry! thou Craft divine!*"

13.

And now one and all, an adieu,—
Coronilla, Carnation, and *Stock*,
Venus' Fly-Trap, Narcissus, and *Rue*,
Cock's Comb, and fair *Lady's Smock.*
"*Hail, Masonry! thou Craft divine!*"

14.

Passion-flower, Jonquil, and *Chrysanthemum*,
Mignonette, and *Clematis-flammula*,
Amaryllis, and *Fig-Mesembryanthemum*,
And farewell, Miss bell-*Campanula.*
"*Hail, Masonry! thou Craft divine!*"

15.

And *Accacia*, and *Lupin*, and *Dahlia*,
Hyacinth, and *Forget-Me-Not*-blue;
And *Larkspur*, and charming *Camellia*,
To all, and to each—an Adieu!
"*Hail, Masonry! thou Craft divine!*"

NOTES AND COMMENTS.

My Garden. As we understand it, this must be the *parlour garden* adjoining the Commercial Exchange, and attached to the Public Library; and the *attempt at verse* is designed, we apprehend, as a *catalogue raisonée* of its contents. We confess we are lovers of gardens and flowers, and wish the taste for such were cultivated with more ardour than is at present the case at the Cape. The loss of a single town-garden, however small, is, we think, a public loss, and on such grounds we deplore its depreciation or destruction. The influence of a flower is well known to those who have perused Park's interesting Travels in the interior districts of our Africa. And, says a writer of some distinction, there is a flower, the common *cowslip* of the fields, which, by reason of associations for thirty years of my life, I never saw without emotion. And, observes a British officer in India, "In one advance of the army to which I was attached, we had some skirmishing with the irregulars of our foe; the pursuit was rapid, and I fell behind my detachment, wounded and weary, in ascending a ghaut resting in the jungle, with languid eyes fixed on the ground, without any particular feeling but that of the smarting of my shoulder. A *cowslip* caught my sight! my blood rushed to my heart—and, shuddering, I started on my feet—felt no fatigue, knew of no wound, and joined my party. I had not seen this flower for ten years! but it probably saved my life. * * * This flower was again seen in Spain. I had the command of an advance party, and in one of the recesses of the Pyrenees, upon a secluded bank, surrounded by a shrubbery so lovely as to be noticed by many—was a *cowslip*. It was now nearly 20 years since I had seen it in the Mysore: I did not start, but a cold and melancholy chill came over me; yet I might possibly have gazed long on this humble little flower, and recalled many dormant thoughts, had not a sense of duty (for we momentarily expected an attack,) summoned my attention to the realities of life: so, drawing the back of my hand across my eyes, I cheered my party with—'FORWARD, *my lads!*' and pursued my rout, and saw it no more, until England and all her flowery meadows met my view." How welcome was the sight of a Daisy to Dr. Carey, of Calcutta, which had unexpectedly sprung up in his garden! He gives it a hearty welcome—

'Thrice welcome little English flower!
My mother-country's white and red;
In rose or lily, till this hour,
Never to me such beauty spread.
Transplanted from thine island bed,
A treasure in a grain of earth;
Strange as a spirit from the dead,
Thine embryo sprang to birth.

Thrice welcome, little English flower!
To this resplendant hemisphere;
Where Flora's giant-offspring tower
In gorgeous liveries all the year.
Thou, only thou, art *little* here,—
Like worth unfriended or unknown;
Yet, to my British heart more dear,
Than all the torrid zone.

Thrice welcome, little English flower!
Of early scenes beloved by me:
While happy in my father's bower,
Thou shalt the blithe memorial be.
The fairy sports of infancy,
Youth's golden age, and manhood's prime;—
HOME, COUNTRY, KINDRED, FRIENDS, with thee,
Are mine in this far clime.

Poor R. Brinsley Sheridan, whose last days, by the bye, were his best days, a circumstance wholly unknown to Mr. Thomas Moore, began, in older life, to love gardens and flowers. We have seen him *pull up* his vehicle in order to gaze and inquire into the merits of the cottager's gardens. We have seen him gather the "wood flowers wild" with all the fondness of childhood's affection. And after one of his country rambles at Polesdon, he commences a letter to Whitbread thus:—Dear Sam. W——, You need not expect me for a week—I am more than ever charmed with the garniture of the meadows, and the warbling of the woods. I have just returned from *primrosing and violetting*," &c. This was strictly true. His hat contained handfuls of these British flowers

We have stated our regret at the little love there is at the Cape for planting and rural pleasures. The *Breda's* and the *Van Renen's* have, however, done much in this way, and so have the British inhabitants of Wynberg and its vicinity. Mr. *Higgs* and *Baker Moore* deserve a premium for their industrious planting habits. The new Agricultural Society should encourage the planting system—it might at least offer premiums. Trees are delightful objects—they are, indeed, the glory, the beauty, and the delight of nature. And we fully agree with Professor Wilson, that "the man who loves not trees—to look at them—to lie under them—to climb up them (once more a school-boy,) would make no bones of murdering Mrs. Jeffs." The reference to a school-boy, makes us recollect our own early days of happiness. It was part of the system of *our school*, to have allotted portions of garden ground—and it was quite delightful to discover in numerous instances, an early fondness for rural recreations. We could wish that something of this kind were encouraged in our colonial schools. Apart from the great utility of rural occupations, it is doubtless a great unhappiness to want a sense of rural enjoyments. He who has no heart for delights so pure and natural, must bribe his appetite with a forced and artificial kind of enjoyment, for which expensive preparations must sometimes be made, sometimes invention must be racked, and sometimes the *principles* subdued.

Again as to trees—We recollect travelling in the colony some few years since, and after encountering much of the sun's oppressive splendour, to find a covert from the heat in a plantation of great beauty and comfort. Some unknown poet had left a grateful tribute behind him in the following lines:

'Peace, peace to his ashes who planted these trees!
Supreme o'er the landscape they rise,
With simple and lovely magnificence please
All bosoms, and ravish all eyes.

Nor marble, nor brass, could emblazon his fame,
Like his own silver trophies, that wave
In graceful memorial, and whisper his name,
And scatter their leaves on his grave.'

Once more. The poets have not been altogether idle at the Cape. The discovery of a little favourite flower in the garden of Mr. Van Renen at the Brewery, has been thus celebrated:

'There is a charming little flower,
A charming flower it is,
The brightest gem in Flora's bower,
And sweet as beauty's kiss.

There is no fragrance in its sigh
To tempt the "busy bee;"
It does not please the butterfly—
But it is dear to me.

I love to see the little thing,
When morning paints the skies,
Before the bird is on the wing,
Opens its sparkling eyes.

Then, bright and fresh with shining dew,
It glitters to the ray,
With triple spots of various hue,
So fancifully gay.

This is the flower that I will wear,
That girls may cease to tease;
Its name is music to my ear,—
What is it called?—HEART'S EASE!'

Under the head—*General results of a Gardening Tour*—in Louden's excellent Magazine for August, we find the following particulars on *Town Gardens.* It is needless to observe that in selecting the extract, we have had in view the interests of our Town Readers—and our greatest reward would be—that they derive some *practical* advantage from its perusal.

Of gardens and grounds attached to street houses, it gives us much pleasure to state that we found some entirely to our satisfaction. The richest and most elaborate of these was that of Mr. Edwin Bullock of West Bromwich; the next, those of Mr. Howe, and Mr. Herbert of Coventry; and the next to these, that of Dr. Louden at Leamington. To these we may add the late Mr. Brookhouse's garden at Warwick, and the garden and grounds of Miss Parsons at Dudley. By the gardener at this last place we were informed that pines grow remarkably well in the immediate neighbourhood of works producing immense quantities of coal smoke. The pines not only grow well, he says, in such situations, but the very considerable quantity of soot which is continually falling on them, and which slides down into the axils of the leaves, effectually prevents the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

growth of the mealy bug, or, indeed, of any other insect. The health of his plants, and their entire freedom from insects, notwithstanding the sooty appearance of the lower parts of their leaves, seem to corroborate his opinion. The fruit grown, we can assert, is equal in flavour to any we have ever tasted. If this opinion should be confirmed by experience in other places, every innkeeper and confectioner, as well in London as in the country, may grow his own pine-apples on the top of his own house, heating a cistern of water, placed under them, by the smoke of the chimneys. The garden of Mr. Bullock contains a number of the most choice hardy green-house, and stove plants, besides select collections of florists' flowers. The two Coventry gardens are perfection's self, in regard to order and high keeping.

The detached town gardens are situated in the suburbs of towns, generally collected together, and separated by hedges. There are upwards of two thousand of such gardens in the neighbourhood of Birmingham, a considerable number at Wolverhamton, some at Dudley and at Manchester, and a few even in the neighbourhood of that stationary town Buckingham. There are also potato gardens near many of the towns through which we have passed, in which are cultivated only the commoner culinary vegetables, and not either fruits or flowers. The rent paid for the enclosed gardens is generally about 2*s.* 6*d.* a rod; and the extent of ground in each garden is from 7 rods to the fourth of an acre. When a party possessing such a garden is about to leave it, the plants and trees, and the right of possession, are bought by the successor for a price which, at Birmingham and Wolverhampton, sometimes amounts to as high a sum as 60 guineas. Twenty guineas is the usual price given for a garden paying from a guinea to 30*s.* annual rental. *It is not uncommon for single men, amateurs, clerks, journeymen, &c. to possess such gardens, and to pass a part of their evenings in their culture.* In one of these gardens, occupied by Mr. Clarke, chemist and druggist, Birmingham, (the inventor of *Clarke's Marking Ink,*) we found a selection of hardy shrubs and plants, which quite astonished us; we shall give a list in a future Number. *It were much to be wished that such gardens were general near all towns; as they afford a rational recreation to the sedentary, and a useful and agreeable manner of passing the leisure time of mechanics and workmen of every description. There ought to be no such thing, in our opinion, as a dwelling without a garden, either attached or detached; and, when self-government comes to be applied to towns in a more perfect manner than it now is, arrangements will be made accordingly.* In the mean time, it appears to us to be the duty, as it would be for the advantage, of townsmen of wealth, to encourage the laying out of fields in small gardens at moderate rents, for those persons in their vicinity who live in houses or lodgings without gardens.

That some attention has been paid to the rural economy of the Cape is not disputed. What we require is a revival of the spirit of bygone days—a something to be done for the uncivilized appearances of our town suburbs. The individuals to whom respect is due for the encouragement of gardening, and the introduction of useful plants among us are the following. That there are omissions in this enumeration we can scarcely doubt. Such, however, are not the result of any unjust intention.

To *Mr. Von Ludwig* very great thanks are due. This gentleman is positively without an equal in affording us inexhaustible delight and instruction from his amateur gardening predilections, as well as his disinterested and public-spirited exertions in the cause of the Natural History of the Colony.

Mr. Bowie has long and disinterestedly laboured in the department of scientific botany, and is, we suspect, not to be excelled in judicious skill, and patient research.

We are indebted to Mr. Bowie for the introduction of the "tow'ring ash," *(Fraxinus excelsior,)*—the Box Tree, *(Buxus sempervirens,)*—the Privet, *(Ligustrum vulgare,)*—the Furse or Whin, *(Ulex Europæus,)*—and many others.

The *Furse* has been likewise introduced with success by the late Dr. Hussey, Col. Bird, and Mr. George Thompson.

The *Cork* and the Olive Tree owe their existence in this colony to Mr. C. McKenzie.

The following is a list of a few other introductions by various individuals:

Arbor Vitæ, (*Thuja occidentalis.*)—The Indian remedy for cough, intermitting fever, gout, and rheumatism—by Mr. *Villet.*

Lime or Linden Tree, (*Tilia europæa*)—The wood of which the carver's prefer, on account of its delicate colour, close grain, easy working, and for its not being liable to split—by Mr. *Villet.*

Laburnam—The flowers of which are avoided by the bees; the leaves agreeable to the goat; and the seeds, in a green state, violently emetic and dangerous—by *Col. Bird.*

Carob Locust-Tree. St. John's Bread, (*Ceratonia Siliqua.*)—A native of Greece, Syria, and Asia Minor; the only tree that grows at Malta, and in abundance in the wilds of Palestine. The Foulahs on our Western coast cultivate the Ceratonia to a great extent, and it is generally prized by the inhabitants of our tropics. Seeds of this interesting plant were introduced by Mr. *Watt*, of the Commissariat Department, in 1831, from which many plants have been reared, which will no doubt prove valuable to our Southern Africa, as a tree producing abundance of food to man and beast, and calculated to thrive even on the most sterile of our Karoo soils.

Ivy, (*Hedera Helix.*)—A plant representing faithful friendship,—by Mr. *Polemann.*

Willow, (*Salix Babylonica,*)—by the late Dr. *Hussey.*

"*Uses of a Freemason's Lodge.*" We have heard that Freemasonry is a thing "which does with jewels precious shine." Whilst we lament the fatal necessity which determined a Lodge on this most unsuitable spot, we are bound in duty to state, that the parties concerned in its foundation, have done so with motives of a fair complexion, and that they have not failed to join in the lament of *Weeping Willowism*, and even to evince much disinterested respect to the little property in question. The words "Hail, Masonry, &c." which are introduced by the complainant in his rhyme, are taken from the orthodox version of a Mason's Hymn, *ex gra.*

Hail, Masonry! thou Craft Divine!
Glory of earth from Heaven revealed;
Which does with jewels precious shine,
From all but Mason's eyes concealed.

Chorus.

Thy praises due who can rehearse,
In nervous prose, or flowing verse?

Thus much for the Garden, botanical introductions, and Masonry. Now for a few illustrations of the text in its natural order.

1. "Weeping Willow," (*Salix babylonica.*)—Few emblems have been more celebrated by the poets than this of the forsaken lovers.

To the brook and the willow that heard him complain—
Ah, willow! ah, willow!
Poor Colin went weeping and told them his pain.
Rowe.

It was on this tree that the poor slaves, the Israelites, *hung their harps*, and bemoaned their beloved Jerusalem, (Psalm 137.) The Willow is of luxuriant growth in the village of Worcester, in this colony—a remarkable circumstance for an unthriving place in most matters.

2. "Flowers."

——— "Flowers that tell,
What words can never speak so well."
Byron.

3. "Heart's Ease," (*Viola tricolor.*)

——— "The garden's gem,
Heart's Ease, like a gallant bold,
In his cloth of purple and gold."
Leigh Hunt.

4. "Marjoram," (*Origanum.*)

"Bind your brows with the flowers of sweet-smelling Marjorum."—*Catullus.*

"Sage," (*Salva.*)—This verse has been left in allusion to its virtues.

"*Cur moriator homo cui salvia crescit in hor to?*"

"Mint," (*Mentha.*)—Of great medicinal and culinary properties. Mint sauce for lamb, and mint leaves for green peas, are indispensably requisite.

"Thyme," (*Thymus.*)—The highest flavoured venison is always found where this penetrating herb abounds. Bees seek it with great activity: the honey of Athens was esteemed the best, on account of the Thyme which grew on the hills which surrounded that city.

5 "Daisy," (*Bellis Perennis.*)—The "bonny gem" of our Robert Burns, an emblem of innocence, from its forming one of the earliest floral amusements of infancy.

"Never dies."

Tis *Flora's* page:——In every place,
In every season fresh and fair;
It opens with perennial grace,
And blossoms every-where.

On waste and woodland, rock and plain,
Its humble buds unheeded rise;
The Rose has but a summer-reign—
The DAISY *never dies.*
(James Montgomery.)

6. "Sugar-Cane," (*Saccharum* of Pliny,)—From the Arabic *sacchar* or *zuchar*, or rather from the *Indian shukur*,—a plant in whose cultivation upwards of 700,000 human beings are devoted by the British Government to personal slavery!!

"Liberty Hall." Thus named after the glorious dinner, to commemorate the last Revolution in France. We can never forget the little *warblers* on that interesting occasion. Capt. ——— sung "Liberty Hall" in grand style; Mr. Blore gave us "*Bill-Bob stay.*"

'Tight lads I have sailed with,
But none ere so sprightly
As honest Bill-Bob-stay so light and so *blue.*
Why he'd sing like a mermaid,
And foot it so lightly,
Was the forecastle's pride, and delight of our crew

And Mr. Geo. Cadogan refined the subject, by giving "*Believe me if all those endearing young Charms.*" And Mr. Benningfield's song was "*A glass of good Burgundy fill, fill, for me.*" And Mr. Merrington sung "*Father and I, Father and I.*" We have registered these things, because the press of 1830 did not perform its duty.

7. "Convolvulus Major," (*Convolvulus purpureus.*)—This flower is given to the ladies, that when they have made their happy choice, they may have an appropriate flower to bestow on their hopeless suitors, so as to extinguish the flame their charms have created.

8. "Rose," (*Rosa,*)—The emblem of beauty and the pride of Flora, queen of flowers, in every part of the globe; and the bards of all nations have sung its praises.

Thy scented buds life's joys disclose,
They shew our paths with magic sweets.
Where many a thorn like thine, fair rose,
Full oft the weary wanderer meets:
And when he sees thy charms depart,
He feels thy thorn within his heart.
(Mary Robinson.)

The Turks are great admirers of this lovely flower, and the Musslemen in general believe that it first sprang from the *perspiration* ...

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Mahomet; on which account they will not suffer a rose leaf to lie upon the ground, or permit any one to tread upon this sacred flower. In Turkey, a rose is sculptured on the monument of all ladies that die unmarried; and in Poland they cover the coffins of children with roses, and when the funeral passes the streets, a multitude of these flowers are thrown from the windows. Mad. de Genlis tell us, that formerly the rose was considered so precious in France, that in several parts of that country, the inhabitants were not allowed to cultivate it, as if all but the powerful were unworthy of such a gift.

9. "Sun-Flower," (*Helianthus.*)—The sun-flower is made the emblem of false riches, because gold of itself, however abundant, cannot render a person rich who is poor in spirit.

'Let a broad stream, with golden sands
Through all his meadows roll;
He's but a wretch with all his lands,
That wears a narrow soul.'
(Watts.)

10. "Wall Flower," (*Cheiranthus Cheiri.*)—This flower is made the emblem of fidelity in misfortune, because, very unlike rational beings, it attaches itself to the desolate, and enlivens the ruins which time and neglect would otherwise render terrible.

11. "Amaranth," (*Amaranthus.*)—Homer having described the Tessalians as wearing crowns of Amaranth flowers at the funeral of Achilles, has induced the bards to place it in the list of funeral flowers, and to make it the emblem of immortality.

Immortal Amaranth! a flower which once
In Paradise, fast by the tree of life,
Began to bloom. *(Milton.)*

"War, Women, and Wine," and "'bacca." What a falling off is here! We apprehend our rhyming correspondent, means to identify the above sentimental toast, and the smoking of Tobacco, with the Free Masonry System.

12 "Violet," (*Viola odorata.*)—The poets of the 16th century, appear to have made this favourite flower an emblem of faithfulness. It is dedicated to St. Gertrude.

"The Reveller." This expression occurs in some exquisitely beautiful lines, written in Richmond Church by the late Herbert Knowles. They are registered in Carlisle's Description of Grammar Schools, 2d vol. page 880.

'Ah! here is a plentiful board!
But the guests are all mute as their pitiful cheer,
And none but the *Worm* is a *Reveller* here!'

13. "Coronilla," *(Coronilla.)*—A little shrub which enlivens the fields of Spain and Italy, and derives its name from *corona*, a crown, because the head of each of its branches is crowned by a corymb of golden flowers.

"Carnation," or striped Pink, *(Dianthus.)*

'With hues on hues.—*Thomson.*

"Stock," or Gilly-flower, (*Mathiola.*)—Lasting beauty is represented by this flower, whose charms, although less graceful than the rose or the lily, are more durable.

"Venus Fly Trap," *(Dionæa muscipula.)*—A native of South America, and exhibits a remarkable instance of vegetable irritability. When a fly happens to light upon one of its leaves, it immediately folds up, and crushes the invader to death!

"Narcissus," (*Narcissus.*)

'Narcissus fair,
As o'er the fabled mountain hanging still.'
Thomson.

See Ovid's beautiful Metamorphosis of the coy Narcissus into this flower.

"Rue," *(Ruta graveolens.)*—Hippocrates commends Rue as resisting the action of contagion. Boerhave speaks of it in similar terms. This plant was formerly called Herb of Grace, from its being used to sprinkle holy water.

"Cock's Comb," or Crested Amaranth, *(Celosia Cristata.)*

'——— Plants divine and strange,
That ev'ry day their blossoms change,
Ten thousand lovely hues.'

"Ladies' Smock," *(Cordamine.)*—This plant has the same sensible qualities as the water-cress. The flower of this plant has a place in the *Materia Medica* of the British Pharmacopœias. Its good effects are well known in convulsive disorders, and spasmodic affections.

14. Passion Flower, *(Passiflora.)*—In the following words from Forbes' *Oriental Memoirs*,* there is a beautiful allusion to this lovely flower. "In this sublunary sphere, there is a tranquil path unknown by the disciples of Epicurus, and little known to the philosophers of the Stoa,—shaded by umbrageous trees with lovely blossoms and delicious fruits. A perennial fountain refreshes the aspiring *passion-flower*, the blushing rose, and lowly lily; emblems of Faith, Hope, and Charity, which adorn the borders and perfume the atmosphere. The rose, it is true, is not always without a thorn; and the lily of the valley is sometimes crushed: but the *Passiflora* soars aloft, clings to a firm support, and smiles in cerulean ether."

"Jonquil," (*Jonquilla.*)

"——— Jonquils,
Of potent fragrance."
Thomson.

"Chrysanthemum," (*Chrysanthemum Indicum.*)—This flower gives cheerfulness to the parterre, when nearly all the other children of *Flora* have withdrawn their smiles.

"Mignonette," (*Roseda Odorata.*)

——— 'The fragrant weed—
The Frenchman's darling.'
Cowper.

An odorous plant of Egyptian sands.

Virgin's Bower, ("*Clematis flammula.*")

"And virgin's bower, trailing airily."
Keats.

"Amaryllis," (*Amaryllis.*)

'In all the liveries deck'd of summer's pride.'
Milton.

"Mesembryanthemum," or Fig Marigold, (*Mesembryanthemum.*)—Most of this species do not expand their gay petals before mid-day, and seldom even at that late hour, unless the sun awakes them by his powerful rays; yet it is amongst the earliest flowers that take repose. It may therefore be bestowed on the sluggard for his armorial bearings.

"*Campanula*" *pyromidalis*, Blue Pyramidal *Bell* Flower. This flower is made emblematical of constancy, on account of its *Whig* colour. *True blue never fades.*

15 "Acacia," (*Robinia Pseudocacia*)—A tree of beautiful blossoms, from North America.

"Lupin," (*Lupinus.*)

——— 'Tristique lupini
Sustuleris fragiles calamos.' *Virgil.*

This plant is named from *Lupus*, a wolf, on account of its ravenous nature, which is such, that it draws in all the nourishment of the soil, to feed its own growth, and destroys all other vegetation.

"Dahlia," (*Dahlia.*)—The first introduction of this beautiful Mexican, marked the year when France became revolutionised: these plants were lost, until again introduced by Napoleon, on his accession to the throne of France.

"Hyacinth," (*Hyacinthus*)—Celebrated by the poets. Homer tells us, that this flower sprang from the blood of young Hyacinthus, the favourite of Apollo.

"Forget-Me-Not," (*Myosotis scorpioides.*)—Found in the Eastern Districts in great variety.

Larkspur, (*Delphinium Ajacis.*)—A graceful, airy flower, but of party-colour fickleness.

"*Camellia*" *Japonica*, Japan Rose.—A beautiful flower; the pride of the Japanese grove.

* In the Public Library.

ORIGINAL CORRESPONDENCE.

OUR WINES—THEIR DEPRECIATION BY WINE GROWERS AND WINE MERCHANTS.

To the Editor of the Cape of Good Hope Literary Gazette.

The rural youth and virgins o'er the field,
Each fond for each to cull th' autumnal-prime.
Exulting rove, and speak the vintage nigh.
Then comes the crushing swain, the country floats
And foams unbounded with the mashy flood,
That by degrees fermented and refin'd,
Round the rais'd nations pours the cup of joy.
Thomson.

SIR,—The commercial state of the western part of the colony of the Cape of Good Hope, offers ground of anxiety and alarm to those who justly estimate, at its real value, this *interesting portion* of the BRITISH EMPIRE. It would be more distressing than difficult, to calculate the sad consequences which would follow in the train of vineyards abandoned, and establishments broken up; and it is but a sorry alleviation of actual distress to reflect upon, or to urge, that the sufferers are the mere victims of their own miscalculations. Such, however, appears to be the fact. About the year 1814, when the admission of Cape wines at *one-third* of the duty on those of Spain and Portugal had taken effect, the wine-exporters of the colony as if moon-stricken, rushed, one and all, to the wine-boers, each out-bidding the other for the subsequent, as well as for the actual crop. By this powerful competition, the first cost of wine at the vineyard was increased from under one hundred to above two hundred rix-dollars per leaguer, eventually to the ruin of all the parties. The *avarice* of the wine-boers experienced a stimulus which it could not resist; and the man was irresistibly impelled to clothe with vine stocks, not only those spots of his farm adapted to produce grapes to advantage, but also every other part on which vines would merely grow. Then follows the natural result: a produce, the consumption of which is limited in its nature, was speedily augmented in an unlimited degree; and, by over-supply of the London market, and an universally deteriorated quality, found a very reduced price. The cheapness of freight, also, in the after-days, tempted the merchant to consign to England an abundance of EXECRABLE composition, under the name of Cape Madeira, without the least regard to *quality—trash* of the worst description. The name of Cape wine, as well as the article, to use a very coarse, unpolite, but applicable term, "*stinks in the*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

London market." This is the true state of the case, however unwelcome to South African ears—"*Ex hac fonte derivata clades, in patriam populumque fluxit.*"

To state that the lately attempted equalized duty would not materially have affected Cape wines, had they encountered in the market the rich wines of Maderia and Seres, would be an extravagant assertion. The blow must have been fatal; for in truth the consumption of Cape wine had been latterly going down stairs, and had nearly been banished into the *kitchen*, at the end of 1830. What can now be effected to alter the course is a matter of serious consideration. Æsop tells us that Hercules assists that wagoner only, who puts his own shoulder to the wheel.

The following is a three years' average of the quantity of wine which passed the barrier into Cape Town from the year 1804. To this is added the export to Great Britain singly, and to all parts generally The reader will be enabled from the perusal, to form an idea to what a degree the bad quality of the wine, and the increased quantity of a wretched article, has abated the price and reduced the sale. The export of Constantia wine remains tolerably steady, but this is a wine, "sui generis," produced in small quantities, and on an appropriate soil; but the export may be taken annually at about 200 half-aums.

Three years average of Cape wine passing the barrier:

1804, 5, and 6, ..	5,249 leaguers,	—total	15,747
1807, 8, . 9, ..	4,470 do.	do.	13,251
1810, 11, . 12, .	5,736 do.	do.	17,208
1813, 14, . 15, ..	7,226 do.	do.	21,678
1816, 17, . 18, ..	9,612 do.	do.	28,836
1819, 20, . 21, ..	10,536 do.	do.	31,608
1822, 23, . 24, ..	10,500 do.	do.	31,500
1825, 26, . 27. ..	11,642 do.	do.	34,926
1828, 29, . 30, ..	14,640 do.	do.	43,920

The average of general shipments:

1817, 18, and 19, ..	9,110 pipes,	—total	27,330
1820, 21, . 22, ..	7,498 do.	do.	22,494
1823, 24, . 25, ..	10,012 do.	do.	30,036
1826, 27, . 28, ..	11,416 do.	do.	34,248
1829, 30, . 31, ..	10,200 do.	do.	30,600

The average of shipments to England:

1817, 18, and 19, ..	7,647 pipes,	—total	22,941
1820, 21, . 22, ..	5,490 do.	do.	16,470
1823, 24, . 25, ..	7,588 do.	do.	22,764
1826, 27, . 28, ..	7,384 do.	do.	22,152
1829, 30, . 31, ..	6,597 do.	do.	19,791

After the most attentive consideration which the writer has been enabled to bestow on the subject, he has convinced himself that to set Cape wine once more "fairly on its legs," three points must be pursued—neither of which, singly, would be equal to the purpose, nor collectively, if an additional duty be imposed in England. The three points are—REDUCTION OF QUANTITY,—DISTILLATION,—IMPROVEMENT OF QUALITY. The first, without which every hope will vanish, is a reduction of the quantity. It has been stated that above 30,000 leaguers of Cape wine have been expressed from the grapes of the last vintage, and are now ready for the market To accomplish this first point, the example might be followed of the Hottentot settlers on the KAT RIVER, who, changing their nature, are held up as a pattern in a late publication, for having (without regard to the excellence of the fruit,) boldly rooted up all their vineyards, under a *new born* horror of the temptation to drunkenness, either of themselves or of others. It is difficult to ascertain whether this is not what the French call "persifflage," *Anglice* "humbug," or whether it be a piece of irony. This abhorrence of the vine stocks on the part of the Hottentots, is peculiar to the KATS. The road to Wynberg never ceases to present to the traveller a sprinkling of Hottentot gentlemen and ladies in a state, disproving any particular dislike of the produce of vine stocks. The writer, however, does not admire those proofs of "mania," and only urges the prudence and necessity of quietly abandoning those vineyards which, adding to an over-grown supply of wines of a poor and hungry quality, overload the market, and do not repay the cost of cultivation. He concludes the act of the Hottentots to have been temporary lunacy from excited feelings, which it would have been more statesman-like to curb and to repress, than to applaud.

With regard to the second point—DISTILLATION. Whenever the state of the wine-trade, and of the wine-boer, has been the subject of debate, the question has been asked, why distillation is not general? and why 66,000 gallons of French brandy, or 600 pipes, were imported in the last year for the improvement of the wine? Cape brandy, distilled with care and skill, has been found *nearly* equal to French. Here at once is the absorption and vent for 3,000 pipes of surplus wine, and a saving of the charges and cost of import. To state that the additional quantity of distilled spirit thus obtained, would be appropriated wholly to the improvement of wine, and none to intoxication, would be absurd; but although the moralist may deplore the inveteracy with which a part of mankind may persist in acts leading to premature death, yet the colonial political economist may be allowed to rejoice if wine, the staple of the Cape, were brought to perfection by brandies grown and distilled there, without any payment to the foreigner.

The last and most important point is, unabating ATTENTION TO THE IMPROVEMENT OF THE CAPE MADEIRA; or rather, to the maintainance of its purity and quality, quite up to the standard of the most favorite vineyards. It was that which caused a preference of Cape wines, possessing something of the flavor of Madeira and Seres, over much of the light and thin produce of France and of the Rhine. There need be no apprehension that the counties of England, distant from the capital, will not resume their taste for Cape Madeira and other strong wines, whenever it becomes entitled to any thing in the shape of approval, or *whenever*, (by way of test,) it shall possess a degree of excellence sufficient to be introduced to the superb and hospitable annual dinner, given by the Merchants in their Commercial Exchange, from which it has *latterly* been *banished*.

A better process of fermentation may be anticipated from care, and the continuation of watchful experiment. The Cape College in ESSE, and the King's College in POSSE, (fifty years hence,) with its PRINCIPAL, its gowns and caps, may be the means, the one immediately, the other eventually, of adding mightily to the *chemical* knowledge of the colony by the lectures of their Professors.

The yield of the vineyards during the last year, has been already stated at above 30,000 leaguers, or 41,454 pipes. That quantity of such wine as is now grown, would be unsaleable at any remunerating price. The sacrifice of property must be continued, until the annual supply be reduced, and the quality improved. If prudence and worldly wisdom do not accomplish it, absolute necessity will enforce the act within a very limited period. Of superior wine a vent may probably be found for full 20,000 leaguers. The present distillery, (town and country,) is calculated at the present rate of distillation, to absorb annually 8,000 pipes; add 6,000 pipes, being the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

quantity required by England annually if it be of the first quality; 3,000 pipes are the average exportation to Australia and other foreign colonies, and 8,000 pipes for the consumption of Cape Town and the Country; making a total of 25,000 pipes.

If the suggestions of the writer be correct, the Cape wine trade may once more rise from its ashes, and by its *export*, give the means of supplying those imports which the *luxury* of the inhabitants, and the *generally increasing prosperity of the colony*, (malgré the temporary distress of the wine trade) has metamorphosed into necessaries. Dissatisfaction and distrust will be expelled from our shores, and "the world will go merrily then."

It must be allowed, however, by the writer, that this anticipated prosperity and revival of the wine trade, primarily resting on the nerve and resolution of the wine merchant and boers, as to the three points required, may greatly be affected by the interference and ill-advised acts of others.

"Behold there ariseth a little cloud out of the sea, like a man's hand." 1st Kings, Chap xviii., verse 44.

This small cloud is the *Temperance Society*, the growth of America; rising in the West, and expanding itself widely to the East.

A number of individuals have latterly formed themselves into a Society under the name of "THE TEMPERANCE SOCIETY," in the declared view of extirpating the habit of what is vulgarly called "*dram drinking.*" The *covenant* has been signed by a mass of individuals, binding themselves, by their *note of hand*, from drinking any portion of ardent spirits, unless when prescribed as a medicine. This may be praiseworthy; for who can do otherwise than condemn a practice, evidently so ruinous to morals and to health—to soul and body—so offensive to God and man.

These COVENANTERS expect, by their signatures, to allure the lower classes from the deadly practice. The example of America is quoted as illustrative of the general success of such an experiment. In America, drunkenness is general in all orders of men. It is the *Rule—Sobriety* is the *exception*. In *South Africa*, comparatively few, except the lowest and most abandoned class of Natives, Europeans, and Hottentots, are guilty of this depravity to any extent; and how can such individuals be expected to be led by the example of subscribed names, which few of them can even read? It is, besides, something more than commonly degrading in a christian and a gentleman, to affix to an agreement his signature, not to do that which would disgrace him in society, were he so to do: and an application to him is almost an insult.

The number of infant schools and free schools now so universally abundant, and still increasing in the colony, will, when added to the powers of our common christianity, together with the recent establishment of Savings' Banks—the practical and every-day check to drunkenness—do more to reform the lower classes of the rising generation, than a folio of *covenants* The individual, so educated and so taught, will reject such abominations as dram drinking with loathing, both from education and a natural sense of right more binding, more lasting, than the tie of a signature. Zealots begin to whisper gently, that WINES, strengthened and matured by a large portion of *brandy*, ought to become gradually subject to the same covenants, and the Society is to exchange the name of *Temperance* into *Abstinence Society*. If the phrensy increase, it will plant a *deadly blow* to Cape prosperity, be the *tomb of social enjoyment*, and extinguish the hilarities of life. *Wine*, from the earliest ages of the world, has been accounted a most valuable gift of Heaven to mortal man, and to argue against the use of Wine, by its *abuse*, is not logical. In *Holy Writ*, the use of it is frequently quoted with approbation, as being acceptable to the Deity: "Wine to make glad the heart of man." Psalm cv. verse 15. "Give wine to those that be of heavy hearts." Prov. xxxi. verse 6. "Wine which cheereth God and Man." Judges ix. verse 13.

The miracle of changing water into wine at the wedding in Samaria, is known to all. Wine is one of the elements in the solemnization of our most religious ceremonies. Amongst the ancient Poets, to travel from sacred to profane history, Homer immortalizes wine as a libation to the Gods, and a gift from them to man.

"On either side a sacred Herald stands,
The wine they mix and on each monarch's hands
Pour the full urn" *Iliad, Book 3d.*

Virgil, in his second Georgic, describes with poetic fire, the merits of the grape and of the process of making the Italian wines.—Divines, Poets, Historians, Orators, and Philosphers, are vehement in their praises of wine, and condemn by anticipation the *Puritans* and *Sectarists* of the Western Continent. "The *Round Heads*" of 1832, who will be quoted as a class of anchorites, best fitted for a shirt of hair, and a girdle of hempen rope, and despising those good things, which Heaven, in its mercy, has provided for the enjoyment of man in this lower state of existence.

The Historian, *Hume*, in his notes upon extraordinary occurrences in one of the years in the History of England, records an Eclipse of the sun, so total, that birds in midday went to roost. In the Cape *world of letters*, a something of like occurrence took place. The *Cape of Good Hope Literary Gazette* became *eclipsed* during the months of November and of December; and for that period the *Editor*, "horribile dictu," with his tribe of rising *literati*, and his band of Colloquists, went to roost. The shadow passed on before the 2d January, 1832, and on that day, the public was gratified by the re-appearance of a periodical, which adds so materially to the instruction and amusement of the colony. The writer observes therein a letter to the Editor, under the signature of *A Subscriber*, upon which he is inclined to make a few remarks.—The letter bears this title: "The Wine Merchants *versus* the Wine Farmers," and presents a catalogue of reciprocal grievances and of mutual complaints. It illustrates how equally and specially industrious, both growers and merchants have been, in endeavouring to achieve the *ruin* of the wine trade and of themselves, which in truth they have pretty nearly effected.

"Nec Lex est justior ulla
Quam Necis artifices, arte perire sua."
(Ovid.)

It is difficult to assign the palm of destruction to either; so nearly have they worked alike; but, upon the whole, the meed must be allotted to the *Merchants*, yet so sharply contested, that the Judge would decide the race to have been won by a nose.—The wine farmer remarks that the low price of wines is to be attributed to the cupidity of the merchants, who pay the same for good as bad, and there is no encouragement held out to the wine growers for improvement. The wine merchants complain, that the quality of the wine retrogrades, and that they have rejected several farmer's wines this year from their inferior qualities, "a measure he before never

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

had recourse to."—Now, Mr. Editor, this is an abundant confession of one of the leading causes of deterioration. Had the merchants made a practice of rejecting inferior wines, it would have been compulsory on the growers to have attended mainly to the quality, and distaste would never have taken place to its present extent. Here is an avowal, that until this year, the merchants received into their vats, all wines exposed for sale, whether good or bad, and these have been the means of creating the present disgust. The "*Subscriber*" proceeds to state, that he has been informed by a very *respectable merchant*, that at the time of the great demand in England, for our wines, the purchasers, who were no judges of the quality, gave what he calls *great latitude* to the merchant: in other words, gave him the opportunity of what is in common parlance, cheating, or taking the buyer in, "and of introducing a great deal of trash, which produced a rooted impression of the general bad quality of our produce, that years will hardly overcome."

After this confession, will it be denied that the *merchants*, and not the growers, have been the leading cause of the general distaste and rejection of Cape wine? Some most extraordinary remarks now follow. An old adage, according to the "*Subscriber*," remarks "all trades require an apprenticeship, but more especially matters of taste." Now, Mr. Editor, it has been understood, usually, that taste is a gift, bestowed by nature on some favored individuals in every line, which cannot be taught. With regard to the small quantity of wine brought into the market, "so that merchants had not the opportunity of picking and rejecting the bad and inferior wines, and of classing his qualities," the reader is referred to the average tables before quoted, for the inaccuracy of that remark. The "*Subscriber*" adds, "neither can the quality generally shipped, enter into competition with Sherry or Madeira, but we hear of wines occasionally seized by the Customs of England, which certainly shews what care and attention *might* do. There is no competition, adds the *Subscriber*, "to produce a corresponding ratio in the price. The *merchants* are all leagued to make the *highest price as low as possible.*" The recommendation of a Wine Committee procured the sanction of the commercial body, to open the room for the sale and exhibition of the farmer's wine. "Prejudice and private interest were too strong to carry so salutary a measure, and it perished." After these *avowals* of the "*Subscriber*," can any man doubt of the larger share in the *destruction* of the *character* of Cape wine to lie with the *merchants*? The question of riding in wine at all seasons is next discussed, and the argument is urged by the "*Subscriber*" in a most unconstitutional manner. "In all other wine countries, the farmer is restricted from even gathering his grapes, prior to notice having been given to the *Government Surveyor*, who first inspects them, and without whose permission he is not allowed to commence his vintage; *and it strikes me very forcibly, that perhaps such an addition to our present regulations might be very salutary.*" Is this the recorded opinion of a free-born Briton, in the enjoyment of the rights bestowed on him by Magna Charta, or of a slavish subject of some Eastern country? After adding a portion of common-place argument as to some points of regulation, and as to a hope of success to the Distillery, in which latter the writer decidedly concurs with "the Subscriber," another HOPE is added, that when the wine trade is retrieved, instead of imitating other wines, we may produce "*a character of our own*"—Mr Editor, it is precisely because our wine has A CHARACTER OF ITS OWN,—THAT OF A PECULIAR and INDISCRIBABLY FILTHY FLAVOR OF THE EARTH—that it is rejected by all judges; the writer uses the freedom to *hope* in his turn, and he trusts not vainly, that the wines of the Cape of Good Hope may, by improved management, and the full and concurrent efforts of wine growers and wine merchants, acquire much of the flavor of Madeira and Sherry, and be with difficulty distinguishable from the most improved wines of those two countries.

I am, Sir,
Your most obedient Servant,
THE BYSTANDER.

BRIGHT PROSPECTS OF AFRICA.

INDEPENDENTLY of the many interesting features at present connected with the growing prosperity of our *Albanian* frontier, and the successful geographical strides of many of her enterprizing sons,—*Africa* in general seems destined to rise in the scale of being, and become the joy and rejoicing of the friends of human kind. From the very circumstances of its peculiar and deepest degradation, both in religious faith and political existence, comes the best hope of its sure and speedy renovation.

We are indebted to a much valued correspondent for the following spirited sketch on the prospects of Africa. If the *Landers* have correctly ascertained that the *Niger*, which discharges itself into the gulph of *Biafra*, is the same as that which rises among the western mountains of the *Gold Coast*, and not very far from the peninsula of *Sierra Leone*, it will be at once seen, by looking at the map, that they have done more for the improvement of British commerce in that region of Africa, than all their predecessors put together. The river is probably navigable for small vessels, at least for such vessels as the neighbouring tribes are accustomed to carry on their traffic in with each other, from its mouth to within some miles of its source; thus forming a semi-circle which encloses the whole coast of *Guinea*, the country of the *Foulahs*, the *Deukeras*, the *Ashantees*, the *Fantees*, the *Warsaws*, and other powerful tribes, and furnishing the means of easy communication with the celebrated city of *Timbucktoo*, with the districts of the *Soudan*, and possibly, by means of the lake *Tschad*, and the rivers that contribute to it, with the teeming plains even of *Abyssinia*.

LANDER's discovery of the mouth of the Niger, has turned public interests once more to Africa, and there may now be at last a rational hope of establishing some useful communication with its people, discovering some portion of the natural riches of a land fertile beyond all conception, where it is fertile at all; and perhaps ameliorating the social condition of those millions of mankind who have been from the earliest ages condemned to be victims of their own ignorance, and of the avarice of every other people of the globe.

Those who scoff at every thing, (as we have lately seen at the Temperance Meeting, may scoff at the idea that providence takes any care about these matters. But there may be no superstition in thinking that there is a striking coincidence between this great discovery of a path into the heart of Africa, and the present perfection of the steam-boat; and that the honour of the discovery, and perhaps its first and most direct advantages, are given to the nation which first declared against the sale of the unhappy African, and which, to this hour, holds an unremitting and most righteous struggle against the incorrigible and hideous avari-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

of the European slave-traders. The entire of Western, and what is called central Africa, are unquestionably laid open by the discovery of the mouth of the Niger, and by the access thus given to the numerous rivers which branch off from it scourse, and which intersect nearly the whole of the middle country. But there is still a vast country, the table-land of Africa, totally unexplored, and of which we even can conjecture little; but, by judging from other table-lands, that its climate is temperate, its population naturally numerous, and that in it we shall probably make the finest and most useful discoveries of natural produce and mineral opulence.

The extent of Africa overwhelms the mind. It is nearly five thousand miles long, by four thousand broad, and it lies directly under the sun's path; the equator almost intersecting it, and the tropics covering the central regions of the north and south. The sun is *always vertical*, somewhere, in Africa. In Major Head's ingenious Life of Bruce, he observes, that "what is marked by nature, on our European scale of climate, as access to heat, is all that the African knows of the luxury of cold, except what is produced by elevation or evaporation." It is two thousand five hundred miles from the equator to its northern boundary, the Mediterranean, and about the same distance to its southern, the Cape of Good Hope. The great question with men of humanity and common sense is, how this mighty continent can be civilized, become happy, and made a contributor to the general happiness and wealth of the world. In this view, we entirely agree with the author of the life of Bruce. Nothing has been made in vain. The Creator had made no country, for the express purpose of defying the activity or benevolent ingenuity of man. All is capable of being turned to good if we but use the means. The earth was undoubtedly made to submit to the mastery of man, and the vast and curious inventions of late years seem to have been put into our hands for the purpose of expediting that mastery. It is not improbable that the discovery of America was *delayed*, until the peaceful state of Europe, the commercial activity of its people, and the adoption of settled governments, rendered it capable of taking advantage of that magnificent discovery. It is observable, that the discovery originated in no striking improvement of either ships or seamenship at the time. The European ships and sailors had been for centuries as good as those which first touch at America. But if the discovery had been made under the Roman empire, it would have been probably neglected by a people who were engrossed with war, and who despised commerce, and hated the sea. If in the dark ages, it would have probably been equally neglected among the furious feuds of the little European powers, too little to bear the expense of remote expeditions, living from day to day on the plunder of friend and enemy, distracted by perpetual change, and generally perishing as soon as they rose. The only use which they would have made of America, would be as a place of refuge to some defeated chieftain and his half savage followers. But a time came, when the Crusades had relieved the European cities of the weight of baronial tyranny, when the sudden opulence of Venice, arising from its eastern intercourse awoke mankind to the value of commerce, and when the leading sovereign of Europe, Ferdinand, the ruler of the most chivalric and daring nation of the fifteenth century, had just flung off the the tremendous pressure of the Moorish wars. And then, at that moment, was divided before the Spanish keel the mighty barrier, which had shut out America from the eye of mankind since the creation.

If Africa, so long known, and so close to the most civilized and inquiring regions of the world, should have remained to this day scarcely less shut out than America, we may well ask, how could we expect to have the treasures of this land given to us, while Europe was guilty of the slave-trade, while, if we could have penetrated the hidden glories of this fourth of the creation, it would have been only to spread more misery, to shed more blood, to fill it with the moral contagion of the most corrupting of all traffic, to inflame more savages to fury and massacre by our temptations, and finally to drag more human beings from their country, to perish thousands of miles from their home. The time has certainly arrived when this trade, which it is no violence of language to call Satanic, has received its death-blow, at least in England, and the time may not be remote when we shall be summoned to apply the national vigour to open up the treasures of Africa. "It is not unreasonable to hope that the whole southern continent may be given over to our tutelage, and that England, the great depository of freedom, knowledge, and religion, may be the elected guardian of the *infancy* of Africa. Our extraordinary advances in machinery, and the general command over the powers of nature, a command which seems to have been almost exclusively confided to this nation, have not been given for nothng, and important as they are to the increase of our wealth and comforts at home, we shall yet see them operating through the world on the colossal scale, suited to the wants of nations. The very fact that our powers of steam and machinery are so rapidly increasing, that we literally can hardly imagine to what known obstacle we shall have to apply them, tends to shew that there must remain something very important in this world for man to do. In short, the enormous tools which nature is placing in our hands, clearly foretell that she has some wonderful work for us to perform, and therefore, instead of calculating, as many people do, for instance, how long our coals are to last us, and in how many years hence we are unavoidably to be left in cold and darkness; is it not justice to believe, that with our new powers, we shall obtain new resources, and that the wisdom of nature will continue to bloom when the idle fears and theories of the day have faded away and perished.

The hope of civilizing Africa, must depend on its being made fit to sustain civilized communities, which from its present natural constitution it is unfit to do; one immense portion of it being overspread with barren sands, and another being alternately turned into a bog by rains and rivers, and into a nest of contagion by the action of the sun upon this mighty morass.

Between the tropics it is constantly raining somewhere, and the rain falls in quantities that absolutely overwhelm the country The hot winds constantly follow the sun from tropic to tropic, and the vapours which they raise, on reaching the higher regions of the atmosphere, and being chilled, are constantly poured down in rain. A country of a thousand miles on the north and south of the line, is thus kept constantly in a state of the most powerful irrigation, and the direct result is, a most superabundant fertility for the month or two while the earth is drying, and excessive heat and excessive moisture first come in full combination. Yet for the remainder of the dry period, the land is a sink of pestilence; so deadly from its miasmata, and so torturing from the swarms of insects generated by the heat, that man and the inferior animals perish in great numbers, or fly even to the desert, where they had rather encounter the tremendons fierceness of the sun, than the agony of the innumerable stings that haunt them in the fertile soil. The country is covered with immense marshes, and thick jungles, where the over-luxuriance of the vegetation checks the air, and all is fever and death.

We see that the whole question turns on the distribution of the rains. Too much water, or too little, makes the misfortune of Africa; and the only remedy for the evils which convert one of the richest soils of the world into a grave, or a nest of reptiles, is to be found in equalizing this gift of nature. It is impossible to doubt that a vast portion of the wildernesses of Africa would produce the fruits of the earth, if they had water. We find in the heart of the desert, vegetation where ever there is a well, and a little colony, surrounded by woods and rich fields, where ever there is any thing like a regular supply of water. The grand problem would be to lead the superfluity of the tropical rains from the innumerable rivers, and immense lakes of Central Africa, into regions now condemned into perpetual dryness. The results would be to dry the watery morass into productive soil,* and to water the burning sand alike into fertility; in fact, to drain the centre of the country, and to irrigate all the rest: and for this purpose the peculiar construction of the continent seems to offer no trivial advantages.

The whole central belt of Africa runs directly under the equator, and from the known figure, and the actual formation of the land, this central belt is so lofty that it pours its rivers, the collection of its rains, down on both sides through the continent in great abundance and force. Denham computes the lake Tchad, one of the reservoirs of those rivers, at twelve hundred feet above the level of the sea, and the ground beyond it towards the south was still rising. Bruce computed the southern elevation to which he had reached, at two miles above the level of the sea, and this is probably but a small part of the whole elevation. To use Major Head's words, "It being true that there are a series of vast tanks and reservoirs placed by nature above tee thirsting deserts of Africa, the stagnation, as well as the rapid evaporation of which, now polluje the climate; and also that a number of immense rivers flow out of Africa into the ocean; would it not be a problem worthy of the inquiry of the travellers, by a scientific reconnoisance, to determine (only in theory, for theory must in this case long precede practice, and with the practice, after all, *we* can have little or nothing to do) what would be the difficulties attending the tapping of those enormous vessels. As also of applying tourniquets upon those veins and arteries, which, eternally bleeding, have left a great portion of Africa destitute of vegetable life."

We fully agree in this conception, gigantic as it is, and difficult as its execution may seem. It would be a truly noble object of inquiry; and would be worth all the idle ramblings of our dilettanti in Egypt—that fashionable lounge—to the last days of the earth. But we greatly doubt the *veto*, that we can have but little to do with the practical part of the change, if it shall take place. If it be ever done, it will be done by England. It is our boast, and deservedly so, that no work of palpable good ever wanted protection in our country, nor the ability to carry it into execution, when once fairly undertaken: and there are some curious instances which may take off our alarm at the difficulty. The water of the tropics is actually conveyed through the whole length of the sands of Nubia in the memorable course of the Nile; and a little sandy region in the shore of the Mediterranean is turned into the most extraordinary example of fertility in the world by this simple watercourse. There are in Egypt itself, the very region of sand and sunbeams, dykes and embankments for irrigation, on a vast scale, to which the permanent fertility of the land is owing. In the Abyssinian history a threat is recorded of one of the kings who had a quarrel with the Divan of Cairo, to turn away the Nile, and thus "stop the cock," out of which Egypt drank. There is a remarkable instance too, of a threat of this kind having been partially put in force, when Lalibala the king, in the year 1200, turned the course of two rivers from the Nile into the Indian ocean.

The true points in which those conceptions should be viewed, are their use to Africa, their use to mankind in general, and their especial honour to England. It is a matter of

* After the manner of Mr. Cloete's splendid instance at *Zandvliet*.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

great importance to have a direct object of acknowledged utility in our researches in a foreign country. Hitherto in Africa we have had scarcely any, or the mouth of the Niger alone. Our travellers have all set out on a hunt for Timbuctoo, of which nobody knew what possible good could be derived from the discovery. But Timbuctoo had been said by some fabling Moor to be a second Paris or London, with only the addition that gold was the paving of the streets. A crowd of able and active minds have been lost to their country in this wild-goose-chase after an Eldorado, which after all turns out to be nothing more than a collection of filthy huts, in the heart of a desert. Bruce, a man of admirable powers, of great acquirement, intelligence, and mental and personal activity, wasted his health, his wealth, and his years, in achieving the trifling discovery, that one of the sources of the Nile was a spring in a hillock, in an Abyssinian valley. But the expedition to discover the means of pouring fertility into the wilderness, and giving health to the tropical regions of Africa, would be among the noblest that can be undertaken by the benevolent ambition of man. That there are vast districts where drainage could be effected with very simple means, and equally vast ones where water might be collected and preserved to supply the failure of the rivers in the dry season, is well known. On such a subject, though rashness may be deprecated, it would be criminal to despair. We must remember, that "the difficulties will not increase, while our powers are hourly increasing;" and in this good spirit let us turn to the service of human nature our last grand discovery of the Niger

But it is a higher consideration still, that by giving health and fertility to Africa we should be actually taking the most direct way to elevate the character of its innumerable tribes. The tyranny of the petty kings is almost wholly founded on the poverty of their people, on their ignorance of every thing, and their unacquaintance with the arts and comforts of European life. The poverty of their kings themselves drives them to the horrid resource of the slave-trade, itself re acting on every feature of the national character. Africa, undivided by its enormous deserts, and with the spirit of man unbroken in it by perpetual disease and poverty, would not long remain without making advances in liberty, knowledge, virtue, and as the combined result and protector of them all, in Christianity.

Our intercourse, unstained by the indescribable pollution of the slave-trade, would rapidly excite the tribes to the employment of their natural powers, and by a wise and well regulated commerce we *must* rapidly rescue those benighted millions of our fellow-men from fetters heavier and more fatal than all that were ever forged of iron. And all this might be done without the most trivial coercion, and with the most direct advantage to ourselves. "In all countries under the sun there is one great road that leads directly to every man's heart, his own interest."—If we were calmly to offer to those people the information that we possess, and give them gratis the inestimable benefits which science can bestow upon rude labour: if we were to offer to the poor woman a wheel for her draw-well to the people who pound their corn in a mortar, a simple method of grinding it—if we would by a common filter sweeten for them impure water, and by an herb lull the painful disorder which it creates—if we would come forward to replace a dislocated limb—if we could shew manure, unknown, lying in the soil before them—and on the greater scale, if we would explain to those people, that by a very simple operation immense districts of their vast country might be either irrigated or drained—in short, if, on great subjects as well as small, we were chemically and mechanically to assist them, we should undoubtedly find that the general good qualities of a mind truly civilized, would, in Africa, as well as elsewhere, be fully appreciated, that our fame would justly extend, and that every tribe and nation would be eager to receive us. The following sketch of the rivers of Africa, shews what vast floods the tropical rains pour down, and how little founded is the complaint which charges Africa with general want of water.

"The only river of consequence which empties itself into the Mediterranean is the Nile. It is the longest river in the whole Continent, being navigable about four hundred and fifty miles from the sea. The greatest velocity of the stream is three miles an hour. The rivers in the Barbary States, which run into the Mediterranean Atlantic, are very insignificant.

"There is no stream deserving notice on the western coast of Morocco to the Senegal.

"From the river Senegal, along the coast of Guinea to the equator, there is more water discharged into the ocean than from any other part of Africa—probably more than from all the rest of that Continent put together. The Senegal has a course of about one thousand miles; is navigable for sixty leagues from its mouth, in all seasons; and, in the rainy season, vessels of one hundred and fifty tons can go two hundred and sixty leagues from the sea.

"The next river of importance is the Gambia. It is navigable for vessels of three hundred tons for sixty leagues. The tide is felt, in the dry season, at the distance of two hundred and fifty leagues. For the first three months, even of this season, the current is so strong, that vessels cannot ascend the stream.

"The next river is the St. Domingo, then the Rio Grande, navigable for vessels about twenty leagues, and for large boats about forty leagues farther. From this river, or more properly from the Gambia to the river Mesurado, the country being flat, the rivers are often united a considerable distance up the country, when they branch off, and discharge themselves into the sea in distinct streams.

"The Mesurado is a large river, so is the Sierra Leone river. Then follow the Ancobar, St. John's, Volta, and Formoso rivers. The latter can be ascended twenty-eight leagues.

"From Formosa river, are the Rio dos Forcados, the Bonny, the New Calabar, the Old Calabar, and the Rio del Rey. These are very large rivers, and not well known. The country about here is low; and these streams intersect the land in every direction, and form numerous islands.

"Turning southward is the river Cameroons, which has several mouths, but its size has not been ascertained. Then succeeds several smaller streams, till we arrive at the Congo or Zaire river, which is very large and rapid, discolouring the sea for a considerable distance, and tearing away large pieces from its banks.

"South of the Congo, for about six hundred miles, there are several rivers of a good size; many of them will admit vessels of one hundred tons. After that, for about eight hundred miles, there is not a single stream of fresh water till we come to the Fish river. Then follows the Orange river, which, although it has a considerable length of course, does not discharge much water into the sea.

"There are several considerable streams in the colony of the Cape of Good Hope, as well as on the east coast of Africa, the largest of which is the Eramo or Zambese, which has a course of about one hundred and eighty leagues. The rest are smaller, but none of these are well known, though many of them are large and deep at their entrances.

"The Decra river, which runs into the Indian ocean to the north of the equator, is very large at its mouth, and is supposed to take its rise in the mountains south of Abyssinia. Beyond this there are no rivers of consequence till we reach the Nile, and indeed it is not known that there is a single stream of fresh water discharged into the Red Sea."

Such is the continent newly opened: for we must call Africa a closed world to us, until the discovery of the connection of the Niger with the ocean. Such are the means of access given to us, now that we have purified our hands of the abomination of man-selling, and that we are masters of that most extraordinary means for defying tide and storm, which steam has given. A great duty is imposed upon us, and England is not what she was, if she does not instantly proceed to fulfil it, and that nobly.

LITERATURE.

THE HUMOURIST. BY W. HARRISON. *Embellished by eighty Engravings.* 1832. Ackerman.

IN contradistinction to the *Forget-Me-Not* of the present year, this Annual by the same publisher, is full of entertaining varieties, and is in its moral tendency altogether unexceptionable. There is a postscript to the work, entitled "An Apology for Laughter"—of a very different description of laughter however, from that attempted to be produced by some ill-advised men at a very recent public meeting at the Exchange The following are extracts:

——————— Be the jest abhorr'd,
And spurn'd the lay, tho' Genius point the rhyme,
That sport with suffering, or make light of crime.
We loathe the wit, however bright the flame
Which sates its appetite on sacred things;
Or veil'd beneath the inuendo brings
On beauty's cheek the burning blush of shame.
Ours be the summer-lightning of the brain,
That scathes not while it flashes. We maintain
That there is in this checquer'd scene of earth
Much that's legitimately food for mirth.

Again—

"There is a time to laugh," 'tis written, and we trace
The text with reverence, yet take our stand
On its authority to prove our case.
"There is a time to laugh;" not when the hand,
That, in the strife, would fain have dealt the blow,
To smite our fame or fortunes, is laid low,
And cannot crush the worm that twines around it.
So fast and firm mortality has bound it!
"There is a time to laugh," but not in scorn
Of human frailty, since th' unblunted thorn
Of conscience is its punishment on earth;
"There is a time to laugh," but not to swell,
The ribald's triumph, when he rings the knell
Of virtue in its rude unhallowed mirth.

REFORM.

On the subject of Reform, we find the following, with an engraving of a huge stage wagon, entitled "Colossus of *Rhodes;*" the fore horse of the team being *Grey.*

We've often thought and perhaps 'twill strike
The reader, the Reform Bill's like
Our subject-plate a wagon;
The fore horse in the team's a *Grey*
And, though they're working night and day,
But heavily they drag on.

For our own parts, we never mix
In state or civic politics,
Yet wish "the Bill" may be a
Most sov'reign cure for England's ills,
And prove like Abernethy's pills,
A perfect panacea.

We boast no legislative powers,
But leave to wiser heads than ours
The labours for which we
Have no vocation, while we say,
Cut every rotten branch away,
But do not harm the tree.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Without pronouncing on "the Bill,"
In praise or censure, there are still,
Some things we can't help noting;
For instance, those who t'other day
Got ten pounds for their vote, will pay
Ten pounds a year for voting.
In many a wight, whose crippled toe
On cushion rests, "the Bill" will blow
Up hope's expiring embers;
He'll soon discard his gouty shoes,
Bless'd with the liberty to choose
Another set of members.
The poor especially 'tis said
Expect "the Bill" will cheapen bread—
We rather doubt it; still
Some reason in the hope we see,
They've heard so much concerning the
Provisions of "the Bill."
And, should it pass into a law,
Such wonders as the world ne'er saw,
'Twill bring about, we trow;
Since it has clauses which propose,
We're told, to give a voice to those
Who have no voices now.
Thus Birmingham, for deeds in *arms*
So famed, though safe from war's alarms,
Will profit by the plan;
While Manchester, of high renown,
Will send two Members up to town
By Pickford's Caravan.
And Sheffield too, who shines in steel,
Its benefits will surely feel
Through all its various trades;
It needs no second sight to see
Its representatives will be
Two keen, well temper'd *blades*.
Nay, in the "Commons' house," a few
Would have the Colonies vote too;
How strange 'twould be some day,
When Parliament for business meets
To see two Members take their seats
Returned from Botany Bay!
'Tis more than probable "the Bill,"
Will oust a few old Members; still
There must be some who never
Can care about a seat, since they
Would be, could they but have their way,
Upon their *legs* for ever.
Our song is sung; if asked to own
Our party, we should answer none,
Whig, Radical or Tory;
We rank ourselves among the friends
Of those who, scorning private ends,
Seek England's weal and glory.

LIFE OF SIR ISAAC NEWTON.

THE outlines of Sir Isaac's life are so well known, that they would scarcely bear repetition. A few of the remarkable circumstances connected with it may be briefly mentioned. He was not only a posthumous, but a premature child; he was so small when he was born, that, as he himself often heard his mother say, he might have been put into a quart mug. The little hamlet of Woolsthorpe, in Lincolnshire, about six miles south of Grantham, had the honour of giving him birth.* At school he was an idle lad, until he was one day treated with marked indignity by the boy immediately above him, and he nobly resolved on revenging himself by getting his enemy's place. He soon passed him, and became the head of his class by a systematic assiduity, the habit of which never afterwards left him. Out of school hours, instead of engaging his leisure in play, he devoted it to mechanical pursuits, at which he readily became an adept. He constructed a windmill, a water-clock, and a carriage, which was put in motion with a handle wrought by the person who sat in it. He had a contrivance by means of which the machinery of his windmill was set a-going without the assistance of the element, when necessary, and this was a wire wheel, like that which is attached to squirrel cages, and in the inside of which he confined a mouse. His kites were always the best in the school, both in form and proportion, and he astonished the natives by sending them up in the night time, with paper lanthorns containing lights, which the rustics doubtless mistook for comets. Of drawing, too, he was extremely fond, and in his youth, it appears, he was a poet, but the imaginative faculties were not those in which he was destined to cut a figure. It was his mother's wish that, upon quitting school, in his fifteenth year, he should attend to the duties of a farm which she held; but nothing could wean his mind from his studies, and his mechanical operations. 'The perusal of a book, the execution of a model, or the superintendence of a water-wheel of his own construction, whirling the glittering spray from some neighbouring stream, absorbed all his thoughts when the sheep were going astray, and the cattle were devouring or treading down the corn. His mother was soon convinced that he never would shine as a farmer, and she therefore very wisely determined that he should be allowed to follow the natural bent of his mind, and she sent him to Trinity College, Cambridge, into which he was admitted on the 5th of June, 1660, in the eighteenth year of his age.

It is strange enough, that the delusions of judicial astrology seem first to have led his mind to the study of mathematics, which at once enabled him to detect the falsehood of that flattering imposture. Without any assistance from his tutor, he made himself master of Descartes's Geometry; in 1664, he purchased a prism for the purpose of testing that philosopher's theory of colours; in 1669, he succeeded his friend, Dr. Barrow, as Lucasian professor of mathematics and it was then that he may be said to have entered upon that course of discovery which has ennobled his name. The first of these appears in the grand conclusion, which he drew from a series of prismatic experiments, "that light was not homogeneous, but consisted of rays, some of which were more refrangible than others." This discovery he immediately applied to the improvement of optical instruments, and although he did not succeed in rendering them as complete as he wished, nevertheless, he laid down principles, by means of which chiefly, those instruments have since been brought to a wonderful degree of perfection. Dr. Brewster gives a detailed account of the different stages of excellence through which the manufacture of telescopes gradually passed, until they were taken up by the Herschels and Dollonds, for which we must refer the reader to the volume itself.*

* On the 25th December, O. S. 1642, exactly one year after Galileo died.

* Life of Newton, by Dr. Brewster.

SOUTH SEA MISSIONS.

THESE Missions are at present the subject of considerable discussion at home, in consequence of the publications of Captains Kotzebue and Beechey. In reply to the strictures of these individuals, Mr. Ellis, the accomplished author of *Polynesian Researches*, has put forth a *Vindication*. We have only read a character of the work from the Reviews:—the following is selected from *Whittaker's Magazine;* a periodical, it must be observed, generally favourable to Slavery, and unfavourable to Missionaries and Missions.

Vindication of the South Sea Missions, by W. Ellis.

IN Capt. Kotzebue's description of his last voyage in the Pacific, he gave a very unfavourable account of the condition of Tahiti (more generally known by the orthography of Otaheite), ascribing all its degeneracy, since Cook's discovery of it, to the mischievous missionaries. His publication has had by far too wide a circulation to be overtaken by the vindicatory pamphlet before us, and we on that account the more readily lend it our assistance, to remove some of the aspersions which Mr. Ellis thinks, and very justly thinks, have been cast upon the missionaries. The tone of Capt. Kotzebue's narrative was pretty plainly a prejudiced one, that is, he was evidently indisposed to believe any good could be accomplished by converting the natives of the Pacific to Christian sentiments, or European habits; but we did not, in the slight glance we took of his book, suppose for a moment that he had *wilfully* misrepresented facts. Nor do we know now that he has done so; but at least, it is indisputable, he has taken up hasty opinions, without weighing his authorities, or rather has trusted blindly to the information afforded by interested parties, because, apparently, it concurred with his own prejudices. He himself was but a very short time on the island, knew nothing of the language, and saw but little of it, or the population, though what he *did* see, he acknowledges indirectly was favourable. His misrepresentations are speculative ones, mere deductions from the reports of others. The main facts relied upon by Capt. Kot-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

zebue for his general inferences is, that the population in 1774, on the testimony of Capt. Forster, was 120,000, and that now it does not exceed 8000. To what is this to be ascribed? To the introduction and influence of the missionaries, says Capt. K. Pomareh, the chief, at their instigation, propagated the gospel by fire and sword, and the race has in consequence been nearly swept away. Capt. Forster's estimate, however, is of no authority whatever, it was made on the most erroneous detail; and certainly in 1797, when the missionaries first landed, the population appeared, on much better authority, when there was no interest in depreciating the numbers, but rather the contrary, to be but 16,000. It is since that period that Capt. K. represents *nine-tenths* of the people to have been extinguished by the missionaries, because he could trace the reduction to no other source. These nine-tenths of his were thus calculated on Forster's estimate instead of that of 1797. But the ravages of imported disease—the introduction of ardent spirits and fire-arms—the continuance of human sacrifices, and of infanticide, to a frightful extent—with ten wars, will sufficiently account for the reduction from 16,000 to 8000, and the wonder should rather be that the natives have not been utterly annihilated All this too occurred *before* the influence of the missionaries began—for not one native was converted before 1812. The fact is, as it may well be supposed in our days, that no force was sanctioned or in any way promoted by missionaries, English or American. Since their influence has been effective, the population has again increased, and life and property is comparatively sacred. To those who read Capt. K.'s volumes, and must have been struck by his representations, we recommend the perusal of Mr. Ellis's vindication—he was himself eight years a missionary, on the Friendly and Sandwich islands, and deserves to be listened to. He cannot, we think, fail to conciliate the good will and confidence of the reader.

MR. JACOB ON THE PRECIOUS METALS.

THE following account will shew the progress of the increase for several years:—

'Gross produce of the duty on gold and silver plate in Great Britain, from 1st August, 1784, to 5th January, 1800:—

Year ending 1st August,	1785 -	£25,300	5	1
	1786 -	22,824	14	10½
	1787 -	25,617	3	9¾
	1788 -	28,397	12	9
	1789 -	25,545	8	9¾
	1790 -	26,681	11	5¾
	1791 -	29,085	8	4¾
	1792 -	31,376	15	5
	1793 -	34,049	18	10¾
	1794 -	cannot be given.		
	1795 -			
	1796 -			
	1797 -	32,423	7	2½
	1798 -	40,052	18	5½
	1799 -	44,079	15	2
1st August, to 5th January,	1799 1800	27,659	6	8¾

Without going into the specific grounds on which Mr. Jacob calculates the proportion of gold and silver applied in the remaining countries of Europe to other purposes than coin, we shall merely state the result of his estimate, which is, that during the one hundred and ten years that intervened between 1700 and 1810, the quantity of gold and silver converted into other objects than coin, amounted to two-thirds of that which was left in Europe, the part conveyed to Asia being subtracted from the total produce of the mines.

Mr. Jacob enters into an elaborate estimate of the recent produce of the mines; that is to say, from 1809 to 1829. He annexes to it a chapter on the consumption of the precious metals in other uses than those connected with the coinage during the same period, and from the many curious and original details which he gives of the trades of gold-beating, jewellery, and indeed, of all those which have gold and silver for their principal materials, we consider this to be a very amusing and instructive portion of the work

In London, it seems, the greatest portion of the precious metals is submitted to manufacture. Next to the capital, the largest amount is used in Birmingham, Liverpool and Chester, Derby, Newcastle, York, and Exeter. There is scarcely a town, indeed, in the three kingdoms, that does not contain a jeweller's shop. Mr. Jacob, by personal inquiries, has obtained what he considers sufficient materials to authorise him in making an estimate of the general consumption of the precious metal in other ways than in coinage. His first step was to ascertain the quantity of gold which is annually produced by the whole of the refiners and *sweep-washers*. The latter class are technically so called from the nature of their business. The sweep-washer is generally a refiner of gold, who purchases the refuse that is swept from the floors of those workshops where the divisions and subdivisions of gold and silver are carried on. The sweepings are crushed by stamping into dust, and the mass being amalgamated with mercury, is exposed to heat, when the mercury comes off by evaporation, and is then condensed and preserved. There are about twenty-four houses of this description in London and in the country. The amount of the gold which these houses refine annually, is estimated at no less than *one hundred and forty-six thousand ounces*—the amount of one hundred and eight thousand five hundred ounces being refined by eleven of these establishments. The mode in which this quantity of gold is disposed of, Mr. Jacob made it is business to ascertain. Some portion of it is taken by gold beaters, of whom there are about eighty in London, and from ten to fourteen in the country, chiefly in the following places, Birmingham, Dublin, Glasgow, Edinburgh, and Liverpool. On the average, these ninety, or ninety-four establishments, consume three ounces of refined gold each per week. The leaf gold, when wrought by the gold-beater, is placed, as every body has seen, between paper, in leaves of three and three-eight inches square, and twenty-five form a book. A thousand of these books usually fetch 2*l.* 15*s.* which, deducted from the gold-beater's expenses, would leave him but 3*s.* profit on each thousand. This would be intolerable, if profit did not emanate from another source, and it happens to do so abundantly, from the clippings which fall in reducing the leaves to the regular size. The consumption of all the gold-beaters in the British kingdom, is estimated at about seventeen thousand five hundred ounces of fine gold every year. The other branch of consumers consist of what is called water gilders, who are employed in gilding metals, and the amount which they have required, has amounted annually, for the last twenty years, to twenty-one thousand eight hundred ounces. The proportions used by manufacturers of gilt toys, the establishments of which are most numerous in Birmingham, and which, indeed, constitute no small item in the list of our exports, is calculated at no less than thirty-one thousand two hundred ounces annually: gilding in the potteries consumes five thousand two hundred ounces a year. We regret that we cannot follow Mr. Jacob into more of his details on this subject; but is conclusion is curious. He says, that the *fine* gold annually used by gilders, platers, and jewellers, amounts to one hundred and forty-six thousand ounces, valued at 638,750*l.*

'Standard gold used by jewellers, two hundred and thirty-two thousand ounces - - - - -	*l.* 902,270	*s.* 0	*d.* 0
Number of gold watches manufactured annually in London	13,820		
Ditto in Birmingham, and other places - - -	900		
Total - - -	14,720 watches		
Which, averaging two ounces each, give, at the rate of 3*l.* 5*s.* an ounce, a total sum of - - -	95,680	0	0
The value therefore of the gold converted to other purposes than coining, in Great Britain annually, is estimated at - - - -	997,950	0	0

The closing chapters of Mr. Jacob's work relate to the prospect of future supplies of the precious metals, and to the subject of paper money. With respect to the former question, it is the opinion of our author that no sanguine hopes can be indulged of a great or material increase in the produce of those mines which have already been worked, at least at present. From what he has stated on the subject of paper money, we gather a few facts which it may be interesting to peruse. Russia is now the only country which ever adopted a paper currency, that has not resumed a metallic one up to this time. Austria, after having witnessed a great depreciation of its paper money, in consequence of the superabundance of it which she was impolitic enough to issue, returned to cash payments about six years ago. There is still paper in circulation, but it is convertible into specie. Prussia has a small circulation in bills, which can hardly be called a paper currency. Holland has, since 1810, a paper currency, but convertible into specie. In all the smaller states of Germany, in Italy, Spain, and Switzerland, the currency has been invariably metallic—that portion of Italy alone excepted which is subject to Austria. Denmark, Norway, Sweden, and Portugal, possess a small paper currency. The notes of the Bank of Paris in circulation in July, 1830, amounted to nine millions. The circulation of the Bank of England at the same time was about twenty millions.

A *Puny* EPISTLE TO *Kirk* OF SCOTLAND: A FRAGMENT.

Somerville, 26th May, 1830.

DEAR *Kirk*,—Agreeably to my promise, made to give you an account of my late visit, last *Whitsonday*, to my friend Mr. *Henry Constable*, *Baillie* of *Landsborough*, of which, by the bye, I have had the honour of being made a *Burgess* and *Guild*brother, I now sit down to give you a short detail of my journey, and of which I *Begg* you will *Grant* me the favor of your perusal, and *Hope* it may amuse, and you'll *Kenn-e-dy* more about it.

Having made my arrangements the previous evening, I started at the *Grey* of the morning; (I wish to *Findlater* hours to rise at,) and although it threaten'd to be *Rennie*, it turned out only *Sommers* showers. After passing *Aiton*, the name of which I have forgot, and where I was sadly *Bisset* with *Biggars*, one of whom, of the clan *Gregor*, with a *Brown* hat, and very few *Clason*, holding out a *Primrose* in his hand, said (to *Currie* favor with me) "*Smellie* tat;" and through *Euston*, where a *Frenchman*, inquiring the time of day, asked me if it was yet *Denoon?* and *Middleton?* At this latter place I was amused in hearing a recruiting serjeant haranging a crowd, and bawling out *Liston* my lads! *Liston!* Not being very well acquainted with the remainder of the road, I inquired of a *Shepherd*, and no *Munson* could be more civil; he directed me to go by the *Burnside*, turn round by the end of a *Milne*, (*Adam Sivewright* is the *Miller*), then to cross the *Ferrie*, which would lead me to a *Muir*, on the other side of which was *Glen* or *Shaw*, where I would find a *Winehouse*, at the sign of the *Reid Lyon*, kept by *Curdie Lamb*, and there get farther information.

Being an excellent *Walker* I set out with

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

vigour, although I had previously climbed a high *Hill*, and from whence I had a fine view of *Colville* and *Melville* on the *Lee* side, and passed a *Cunningham* lass on a *Carr*, carrying a *Vemyss*, almost *Stark* naked, in her arms. Having arrived at the *Muirhead*, I observed several *Cairns* at the side of a *Wood*, which a *Black Smith* with a *White Baird*, who was *Brunton* the hand, and firing a *Canaan*, told me were frequently by a *Bogle*, and made people as frightened as *Duncan* in *Macbeath*.

By the time I came to the hostelrie, I found, from my long walk, my bones *Aitken*. It is pleasantly situated by the side of a *Burn*, at the bottom of a *Craig* of *Alpine* height, and had a *Kidd* browsing on it; a *Bower* of *Roses* (with a *Goldie* chirruping in it,) made by a *Gardiner*, and a sweet fragrance of *Flowerdew*; a bowling *Green* in front, and in view of *Lochore*, and a *Swan* on it. I resolved to dine there, and, upon knocking at the door, some one called out "*Cumming;*" upon entering and going into the *Spence*, I inquired at the *Cook*, who was sitting at the *Inglis* side, what I could have for dinner; when she told me that the landlord was not at *Home*, and the only thing she could give me was a *Cock*, which I might have done on the *Brander;* but this, I considered, would be too *Tough* for me, so would not *Touch* a *Tait* o't. My appetite by this time beginning to *Craik* and *Cron*, I rung the *Barr Bell*, on which the landlord—who had been calling on the *Laird* concerning *Humphry Cooper*, the *Glover*, having been fighting with a *Taylor*, a *Souter*, and a *Baxter*, about a *Gunn*—made his appearance, and, upon stating my wish to him, he told me to "*Boyd* till I see; and I'll *Mc' All* right to ye;" and on his return said, that I had a *Story* put upon me, for that I could have a steak off a free *Martin*, but it proved as hard as *Steel*, a *Craw* pye (they never will again cry *Caw!*) or a *Dow* dressed with *Butter*—this I picked to the *Bayne*—and perhaps a *Garvie Heron*, but of *Salmon* he had not so much as a *Phin*, having mislaid the *Lister*. I accordingly ordered the whole, being determined to *Mc Lean* work; and, while thus occupied, the landlord, a *Jollie* enough personage, with a bald *Pate*, who professed the *Cottart*, or breaking of horses, and spruce as a *Greig*, but withal *Wyllie* as *Tod Lawrie* told me he was a *Welch*man, and loved *Scott*. He had been a great traveller, having been at *Leith*, *Forfar*, *Dingwall*, *Stirling Hamilton*, *Lockerby*, *Irvine*, *Traquhair*, *Dunbar*, and even as far as *Lunan*, and seen the *King* attended by a *Noble*. He appeared to be well acquainted with the *Burgh*. He said that it could scarcely be called a *Freeland*, for that there were—I *Add is on* words,—"o'er *Monilaws* in't;" and since the Temperance Society began, (*Minz'ies* are now opening,) there was only one *Brewster* in the place. The *Sherriff*, Mr. *Lawson*, who is a terrible *Flyter*, and has got *Roger Maule* appointed *Dempster;* and his *Clerk*, who is very *Gleig*, he was intimate with, and also with Mr. *Herdman*, the minister, who is very *Meek*, *gentle*, and *Sage*, and as worthy an *Adamson* as ever mounted a pulpit, and though an *Auld* man is married to a *Young* wife, and still *Patters-on* on his accustomed old way. He has an excellent band of *Singers* in his *Kirk*, which is led by *Davie Sangster*, the precentor, who has a pair of *Cruickshanks*, but is a first rate *Singer*. One peculiarity is that all *Cosins* go there in *Capples*, carrying a pair of *Tawse* in there hands; and the females with a *Paton* on one *Foote* only, and that that they call the *Provdfoot;* this was a *Les-lie* than I expected! *Eadie*, lately the people were not a *Little* alarmed by a *Dunn Bullock* bolting into the church, just as he had given out for his text, "*Asher* shall not save us; however, *Peter Meiklejohn* the *Hunter* (although in general no *Turnbull*) and *Paul Littlejohn* the *Forrester*, soon turned them out—the latter having a cudgel, part of the *Firewood*, given him by a *Wright*, in his hand.

By this time it was beginning to *Macknight*, although the *Moon* * *

LITERARY EXTRACTS.

ALLITERATIVE ADVERTISEMENT.

This date is attached to the following announcement, printed as a handsome hand-bill, which appeared at Manchester in 1829,—viz.:

SPANKER,

The property of O** D**.

Saturday, the 16th of September next, will be sold, or set up for sale, at Skibberdeen,

A strong, staunch, steady, sound, stout, safe, sinewy, serviceable, strapping, supple, swift, smart, sightly, sprightly, spirited, sturdy, shining, sure-footed, sleek, smooth, well-skinned, sized, and shaped, sorrel steed, of superlative symmetry, styled SPANKER; with small star and snip, square-sided, slender-shouldered, sharp-sighted, and steps singularly stately; *free from* strain, sprain, spavin, spasms, stringhalt, sciatica, staggers, strangles, seeling, sellander, surfeit, seams, strumous-swellings, sorrances, scratches, splint, squint, scurf, sores, scrattering, shuffling, shambling-gait, or symptoms of sickness of any sort. *He is neither* stiff-mouthed, shabby-coated, sinew-shrunk, spur-galled, saddle-backed, shell-toothed, slim-gutted, surbated, skinscabbed, short-winded, splay-footed, or shoulder-slipped; and is sound in the sword-point and stifle joint. *Has neither* sick spleen, sleeping evil set-fast, snaggle-teeth, sand-crack, subcutaneous sores, or shattered hoofs; *nor is he* sour, sulky, surly, stubborn, or sullen in temper. *Neither* shy nor skittish, slow, sluggish, or stupid. *He never* slips, strips, strays, stalks, starts, stops, shakes, snivels, snuffles, snorts, stumbles, or stocks, in his stall or stable, and scarcely or seldom sweats. Has a showy stylish, switch tail, or stern, and a safe set of shoes on; *can feed on* stubble, sainfoin, sheaf-oats, straw, sedge, or Scotch-grass. *Carries* sixteen stone with surprising speed in his stroke over a six-foot sod or stone wall. His sire was the SLY SOBERSIDES on a sister of SPINDLESHANKS by SAMPSON, a sporting son of SPARKLER, who won the sweep-stakes and subscription-plate last session at Sligo. His selling price sixty-seven pounds, sixteen shillings, and six pence, sterling.

CAPITALS AND THEIR DISTANCES.

The French, in their day of revolutionary renown, had a favourite boast that all the roads of the world centered in Paris, a boast which expressively hinted that the march of a French army was easy to any capital of the globe. But England has now taken the lead in the locomotive propensity, and her travellers, whether by steam, by carriage-wheels, or by balloons, will soon leave no spot untraversed where man can live and be looked at. How would it have astonished our forefathers to hear that St. Petersburg could be reached from London, slept in, and returned from, within the week. Of course, this lays all Europe, where a steam-boat can approach, directly at the mercy of the cockney who can spare from twenty-four hours to half a dozen days. A simple glance at the map shews the distance of all the ports.

The distance from			
Amsterdam	to London is	190 miles W.
Copenhagen	to London is	610 miles N.W.
Stokholm	to London is	750 miles S. W.
St. Petersburg	to London is	1140 miles S. W.
Constantinople	to London is	1660 miles N.W.
Lisbon	to London is	850 miles NN.E.
Dublin	to London is	338 miles S. E.
Edinburgh	to London is	395 miles S.

The distances between London and the capitals not accessible by sea are more formidable from the mere circumstance of their being out of the way of the steam-boat; but time may introduce the railway, at least upon the principal highroads of Europe, and we shall disregard miles equally by land or sea. The distances of the remaining capitals are:

London from Paris	is 225 miles N.N.W.
London from Berlin	is 540 miles W.
London from Vienna	is 820 miles N. W.
London from Madrid	is 860 miles N. N. E.
London from Rome	is 950 miles N. N. E.

HARVEST HOME IN OLD ANGLAND.

HARVEST-HOME was formerly kept up with good old English hospitality. When the last load was ricked, the laborers, male and female, the swarthy reaper, and the sun-burnt hay-maker, the saucy boy who had not seen twelve summers, and the stiff horny-handed old mower who had borne the toil of fifty, all made a happy group, and went with singing and loud-laughing to the "harvest-home supper" at the farm-house, where they were expected by the good mistress, dressed in a quilted petticoat and a linsey-wolsey apron, with shoes fastened by large silver buckles which extended over her foot like a pack saddle on a donkey. The dame and her husband welcomed them to a supper of good wholesome food,—a round of beef, and a piece of bacon, and perhaps the host and hostess had gone so far as to kill a fowl or two, or stick a turkey, which had fattened in the wheat-yard. This plain English fare was eaten from wooden trenches, by the side of which were put little cups of horn filled with beer or cyder. When the cloth was removed, one of the men, putting forth his large hand like the gauntlet of an armed knight, would grasp his horn of beer, and standing on a pair of legs which had long out-grown the largest holes of the village stocks, and with a voice which, if he had not been speaking a dialect of the English language, you might have thought came from the deep-seated lungs of a lion, he would propose the health of the farmer in the following lines:—

Here's a health unto our miaster
The founder of the feast,
And I hope to God wi' all my heart
His soul in heaven mid rest;

That every thing mid prosper
That ever he tiak in hand
Vor we be all his sarvants,
And all at his command.

After this would follow a course of jokes, anecdotes, and songs, in some of which the whole company joined, without attention to the technicalities of counterpoint, bass, tenor and treble, common chords and major thirds; but each singing the air and pitching in at the key that best fitted his voice, making a medley of big and little sounds, like the lowings of oxen and the low bleatings of old ewes, mixed up with the shrill pipings of the lambs at a fair. The conversation commonly turned on the incidents of the summer: how the hay-makers overtook the mowers, or how the rain kept the labor back; how they all crept in a heap under the wagon in a thunderstorm; how nearly some of them were crushed under the load that was upset; who was the best mower or reaper in the village; which field yielded the best crop; and which stack was most likely to heat. (*Scene—Dorsetshire.*)

Sun-rise.—When the sun approaches towards the gates of the morning, he first opens a little eye of heaven, and gives light to a cock, and calls up the lark to mattins, and bye-and-bye gilds the fringes of a cloud, and peeps over the eastern hill, thrusting out his golden horns like those which decked the brows of Moses, when he was forced to wear a veil, because himself had seen the face of God; and still, while a man tells the story, the sun gets up higher, till he shows a full fair light, and a face, and then he shines one whole day, under a cloud often, and somtimes weeping great and little showers, and sets quickly; so is a man's reason and his life.—*Jeremy Taylor.*

POLAND.

POLAND has fallen. Still the cause of Poland, if honestly prosecuted—the cause in fact of justice against injustice, of truth against falsehood—is but delayed.

"Freedom's battle once begun
Bequeathed from bleeding sire to son,
Tho' baffled oft, is ever won!"

The children of those who fought at the capture of the Bastile in 1789, assisted in the capture of the Louvre in 1830; the companions of Fox in his apparently hopeless stand in 1796, have been the triumphant advocates of his principles in 1831. The laws which govern the moral world will not find an exception in Poland.

Spectator.

INSCRIPTION FOR A MONUMENT AT OLD SARUM.

Reader! if thou canst boast the noble name
Of Englishman, it is enough to know
Thou standest in Old Sarum. But if, chance,
'Twas thy misfortune in some other land,
Inheritor of slavery to be born,
Read and be envious! dost thou see yon hut,
Its old and mossy walls with many a patch
Spotted? know, foreigner! so wisely well
In England it is ordered, that the laws
Which bind the people, from themselves should spring;—
Know that the dweller in that little hut,
That wretched hovel to the Senate sends
Two delegates. Think, foreigner, where such
An individual's rights, how happy all!

ECCENTRICITY.

Eccentricity find eccentric reasons for its doings. Schlager, a Danish man of fortune, sold his estate, and fixed in the northernmost corner of Iceland. He said that he fixed there because he hated the confined air of Europe, and chose to have his breeze fresh from the pole.

An Englishman some years ago, was found vegetating in the midst of bogs and solitudes, in a village on the west coast of Ireland. His reason was, to be in the next post-town to America.

A Spaniard perched his house on the summit of the Sierra Morena; on being asked, "why he preferred that place of clouds, storms, and solitude?" he said, "that he was tired of mankind, and the clouds hid mankind from him; that he was tired of his wife's tongue, and that the storms drowned her talk; and as to the solitude, he could not be solitary, who had the angels for his next door neighbours."

SELECT NOTICES.

From the debates in Parliament in September last, it would appear that the slave-trade is more extensively carried on than ever at Rio, under the flag of France; that vessels are crammed to suffocation with slaves; and that great numbers are thrown overboard alive!——The plan of fortifying Paris is to be carried into effect.——The Archbishop of Paris, and the Prime Minister, are involved in a paper war on the subject of church processions.——The Belgian army is to be in two divisions of 25,000 and of 15,000 men respectively, and to be commanded by 7 French generals, and 300 French officers.——The Cannon-foundry of Liege has been at work day and night——*Oriental Ink*—Lampblack and vitriol, equal parts, the weight of both of fine galls, the weight of all three of clean gum Arabic; pulverise and triturate on a marble slab six minutes, mixing water till of a proper consistency to write with. This, which is the ancient Persian way of making it, will produce the finest and most durable ink in the world——*Driving.*—The coaches between Plymouth and London travel at the rate of 12 miles an hour, including stoppages.——In Alexander's East India Magazine for September, there is a powerful appeal to government in behalf of the *Cape of Good Hope.* It is stated that, by the narrow, miserable colonial policy of England, the people of the Cape are prevented trading with other nations on a fair footing.——Mr. Strachan, the King's printer, whose death has just taken place, has left by will £700,000 in legacies!——The Autobiography of Lavallette has been published, (now in the Public Library,) and is a romantic story, which will be read with eagerness and delight——The foundation stone of a new London Hospital has been laid at Charing Cross.——Spanish Refugees are seen, according to the last accounts, wandering about the streets of London in great distress.——The Malta steam packet performs the voyage from Corfu in 17 days, including calling at Malta, Gibraltar, and Cadiz.——The London Gazette of Sept. 16th, contains a list of 28 persons raised to the dignity of Baronets.——A correspondent in the Times newspaper complains, that the Commissioners of Inquiry into the state of abuses, &c. of the Cape, Mauritius, and Ceylon, have been returned from those colonies for upwards of four months, but not a word is yet known as to the results of the Commission.——Warsaw has fallen, and the robber power has triumphed The author of an article in the *United Service Journal*, on the Russian army, says, supposing Warsaw to be taken, Warsaw is not Poland, and Poland will be free since she resolves to be so. The camp is their country, and the tent of their general is their capital.——*Travelling.* The wonder of Shrewsbury was the first *day* coach which completed a journey of 153 miles. The Exeter coach travels to London in one day (164 miles).——The Hon. Capt. Moncton, of the 88th Regt. has been murdered at Corfu by a soldier. The fellow gave himself up, was tried by a Court Martial, and hanged immediately.——Mr. Atherstone the poet, is delivering a course of public lectures at Cheltenham on Poetry.——A great many of the Parishes of London have refused to pay tithe and parish-rates, on the ground of their being imposed by *select Vestries* Several destraints have taken place, but there were no buyers at the auctions.——Mr. Calcraft, M. P. has committed suicide. It appears he had been long in a melancholy state of mind.——The Government has made the Rev. Sydney Smith a Bishop.——The Rev. Geo. Croly, has been presented to a valuable living.——On the 21st of July, the Cholera Morbus was raging at Mecca, and had carried off 5,550 persons in the space of from 20 to 30 days.——It is calculated, that in the space of 5 years, Miguel has imprisoned 26,270 of his subjects, 16,000 have been transported to Angola, to the Cape Verd Islands, and to Mosambique. 13,000 have been forced to fly from his paternal government; 13,700 have perished on the scaffold; and 5,000 are either in concealment or wandering up and down the earth.——*Metropolitan Sunday Schools.*—The birth day of Robert Raikes, Esq. the founder of Sunday Schools, was observed as a day of Jubilee by the children of the London schools, Sept 14th. Five thousand children went in procession to Exeter Hall, where they heard an address, &c from Dr Morrison. In the evening six thousand persons, *Teachers* and friends, met at the same place, Lord Henley in the chair, In America, it was stated at the meeting, there are 700,000 children taught in the Sunday schools, and 70,000 teachers engaged in the laudable work——The skeleton of Corder, the murderer, has been placed in a recess of the museum of the Suffolk Infirmary, Bury St. Edmonds. It is covered with a glass case, beneath which is a box to receive contributions. Every visitor is expected to put silver in the box, to be applied to necessitous patients.

Translations.—Julius Cæsar, the prince of gazette-writers, has undergone the torture of the wits in his Latinity. "*Venit summa diligentia*" is translated "come on the top of a diligence:" proving that, in his time, they travelled by public coaches in France. Tacitus is authority for the Roman invention of telescopes; for it is said of the same Cæsar that, in his invasion of England, he examined the country *positis speculis*—"by fixing his glasses;" though another translation pronounces it—"putting on his spectacles." And Suetonius is equal authority for attributing the trial by jury to the Romans. Speaking of Cæsar's death, he says, "*Jure cæsus videtur,*" which is translated—"he appears to have been put to death by jury;" a proof unanswerable, and which may lower the crest of our Anglo-Saxon law-makers.

CAPE OF GOOD HOPE.

NOTES OF THE MONTH.

(By VIVIAN.)

HERMITS though we be, we do not view the Cape world only "through the loop-holes of *Retreat;*" we contrive

——— "To see the stir
Of the Great Babel,"

as one of the *cordial* comforters of our meditative existence—the best remedy—the elixir (far better than *brandy,*) that we would recommend to the moody hypochondriac, whether of mind, body, or estate. And then when we are tired of seeing the world at our thousand and one auction marts, and hearing the captivating sounds of "*rix-dallar,*" "*rix-dallar,*" we can happily view the world at a distance, thanks to the march of intellect, which has at length established a communicating *tube* between Graham's Town and our Metropolis. This leads us to notice,

1. *The Frontier Press.*—The New Year has introduced to us a new paper from the chief seat of the British Settlers—Graham's Town. "THE GRAHAM'S TOWN JOURNAL, edited, printed, and published by Mr. L. H. Meurant." The world is in a fair way of doing well. The *Cherokee* Indian *Free Press* is succeeding to admiration. The *Bedouin Journal* takes vastly among the *Arabs,* and advocates the "glorious principles of *Whiggism;*" whilst on the other hand the *Wahabyan Sentinel* (a *Tory,*) is greatly supported by the friends of good order, and the *Dey of Algiers.* A King's College is talked of. And as for *De West Afrikaan* of Ashantee, we take the following sample of its attachment to royalty:

Hurra! for the brother of the sun!
Hurra! for the father of the moon!
Throughout all the world there is none
Like Quashiboo—the only one
Descended from the great Baboon!
Baboon, African Baboon!
Buffalo of Buffaloes, and Bull of Bulls,
He sits on the throne of his enemies skulls,
And if he wants others to play at foot-ball,
Ours are all for him—all, all, all!
Huggabajah—huggabajoo!
Hail to the royal Quashiboo!
Emperor and Lord of Timbuctoo!

This African laureate beats Southey hollow. But let us come nearer the contents of the *Graham's Town Journal.*—Board and education at Uitenhage for £22:10 per annum. At Graham's Town for £25 and £30; and at Port Elizabeth, a *day* school at £20 pr. ann. the *children* to be prepared for the Universities of Oxford, Cambridge, or *Trinity* College, Dublin. (Oh, oh!) Then, again, we read much about the prosperity of the frontier in the establishment of Savings' Banks, Infant Schools, and the opening of a high road to Port Natal! They have also a Temperance Society with 500 members. The advertisements are highly interesting. Mrs. Jennings has opened "a *stay* warehouse," (would this *bind* rambling servants?)

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and has a large "assortment of silks, ribbons, bonnets, a quantity of shoemakers' tools, and cast iron milk-pans." And a servant is wanted, "a member of the Temperance Society will be preferred".—And James Collet has for sale at his store, "a few *good* ladies, —saddles." The following is well worth recording, and tells a *civilization* tale that speaks a volume. "A Bechuana, who has a small stock of cattle, would be glad to buy or hire a small farm fitted for grazing; or he would take care of a farm and stock, in consideration of the grazing of his cattle. Apply, &c."

2. We shall now notice a few of our home varieties.—*The Prospects and State of the Colony.*—These are admirably stated in the *Advertiser* of the 4th of January. We admire, as much as it is possible for our readers to admire, the masculine sense, the warm philanthropy, the exuberantly copious, yet precise and energetic diction of this editoral article which introduces the New Year.

3. *Advertisements—Modern Refinement.*—Mr. Chisholm advertises "collarets and *chemisetts*" for sale.

The Players.—"Due care will be taken by the *Amateurs* to *prevent* the House being too crowded!" (*Credat Judæus Apella.*)

"PEOPLE WANTED by Mr. Benningfield."

4. *The Plague-spot of the Colony.*—This month has been one of unusual traffic among the slave-dealers; various public sales of men, women, and children having taken place, at which numerously elegantly dressed females attended—some of whom became purchasers. In one case there were between seventy and eighty of our fellow-creatures *put up* for sale. The advertisements respecting this *lot* were *markedly kept out* of that Newspaper which pleads the cause of humanity, irrespective of colour or clime. Without entering into the merits of the slave-question, we certainly do think that it is illegal to constitute a large portion of His Majesty's British Subjects the *mere* "*goods and chattels*" of another portion of His Majesty's Subjects; and, as is the general case at the Cape, to make the human being appear *secondary* to "household furniture, wagons, carts, horses, oxen, cows, mules," and to *expose* men and women on a table for sale. Surely some plan of *tender* might be adopted in cases of sale. We consider that a slave cannot be considered as a *mere article* of private property, because *he is a subject*. Wherever a government exists, the life of man has never yet been considered as so absolutely an article of private property, that it may be *extinguished* like that of an ox, a horse, or a dog, at the pleasure of the owner. In the case of slaves, the law has always assumed a power of *interference* and control, founded upon the *eternal distinction* between this species of property and every other. No other description of property, no other *chattel*, has such *responsibilities* attached to it, and *rights* arising out of those responsibilities, similar to those which are inherent in the slave.

May the day soon dawn, which shall bring deliverance to our brethren in captivity all over the world! The spirit of o'erwearied Nature crieth out Amen.

5. *False Report.*—A number of ignorant persons, according to a very spirited circular on the part of Government, (Jan. 11th) were betrayed (WE know by whom) to "put their trust in absurd and ruinous reports, and to arm themselves against their fellow subjects,"—the Hottentots at Balfour. On arriving at the village, and breathing out slaughtering and threatenings against the supposed enemy, our worthy aborigines were found engaged in church services, and in large numbers were partaking of that holiest of the christian rites—that *peace*-speaking ordinance, in which the emblems of the broken body and shed-blood of the World's best Friend and only Hope are so comfortably set forth.

6. *More False Reports.*—A very scandalous report was noised abroad towards the close of the month, to the end and purport that the merchants, *i. e.* the ruling gentlemen of the Commercial Exchange, had refused to grant the use of their splendid Hall for the meeting of the *Temperance Society*. We cannot be silent when such slanders are propagated. Too long have certain men indulged in, and vented their spleen against the Commercial body. One Mr. Samuel *Johnson* led the way. In his 'Thoughts on Agriculture,' published in the *Universal Visitor*, 1756, he has stated many very *ungenteel* things. Says he, in his usual rude manner, "Mankind cannot subsist upon the *indulgences* of Nature, but must be supported by her common gifts. They must *feed* upon bread, and be clothed with wool." What a Goth! And then again, we have that man *Franklin*, who, opposed to certain *interests*, has declared before the world, that 'a two-penny loaf contains more nutriment than three times that worth of distilled liquor.'

The Commercial Room has happily enjoyed for a series of years past, the hearty good will of the public, and very liberally has it been granted for the use of every description of meeting which individuals have thought proper to convene. Savings' Banks, Infant Schools, Reform, Legislative Assemblies, Wines, the Press, &c. have all been advocated within its walls; whilst Concerts, Balls, Dinners, Suppers, Lectures, have been equally tolerated. To suppose for one moment that the Room would be withheld from the Temperance Meeting, on account of the great *interest* which many of the merchants take in the sale of distilled liquors, is most unfair, and deserves the utmost reprobation. We have no doubt of the *sacrifice* these gentlemen would be disposed to make for the country's good, when required so to do. Some men, equally morbid with Mr. William *Cowper*, the poet of enthusiasm, may think otherwise. Mr. W. Cowper, in reference to our friends, has had the hardihood to say:

"Doing good, *disinterested* good, is not their trade."

This is really too bad,—but a scribbler, of the name of Edmund *Burke*, has gone much further; and, in the most unequivocal language, has attacked the pillars of the state, in language very far from "The Sublime and Beautiful." This man, this Burke, has dared to say—"Do not talk to me of a merchant;—a merchant is the same in every part of the world—his gold is his God, his invoice his country, his ledger his Bible, his desk his altar, the exchange his church, and he has faith in none but his banker."* But we hesitate to make any further allusion to a writer who could venture to indulge in such abominable scurrilities and personalities.

The best proof that we can advance of the public *spiritedness* of our Cape merchants is, that having gained a knowledge of the report in question, they called a meeting of council, and *immediately* resolved to grant the use of their Hall to the *Temperance Society;* and furthermore, deeply impressed, they determined by a public notice not to grant the use of the Hall, in future, for any other purpose than the one above, and similar charities; of course not excluding commercial meetings. Now this is a bold determination, and we cannot take upon ourselves to say what the *world of fashion*, with its routs and balls, will think of this revolutionary measure; and how the dinner-eaters and the masons will like this turn-out. All that we know is, that the friends of human improvement are highly gratified, and we do not care a single straw about the opinions of the people, who, with no notion beyond chandeliers, fiddlers, silk stockings, and pumps, consider life to be merely a theatre for bounding, skipping, swinging, twirling, capering, and throwing the body into ten thousand attitudes.

In coming to the happy conclusion of supporting our public charities which the merchants have done, we have every reason to believe they were worked upon by the many scenes of poverty and misery around us. In the Temperance case, they would contemplate the national loss occasioned by intemperance—the ruin of individuals, and the beggary of families. They would discover how much was bound up in the life of an individual; that *people* were *scarce* at the Cape, and that as a question of *profit and loss*, we could not *afford* the great destruction of life, which is sacrificed at the altar of intoxication. Detesting idleness, quarrels, litigation, improvidence, and wastefulness, they would hail the Temperance Society as the most blessed of charities. A charitiy to individuals, begun in time, and having the sublime of eternity connected with it. A charity to families and parishes. A charity of the most elevated scale to the whole family of man. They would, previously to their noble advertisement of exclusion, seriously determine the import of the word charity. They would look into *Cruden*, page 85, and there learn how little it was connected with mere Rix-dollars. There they would read —CHARITY. It is a *principle* of prevailing love to God, and good will to men, which effectually inclines one endued with it to glorify God, and to *do good to others;* to be patient, slow to anger, and ready to put up with wrongs; to shew kindness to all, and seek the good of others, though with *prejudice to himself.*" And lastly, as philanthropists, they would, in giving their kind countenance to the Temperance Society, and bidding it *God's speed*, contemplate the departure of nausea at the stomach—disordered bile—destruction of the liver—jaundice—dropsy, hoarseness of voice—epilepsy—gout—cholic—palsy—apoplexy—insanity—those body-guards of intemperance, from the Colony of the Cape of Good Hope.

* Prior's Life of Burke, vol. I, page 374.

CORRESPONDENCE.

THERE is no escape from cavil: where one is pleased another is sure to find fault; and if we listen to all, we must do like the old man and his jack-ass, and at last throw the thing into the sea. Thus much in reply to the letter of *An Observer*.

W. W. S. will have no reason to find fault with us on the score of *partiality*, if he will take the trouble to read the communication of *The By-stander* in the present number. We have never desired to exclude opinions from this Journal distinct from our own, provided such be stated in fairness.

We beg to remind *A Friend to Peace*, that when *Vivian* made some favourable allusion to the *Advertiser* in his review of the *State of the Press at the Cape*, he did so solely on *public grounds*. We consider the *Advertiser* more than justified in giving *no quarter* to that Anti-colonial Press—the *Zuid-Afrikaan*. If we had any complaint to utter against the *Advertiser*, it was his long silence, his lateness in taking the field. We cannot praise a fugitive and *cloistered* virtue, that never sallies out and sees her adversary.

Note. Under the head of *More False Reports* in the present number, it is our duty in fairness to observe, that the quotation in reference to the Merchants by the celebrated Mr. Burke, was subsequently acknowledged by him to have been uttered in the heat of the moment. We also fully concur with a late declaration by Mr. Hamilton Ross, that "the merchants of this colony have ever been foremost in the support of our public institutions." And as it regards that interesting safe-guard of our liberties, the Press—they have confessedly done their duty; and unworthy should WE be, did we not at this moment avow what perhaps may be news to some of our readers, that it is entirely owing to the *steady* patronage of the mercantile body of Cape Town, that this journal is kept afloat—that it is enabled to *pay its way*. All other countenance has been hitherto as the small dust of the balance; and the motives of this support by the merchants cannot be questioned, since this journal has been unsparing in its criticisms on commercial affairs in general, beyond that of all others.

THE COLLOQUISTS.

No. VII.

SYNOPSIS.

PLACE, - - - *The Retreat.*
TIME, - - - - *Monday Evening.*
COLLOQUISTS, - - { *Vivian.* / *Hermes.* / *Orlando.*

Hermes.—Ha, ha, ha! He, he, he! Oh, oh, oh!

Vivian.—Is the man mad? Hermes, wherefore this boisterous laughter?

Orlando.—"The loud laugh that speaks the vacant mind."

Hermes.—Ha, ha! for any sake, gentlemen, let the fit have its full exercise. He, he! Ha, ha!

Vivian.—What's it all about? Tell us;—why monopolize all the good humour for your own selfish benefit?

Hermes.—Well, well, then—I am now better, and will tell you all about it. I have just laid hold of an author (Jefferson), who asserts that the roads of the colony, and the streets of Cape Town, are paved with *bullocks'* tails!!

Vivian.—The source of the mistake is certainly ridiculous enough, and only adds another proof to the many already existing, that our tourists are but sorry botanists.

Orlando.—Pray explain the nature of the mistake.

Vivian.—The channel of the river *Zonder-end*, as well as other streams in the colony, is encumbered with a species of bog-rush, that spreads over the surface of the stream, and interlaces its creeping stems so firmly, that a man may walk upon it without the least danger of sinking. When many of our farmers send their wine to market, they line the sides of their wagons with the stems of this rush, which are thrown out into the street or roads when they are no longer required—and these were the bullocks' tails with which our traveller said Cape Town was paved.

Orlando.—But gentlemen—the question for this evening is *Temperance Societies.*

Vivian.—A *grave subject* and well befitting the serious attention of Legislators and People.

Hermes.—Especially one of vital importance to the Cape of Good Hope, where people are scarce.

Orlando.—Yes, Temperance Societies will, when rightly estimated, work miracles, raise the dead—in other words bring *subjects* from the *grave.*

Vivian.—The late meeting of the Cape Town Temperance Society in the Commercial Hall, was, I think, one of the most respectable that I ever remember to have witnessed.

Orlando.—The misfortune is, that the good men who borrowed the room for themselves and their friends, should have met with interruption.

Vivian.—I derive encouragement of the eventual success of the Society from the opposition in question.

Hermes.—Do you call it opposition. Its opponents were only loud in proclaiming their conviction that it cannot possibly endure, that it must shortly come to an end, that it is unfitted to accomplish the good purpose it undertakes to bring about.

Orlando.—Accustomed as I am to think for myself, and to speak with freedom, I cannot help thinking that the difference of opinion on the part of the malecontents, is alone sufficient to awaken suspicion of a design not distinctly avowed. If the Society be the offspring of enthusiasm, and is shortly to fall into contempt, why not leave it to its fate? Why display an anxiety to accelerate its overthrow? why use a violent effort to crush the feeble, and precipitate the falling? If, as they contend, it contains within itself the seeds of speedy dissolution, no evil can result from abandoning it to the operation of its native tendencies, and suffering it to die a natural death. Is it not apparent that all this commotion and effort indicate a suspicion that it is not so fraught with the elements of self-destruction as they pretend? Men are not accustomed to exert themselves with vehemence against an object of which they entertain no apprehension: they usually proportion their efforts to their alarms.

Hermes.—It has been observed that there was a want of *temper* at the meeting; that men were fiery, irritable, irrascible.

Vivian.—I quite understand the thing: the leading speakers of the Society had not *worldly wisdom* enough to *hide* their thoughts; they forgot that the primary essential of skill and success in business is *sang froid* and *seeming* command of temper. The Rev. Mr. Pears and Dr. Philip were by far too warm in debate, by far too enthusiastic and zealous, it has been argued. But zeal, I contend, in any cause, is the only proof of sincerity; and as for warmth, "believe him not," said an old Roman in debate in reply to an antagonist, "for the *cold* manner in which he argues the cause." There is a mode of self-management which some men possess, which is as impossible to me, as it would be to command the winds. My *countenance* would betray me if my *words* did not; I *must* say and even *look* what I think: I cannot suppress my instantaneous rising of heart, at every veiled artifice which I perceive; every subterfuge, every attempted concealment of opinion and purpose, and every insidious perversion of fact announced with pretensions to candour and frankness. The gentlemen alluded to spoke from the heart, and wherever the *heart* speaks, there is always eloquence, interest, and instruction.

Hermes.—Dr. Macartney seemed to be extremely happy on the occasion of the meeting, and enlivened it by his imagination and wit.

Vivian.—I differ in *toto* with you, Hermes. The Doctor produced an array of materials, without the controul of judgment. His passion for speaking—

Orlando.—I rise to *Order.* I will not consent to the personalities of *Vivian*, and I desire to protect an absent friend. His good humour, kind hospitality, and professional skill, entitle him to our warmest esteem. His labours during the last two winters, in his course of lectures, deserve the highest praise. In the absence of Assemblies and Concerts, Dr. Macartney relieved the tedium of the winter's evening to admiration.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Vivian.—If my friend Orlando thinks that he can prevent the freedom of criticism, he is much mistaken. I look to public character, and maintain my right to search into *mind*, in the same ratio as I would into *minerals*. There is a good deal of *cant* in the modern use of the word *personality*, and we discover many a *professed liberal* at the Cape, chuckling over the highly-spiced articles of the Times or Blackwood, who puts on a solemn and lank face the moment you apply the test of criticism, even in its most diluted form, to the men and manners of the Cape of Good Hope. Seven or eight thousand miles off it is an excellent thing—*here* it must assume a *limited* principle, *here* we are friends to the *liberty of the Press*, but not the press near at hand;—lauding *free discussion*, but it must be conducted in the House of Commons;—bawling for a *Legislative Assembly*, to put down voluntary association;—crying out for *free trade*, yet aiding and abetting the most disgraceful monopolies;—*liberty boys*, and dealing in human flesh! Monstrous anomalies! In our present discussion, I trust we shall keep in view the rule laid down by the Editor of the Cape Literary Gazette, in his first Number, page 3. "Angry criticism is a possibility of evil, which, in the present activity and dispositions of human nature, no precautions can avert. The right of every one is to judge as he pleases; and each will express himself according to his own taste and choice. It is for the advantage of our own individual character to judge equitably, and to write with honourable candour. But even in this respect *no one can be dictated to*. Like Draco, the conscientious reviewer must visit the sins of vanity and egotism, with no less severity than those of cruelty and profligacy."

Hermes.—If our friend will confine himself solely to the *composed and printed* speech of the worthy doctor, I think he is entitled to be fully heard. As a composition, it is fairly open to criticism.

Vivian.—I am willing to concede the point of a certain order of merit to Dr. M'C. and to agree with his warm friend, Orlando, that he is really an excellent companion, a clever surgeon, and a warm-hearted Irishman,—but I have to do with his mind, and I must declare that I have a very great dislike to the displays of artificial memory. There is a *memoria technica*, and it is notorious that there is nothing in which this art deals so much as in *words*. Piquancy is all well enough in its proper place; but surely after the serious details of the death and destruction brought about in the colony by spirituous liquors, it was extremely ill-timed, and quite out of order, to raise an objection to the remedial measures adopted at the Temperance Meeting—to meet the question by endeavouring to excite a false stimulus, provoking a sneer and calling up a laugh. Let us suppose a painter, thrown by chance an eye-witness of some grand battle. What should we say, if, instead of endeavouring to transmit to his canvas the representation of its grand images and terrible conflicts, he should shrink from his subject, and prefer the delineation of some grotesque figures (after the manner of the *Dutch* school,) playing unconsciously in the skirts of the camp; and, by way of supplying a *factitious* interest, invent some extravagant figure, or group of figures, which every sound judgment must know could never have existed, at least in that situation. These inventions, however, sit lightly upon the author who produces them; there is no *wear and tear* of the passions; they are totally artificial, not intrinsic; and he can put them on and off like his clothes.

Orlando.—But the worthy doctor's speech was well received—it amused and called forth plaudits.

Vivian.—Just because the *world* loves the gay and the frolicsome, the lively and witty; because it hates all serious affections and deep anxieties; over whatever it can ridicule, it thinks that it has gained a superiority.

Orlando.—But my friend was by no means opposed to the Temperance Society. He only considered that the means proposed were not adequate to the contemplated end.

Vivian.—There is nothing which, if taken in a perverse light, may not be given an unfavourable character. The trite *trick* is to set up a measure or model, distinct from the one proposed, but *professing* at the same time to wish well to the original scheme,—nay, to exceed it in its usefulness. This plan is of olden date in the colony.

Hermes.—Now really, Vivian, I think you somewhat fastidious. The speech is one of ingenuity, composed with apparent care, and combining a vast variety of subjects. I think great allowances should be made. Think of the extensive professional duties of our friend.

Vivian.—Truth, sir, is eternal and unbending—it allows of no *humourings*, tamperings, *barters*, or *exceptions*. As for ingenuity—be it remembered, that *fil'gree-work* pleases only effeminate triflers, and in oratory is merely a *ruse*, uttered *ad captandum*. It gives an outside polish, plausible to the eye, and apparently of genuine material; but it will not bear analysis and decomposition. It is either a disguised *theft*, or if it is novel, it is not true. It is a factitious *ingenuity*, like a moon upon a stage, which looks silver, but gives no light or warmth. Whatever is artificial has no vitality in it: it loses its charms upon being handled or steadily looked upon.

Orlando.—Positively, Vivian, you overlook that universality of mind professed by our friend. To me, he appears to be at home on every subject. His great variety of topics surely bespeak him a man of *general information*.

Vivian.—Most readily granted. Possessing a perfect Sir John Sinclair's mind, and this is saying much. It matters equally to the susceptible patriot on the other side of the water, whether the granary of a nation be about to be swallowed up by an over-abundant population, or a parterre of polyanthuses about to be destroyed by a swarm of wire-worms, or the horse-sickness, or the tooth-ache prevail; or that people die of gluttony, and *not* drink,—the cordial sympathy, and the honest indignation of Sir John, are as generously prompt. It would do any body's heart good to observe with what earnestness the philanthropist exhorted the late Emperor Alexander to encourage the carding of flax: how tenderly he pressed on the Duke of York some choice hints on the better management of the army; how he addressed Coke of Norfolk, on the advantages of the Cottage System, and our own colonial government on the merits of the Cassava *(Jatropha manihot)* of Brazil; while at the same time he drew tears from all to whom he had access by his papers on the congenial subjects of Bullion and Gymnastics. What must be the universal love for his kind of that extraordinary man, who writes now the description of a battle, and now of a competition of pipers, and now of providing milk to a ship's crew even after the death of the only cow on board! who sent yesterday a despatch

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

on grave matters to Mr. Pitt, and sends to-day a pebble to Lady Jardine, and a white sparrow to Sir William; who astonishes Admiral Keith in the morning with a grand protection against French invasion, and concludes the day by transmitting the plan of a tragedy to Miss Ballie; who writes an essay on the advantages of *saving* to civil servants at home, and with the same pen suggests a plan to the late Lord Charles Somerset, by which all civil servants at the Cape, whose incomes exceed £300 per annum, shall be obliged to *spend* at least £30 per annum of their income in supporting the Press, Libraries, Schools, Commercial Halls, and Public Charities.

Hermes.—By the bye, this last proposition is not a bad one. Look at our high salaried men. With the exception of the two or three gentlemen at the very head of affairs, how cold, indifferent, niggardly,—aloof from schools, education, newspapers, libraries, philanthropic societies, are the *receiving* mass: mere *lookers on* in "works of labour or of love;" and what is worse, sometimes affecting a contempt for the promoters of good will to man, by a significant shrug of the shoulders when you ask for their aid. I certainly do think, in reference to public spirit, that the colony is very little indebted to the Magist——

Vivian and *Orlando.—Order, order! Question, question!*

Hermes.—Nay, gentlemen, hear me out.

Vivian and *Orlando.* — *Question, question, question!*

Hermes.—Let me explain and—

Vivian and *Orlando.* — *Question, question!*

Orlando.—By way of inducing the meeting to return to the question, I am inclined to think with Vivian, that the worthy Doctor's speech is really replete with all the varieties of a Sir John Sinclair's mind. But this is a compliment of which Dr. M'C. may well be proud, as he justly may be of his intellectual lectures on phrenology, which gave us all so much pleasure.

Vivian. — Yes: his craniological lectures greatly amused me I confess. Till that time I had not known that the presiding majesty of mind sat in state somewhere in the brain-pan; I have often read Paley with pleasure on the wisdom displayed in the structure of some of the human bones. But, simple man! he never bethought himself what a *chef d'œuvre* in this microcosm, what a master-piece in the human structure was the human skull. It strikes me very forcibly at this moment, that the phrenologists might be led to form a number of useful *automaton speakers*, with minds in a state of *fusion*, at all times ready to come forth with the show-box of memory. In the establishment of a manufacture for heads, it would only be following in the wake of alchymy to do so. A cast, moulded with the best bumps, and a kettle full of boiled brains to be poured into it, then left to cool awhile, would nearly complete the business.

Orlando.—Excuse me, but I am apprehensive we are leaving the question of *Temperance Societies*. In fact, I think we have wandered too much on the surface of things. It is reported that *Temperance Societies* are *Abstinence* Societies in disguise, and that *water-drinkers* are without *spirit*.

Vivian.—If it be the *spirit* which the execrable Cape Wine and Brandy produce, we had by far better become drinkers of the purest of liquids. An amusing and instructive example of the good effects of abstinence, occurs in the case of *Pomponius Atticus*, the friend of *Cicero*. The melancholy accompanying a disordered stomach, brought him to the resolution of destroying himself, and he called together his friends to consult as to the best means of accomplishing his design His son-in-law, Agrippa, with great sagacity, advised and persuaded him to starve himself; recommending, however, that he should occasionally swallow *a little water* to alleviate the pains of abstinence. To this he consented, supposing, as people generally do at this day, that *water* affords no nourishment, although, in fact, it is almost *the only fluid that does nourish*. In this case it sustained *Atticus*, day after day, beyond the time he had calculated upon dying by starvation: and not only so, but this WATER, and the abstinence, removed the complaints of his stomach and his dejection of spirits: and he was then easily persuaded by his son that it was his duty to live. He did live as a *water-drinker* to an advanced age.

Again, to those public men who are determined in spite of arguments and physicians to live as they have lived, in the indulgence of their appetites, there is one direction which may serve to obviate the effects of their excesses. It is abstinence. This is the sovereign remedy the brutes employ for nearly all their diseases; and indeed in all our chronic complaints, as well as the other "ten thousand ills to which flesh is heir to," it has a wonderful power over the constitution. *John Home*, the author of *Douglas*, and otherwise distinguished in literature, bore without inconvenience the luxuries of London, by eating on the *Sabbath* nothing more than a single poached egg. Not only this, many, yea hundreds of the Scottish borderers now in London and at Liverpool,—those worthies especially connected with the *Secession Church*, display much of the primitive simplicity, and much of the primitive faith, and much of the primitive peace of mind, and tranquility of soul, by a Sabbath abstinence:—this self-denial bringing with it health and longevity. *John Howard*, the illustrious Philanthrophist, fasted at least one day in the week, as did also *Franklin*. *Bonaparte*, when he felt his system unstrung, which was often the case, gave up his usual repasts, and fed on the pure air of heaven. Our ablest physicians,—and we appeal to the Doctors Murray, and Bailey, and Abercrombie, and Leisching, and Laing, and Fairbridge, and O'Fiinn and Atherstone, and Gill,—declare that abstinence is one of the most effectual means of preventing violent and inflammatory disorders, such as fevers, sore throats, &c. And, as it regards the pestilence, let us bear it in mind that *De Foe*, the fearless Englishman, was saved during the ravages of the celebrated plague in London, and walked on foot through the *pestilence at noon day*, because he had not bowed to the altar of Distillation—because he was a *water drinker*. And *Socrates* lived in *Athens* during the whole of the plague that made such desolation in that city in his time; yet he escaped unhurt: and this is unanimously ascribed by the writers of those times, to his *uninterrupted* temperance.

Hermes.—Those who argue for the use of *pure* Wine, as I believe we all do in moderation, touch not the principles of Temperance Societies; for Temperance Societies have not pronounced the use of Wine to be sinful, nor have they passed any judgment respecting the expediency or inexpediency of its use. Against distilled spirits — the fell destroyer of their race — they wage an exterminating warfare—against distilled spirits, in addition to all that has been already published, I hold in my hand a docu-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ment which has been signed by four Professors of the Medical Faculty of the Edinburgh University, eleven Members of the Royal College of Physicians, the President, and twenty-seven Fellows of the Royal College of Surgeons, and thirty-four other Medical Practitioners.

"We, the undersigned, do hereby declare our conviction, that ardent spirits are not to be regarded as a nourishing article of diet; that the habitual use of them is a principal cause of disease, poverty, and misery, and that the entire disuse of them would powerfully contribute to improve the health and comfort of the community."

It is acknowledged that three-fourths of all the pauperism in our country, four-fifths of all the aggravated crime, one-half of all madness, one-half of all sudden death, and one-fourth of all death in persons above twenty years of age, are caused by spirituous liquors. And it is a fact that these evils equally abound in this colony, and are not only daily filling the grave with victims, but constantly furnishing ample *materiel* for the Police Office, Courts of Justice, the High Sheriff, and the Sequestrator. And shall nothing be done, nothing *attempted* to arrest the plague? Shall benevolence and patriotism sleep on, with such exterminating evils around them? No—forbid it humanity! forbid it ye who have commenced the good work in Cape Town! And, respecting these gentlemen, I have a few observations to make. They have been accused of presumption in forming a Temperance Society without having first consulted—whom? the spirit-merchant—the canteen-men—*the children of this world!* Such absurdity requires no comment. Then, again, the numbers of the Society are a very few people. What can *they* do? Spare your *disinterested* concern, my dear Sirs;—to whom do we owe our ameliorated condition in general? To the mob—to the multitude?—No: to the successive Few in every age (more, indeed, in one generation than in another, but relatively to the mass of mankind always *few*) who by the *unbending intensity* and permanence of their action, have compensated for the limited sphere within which it is at any one time intelligible; and whose good deeds *Posterity* reverence in their results. I appeal to the histories of the Jewish, the Grecian, and the Roman Republics,—to the history of Europe, and to the Records of the Christian Church. What do they contain but accounts of noble structures raised by the wisdom of the *few*, but often assailed and scorned by the *many*. But I will take higher ground—Temperance Societies are completely independent of mere *human opinion*. Their foundations are laid broad and deep in *Christian Charity*, and Nature's first law—*Self Preservation*. And if Temperance Societies do not furnish a practical comment on a certain verse in the 14th chapter of the Epistle to the Romans, I profess myself completely ignorant of its meaning, and shall feel much indebted to any one who shall furnish a just explanation of the passage—"It is good neither to drink Wine or *anything* whereby thy brother stumbleth or is offended, or made weak."

Orlando.—Wines are, however, recommended in Scripture. There was abundance of fine vineyards and excellent grapes in Palestine. Recollect the valley of Eschol and its grape-bunches of 10 and 12 lbs. In confirmation, examine Strabo and Pliny.

Vivian—Good, Orlando!—I thank you for calling my attention to the Wines of Scripture. The Jews were, in general, a temperate people, and water-drinkers. They used wine, however, when it became necessary; but observe, it was the "pure blood of the grape," (Deut. 32—14,)—*pure unmixed wine*, the simple product of fermentation,—not the learned *Bystander's* Cape Wine, characterized by him as an "Execrable *composition*," possessing "a peculiar and indiscribably filthy flavour;" not the Wines of the Cape, as noticed by *A Subscriber*, who preceded the *Bystander*, and declared by him (a writer of good authority) to be "notoriously retrograding" in quality. *Retrograding* even from their present vile condition,—becoming worse and worse!

Hermes and *Orlando.—Hear, hear!*

Vivian.—The truth is, I am getting a new light myself on the subject. *Temperance Societies* will reform the quality of Wines, will introduce a wholesome beverage, will stir up a question that shall make man refuse any longer to drink poison, that shall dive into the whole process of admixtures and distillation; that shall introduce once more to the world the "pure blood of the grape." It is high time this should be the case. Who can estimate the mighty sum of disease introduced into Cape Town, and all the world over, by the abominable Wines and Spirituous Liquors of the licensed houses?

Hermes.—Very true, it is most astonishing what a conspiracy there is in trade and monopoly against the stomach of man. If the Temperance Societies do no more than impress upon the mind of John Bull the necessity of paying particular attention to the *quality* of that which he consumes, especially if he wishes to transmit to his posterity the vigorous constitution which he derived from his hardy ancestors, they will do much. Adulteration is the order of the day, and it assumes every shape to ruin the family of man. The modern use of opium in *beer* has brought many an unhappy wretch to commit robbery and murder. Mr. Golding Bird, an intelligent revenue officer, states before the House of Commons, that in the short space of three weeks he visited about 500 public houses, and made fifty-three detections; and that it is usual to draw off 20 gallons from a butt of 108 gallons of porter, and substitute the 20 gallons with water, mixed up with colouring prepared from burnt sugar, treacle, salt, copperas, and liquorice He had reason to believe (he states on evidence,) that *all* the 500 houses he visited, adulterated their beer. Nearly the whole 53 convictions were at houses owned by Monopolists; he never detected those practices at what are called *free-houses!*

Orlando.—I apprehend there are still many good men who would join us, but have scruples of conscience. They say—*how can these things be?* of what use am I in the scale of colonial improvement? If I thought I could do any good I would sign my name directly.

Vivian.—In the first place "*scepticism*," says Dugald Stewart, "is the child of imbecility." It is certain that Temperance Societies offer to the public no Utopian project. Their beneficial results are on record; and there is no reason to doubt their efficacy wherever they are fairly tried. Leaving America out of the question, just look at Scotland. There, Temperance Associations, in despite of inveterate habit, prejudice, and self-interest, are making a most rapid progress. There are 208 Societies already established, consisting of 40,529 members. In

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the last Record, we observe that the 4th Royal Irish Dragoons, and the 91st Argyleshire regiments, have adopted the plan of Temperance Societies. The question—"of what use am I in the scale of being?" I would answer in the words of the Persian fable. "A drop of water fell out of a cloud into the sea, and finding itself lost in such an immensity of fluid matter, broke out into the following reflection: "Alas! what an insignificant creature am I in this prodigious ocean of waters; my existence is of no concern to the universe; I am reduced to a kind of nothing, and am the least of the works of God." It happened, that an oyster which lay in the neighbourhood of this drop, chanced to gape and swallow it up in the midst of this its humble soliloquy. "This drop," says the fable, "hardened in the shell, until by degrees it was ripened into a pearl, which, falling into the hands of a diver, after a long series of adventures, is at present that famous pearl which is fixed on the top of the Persian diadem."

Orlando.—But it is argued, we are not dram-drinkers in this colony; it is only the lower orders who indulge themselves, and how cruel to debar the poor man of his little comforts.

Vivian.—Not dram-drinkers!—the man who asserts this, knows nothing of the *habits and customs* of this colony; knows nothing of *supply and consumption*. And they who come forth now to compassionate the poor man and his comforts, we know well enough are playing an hypocritical game. Their regard for the poor man is all pretence. Not dram-drinkers! Let us not deceive ourselves. Like the man who used to pull off his hat with great demonstration of respect whenever he spoke of himself, we are fond of styling our own a very enlightened age, or a very moral country, or a remarkably sober people!

Orlando.—I confess I am inclined, with Vivian, to place a good deal of credence in the great use these Societies will have in purifying the public taste, and I shall be perfectly satisfied in the amount of good which they will do, in directing public attention to the *qualities* of the liquid brought to market.

Vivian.—Yes, and avaunt the notion that we wish to deprive man of his pleasures. We do not; we only accelerate the march of real civilization. And genuine civilization is nothing more than a thorough knowledge of the elements of human happiness and misery, and of the means best calculated to produce the former, and avert the latter. Its proper operation, therefore, cannot be to abridge our pleasures, but to purify them.

Hermes.—I have often heard it asked, why should moderate drinkers in the upper ranks practice abstinence? Why should they make a sacrifice, and what effect will self-denial on their part have on the drunkard of low degree?

Vivian.—To this I answer that the lower ranks derive all their views and feelings from the higher. Fashions are never known to press upwards; example, therefore, is the only means by which the upper ranks can with any prospect of success enforce temperance on the common people; fashion is every thing in the world's history; what in fact has of late years produced sober habits among the better orders in Britain, but the fashion of imitating continental temperance? What produced a change in the conversation at home, and drove out of society the ungentlemanly habit of profane swearing, but the bright example of George the III. and his court. Again, Temperance Societies remain valuable as the only opposition afforded to a wide-spreading and fatal pestilence. They *stay* the plague. They influence the new beginner of life, they habituate to reflexion; the working classes have their instincts of self-preservation as strong as those of their superiors; and through the Press doing its duty, and the Societies in question going forward nothing daunted against the "strong holds" opposed to them, we have a right, under God's good blessing, to expect every success. The influence of this success it may be thought is merely personal, and that the number so to be effected, bear too small a proportion to the mass to effect any radical change in the popular habits. This is the discouraging outcry at the outset of all improvements. Knowledge is diffused, like waves, far beyond the central points where the impression is first made.

Hermes.—Exactly so: no sooner did Dr. Bailey at the late meeting, come forth with his statement of important facts, that since the Government had so humanely shut up the drinking houses on the Sabbath, a vast deal of crime and accident had ceased to be, than Mr. Hamilton Ross with great spirit argued, let the Government go on to perfection—For if one day in seven will do so much how much will the whole seven days perform?

Vivian.—Once more, the efficacy of these institutions will be felt in the knowledge they will diffuse of the morbid and malignant nature of ardent spirits. When the fact is universally known and understood, that the greater part of the dropsies, diseased livers, palsies, lunacies, asthmas, and fatal coughs, which crowd the hospitals, and prematurely consign to the grave a large portion of the working classes, are the sure and inevitable consequences of this infernal poison;—when it is daily and hourly demonstrated that the money, worse than wasted in its consumption, would suffice for the purchase of most of the *comforts* of humble life; when it is dunned, as it were, into the ears of the poor, that their improvidence in this particular, deprives them of their political and social efficacy, and condemns them to a progressively increasing hardship of lot, it surely is not too much to expect that the impression on the mass will be *proportionate to the importance of the instruction.*

Orlando.—The institution of Temperance Societies seem to excite the tongue and the pen of ridicule; every witling is on the *qui vive*. Not only this, *eloquence*, as at the late meeting, is not with us. This, however, we have already noticed.

Vivian.—I shall have something to say on ridicule in conclusion. As it regards the gambols of oratory, you may every day meet with persons in the world professing liberal and enlarged notions, and affecting great superiority over the vulgar, who are as vulnerable to the tricks of rhetoric, as the shallowest of the multitude, being led by a melodious period, by a brilliant metaphor, by a pathos purely *artificial*. In fact, the animal whom Yorick was wont so frequently to coloquize, and to whom he gave the *maccaroné* at—I forget where—was never more readily led by the ear than man. Words have ever been his idols: to these, *artfully* arranged, he gives the name of wisdom; to them he bows down in worship; by them he is irritated, enraged, maddened. The master of words is his master. The principal merit of the institutions of Lycurgus, abused much oftener than understood, was, that they emancipated the citizens of Lacedæmon, from

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the tyranny of false and hired rhetoric. Secondly, as to ridicule, let us just glance at its every-day doings. The language of censure is easy and undefined, and like that of calumny exceedingly cheap. It costs no labour, and needs *no intellect* to pronounce the words foolish, stupid, dull, odious, enthusiastic, cant, hypocrite, absurd, ridiculous. The weakest or most uncultivated mind may, therefore, gratify its vanity, laziness, and malice, all at once, by a prompt application of vague condemnatory words. Notwithstanding that these words are trite and vague, he who adopts them feels a vast deal of self-importance, and imagines that he has uttered a good pungent thing. There is a satiric smartness in the words, though there be none in the man; and in default of keen faculty in the mind, it is delightful for the vulgar to find something that will do as well ready bottled up in odd terms*. I am aware that it requires a hardy virtue in some minds to repel a sneer, to withstand "the world's dread laugh." But a man endowed with a noble spirit, says with a sober consciousness, as remote from the spirit of bravado as it is from timidity—Thus and thus is my conviction and my determination; now for the jeerers, the scoffers, the *fabricators*, and the phantoms of fear; let me look them in the face; they will find I am not made of trembling materials: "I have to do all that may become a man." I shall firmly confront everything that threatens me in the prosecution of my purpose, and I am prepared to meet the consequences of it when it is accomplished. I should despise a being, though it were myself, whose agency could be held enslaved by the gloomy shapes of imagination, by the haunting recollections of a dream, by the whistling or the howling of winds, by the shriek of owls, by the shades of midnight, or by the *threats or frowns of men*. I should be indignant to feel that in the commencement of an undertaking, I could think of nothing but the deep pit by the side of the way where I must walk, into which I may slide, the mad animal which it is not impossible I may meet, or the assassin who may lurk in a thicket of yonder wood. And I DISDAIN TO COMPROMISE THE INTERESTS THAT ROUSE ME TO ACTION, FOR THE PRIVILEGE OF A DISGRACEFUL SECURITY. But as the conduct of a decisive man is always individual, and often singular, he may expect some serious trials of courage. This fact must not be concealed. For one thing he may be encountered by the strongest disapprobation of many of his connections, and the censure of the greater part of the society where he is known In this case, it is not a man of common spirit that can shew himself just as at other times, and meet their anger in the same undisturbed manner as he would meet some ordinary inclemency of the weather; that can, without harshness or violence, continue to effect every moment some part of his design, coolly replying to each ungracious look and indignant voice, I am sorry to oppose your views: I am not unfriendly to you, while thus persisting in what excites your displeasure; it would please me to have your approbation and concurrence, and I think *I should have them*, if you would *seriously* consider my reasons; but meanwhile I am superior to opinion, I am not to be intimidated by reproaches, nor would your favour and applause be any reward for the sacrifice of my object. As you can do without my approbation, I can certainly do without yours; it is enough that I can approve myself, it is enough that I can appeal to the last authority in the creation. Amuse yourselves as you may, by continuing to censure or to rail: *I must continue to act.* Once more, attack of contempt and ridicule is a still greater trial of courage. It is felt by all to be an admirable thing, when it can in no degree be ascribed to the hardness of either stupidity or confirmed depravity, to sustain for a considerable time, or in numerous instances, the looks of scorn, or an unrestrained shower of taunts and jeers, with a perfect composure, which shall immediately after, or even at the time, proceed on the business that provokes all this ridicule. This invincibility of temper will often make even the scoffers themselves tired of the sport; they begin to feel that against such a man it is but a poor sort of hostility to laugh. There is nothing that people are more mortified to spend than their scorn. Till, however, a man becomes a veteran, he must reckon on sometimes meeting this trial; and to the question—*will they not laugh at us?* a man of the right kind would say—They will smile, they will laugh, will they? Much good may it do them. I have something else to do than trouble myself about their mirth. I do not care if the whole neighbourhood were to laugh in chorus. I should be sorry to see or hear such a number of fools, but pleased enough to find that they did not consider me as one of their stamp. The good to result from my project will not be less, because vain and shallow minds, that cannot understand it, are diverted at it and me. What should I think of my pursuits, if every trivial thoughtless being could comprehend or would applaud them, and of myself, if my courage needed levity and ignorance for their allies, or could shrink at their sneers? Gentlemen! I have trespassed too long on the time of the meeting, permit me to conclude in the beautiful language of the Rev. Dr. Adamson, in reference to our newly-established Temperance Societies in Cape Town:—"Even though it accomplish little, yet its purpose cannot utterly fail. *Be it that it expires as the flash before the shipwrecked sailor in the tempest: be it as the shore-lit fire which the wind seizes and scatters and extinguishes in its wrath; yet shall we have cause of rejoicing, if, by its light, some storm-struck wretch has raised his weary limbs upon the rock to which he clung, safe from the deadly surge that raged around him.*

* See Foster's Essays.

MORTALITY—EPIDEMIC CHOLERA.

PUBLIC attention is at present directed to the progress of epidemic disease in Europe, and especially to its *reported* appearance in England. From the accounts which we possess of the state of the English population, it would appear that, from the earliest times, it has been regularly subject to some malignant influence, superadded to the ordinary causes that produced mortality. Seasons of scarcity, with the plague in their train, no sooner ceased to exercise their terrific power over human life, than the small-pox assumed its baneful dominion. *Intemperance* also has been a uniform agent in the work of destruction. The mortality of our home population in the sixteenth and seventeenth centuries was remarkably high. Out of every forty who were born, one was said to die in the early part of this period. The proportion varied in progress of time, but it is very doubtful to us if the mortality of the industrious classes be not still as great as ever. In the counties where agriculture formed the chief occupation of the people, life seems to have been uniformly maintained for a longer period, than in those districts where the more active employment of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

manufactures brought together a large concourse of inhabitants. But it was not until the last century had somewhat advanced, that manufactures were carried to such an extent as to be able to make a very decided impression on the rate of mortality. The chief impediment to longevity about that time, appears to have been produced by intemperance, and the effects of that vice were of such a striking nature as to call for the interference of the legislature. We find that in the ten years before 1751, the average number of deaths within the bills of mortality in London, from fever, was 4351 annually, whilst in the ten years which succeeded the same date, the deaths from this disease fell to 2565 a year. In looking for adequate materials to explain the reason of this remarkable decline of deaths from the *effects of intemperance*, we are at once struck with the fact, that the use of *ardent spirits* was suddenly restrained by a bold and severe legislative enactment. The restraint imposed by the law, was rendered still more strict by a total prohibition of the manufacture of spirits. This prohibition was chiefly confined in its operation to the period between the years 1757 and 1760, when the annual average of deaths from fever was reduced to 2136. The policy of the legislature was altered in 1761—spirits became more accessible, and we find that the deaths from fever attributed to the year 1763, are no less than 3742.

The manufacturing establishments of our country were meanwhile growing apace. They became an important means of supplying employment to the people. They were found, however, to have acted with the most destructive consequences on the health and lives of the population, until at length the legislature was forced to interfere. The 42d of Geo. III. c. 73, is the first of those national regulations, which were framed with the view of checking the devastating influence of the factories. These laws, however, are too exclusively confined to the protection of children; and it unfortunately turns out that the rate of mortality amongst the adult manufacturing population, is as great as it almost ever has been with reference to the general amount.

But our present business is with the *Cholera*. We are happy to entertain but slight apprehensions of the consequences, even if the *Cholera* should find its way to London and the great towns of the empire. In the first place from being surrounded by the sea as we are in Cape Town, the atmosphere is in constant renovation. It is pretty well ascertained, that in those places where the disease has prevailed to any considerable extent, the atmosphere, if it has not caused the malady, has been a very active agent in propagating it. Indeed, it has been suggested by one of the medical gentlemen who have written upon this subject, that the cholera is caused by a derangement of the air which we inspire—a derangement that reduces its electricity far below the ordinary proportion. However this may be, it cannot be questioned that a tainted atmosphere greatly augments the number of patients in an infected district, and, therefore, as the miasma cannot long remain in our clouds, rapid as they usually are in their movements, we should hope, under the dispensing care of Providence, that the pecular position of our mother country may prove, on this occa sion, as it has proved in times of war, of the most material service towards the safety of the nation.

The modern habits of the people are also, as compared with those of the inhabitants of the countries to which the malady has reached, cleanly and healthy. The natural consequence of these improved habits has shown itself, in the exemption of the British kingdom for many years from every disease of pestilential nature. One of the principal epidemics which have prevailed in England, was that too appropriately named *The Black Death*, which occurred in the reign of Edward III. Like the cholera, it originated in the marshes of the Indies; it travelled over all the world, and is said to have swept away a fourth part of mankind. It destroyed above fifty thousand persons in London alone, and so deeply was it felt as an universal calamity, that it had the effect of maintaining and prolonging the truce between England and France. May we not conjecture that the malady, which has for the last twelve months afflicted the north of Europe, has produced a similarly pacific effect upon the councils of the Great Powers, and impressed their minds with the religious necessity of not adding to pestilence the still more formidable evils of a general war?

The Black Death was the great scourge of the fourteenth century. Towards the end of the sixteenth (1593,) London was visited by a plague, which killed nearly twelve thousand individuals. It does not appear, however, to have spread through the country, nor to have extended generally to the continent. Ten years after that visitation, London was again (1603) afflicted by another plague, which was imported from Ostend, while it raged violently there as in the Low Countries. On this occasion, the capital lost upwards of thirty-six thousand of its inhabitants, who fell victims to the disease. Nearly the same number was carried away by a similar malady in 1625; in 1636, it appeared in the metropolis again, and destroyed upwards of thirteen thousand persons, and in 1643-4, the armies engaged in the civil war diffused a malignant fever over the whole country, which was attended with a roughness and a sliminess of the throat and jaws, with pain, but scarcely any swelling or inflammation. But the most formidable pestilence by which the metropolis has been invaded, was that which commenced in 1665, immediately after the great frost, and consigned to the tomb, or rather to the earth, for there was no time for the construction of tombs, sixty-eight thousand five hundred and ninety-six persons, according to the lowest computation. 'Since that time,' says Dr. Sims, 'the plague has vanished from London, and all other epidemics seem to have become less malignant, owing to many causes; among which may, perhaps, be a greater use of fresh vegetable food, a less use of fish, an universal use of tea, superior cleanliness in our persons, a greater attention to the poor in times of scarcity, which are now scarcely felt in any extreme degree; and, lastly, the tremendous fire in 1666, since which the streets have been very much widened, and the houses so enlarged, that the same number of inhabitants now occupy above double the space.' Since that period London and the country generally have been free from contagious disease, with the exception of the year 1740, when occurred the severest frost that had been known for three hundred years; it was accompanied by a malignant spotted fever, which caused great havoc in Bristol and in Galway, and which reached London in the following year, where it produced a degree of mortality nearly equal to that of the great plague. Unless we enumerate the small pox and occasional typhus and catarrhal [illegible], we may say, that for nearly a hundred years England has not been visited by any general malady, and this good fortune it owes partly to its strict quarantine regulations, but chiefly, in spite of the growth of intemperance, to the improved habits of the people. Within recent memory, several other countries, with which we have been in constant intercourse, have been severally visited by the plague; Egypt, Turkey, Spain, Malta, Gibraltar, and the United States of America, have been within the last twenty years the seats of pestilence, and yet it has never touched the British shores.

It may be also mentioned as a circumstance calculated to allay apprehension, that according to the report of a resident of Hamburgh, who left that city on the 15th of October last, the cholera, which had then prevailed eight days in that crowded city, had only affected thirty-one individuals, and that even of these, several were mere cases of suspicion. This is undoubtedly a trifling proportion, in a population of 130,000 souls. The disease appears, according to the same authority, to have originated at that place in a low wretched quarter, called the "Deep Cellar," which is wholly frequented by beggars, vagrants, and other abandoned objects of both sexes. To these profligate classes the cholera has been hitherto confined: the alarm which was first excited by its appearance, has entirely ceased, and private parties and public amusements go on just as usual.

In Breslau, Berlin, and Vienna, where the malady still continues, it has hitherto preserved the same mitigated character. According to late accounts from the latter capital, there were remaining in all only 284 cases, of which existed in the city only sixty-six, the remaining 218 being in the most miserable parts of the suburbs. It should, moreover, not be forgotten, that in London, as well as in England generally, the autumn now closed, and the latter part of the summer, have been remarkably unhealthy. Bowel complaints were seldom known to have been so prevalent, both amongst adults and children; they have not been fatal in many cases, but it has been remarked, that the state of the weather exercised considerable influence upon them. When the atmosphere was humid and laden with clouds, the malady increased; when the vapours were dispersed, and the sun appeared, or a bracing cold day came, the malady was alleviated, and frequently altogether removed. These facts go to prove the connexion which exists between the state of the atmosphere, and the ordinary course of our animal functions. Indeed, to any person who has reflected much upon this subject, and upon the wonderful sympathies which exist between many parts of animated nature, it must appear as if we were all but so many links of an electric chain descending from Heaven to the remotest material objects of the whole creation. We would infer from these facts then, that our country has already had its visitation from the cholera, in the shape of the complaint which we have mentioned, and that it is not likely to behold it in any severer form in this country. In this impression we are countenanced by the remark of Dr. Onufriew, who states in one of the Russian official documents, that "during the prevalence of the epidemic at Orenburg, there was scareely a single inhabitant of that city

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

who had not some symptoms of disordered digestion. One complained of oppression and pain in the heart; another of headache, slight sickness, looseness of the bowels, and the like. These trifling symptoms of disease were usually ascribed to errors in diet. But to me it appears, that their cause was *a general invasion of the system by cholera, which, however, was prevented from developing itself in its perfect characters, by a regular manner of living, and other circumstances of the kind.*" In the same manner we think that the cholera has already invaded England, and that the general habits have subdued it to the more mitigated symptoms, which has been so widely experienced.

We conclude this article with a recommendation to ventilation, &c. as a precautionary measure to all who are concerned in the health of the public in general. It is an article from the Bengal Almanack.

ON VENTILATION AND HOUSEHOLD CLEANLINESS.

We are all thoroughly aware of the necessity of breathing; and the agreeable freshness and reviving influence of the pure morning air must convince us that the breathing a pure atmosphere is conducive to health; yet we as carefully exclude the air from our houses as if its approach were noxious. Intending to shut out the inclemencies the weather only, in our care to guard ourselves from the external air, we hinder that renewal of the atmosphere which is necessary to prevent its becoming stagnant and unfit to support animal life.

Few persons are aware how very necessary a thorough ventilation is to the preservation of health. We preserve life without food for a considerable time, but keep us without air for a very few minutes and we cease to exist. It is not enough that we have *air*, we must have *fresh air*; for the principle by which life is supported is taken from the air during the act of breathing. One fourth only of the atmosphere is capable of supporting life; the remainder serves to dilute the pure vital air, and render it more fit to be respired. A full grown man takes into his lungs nearly a pint of air each time he breathes; and when at rest, he makes about twenty inspirations in a minute. In the lungs by an appropriate apparatus, the air is exposed to the action of the blood, which changes its purer part, the vital air, (oxygen gas,) into fixed air, (carbonic acid gas,) which is not only unfit to support animal life, but is absolutely destructive of it. An admirable provision of the great Author of nature is here visible, to prevent this exhausted and now poisonous air from being breathed a second time:—while in the lungs, the air receives so much heat as makes it specifically lighter than the pure atmosphere; it consequently rises above our heads during the short pause between throwing out the breath and drawing it in again, and thus secures to us a pure draught. By the care we take to shut out the external air from our houses, we prevent the escape of the deteriorated air, and condemn ourselves to breathe again and again the same contaminated, unrefreshing atmosphere.

Who that has ever felt the refreshing effects of the morning air can wonder at the lassitude and disease that follow the continued breathing of the pestiferous atmosphere of crowded or ill-ventilated apartments? It is only necessary to observe the countenances of those who inhabit close rooms and houses, the squalid hue of their skins, their sunken eyes, and their languid movements, to be sensible of the bad effects of shutting out the external air.

Besides the contamination of the air from being breathed, there are other matters which tend to depreciate its purity: these are the effluvia constantly passing off from the surface of animal bodies, and the combustion of candles and other burning substances. On going into a bed room in a morning, soon after the occupant has left his bed, though he be in perfect health and habitually cleanly in his person, the sense of smelling never fails to be offended with the odour of animal effluvia with which the atmosphere is charged. There is another cause, perhaps, still more striking, when a person fresh from the morning air enters a coach in which several persons have been close-stewed during a long night. He who has once made the experiment will never voluntarily repeat it. The simple expedient of keeping down both windows but a single half-inch would prevent many of the colds and even fevers, which this injurious mode of travelling often produces. Outside passengers, though they may suffer a little more from cold and wet, generally escape these every-day complaints of those who pay double their fare. If under such circumstances the air is vitiated, how much more injuriously must its quality be depreciated when several persons are confined to one room, where there is an utter neglect of cleanliness; in which cooking, washing, and all other domestic affairs are necessarily performed; where the windows are immovable, and the door is never opened but while some one is passing through it! On entering such a den of filth, the nose is saluted by a stench so horrible, as to make any person, unused to it, recoil and pause before he ventures in; but the wretched inhabitant has his sense of smelling so blunted, that he does not perceive that, with every breath he takes, he inhales a poison, which is sapping the vigour of his body, and destroying the energies of his mind.

Can we wonder that, with such absolute neglect, all the diseases of persons so situated should be of a dangerous character? or that the mind should be dispirited, and that the man should fly to drams for relief from the burthen which he finds to be weighing him down?

It may be taken as a wholesome general rule, that whatever produces a disagreeable impression on the sense of smelling is unfavourable to health. That sense was doubtless intended to guard us against the dangers to which we are liable from vitiation of the atmosphere. If we have, by the same means, a high sense of gratification from other subjects, it ought to excite our admiration of the beneficence of the Deity in thus making our senses serve the double purpose of affording us pleasure and security; for the latter end might just as effectually have been answered by our being only susceptible of painful impressions.

To keep the atmosphere of our houses free from contamination, it is not sufficient that we secure a frequent renewal of the air—all matters which can injure its purity must be carefully removed. The linen of beds should not be allowed to remain unchanged till it has lost all appearance of ever having been white, or of ever having had any acquaintance with the washing tub. The contents of chamber-vessels should not be left in the house an instant, if it be possible, and certainly not in the room of a sick person: every moment they remain they fill the air with a filthy odour which is little less than poisonous to all who breathe it.

Those who have but one apartment in which they must of necessity perform all the domestic duties, should be careful to remove all matters that are offensive in smell, as cabbage water, dirty soapsuds, &c; they should indeed, if possible, avoid washing in the room they live in. For the same reason, drying clothes in doors should be avoided.

Flowers in water and living plants in pots greatly injure the purity of the air during the night, by giving out large quantities of an air (carbonic acid) similar to that which is separated from the lungs by breathing, which, as before stated, is highly noxious. On this account they should never be kept in bed rooms: there are instances of persons, who have incautiously gone to sleep in a close room in which there has been a large growing plant, having been found dead in the morning, as effectually suffocated as if there had been a charcoal stove in the room.

A constant renewal of the air is absolutely necessary to its purity: for in all situations it is suffering either by its vital part being absorbed, or by impure vapours being disengaged and dispersed through it. *Ventilation, therefore, resolves itself into the securing a constant supply of fresh air.*

In the construction of houses, especially in those built for the poor, this great object has been too generally overlooked, when, by a little contrivance in the arrangement of windows and doors, a current of air might, at any time, be made to pervade every room of a house of any dimensions. Rooms cannot be well ventilated that have no outlets for the air; for this reason there should be a chimney to every apartment. The windows should be capable of being opened, and they should, if possible, be situated on the side of the room opposite to, and furthest from the fire-place, that the air may traverse the whole space of the apartment in its way to the chimney.

Fire places in bed-rooms should not be stopped up with chimney-boards. The windows should be thrown open for some hours every day, to carry off the animal effluvia which are necessarily separating from the bed-clothes, and which should be assisted in their escape by the bed being shaken up, and the clothes spread abroad, in which state they should remain as long as posible; this is the reverse of the usual practice of making the bed, as it is called, in the morning, and tucking it up close, as if with the determination of preventing any purification from taking place. Attention to this direction, with regard to airing the bed-clothes and bed after being slept in, is of the greatest importance to persons of weak health. Instances have been known in which restlessness and an inability to find refreshment from sleep would come on in such individuals when the linen of their beds had been unchanged for eight or ten days. In one case of a gentleman of very irritable habit, who suffered from excessive perspiration during the night, and who had taken much medicine without relief, he observed that, for two or three nights after he had fresh sheets put upon his bed, he had no sweating; and that, after that time, he never awoke, but that he was literally swimming, and that the sweats seemed to increase with the length of time he slept in the same sheets. By not permitting him to sleep in the same sheets or night clothes more than twice without their being washed, he instantly lost this debilitating affection.

Various means are had recourse to at times, with the intention of correcting disagreeable smells, and of purifying the air of sick rooms. Diffusing the vapour of vinegar through the air, by plunging a hot poker into a vessel containing it; burning aromatic vegetables, smoking tobacco, and exploding gunpowder, are the means usually employed. All these are useless. The explosion of gunpowder may, indeed, do something, by displacing the air within the reach of its influence; but then, unfortunately, an air is produced by its combustion, that is as offensive, and equally unfit to support life as any air it can be used to remove. These expedients only serve to disguise the really offensive condition of the atmosphere. The only certain means of purifying the air of a chamber which is actually occupied by a sick person, is by changing it in such a manner that the patient shall not be directly exposed to the draughts or currents

Chemistry has furnished the means of purifying the air of chambers in which persons have been confined with contagious diseases, so as to destroy the noxious power of the effluvia generated in such situations, and thus of preventing the disease from extending. This will be accomplished by attending carefully to the following directions.

Close all the windows and doors of the room

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

intended to be purified, except the one by which you propose to retreat, and make up the aperture of the chimney or fire-place, except for about an inch or two at the bottom. Having put three table spoonsfuls of common salt, (*muriate of soda*) rubbed fine, into a shallow dish, place it upon the floor of the apartment.—if with a few hot cinders beneath it, the better; and then pour, at once, upon the salt, a quarter of a pint of strong oil of vitriol (*sulphuric acid*); retire and close the room for forty-eight hours. Immediately the acid is poured upon the salt a pungent vapour (*chlorine*) is given out freely, which is extremely unpleasant to breathe, and very destructive to most metallic surfaces. It is on this account that the operator should leave the apartment quickly and that all the iron and brass furniture should be previously removed. This vapour continues forming for many hours, and diffusing itself completely through all parts of the room, effectually destroys the matter on which infection depends: at the expiration of about forty-eight hours, the room may be entered, the doors and windows thrown open, and a fire made in the chimney, in order that the apartment may be perfectly ventilated. It may then be safely occupied. The above quantity of salt, &c. is quite sufficient for a chamber of the usual size; for a much larger room, double the quantity, divided into two vessels, should be used. The merely offensive odour of sick rooms, or of any other apartments, may be readily corrected, by placing in them plates containing the *chlorosodiac solution of Labaraque*; which is now well known in this country.

But no fumigation will be of any avail in purifying stagnant air, or air that has been breathed till it has been deprived of its vital part; such air must be driven out, when its place should be immediately supplied by the fresh pure atmosphere. The readiest means of changing the air of an apartment is by lighting a fire in it, and then throwing open the door and windows; this will set the air in motion, by establishing a current up the chimney. The air which has been altered by being breathed is essential to vegetable life; and plants, aided by the rays of the sun, have the power to absorb it, while they themselves at the same time given out pure vital air. This process, going on by day, the reverse of that described before as taking place during the night, is continually in operation, so that the purification of the atmosphere can only be prevented by its being preserved in a stagnant state.

In the country, there are other circumstances which require to be attended to besides cleanliness in the house, and the free admission of the air into it at all times. Care ought to be taken that nothing be allowed to exist very near the house that can injury the purity of, or produce humidity in, the atmosphere: heaps of putrefynig vegetables, dunghills, pools and ditches of stagnant water, privies and open drains, furnish a constant supply of the exhalations which produce fever. In hot seasons especially, every breeze in such neighbourhoods must carry poison with it. These things are much too common before the doors of cottages, and even of larger houses. Those who build houses for the poor would do well to choose situations sufficietly elevated to allow the waste waters to de drained off with facility: without this, they must stagnate and putrefy, to the danger of the health of the inhabitants.

LOYAL AND PATRIOTIC ADDRESS

Of the Lutheran Community at the Cape of Good Hope, to Her Majesty the Queen.

On the 17th of October, 1831, the Rev. F. R. Kaufmann*, late of Cape Town, was introduced to Her Majesty at St. James' Palace, by Dr. Küper, the Lutheran Minister in London; on which occasion, the Reverend Gentleman presented an Address to Her Majesty from the Lutheran Community of this Colony, and in performing which, thus addressed Her Majesty:

Von Afrika's äusserster Südspitze hier angelandet, habe ich die erhabene Ehre, das grosse Gluck, die innige Freude, diesses Glucks-wünschungschreiben einer Deutschen Gemeinde am Vorgebirge der Guten Hoffnung Eu: Königl: Maj:—einen Köstlichen Blume aus Deutschland's Boden auf England's Grund verpflanzt—hier mit demüthigst zu überreichen:—Es gefalle Eu: Königl: Maj: auf dieses kindliche Opfer Christlicher Herzen gnädig herabzublicken und es als ein Solches Zu empfangen.

Der Grosse Herr der Welt lasse aus dem Fullhorne Seines Uberflusses, die reichsten Segnungen auf Eu: Konigl: Maj: Haupt und auf England's erhabenen König Wilhelm den IVten niederfliessen.

A copy of which was requested to be given to Her Majesty.

Her Majesty was graciously pleased to express Her high satisfaction in reply "that Her German brethren in South Africa entertained such affection towards Her."

The following is an extract from the London Gazette of the 20th of October.

St. James's Palace, October 20, 1831.

The following Address has been presented to Her Majesty, and graciously received:

To the QUEEN's Most Excellent Majesty.

May it please your Majesty,

We, the undersigned inhabitants of South Africa, happy in being numbered amongst the faithful and loyal subjects of our most gracious King, beg leave to approach your Majesty's sacred Person with feelings of the deepest love and veneration.

Descended from one common origin with your Majesty, from the brave Teutonic race, we feel peculiar satisfaction in recognising the Consort of our illustrious Monarch as a Member of that Community the tenets of which form the basis of our religious hopes and of our faith—of that Church which is named after the great Champion of our protestant faith—the immortal Luther.

As representatives of the Lutheran Community at the Cape of Good Hope, we entertain towards your Majesty's person, sentiments of devoted loyalty and sincere attachment, arising from the twofold tie in which we stand connected with your Majesty as British subjects and as members of one Church; and in the name of the Community whom we represent, we humbly beg to offer to your Majesty the expression of their heartfelt joy and congratulation at the accession to the Throne of these Realms of our most gracious Sovereign King William the Fourth.

The feelings which this Community, in common with all your Majesty's subjects, bear towards your Royal Person, and that of our beloved Monarch, will be testified to your Majesty by the late Pastor of our Congregation, who has the honour of presenting this Address,—a minister who has deservedly earned the greateful thanks of a widely extended community, by his unceasing attention to their spiritual comforts—and to whom we commit the pleasing task of conveying to your Majesty the assurances of our devoted loyalty and attachment.

That your Majesty's reign, and that of our beloved Sovereign, may be happy and propitious, and that it may be prolonged for the welfare of the people of these realms, is the fervent prayer of your Majesty's most devoted and most loyal subjects, the Churchwardens of the Lutheran Congregation at the Cape of Good Hope.

Consistory of the Lutheran Church, Cape Town, Cape of Good Hope, July 31, 1831.

J. M. Kloek van Staveren, V.D.M.
C. Matthiessen, Presiding Elder.
R. A. Zeederberg, J. G. Stegmann, } Elders.
C. M. Zastron, J. W. Nelson, G. W. Silberbauer, W. Herman, } Deacons.

* The Rev. Mr. Kaufmann left the Colony on the 7th of August, 1831, and arrived in London on the 11th of October. Previously to the departure of this respected clergyman, the acting and retired members of the Evangelical Lutheran Community in Cape Town, were pleased to present him with a piece of Plate,—viz: a Salver—in testimony of their undiminished regard towards their former Pastor.

THE ECCLESIASTICAL AFFAIRS OF THE COLONY.

I. *The Reformed Presbyterian Church Establishment of the Colony.*
II. *The English Episcopal Communion.*

The Colonial Church.

This Church was planted in the Colony as far back as 1704. The Dutch were the first protestant nation that paid attention to the religious interests of their colonial possessions. Few nations it will be admitted, had so many fair opportunities. When the Cape surrendered to the British arms in 1806, the terms of capitulation—that the Dutch Reformed Church should remain, &c. were *faithfully* respected. This arrangement did not even interfere with the existing Church Regulation, which placed *the Establishment* under the supreme Ecclesiastical jurisdiction of the High Church Authorities at *Amsterdam*. But when by Treaty of the Cape of Good Hope in 1814, the Colony was ceded by Holland to the British Crown, this *foreign* appeal in Church affairs, or interference in the Ordination of British subjects to fill the vacant Churches, was scarcely to be expected; any longer at least, than circumstances should provide a better order of things. It is true that at this moment the Reformed Church exists without having any High Court of Appeal of an ecclesiastical nature, beyond that of secondary church courts, or what is equally contrary to Presbytery, the *Civil Authority*. Presbytery never took it for granted, that the *civil power* was the basis of its religious constitution. All that the Presbyterian Church required when it became *Established* in the Mother Countries, was, a legal recognition of those powers which she *claimed* as belonging to her by scriptural institution. While it encourages a friendly co-operation between the civil and ecclesiastical authorities, and *renders unto Cæsar the things that are Cæsar's*, "it avoids at the same time the confounding of their limits—prohibits church courts from meddling with any thing pertaining to the civil jurisdiction—establishes their independence in all matters which belong to their cognizance—and guards against what is the great bane of religion, and curse of the church, a priesthood which is merely the organized puppet of the state, and moves and acts only as it is directed by a political administration."*

What measures may be taken to render the *Presbyterian Church Establishment* of the Colony more *scripturally* and firmly united to Government, and worthy of sustaining its Reformed character we know not. Its friends however may be congratulated on its advances towards perfected order. The recent division

of the Churches into Presbyteries, and other regulations are proofs of this.—*Fragment of Church History, Cape Town*, 1827.*

THE ENGLISH EPISCOPAL COMMUNITY.

A reference to the table No. IV. in the preceding pages and the comparatively *small number* confirmed by the Bishop of Calcutta (in which are included, the military and some converts from other churches) will show, that the extent of the Episcopal Church in the Colony is not in unison with the naturally enlarged views of its faithful members. But it should be considered from the *great mass* of the white population being attached to their own *Church Establishment*, and with *very few instances of defection* from its communion, it does not appear very probable that it will ever attain to any great height in the scale of the population. On these grounds nothing very extensive in Episcopal affairs seems essential. It was the consideration of this, that directed the British Government to provide at the suggestion of *Dr. Claudius Buchanan*,—Ecclesiastical Establishments in the East and West Indies; but to reject that part of his recommendation which refers to the Cape of Good Hope. Though the *territorial religion of the Colony* was overlooked by that excellent man in his "Brief view of the Colonies of Great Britain,"—Government took care to confirm it, as *the Established Church*,—to provide for its better security, and future enlargement; and to identify itself with its procedings. Even in the appointment of Episcopal Chaplains at the Cape, it is understood that they are only such as connected with the "British *Civil* Establishment"† of the Colony. *(Ib.)*

"I have come amongst you with *no power, no jurisdiction*: I come on a mission of charity and of peace."—*Bishop James's Address in the Commercial Hall, vide his Life, page* 26.

THE SEQUEL.

Report of the Society for Promoting Christian Knowledge, 1830.

CAPE OF GOOD HOPE.

The attention of the SOCIETY has been called, by the present Lord Bishop of *Calcutta*, in an especial manner, to all matters connected with the interests of religion and of *the Church*, in the Colony of the *Cape of Good Hope*. Before his Lordship sailed from *Portsmouth, July*, 1829, he received from Mr. *Hay*, one of the Under Secretaries of State for the Colonial Department, intimation of a wish, that, on his arrival at the *Cape*, he should put himself into communication with his Excellency Sir *Lowry Cole*, the Governor, for the purpose of ascertaining what arrangements it would be desirable to adopt, with reference to the *ecclesiastical establishment of the Colony*. It happened, unfortunately, that, on his Lordship's arrival, and during the whole period of his visit, the Governor was absent on a tour of inspection to the frontier. His communication was in consequence made to Lieut. Col. *Bell*, Secretary to the Colonial Government, from whom it received immediate and full attention; and who entered into the subject of the Bishop's official inquiry, with the greatest earnestness, and with a most cordial desire to carry it forward to a successful accomplishment. From the Rev. Mr. *Hough*, the senior Chaplain, the Bishop also obtained the most efficient aid: Mr. *Hough's* long experience in the affairs of the Colony, and his zealous attachment to the Church, of which he is so valuable a minister, demanding high consideration of his opinions. The result of an inquiry thus conducted, the Bishop stated in a letter to Sir *George Murray*, from *Cape Town*, a copy of which letter he transmitted to his Grace the Archbishop of *Canterbury*, and a second to Sir *Lowry Cole*. He addressed also from the same place, to Archdeacon *Hamilton*, for the information of the *Incorporated Society for the Propagation of the Gospel in Foreign Parts*, a statement in detail, not only of the more immediate concerns of that SOCIETY, but of all matters in which the interests of the *Colonial Church* were involved. And, lastly, in a despatch dated on board His Majesty's ship Pallas, at sea, *November*, 1829, he entered at large on the several points connected with the views and objects of the SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE, during his stay in the Colony of the *Cape of Good Hope*.

The Bishop having stated, in this despatch, that the English portion of the Colonial population is rapidly increasing in numbers and influence; that their claim to have their advantage consulted in the all-important concern of religion must of course be strengthened in the same proportion; and that the Dutch inhabitants themselves would be more effectually conciliated by measures advisedly adopted for the spiritual good of the English population than they ever will be by *temporising concessions*, which, end where they may, must have had there beginning in lukewarmness and indifference, wrote as follows:

"After diligent inquiry, I am satisfied, that the general feeling of the more respectable classes at this moment is favourable to our Church; the personal character and declared views of the present Governor, and of Lady *Frances Cole*, have had a most salutary influence; those who were disposed to activity have had their hands strengthened; *the hostile are conciliated;* and many who professed indifference have been induced to declare themselves. In this concurrence of favourable circumstances, it remains only that our two great Church Societies should come forward in an efficient manner, by administering liberally to the actual wants of the Colony, and by bringing into action all their influence at home. There will then be the best ground to hope, *that this branch of our National Church* will, at no distinct period, flourish abundantly, and be made a lasting good by diffusing, through *every district* of this Settlement, a portion of the spirit which animates our most valuable institutions. The several points to which the SOCIETY'S attention should be turned may be enumerated under the following heads:

"1. The appointment and maintenance of the Clergy.
"2. The erection of Churches.
"3. The establishment of Schools.
"4. *Missionary Institutions* for the direct object of converting the Heathen."

Having enlarged upon each of these heads, and having stated, that, in reference to the first head, viz. the appointment and maintenance of the Clergy at the *Cape*, he had fully communicated his sentiments to Sir *George Murray*, the Bishop concluded his despatch in the following impressive words:

"I should apologize to the Board for the length to which this letter has been extended, if I did not feel persuaded that the subject will justify a large demand on their attention. The question is nothing less than this, whether a colony so fertile in resources, so rapidly advancing in civilization and social importance, *shall or shall not form an integral part of our National Church?* Should this question be resolved favourably, we shall look forward with confidence to the issue; but should the decision be adverse, we must be prepared to see this powerful dependency, not merely *alienated from our establishment*, but engaged in actual *hostility against us*."

At a General Meeting of the SOCIETY, holden on *Tuesday*, the 11*th May*, ult. (the Lord Bishop of *London* being in the chair,) the despatch from the Bishop of *Calcutta*, was read to the Board, and, after mature deliberation, the three following resolutions were unanimously adopted:

First, That a respectful application be made to his Grace the Lord Archbishop of *Canterbury*, President of the SOCIETY, requesting him to second with his powerful influence the suggestions offered to his Majesty's Government by the Lord Bishop of *Calcutta*, relative to the appointment and maintenance of Chaplains at the *Cape of Good Hope*, and to other measures for promoting the best interests of religion in that important colony.

Second, That as the present appears to be a very favourable moment for taking decisive measures to advance the interests of religion in the Colony, and in furtherance of the views of the Lord Bishop of *Calcutta, a sum of* 2000*l.* be placed at the disposal of the Standing Committee of the SOCIETY; and that the Committee be authorized to enter immediately into communication with his Excellency Lieutenant-General Sir *Lowry Cole*, Governor of the *Cape of Good Hope*, for the purpose of ascertaining from him the best methods of employing that sum towards encouraging the erection of Churches, the establishment of Schools, and *such other objects* as may come within the province of the SOCIETY.

Third, That the thanks of this Board be returned to the Lord Bishop of *Calcutta* for his valuable communication; and that he be apprised of the steps now taken by the SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE, in the furtherance of his pious and benevolent views.

Independently of the measure of aid thus granted by the Board towards advancing the interests of religion in the colony of the *Cape of Good Hope*, the SOCIETY is quite prepared to fulfil certain engagements entered into, on its behalf, by the late lamented Bishop of *Calcutta* (the Right Reverend Dr. *James)* with Lieutenant-Colonel *Bell* and the District Committee, in regard to the establishment and maintenance of Schools in *Cape Town*.

LITERATURE.

HISTORY OF ENGLAND, vol. I. ANGLO-SAXON PERIOD, by FRANCIS PALGRAVE F.R.S & F.S.A

This delightful little volume forms one of the recent numbers of Mr. Murray's *Family Library*. It is written in a remarkably clear and agreeable style, and deserves a place in every Family and School Library in the Colony. We extract the following pleasant remarks from the author's preface:

The Anglo-Saxon history, in every part and branch of it, is extremely obscure; and though I have done my best to discover the truth, still I am convinced that others, working with the same intent, may probably come to very different conclusions. No person ever can attempt any historical inquiry, who does not bring some favourite dogma of his own to the task—some principle which he wishes to support—some position which he is anxious to illustrate or defend—and it is quite useless to lament these tendencies to partiality, since they are the very incitements to the labour. And so strong is the effect of opinion, that, even in matters where there would seem to be the least possible reason for doubt, even our senses may be deluded by our passions and feelings.

The annals of justice furnish numerous instances of these hallucinations: but one of the most striking examples occurred a few years ago at Dublin:—

A pleasure-boat, belonging to a party of noted Brunswickers, having been moored on

* To all who seek the light, we recommend this little pamphlet—*A Fragment of Church History*, published at the Cape in 1827. In merciful charity towards the funds of the venerable *Society for Promoting Christian Knowledge*, we think a copy of the *Fragment* should be sent forthwith to the Secretaries—the Rev. Wm. Parker, or the Rev. Dr. Burrow. The latter gentleman is, we understand, at the present moment in the colony, on a mission from the Society. There is a tolerably pungent Review of the "Fragment" by the late Mr. J. L. Kelly, in the *Colonist*, page 133.

† Cape Gazette, No. 299.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the River Liffy, near Carlisle-bridge, some of the bystanders on the adjoining Quay were extremely incensed at the standard of defiance which the vessel displayed. The vane at the mast-head, like those of the ships of the Conqueror, displayed an effigy—an *Orange*-man *trampling* on a *green* shamrock. This affront, aimed at the feelings of the multitude, was not to be borne. The *Milesians* attacked the hostile *Saxon* bark by hurling a furious volley of paving-stones, and the unlucky crew, urged by danger or by apprehension, discharged their fire-arms, and wounded some of the surrounding assemblage. A great commotion was excited, the leaders of the belligerent parties were conducted to College-street Police-Office; amongst the witnesses who were called was the Tinman who had made the vane. And this worthy tradesman gave the most candid and unequivocal testimony, in full proof of the pacific intention of the pleasure-boat, though certainly somewhat to his discredit as an artist. The unlucky cause of so much dissension and bloodshed, the supposed *Orange*-man *trampling* on the *green* shamrock, was in truth, a *Flesh-coloured* Mercury *springing* from a *blue* cloud.

I will not stop to inquire whether the Agitators on both sides of the question might not derive some useful instruction from this display of the effects produced by opinion; I will only ask you to apply the lesson to history in general.

I have exerted myself to see the objects before me clearly and distinctly. I have endeavoured to place them in a proper light; and I have approached them as nearly as I could, in order to ensure the utmost accuracy. However, when I took the pen in hand, I had many an hypothesis of my own to elucidate; nor did I come to the task without having settled my opinions on the most important points and doctrines connected with history. And whilst I am most ready to believe that my eyes may have often deceived me, I hope that those who see differently, will admit, that they also may, with equal unconsciousness on their part, be labouring under a similar delusion.

Should I, therefore, be found on any occasion to have erred, and to have mistaken *green* for *blue*, or *blue* for *green*, I trust that those who know how easily the tints may be confounded with each other, will excuse the failing. Let me, however, lastly observe, that I shall principally rest my claim for lenient treatment upon this simple plea, that, deceived or prejudiced as I may be *I have never thrown stones;*—and with this appeal, I submit myself to your judgment.

After the declaration (page 57,) that "the Church of Rome perverted many human institutions into articles of faith," the respected author details, with elegant simplicity, Pope Gregory's sympathy on behalf of the English Slave children in the market at Rome, and also the mission of Augustine to Britain. *Ex. gra.*

Pope Gregory had become much interested in the welfare of the Anglo-Saxons, in consequence of an incident which happened to him at an earlier period of his life. It chanced that he passed through the market at Rome, where certain dealers had just arrived from foreign parts with various kinds of merchandise. Amongst other articles, there were slaves for sale, like cattle. This wicked traffic had existed from time immemorial; and though Christianity had alleviated the lot of the slave, it had not succeeded in breaking his bonds. Gregory, therefore, could only pity the captives; and he was particularly interested by the appearance of some poor little lads, who stood trembling in the expectation of being consigned to a new master. They were beautiful children, with ruddy cheeks and blue eyes, and their fine yellow tresses flowing in long curls upon their shoulders. Long hair, in those days, was a token of dignified birth. Only kings and nobles were accustomed to allow of its growth: persons of an inferior or servile class were closely shorn. Gregory must, therefore, have felt an additional motive for compassion, since he perceived that these children had sustained some great reverse of fortune—and their sufferings must be comparatively much more poignant than if they had been accustomed to privation and labour. The father of the boys had probably been killed in war; and the children, brought up in ease and comfort, were now exposed to hopeless captivity, passing from the tender care of their parents to the power of a merciless task-master in a strange land.

'To what nation do these poor boys belong?' was the question which Gregory asked of the dealer. 'They are Angles, Father.' 'Well may they be so called, for they are as comely as angels; and would that, like angels, they might become Cherubim in Heaven! But from which of the many provinces of Britain do they come?' 'From *Deira*, Father.' 'Indeed,' continued Gregory, speaking in Latin, '*De irâ Dei liberandi sunt.*'—From the wrath of God they are to be delivered. And when, on asking the name of of their king, he told it was Ella, or Alla, he added, that *Allelujah*—praise ye the Lord—ought to be sung in his dominions.

The conversation may appear trifling; but it was destined to produce the most important effects. The state of Britain having been introduced to the notice of Gregory, he brooded over the thought, and determined to proceed hither in the character of a missionary. Impediments arose, which prevented him from carrying this design into effect, but the impression continued firm in his mind; and when he became Pope of Rome, he despatched Augustine to fulfil the task, the accomplishment of which he had so earnestly desired.

At this period, Kent was governed by Ethelbert, a monarch of great power and ability, who had compelled the other sovereigns of the island, whether Britons or Anglo-Saxons, to acknowledge him as their superior. He had married a princess named Bertha, the sister of Charibert, king of Paris. This lady was a Christian; and, by permission of her husband, she had caused a deserted church, built by the Romans in the neighbourhood of Canterbury, to be repaired and fitted up for divine service. Ethelbert, therefore, was not altogether unacquainted with the character and functions of Augustine and his forty companions, who, when they had landed in the Isle of Thanet, sent a messenger to him, soliciting an interview. Still he had a strange opinion that they might be magicians; and, by a still stranger idea, he fancied they were less likely to be able to hurt him by their enchantments, if he received them in the open air.

Augustine and his companions proceeded to the appointed place, and advanced towards the king, chanting the Litany, and praying earnestly for the Divine blessing and protection*. Ethelbert did not at first yield much attention to the Missionaries. He excused himself from attending to their exhortations; but he received the Priests with kindness, and allowed them free liberty to preach to the people. Ethelbert himself soon became a listener and a convert; and within a short period, all the inhabitants of Kent were convinced of their folly in worshipping Thor and Woden, the idols of their ancestors.

So earnestly indeed did the men of Kent listen to Augustine, that upwards of ten thousand of them were baptized on one Chistmas-day. And we have yet a friendly, and confidential letter, addressed by Pope Gregory to Eulogius, his brother Patriarch of Alexandria, containing an account of the joyful success attending the missionaries who had laboured amongst the English, 'in the most remote parts of the world.' He speaks nearly in the same tone which we should now adopt, if relating the fruits of a mission in Polynesia.

The author thus describes the progress of Christianity among the Anglo-Saxons:

Edwin was one day alone in his chamber, being in that state of imperfect conviction, when the feelings of religion, alloyed by human doubts, impart more distress than comfort to the soul,—Paulinus suddenly entered, placed his hand upon Edwin's head, and announced a great deliverance from his enemies. The appearance of Paulinus, his attitude, and the intelligence which he thus communicated, corresponded with a foreboding or presentiment which Edwin had received, probably by a dream, when in exile at the court of Redwald, King of the East Angles; and Paulinus, availing himself of the impression thus created, earnestly exhorted Edwin to acknowledge that Power by whom he had been protected and rescued fromtemporal danger. Edwin now began to yield the assent which he had so long delayed; and he declared unto Paulinus, that he would receive the sacrament of baptism, provided the wise Lawgivers of his kingdom would sanction his conversion, and also adopt Chistianity.

Edwin had even yet only a wavering faith: humanly speaking, however, his conduct was palliated by the circumstances in which he was placed. The Kings of the Anglo-Saxons did not possess a despotic authority. They were forced to act by the advice of their Nobles, many of whom were Sovereigns in their territories, though the Vassals of the King; and if the Northumbrian chieftains had continued contumaciously averse to Christianity, Edwin would not only have been unable to protect the Missionaries, but he might himself have been in danger of losing his crown, and perhaps his life. And that the course so adopted was prudent, may be understood by the ready assent given by Paulinus, to the proposition which Edwin had thus made.

Edwin, therefore, convened his Nobles and Counsellors—and craved their advice upon the important question which he propounded: each was to give his opinion separately from the rest, and each was asked by the King to declare his mind concerning Christianity.

The first who spake was the High Priest of the Heathen Gods, Coifi by name, who acknowledged the utter vanity of those idols which he had served. He had found that these imaginary Deities could not reward the good; we must suppose that he equally acknowledged their want of power to punish the evil doer; and he concluded by declaring, that if any better doctrine could be taught to him, he would adopt it without hesitation or delay.

Then spake another of the Nobles, who, addressing himself to Edwin, compared the present life of man to the flight of a swallow:—whence it comes we know not, nor whither it proceeds: our human existence is a gleam in the midst of darkness. 'We know nothing of our origin,' said he, 'nothing of our end; and if this new doctrine can teach us anything certain of our destiny, well is it worth that we should follow its law*.'

---

* 'For ever hallowed be this morning fair,
'Blest be the unconscious shore on which ye tread,
'And blest the Silver Cross, which ye, instead
'Of martial banner, procession bear;
'The Cross preceding Him who floats in air,
'The pictured Saviour!—By Augustine led,
'They come—and onward travel without dread,
'Chanting in barbarous ears a tuneful prayer,
'Sung for themselves, and those whom they would free!
'Rich conquest waits them:—The tempestuous sea
'Of ignorance, that ran so rough and high,
'And heeded not the voice of clashing swords,
'These good men humble by a few bare words,
'And calm with fear of God's divinity.'
WORDSWORTH.

* I cannot deny to myself and my readers the pleasure of inserting the lines by which Wordsworth has rendered the text of Bede:—
'Man's life is like a sparrow, mighty King!
'That, stealing in, while by the fire you sit
'Housed with rejoicing friends, is seen to flit

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

All the other Nobles and Counsellors delivered opinions to the same effect: not a dissentient voice was heard; and Coifi, the High Priest, proposed that the Heathen places of worship should be destroyed, or burnt with fire.—But who is to execute this task?—The High Priest answers, that he himself will set the example of destroying the pristine objects of idolatry.

From the tone in which the question was put and answered, it is probable that some danger was apprehended from the anger of the people, and Coifi began his work in such a manner, as to shew the most complete abandonment of the Heathen law. According to the ritual of Deira, a Priest could not bear a weapon, or ride on a horse. Coifi girt himself with a sword, and grasped a lance in his hand, and mounting one of the royal steeds, he galloped to the temple of 'Godmundingham.'

This place of worship appears to have been encircled by several concentric enclosures, like the morais of Polynesia, and as soon as Coifi came within reach of the fane, he hurled his spear against its walls. When the people first saw him sally forth, they thought some sudden insanity had seized him. How much more must they have been astonished at this act!—Yet no opposition was offered; within a very short space of time, the fabric was levelled to the ground; and after the lapse of so many centuries, its name, but slightly altered, (Now 'Goodmanham,' Harthill Wapentake, in the East Riding of York.) continues to attest the truth of the history.

Baptism was then performed by immersion, and so general and so fervent was the zeal of the Northumbrians, that Paulinus was employed during thirty-six successive days, from morning to night, in baptizing the eager multitude.

Before a century had elapsed, Christianity was firmly and sincerely believed throughout Anglo-Saxon Britain; and, in the state of society which then prevailed, the establishment of the true religion became the means of conferring the greatest temporal advantages upon the community. A large proportion of the population consisted either of slaves, or of churls or villains, who were compelled to till the ground for the benefit of their masters. These classes immediately gained the comfort of rest, one day in seven; and they whose labours had hitherto been unremitted, without any pause, except when fainting nature sunk under incessant toil, could now expect the Sabbath of the Lord, as a day of holiness and of repose. So strictly did the temporal laws protect the observance of the seventh day, the right and privilege of the poor, that the master who compelled his slave to work on the Sunday, was deprived of the means of abusing his power,—the slave obtained his freedom.

ORIGINAL CORRESPONDENCE.

THE BYSTANDER'S SECOND LETTER.

To the Editor of the Cape of Good Hope Literary Gazette.

"Quæris,
Mæcenas, iterum antiquo me includere ludo.
Non eadem est ætas, non mens."—(*Hor. Epist.*)

SIR,—The ruin of the Wine Trade at the Cape of Good Hope, stands for the moment suspended by a single hair; as did the drawn sword of *Dionysius* over the head of *Damocles*. The letter in the Cape Literary Gazette of 2d January, entitled "Our Wines and their Depreciation, &c." proposed certain measures, which, if adopted in the real spirit of improvement, might give a stimulus to the sale of the natural produce of the Colony. They might avail to place the Wines of the Cape, *not in rivalship* to those of continental Europe and of Madeira, but to introduce them fewer in quantity, and ameliorated in quality, so as to become a beverage grateful and acceptable wherever comparative price is an object of domestic attention. If the sword does fall, much must be endured 'ere the Colony rise from its ashes, and 'ere it acquire a spring, of force sufficient, to urge it on to new-formed resources, and to heretofore untried experiments. It is less costly to repair a building, whose walls and foundation are firm and solid, than to erect a new one from the ground. To arouse, and, if possible, to force into action parties so vitally interested, was the object of the writer; for he makes boast of an attachment to theColony, and to the interests of the Colonists, unyielding to that of any other man.

In this endeavour to improve the state of the Wine Trade, he encountered at starting the reproof of 'THE PRESS," and latterly the remarks of two of its *Correspondents*. To neither of these two, particularly to *A Temperance Boy*, does the writer take the trouble to reply. The *Collegian*, dating from the *South African College*, appears to be jealous lest his *Brat* should be laid at any other door; he advances his sentiments to his FRIENDS AND FELLOW COLONISTS, cloathed in a *coarse and homely dress*, rather than in the tasteful robe of the Roman *Atticus*. Presuming that this bombast cannot have been shewn up, as a specimen of *Collegiate acquirements*, or of *academical learning*, the writer refrains from remark; lest the public should estimate any observations, as time and paper, wasted on *inability* and *presumption*. However, no man can deny the *Collegian* to be versed in PROPOSITION and CONCLUSION; for he says as much himself:

"He is in logic a great critic,
Profoundly skilled in analytic;
He can distinguish and divide
A hair 'twixt south, and south-west side;
He'd undertake to prove, by force
Of argument, a man's no horse:
All this by syllogism, true
In mood and figure, he would do."
(Hudibras.)

The *Bystander*, "Impar congressu Achillis," does not feel bound to respond to the call of "THE PRESS," as to identifying the persons who have shipped inferior Wines. That Cape Wine is acknowledged universally to have *retrograded*, suffices to warrant his argument of the necessity of improvement. When any article is generally deteriorated, the best judges, though intending to act faithfully, become vitiated in their palate by that very circumstance; and, following the *herd*, unwittingly export a decried merchandize. In contradiction to the denial of THE PRESS, the majority of the meeting of Merchants and Wine Growers at the Commercial Exchange, on the 6th ultimo, were decidedly under a conviction of the retrograde movements of Cape Wine; and the writer submits whether it will finally tend to the advantage of the trade, that THE PRESS should persevere in *encouraging a delusion*, so dangerous and so vital to the interests of those who are concerned in the improvement of our colonial produce.

Having assigned sufficient reasons for a belief that Cape Wine is deteriorated so as to affect the sale, the writer offers a few remarks as to quantity. He is charged with being led "astray" in his conclusion, — That the average quantity of Wine transmitted to England since 1816, to the end of 1831, has been somewhat diminished, is true, as is stated by "THE PRESS,"—but what then? The supply has exceeded the demand during the course of each year. In 1829, a glut of 10,000 pipes arriving in London, oppressed the market up to satiety. No sale of consequence has since been affected but at a ruinous loss; and it is owing to the export during 1831 to London, amounting to no more than 3,122 pipes, that the average exports to London of 29, 30, 31, did not surpass the former one. The writer now claims to have convinced those who are open to conviction, that the rejection of our Colonial Wines is caused by a mixed motive; partly arising from an over-supply, and partly from a general reduction of the quality of Cape Wines; and he asks—Does THE PRESS mean seriously to contend, in opposition to these opinions, that Cape Wine needs no improvement, and that the quantity requires no diminution?

The leaguers of Wine which passed the barriers in 1828, 29, 30, amounted

'Safe from the storm, in comfort tarrying.
'Here did it enter—there, on hasty wing
'Flies out, and passes on from cold to cold;
'But whence it came we know not, nor behold
'Whither it goes. E'en such that transient thing
'The human soul; not utterly unknown
'While in the body lodged, her warm abode—
'But from what world she came, what woe or weal
'On her departure waits, no tongue hath shewn:
'This mystery if the stranger can reveal,
'His be a welcome cordially bestowed!'.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

to the number of 43,920, or 60,689 pipes; and as the return of 1831 had not been made at the barrier, the same years are the corresponding years of general export, and gives 37,642 pipes to be deducted from 60,689; leaving 23,047 pipes as the disposable surplus beyond what has been required to fill up the vats,—and not 30,600.

After going through some *dull calculations*, THE PRESS grows facetious, and draws this "curious conclusion," that, to consume the triennial surplus of Wine, beyond the average exportation and consumption, it would require a population, computed at 12,000, to drink 92 gallons per head annually, or rather more than one bottle each per day!! One bottle per day is not an undue allowance for a man whose energies are constantly in action, and whose understanding, *ratione officii*, is deeply engaged—the Editor, for example, of any distinguished paper, but it is an astounding dose for one of *softer* intellect, and would be the parent of *dementia tremens and white liver*. It then proceeds with *a mock argument*, built upon *its own sophistry*, that these are the notable means of diminishing the amount of drunkenness proposed by the writer.

It will be in the recollection of the reader, that in his former letter the *Bystander* complained of the redundancy of Wine, which, like the influence of the Crown in the days of Mr. Burke and Mr. Dunning, had increased, was increasing, and ought to be diminished. As a cure for this vinous Plethora, he advised 'large distillation,' and an abandonment of the vineyards of poorer quality.—Why does not the *Orator* of the Temperance Society disclaim in an open manner all interference with Wine, and satisfy the doubting portion of the community of the sole view and intention being to put an end to *dram drinking* of ardent spirits, of which a suppression could not be more beneficial to the objects, than praiseworthy and honorable the to Society itself? Why like an impending pestilence hang over the public mind on a subject, the adoption of which, as to Wine, might destroy the prosperity of the Colony?

This (so-termed) "singular writer," is quoted as drawing a conclusion, of which he never had a thought. He did assert, and now repeats, that the Wine Trade, labouring under many pressing difficulties, upon the pinnacle of a precipice, may be greatly affected, —nay, precipitated, — "by the *interference and ill-advised acts of others.*" He did say, and still continues to think, that any successful attempt on the part of the *Temperance Society* to put down the use of Wine, under whatever plea it may be made, will cause the ruin of the Wine Trade of the Colony; will be more than an "act of frenzy, a FELO DE SE, and will plant a *deadly blow to Cape prosperity, be the tomb of social enjoyment, and extinguish the hilarities of life.*" As the principle of abstinence is to course to be exercised in private life, it will be truly amusing and delightful to witness the advocates of the system of Dr. Sangrado, (the "*Temperance Boy,*" President, the "*Collegian,*" Croupier,) around an after dinner table, crowned with bottles of the PURE ELEMENT; or like the Hottentots at the celebrated *feast of Bethelsdorp* in Febr. 1830, producing sense and wit from waterlogged mouths, and pass toasts to the tinkling of empty glasses. Boswell, in his Memoirs of Dr. Johnson, furnishes no similar descriptions of the social enjoyment and of the hilarity of that eminent man in his coteries in Bolt Court, yet Dr. Johnson was a celebrated moralist and pious Christian, and his example may safely be imitated. The writer, by his fondness for scripture quotations, appears to have given offence, and to have exposed himself to a charge of profanation, by those, whose style of thinking does not incline them to follow the example. So to do, is in accordance with his judgment and his taste;—if he be asked why? It is, that he believes the books of *Holy Writ* to afford the purest and surest precepts for the guidance of man in his moral conduct and in the performance of his religious duties. He acknowledges their inspiration, and would wish himself and others to be directed by their precepts,—to obey their commands and to follow their ordinances,—as the sure and certain guide to that which ought to be practised or omitted by himself or by others.

"Confirmation strong
As proofs of Holy writ."
(*Shakspeare.*)

The Bystander now dismisses a subject which was not calculated to form a main argument in discussing the State of the Wine Growers and Wine Merchants. It was a mere episode, rendered of importance by the observations of THE PRESS. If the Temperance Society disclaim all intention of including Cape Wine in their prohibitory system, and recall the resolution of expelling all those who are seen at any time intoxicated, by whatever means, whether by dram-drinking or otherwise, the danger from this source, accruing to our Wine Trade from the Temperance Society, will cease and determine.

Since the first letter of the *Bystander* appeared in the *Cape of Good Hope Literary Gazette*, a meeting of Wine Merchants and Growers, *highly respectable* in its personal appearance and character, has taken place.—It was anticipated by the public, that weighty arguments would have been adduced upon the subject of the repeal of the law now in force, as to the limited or unlimited period of riding Wine into the capital.—It must, however, be stated with regret, that the opinions of the individuals were so *opposite and contradictory*, so at variance in many instances with the very benefits solicited by those who urged them, that they appeared to be arguments *per contra*, and the mass of opinions could be resolved only into the "Principle of *Selfishness.*"

In such a discord of sentiment, surely the Committee would have been justified in adopting the tenets of the *Huskisson school*, by the recommendation of that *liberal and open system of trade*, now so prevalent in every branch of our commerce and manufactures—*To leave to every man the care of his own interests*, and to allow him to conduct his affairs as he thinks fit; or, to speak more popularly, "Is it not lawful for me to do what I will with mine own?"

The writer cannot conclude in a manner more to the purpose, than by re-stating a piece of advice, given some years since to the *intermeddling* Burgher Senate, "The Board should follow the counsel given by a French mercantile body to Mon. Colbert, the French minister of finance; who, anxiously inquiring how the Grand Monarque could best serve it, received for answer "*Laissez nous faire;*" a saying which every Government should keep in mind when it inclines to meddle in commerce or manufactures."

I am, Sir,
Your obedient Servant, &c.
THE BYSTANDER.

NATURAL HISTORY, &c.

Nothing Passive or Inert.—The term inert matter is objectionable, inasmuch as that no matter whatever is really passive or inert. From the grand system of the universe, to

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

bodies many times smaller than a grain of sand, nothing in nature is inert, but is full of activity. Myriads of planets are perpetually rolling through the space around us in fixed paths, and turning their own axis; their surfaces constantly undergoing changes by which mountains are elevated or depressed, plains levelled out, valleys converted into watery wastes, islands appear and disappear. Below the surface, the bowels of the earth are in constant action; and the intestinal changes which go on from the expansion of internal heat, find vent in earthquakes and volcanoes, as the safety valves of the great steam-engine of nature. Thus all is active in the collossal world; and while the tempest rages above, or the artillery of heaven resounds along the surface of the earth,—while the lightning rends asunder the ancient tenants of the forest, and the earth trembles with inward commotion, the minutest parts of matter, only visible through a microscope, partake in the universal activity.

Mr. Browne, the celebrated botanist, and a general naturalist, discovered a vibratory motion going on in pulverized granite, flint, glass, &c. which is wholly unaccountable upon any principle of motion in the physical world hitherto ascertained, and which may therefore possibly be identified with that which governs the changes of organized bodies under different modifications.

The Importance of Insects.—The importance of this little race of animated beings is so great, that if it could be suddenly annihilated, the remaining part of animal and vegetable life, even man himself, would shortly follow. To understand the truth of this proposition, it is necessary to consider the following train of reasoning on which it is founded. Let us suppose a series of animals and vegetables A. B. C. D., &c. each in succession feeding on the others; (i. e.) Let A. eat B.; B. C. and so on; and it is obvious that such a system can only be of finite duration, unless the last term C. can reciprocally eat A. This great end is accomplished by means of insects and reptiles—they perform it by reducing every fragment of animal or vegetable matter into a state fit for application to the roots of plants—sometimes dragging down the particles, bodily, under the surface of the earth, but more commonly by preparing them to be washed down by rain. Thus do vegetables feed on animals who feed on each other, and finally again on the vegetables themselves. This theory is exemplified in the natural history of fishes. The great mass of the ocean is uninhabited, for fish, as to their food, are terrestrial animals; their existence depending on the animal and vegetable matter floated down to them by our rivers. A little consideration will show us, that if the ocean were filled with fish only eating each other, they would have a very finite existence; but it is comparatively uninhabited, because there is no insect creation similar to that explained above to promise for their reproduction.

Boring the Earth.—On the 20th of June a letter was read from M. Jobard, of Brussels, announcing that he had brought to perfection a new machine for boring the earth to any depth, and through any soil. He stated that his plan had been tried with the greatest success in the neighbourhood of Marienburg, where he had rapidly attained a depth of 75 feet through an inclined rock of phylade, mixed with argillaceous flints. By a process something similar, though less perfect, wells have been dug in China to a depth of from 2,000 to 2,800 feet, through solid rock. M. Jobard anticipates the greatest advantages to geognosy from his discovery; and, with the usual enthusiasm of projectors, looks forward with confidence to the period (not far distant) when we shall be as well acquainted with the centre of the earth as we now are with its surface.—*Proceedings of the Academy of Sciences of Paris.*

LITERARY EXTRACTS.

THE PRESS.

We deprecate attacks on private character by the press, as much as any, but contend for its right to canvass the conduct of public men, whose conduct merits animadversion — to laugh at *blockheads* and to chastise *fools*. We trust, however, that in treating matters of government, it will always act with temper, and in a proper spirit; neither malicious nor unjust, but recollecting its best interests are those of the country. The Press is the mouth-piece of public opinion. It is a mighty engine, and the attacks made upon it, it may well afford to bear. Such attacks are but dew-drops on the lion's mane. It is remarkable that intellect, and all connected with it are odious to the "serviles," (the *crawlers,*) in every country. In Russia, the Poles are all to be forgiven, save those who nobly aroused their slumbering country by appeals to their patriotism through the Press. He who strikes with the sword is pardoned. but not the hand that strikes with the pen. Despotism known the difference. It nurses ignorance like a darling child, but casts knowledge like Ismael, into the desert, lest it should be too many for its parent.—*(Metropolitan.)*

SMALL BEGINNINGS.

The culture of rice was introduced into South Carolina about the year 1694. Different accounts have been given as to the manner of its first introduction. The account, however, given by Dr. Ramsay, in his History of South Carolina, is, probably, the most correct, and which we shall give in his own words:

"Landgrave Thomas Smith, who was governor of the Province in 1693, had been in Madagascar before he settled in Carolina. There he observed that rice was planted and grew in low and moist ground; having such ground at the western extremity of his garden, attached to his dwelling house in East Bay-street, he was persuaded that rice would grow therein if seed could be procured: about this time a vessel from Madagascar, being in distress, came to anchor near Sullivan Island; the master of this vessel inquired for Mr. Smith; as an old acquaintance, an interview took place; in the course of conversation, Mr. Smith expressed a wish to obtain some seed-rice to plant in his garden by way of experiment; the cook being called, said he had a small bag of rice suitable for the purpose; this was presented to Mr. Smith, who sowed it in a low spot of his garden; it grew luxuriantly; the little crop was distributed by Mr. Smith among his planting friends: from this mall beginning the first staple commodity of Carolina took its rise."

In the year 1816, the quantity exported from the Carolinas was 137,846 Tierces; value 3,555,000 Dollars.—*Pitkin's Commerce, United States of America.*

Astonishing increase of Cotton Manufactures in Manchester.—In the year 1784, 8 bags of cotton were imported into Liverpool from America; in 1824, 409,670 bags; and 1829, 640,998.

In 1790, the first steam engine was created in Mancester; in 1824, it contained 200 steam-engines; in 1784, there was not one power loom in Manchester; in 1824, there were 30,000!—*Ackermann's Descriptive Particulars Liverpool and Manchester Railway.*

POETRY of the NEW YEAR.

SONNET

BY LORD HOLLAND, ON READING MILTON.

Homer and Dryden, not unfrequently
The playful Ovid or the Italian's song,
That held entranced my youthful thoughts so long
With dames and loves, and deeds of chivalry,
E'en now delight me. From the noisy throng
Thither I fly to sip the sweets that lie
Enclosed in tenderest folds of poesy;
Oft as for ease my weary spirits long.
But when recoiling from the fouler scene
Of sordid vice, or rank atrocious crime,
My sickening soul pants for the pure serene
Of loftier regions, quitting tales and rhyme,
I turn to Milton; and his heights sublime,
By me too long unsought, I strive to climb.
(The Keepsake.)

STANZAS

BY LORD MORPETH.

Who has not felt, 'mid azure skies,
At glowing noon or golden even,
A soft and yellow sadness rise,
And tinge with earth the hues of heaven:
That shadowing consciousness will steal
O'er every scene of fond desire,
Linger in laughter's gayest peal,
And close each cadence of the lyre.

In the most radiant landscape's round,
Lurk the dim haunts of crime and care;
Man's toil must plough the teeming ground,
His sigh must load the perfum'd air.

O, for the suns that never part,
The fields with hues unfading dress'd,
Th' unfaltering strains, th' unclouded heart,
The joy, the triumph, and the rest. *(Ib.)*

THE GARRICK CORRESPONDENCE.

We give the following as a specimen of Garrick's easy mode of disposing of offensive persons, who thought that when the dull pieces which they sent to the theatre were rejected, they were bound to call the manager to account.

"'Master Robert Dodsley,

"'When I first read your peevish answer to my well meant proposal to you, I was much disturbed at it—but when I considered that some minds cannot bear the slightest portion of success, I most sincerely pitied you; and when I found in the same letter that you were graciously pleased to dismiss me from your acquaintance, I could not but confess so apparent an obligation, and am, with due acknowledgements,

"'Master Dodsley,

"'Your most obliged,

"'DAVID GARRICK.'"

Punning Notice.—The following announcement appears on an old barn-like-building in the pleasant lane leading from Hamstead church-yard to Kilburn, Middlesex.—

"Horses taken into the *straw*-yard and fed upon *hay*."

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

AN APPROVED RECIPE FOR GOOD AND NOURISHING BEER.

PUT 1 peck of barley or of oats into an oven just after baking, or into a frying pan, just to steam off the moisture, and dry it well, but on no account to burn the grain; then grind or bruise it roughly. Boil 2½ gallons of water, and when it has stood ten minutes (say at a heat of 175 degrees, or so hot as to pain the finger sharply,) put in the grain; mash it well, and let it stand three hours; then drain it off. Boil 2 gallons more water, which pour on the grains (rather hotter than before, but not boiling, say 196 degrees,) and mash them well, let it stand two hours and draw it off; mash the grains again well with 2 gallons of cold water, and in one hour and a half draw it off. The three sorts will be about 5 gallons. Then mix 7 lbs. of treacle, or 5 lbs. of the *darkest* sugar, in 5 gallons of water, and boil the whole 10 gallons with 4 oz. of hops, for one hour and a half, taking care to stir it so long as the hops float on the top; let it cool, and when about milk-warm take a good teacupful of yeast, and stir it well together, beginning with about a gallon of the wort at a time; let it ferment for eighteen hours in a tub covered with a sack; put it into a nine-gallon cask, and keep it well filled; bung it up for three days, and in fourteen days it will be good sound fine beer, equal in strength to London porter. The nine gallons of beer thus brewed will cost as follows:

1 peck of barley	1*s.*	3*d.*
7 lbs. of treacle	1	9
4 oz. of hops	0	3
	3	3: or 1*d.* per pot.

Many persons are, however, prejudiced in favour of malt: If, therefore, *malt*, with sugar or molasses is preferred, the following recipe will be found to make good wholesome ale:

Boil 8 gallons of water, and when it has stood ten minutes (say 176 degrees,) or so hot as to pain the finger sharply, put into it 1 bushel of ground and malt; mash it well; let it stand for three hours, draw it off; pour upon the grains 8 gallons more of boiled water rather hotter than before, but not boiling (say 196,) mash it, and let it stand two hours, and draw off; then mash the grains with 8 gallons more water, let it stand one hour and a half, and draw it off; mix 28 lbs. of treacle, or 20 lbs. of the darkest sugar, in 20 gallons of water, and boil the whole together with 2 lbs. of hops for two hours, stirring it so long as the hops float; let it cool, and when about milk-warm mix half a pint of yeast by about 2 gallons at a time, and stir it well; let it ferment for twenty-four hours with a sack over it; then put it into a barrel, keep it well filled up; bung it down in three days; and in three months you will have 36 gallons of good ale at the following price:—

1 bushel of malt	9*s.*	0*d.*
28 lbs. of treacle	7	0
2 lbs. of hops	2	0
	18	0: or 2½*d.* pr. quart.

NOTE.—The only risk is, from using the water *too hot*, which will prevent the draining off of the liquor, by *setting* the grain. The dried raw grain will drain better by mixing with it *about a handful of oat-chaff* before the first water; *it will prevent it from setting.* The hops will yield better if they are pretty well damped before they are mixed with the worts. Observe, that you in no case use *boiling* water to the grains.

WONDERFUL EXHIBITIONS AT A COUNTRY FAIR.

WALK up, walk up, han see the vunderful dwarf honly six hinches igh, who — devours ten cart-loads of hay, besides wat the comp'ny pleases to give un. This way, maum, make way there for the ladies just to step upon the— fine strawberries and cream here, and hot mince-pies.

Here you will see for one penny, the unappy man as vas angd for murdering off — the vunderful diamond — beetle with 300 pair of heyes, and 700 pair of orns.

Hin this here hexibition is the great Hirish giant, measuring twenty feet in ite, weighing 700 weight, and who — will dance a hornpipe in the palm of hany one's hand as likes.

This is the famous sapient pig Toby, as can tell the pretty young vimen their sweathearts' names, and — though born vithout heither harms or leggs, can write a beautiful hand with the mouth, and vurks chain — stitch and hembroid'ry.

A most helegantest Hingy parrot — who was hanged for the murder of his hunfortnet wife, and the rope breaking from his veight, he recovered after hanging a fortnight in the severe frost, and having one of his arms torn off by the ravenous Russiay wolves.

Here you may see the deep and bloody tragedy of Romeo and — gingerbread nuts, gentlemen, nice spiced nuts, I assure ye.

Maum, I recommends this oyster-knife to your notice, cause besides opening the oysters, it — plays upon three instruments at once, balancing glasses of water on the nose, forehead, and both feet.

Come and see the vunderful fat Hox, whose fore leg alone — can write the song of Rule Britannia on a silver-sixpens.

This is a vieuw of the North Pole and the hice mountains, vere it halvays freezes — all ot, all ot, all ot.

Try your hand in the lucky-bag, Mam, and ye'l get summut o' wally, as it contains — hall the wenemous sarpins of Haffricky, with sentipees, crocodiles, scorpins, and other beastes, too noomerus to menshun, all alive.

Them as would like to see the woracious and rav'nous hanimals fed, must come at 10 o'clock at night, ven ve gives um large buckets of — wax dolls a hay-penny a piece, and big uns at a penny.

Here is the clever calculating boy as never is wrong, and who has been known in the space of two hours to — tell the hour by looking at a watch a scraping with his fore-paw, without briddle or saddle on him.

The beautiful and helegant white-haired Albeenee, ladies and gentlemen, she has pink heyes — five horns, and seven legs, with the head turned the wrong way.

Your new bonnet, my dear, would be improved, if you'd stick on one side — the jawbone of a whale, 60 feet long, and all's teeth in the front, and a vunderful mermaid, with a comb in her hand.

Here you may see the hactive young Chinee as jumps hover at once — the whole City of London, with the shopmen stanning at their doors, and the smoke comin' from the chimneys all as naitral as life.

Here's a coorosity! the hextraonary Hameriky sarpint as daily devours — poison for rats, moletraps, plated candlesticks, and cheap second-hand coal skuttles.

Walk in here, ladies and gentlemen, and see the larned Canary-bird Dicky — who balances a cart-wheel on his nose, swallows ten real swords, and lastly will have a block of stone weighing 3 tons, placed on his breast, and broken with 60 sledge hammers.

Well, I must indulge myself with one concluding observation,—they did not utter such nonsense in my day!—*Comic Annual, by Miss Sheridan.*

BREVITIES.

DRINKING, with a view to heighten natural good spirits, is like attempting to improve the natural fragrance of the rose by smearing it with pomatum.

A benevolent man would not so much wish for the lever of Archimedes to move the world itself, as for a moral lever that would enable him to lift its inhabitants one degree nearer to heaven;—and this glorious privilege every such man does in a degree possess. His example operates as a strong arm, stretched out to raise his fellows to the eminence he has reached himself.

In the heathen mythology, Diana was twin-born with Apollo—a useful hints to poets of the luxuriant class.

It is a severe satire on mankind to say that prosperity is more difficult to bear than adversity. The maxim implies a natural meanness or malignity in those to whom it is applicable; for if a man has but the habitual wish to diffuse happiness, what more does he require to make his prosperity a blessing to himself and all about him?

Fame, like money, can never be enjoyed while we are obliged to dun the world for it. That only is worth having which comes unasked.

Genius is the wand of an enchanter;—talent, the strength of a giant.

Continuing the game-laws in order to induce country-gentlemen to reside on their estates, reminds one of Master Billy enticed to school by his tender parents, with a promise that, if he is a good boy and minds his book, he shall kick the cat about when he comes home.

The Genius of Astronomy, with his starry wand, has effectually shivered the fortress of Superstition—shivered, but not destroyed;—almost every one possesses a piece of the ruin as a sort of relic;—but it can never be re-united as a place of strength to overawe the nations. Where Newton is freely studied and believed, we shall have no more religious wars.

Nations are sometimes, though rarely, ungrateful; but they much oftener commit the folly of being grateful infinitely overmuch. Let them beware of this; it is wasting one of the most precious streams, that Providence has ordained to fructify human genius and benevolence.

SELECT NOTICES.

Gaming.— Lord Suffield lately spoke to the following effect in the House of Lords. "Care ought to be taken that gambling for money should not be allowed to prevail in beer houses or in any sort of public houses. There is nothing that so much corrupts the heart and the morals as gaming.——*Keeping Accounts.*—"Being a good accountant is not only of solid use in itself, but it gives the mind a habit of accuracy in other matters."—*(Life of Sir T. Lawrence.)*——*The Welsh Peasantry.*—Lieut. Morrison of the *Rothsay Castle,* has published a statement of the admirable conduct of the Welsh Peasantry in this case. The Lieutenant contrasts the conduct of the Welsh with that of others placed in like situations, and considers their honesty and benevolent feelings to have been produced by the great spread of religious knowledge in Wales. Money found loose and in great variety about the bodies of the unfortunate people who were wrecked, was scrupulously brought to Beaumaris by the country people. Every article of the wreck was also religiously preserved. It must not be forgotten that the *drunkenness* of the Captain caused the fatal loss of the Rothsay Castle.——*Population and the Press.*—In April, 1828, Mr. Balbi published as follows:

	Population.	Number of Journals.
Europe, . . .	227,700,000	2142
America, . . .	39,300,000	978
Asia, ...	590,000,000	27
Africa, . . .	60,000,000	12
Oceania . . .	20,000,000	9
General Total for the whole Globe,	737,000,000	3168

——*The Americans.*—These extraordinary people have just shortened the navigation of the Great river Mississippi between New Orleans and Louisville, about *forty-two* miles, by cutting two bends in the river. For particulars see Mechanics Magazine for October.——*Travelling.*—The price of steam travelling between Liverpool and Dublin is sixpence per head.——*Evaporation.*—The *Sun flower plant* will lose as much as 11b. 14oz. by perspiration in 12 hours; and in general,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

in equal surfaces and equal times, a man will perspire 1 50, the plant 1-165 or as 50:15; so that taking all things into account, a sun flower perspires 17 times more than a man.——*Lord Brougham* was born at Edinburgh, and baptized there in 1779 Lord Brougham, in 1816, married Mary Anne, the widow of John Slade, Esq. and a distant relative of the Auckland family. By this lady he has had two daughters, one of whom died in infancy.——*King's College, London.*—Principal Otter, who has been appointed to the King's College, is a gentleman of high intellectual attainments, and is a *liberal* in sentiment. He is well known as the author of Dr. Clarke's life, and several pamphlets in defence of the British and Foreign Bible Society.——*England and Reform.*—When Sir Joseph Jekyll died, he left his fortune to pay the National debt. "Sir," said Lord Mansfield, to one of his relations, "Sir Joseph was a good man and a good lawyer, but his bequest is a very foolish one—*he might as well have attempted to stop the middle arch of Blackfriars Bridge with his full bottomed wig!*" so say the Reformers of England—the House of Lords can no more stop the success of Reform, than Sir Joseph Jekyll's bequest could pay the National debt, or his wig impede the current of the river Thames.——*Russia.*—The inglorious war with Poland has caused her almost two years the expenditure of millions of money, and little short of 200,000 lives to break down the resistance of the poorest people of the earth. She has no triumph to boast of in the field. To garrison Poland she must expend an army. The spirit of the country is not dead, and every movement in Europe will vibrate to Warsaw.——*Italy* is again disturbed. Italy is the most palpably intended by nature, for power, productiveness, and general human enjoyment; yet for centuries Italy has been the toy, or the drudge of Foreigners; her fine country the common field of blood and plunder to the Austrian, the Swiss, and the Frenchman. Italy, some years since, contained, at the lowest estimate, 14,000,000 of people—she probably now contains 18 millions. Previously to last year, all Italian insurrections were for the Priesthood. The cry is now "down with the Monks and Friars."——*Holland and Belgium.*—By the treaty, Belgium is to pay between 8,000,000 and 9,000,000 Guilders of the National debt, the interest of the whole amount being 27,000,000 Guilders.——*Portugal.*—Don Miguel still sits on his unacknowledged throne, whilst Don Pedro is collecting soldiers and exiles.——*Law.*—The Lord Chancellor recently alluded in Chancery, to the custom of persons going abroad to avoid the payment of their just debts. He himself, his Lordship said, knew a man of £8000 a year, who had lived in the *rules* to avoid his creditors. The expenses of law proceedings, those of the Insolvent Court, the discharge of prisoners, the expenses of debtors while in gaol, and those of collecting funds to £600,000 a year, and all this was abstracted from the funds of the Creditors. In addition, the sum of £116,000 was spent in justifying bail.——*Value of the Oak.*—An oak tree was last week felled near Ludlow, Shropshire, the produce of which was 39 tons of timber, 55 cords of wood, 200 park pales, and 5 cords of brackets. A bough broke off before the tree was cut down, which weighed 7½ tons. Three men were employed a month in stacking it. The whole tree was valued at £165. (*Chester Chronicle.*)——*The Rev. R. Hall's Works.*—The publishers have announced that the Memoir of that distinguished writer, including a sketch of his Literary Character, will be from the pen of Sir Jas. Mackintosh. An interesting original letter from Sir Jas M. to the late Mr. Hall, was first published in the Cape Literary Gazette, No. 1, page 6.——*Religious State of France.*—It is stated in the public Journals on good authority, that a new era as to religion has begun in France, since the astonishing revolution of July, 1830. The obstacles to the spread of religious truth, which the ancient government always suffered more or less to remain, have almost entirely disappeared; it is no longer necessary to obtain permission to preach the gospel and hold religious meetings. Already three new Protestant Churches, which do not receive stipends from the State, have been organized at Paris; others of the same kind have been formed in the country, while at the same time a purified Catholic Church has risen up, called The New French Catholic Church, to which many of the best of the Catholic Clergy have attached themselves. Fifty Priests have already joined this communion, over which the Pope of Rome has no authority.——*Kings of England.*—The average reign of Kings, from William the Conqueror to the death of George IV. is twenty-two years: 34 *crowned* heads having reigned 754 years.——*Tastes of Men.*—When the King of the *Sandwich* Islands visited London, he said, that the most admirable of the British Institutions was the *Cooks' Shops.* When Prince Le Boo was in England, he always paid the most attention to the *Potato* warehouses. When a North American Indian was in London, he contemplated with unmixed delight the wealth of the *old-iron* shops: and when a poor Bushman of the Cape frontier visited the Public Library in Cape Town, and was shewn the pictured-books, none awakened his attention but the botanical works with *bulbous* illustrations.——*Players no better than great beasts!*—What would Dr. Johnson say to the following, who used to call the players a set of *dancing dogs.* "An oriental spectacle entitled *Hyder Ali, or the Lions of Mysore,* was this evening produced at Drury lane, in which the *principal actors* were the habitants of the menagerie of Paris, and M. Martin, their keeper, the hero of the drama. The animals that figured on the stage were two elephants, a lion and lioness, a tiger, a pelican, a few monkeys, &c. (*London Paper, Oct.* 17.)——*The Deluge.*—It is evident that the flood was universal *as to mankind;* but from thence follows no necessity at all of asserting the universality of it as to the globe of the earth, unless it be sufficiently proved that the whole earth was peopled before the flood. (*Stillingfleet.*)——*Great News to the afflicted Anti-Temperance People.*—A German critic says, that the leaf which the dove brought to Noah in the ark was not an *olive leaf,* but a small branch of the *vine,* which he immediately planted on his landing on *Terra Firma.*——A Scientific association has been recently established under the auspices of some of the most distinguished *literati* of the kingdom. Its objects are for the general promotion of science through the medium of Public Lectures; for which purpose meetings will occasionally take place, on stated occasions, in the principal towns of England. The first meeting took place at York, at which Lord Milton presided. The theatre of the Museum was occupied by a numerous assemblage of men of science, consisting of some of the most distinguished members of the learned bodies in the Kingdom. The sitting of the meeting lasted one week. On the last day, Lord Morpeth addressed the meeting in a speech of great excellence. He stated that the objects of the association were to give a new motive amd a guarentee to the friendly intercourse and continued concord of nations, to make further inroads into the untravelled realm of discovery, and glean fresh harvests from the unexapusted fields of nature, to promote the comforts and augment the resources of civilized man, and to *exalt above and over all, the wonder-working hand of Heaven.* The next meeting of the association is to take place at Oxford.——*Pounding Divinity.*—from an old Divine. "Please you, therefore, to call to mind the several parts of my text; 1 Quis: 2 Quando; 3 Cui; 4 Quid; 5 Pro Quibus; 6 Quare; 4 Quid the thing prayed for. Pardon and Forgiveness."——*Dr Magee,* the late Archbishop of Dublin, was the son of parents extremely humble in life, and was *servitor* in the University of which he was afterwards the distinguished ornament.——*Knowledge.*—At the last Cambridge examination the senior wrangler—he who got the highest honours—was the son of a poor man at Sheffield, who had been sent to school by his kind neighbours, who appreciated his early talents; and the next victor was a little boy of Westmoreland, who had been taken by the hand by the Lord Chancellor Brougham. In the Island of St. Thomas was a negro, a slave, who in early life had shewn great ability: he was educated, and became eminent for his knowledge of architecture and engineering; and on this account he was engaged in the construction of some of the most important public works: he was also skilled in five different languages: he was however still a slave, and so were all his family. By his skill, industry, and perseverance, he amassed some money and he purchased—his own freedom? No. first that of his wife. He again proceeded with his industry and economy, until he was enabled to purchase his own freedom at a very high price, and subsequently the freedom of his six children. He died at an advanced age, nearly 100 years, leaving his family in independent circumstances. (*James Montgomery.*)

A NOTE OF THE MONTH.

THE SAVINGS' BANK.

FROM the circumstance of having devoted many pages of this Journal to the interests of *The Cape of Good Hope Savings' Bank*—especially at its commencement, when, "with bended bow and quiver full of arrows," the enemy hovered over it, we cannot easily express how gratified we feel as to its complete success. From the report of the Managing Committee, it appears that the amount of Deposits now in the Savings' Bank, is upwards of *Nine Thousand Pounds Sterling.* The following are the Office-bearers of the Savings' Bank for the present year:

J. Marshall, Esq. *President;* the Hon. Sir John Truter, the Hon. Col. Bell, the Hon. J. W. Stoll, A. Oliphant, and J. J. L. Smuts, Esqrs. *Vice-Prssidents;* Messrs. W. W. Bird, W. Hawkins, E. I. C., C. S. Pillans, J. B. Ebden, E. Christian, H. G. Muntingh, H. Ross, D. Kuys, R. W. Eaton, and Major Rogers, *Directors;* Messrs. H. E. Rutherfoord, W. Liesching, J. H. Tredgold, J. C. Gie, F. S. Watermeyer, G. Sanford, G. W. Silberbauer, G. H. Maasdorp, and R. J. Jones, *Managers.*

CORRESPONDENCE.

The length of several of the Articles in the present Number, precludes our admission of *Recent Rambles among the Mountains, No. II.*

Communications from *Mauritius* have come to hand, and will be attended to.

W. S. S. must address *The Editor* to the care of the Publisher.

He who asserts that our Travelling correspondent has broken faith in publishing the details of private conversation, knows well enough that he is telling an untruth.

We are much obliged to *A Well-Wisher* for his kind suggestions: we had counted the cost of the articles in question before they appeared in print.

A Subscriber at Stellenbosch is entitled to our thanks, though mistaken in his views. The sayings of the "worthy Magistrate," as they appeared in our last Number, were merely a *re-print;* they had often found their way in the Newspapers in the reports of law proceedings. And if we take up the Graham's Town Journal, No. 6, we shall find, under the head The Protector of Slaves *versus* M. M. Marais, as follows: "The Magistrate regretted that the Law in this case was imperative," which is simply the reiteration of the words of the "worthy Magistrate" in question, and which words our correspondent repeated in substance in his travelling sketches.

In reply to *Clio,* Martyn's Gardners' Dictionary, 4 vols. fol. (in the Public Library,) may be consulted on the Sugar-cane. The Plants distributed from the late Library-Garden, were originally received from *Slangekop,* with many others which were kindly selected by Mr. ROCHER, the Proprietor.

Printed and published by W. BRIDEKIRK, Heeregracht, Cape Town.

RECOLLECTIONS OF RAMBLES AMONG THE MOUNTAINS.—No. II.

After climbing the *Delectable Mountain* leading to Gnadendal, we entered the tranquil "vale of Grace" on the evening of the 5th of Nov. We know of no place on earth equal to this delightful Missionary village for solacing the wearied spirit, and "resting the aching wing." We were in time for vespers, and found the chaunt or melody of the Hottentots, as strikingly original and beautiful as on former occasions. What are our oratorios at home, or the mock chaunt, with all that can ravish the eye as to *spectacle*, in Romeo and Juliet at old Drury, in comparison with the divine eloquence of Hottentot Psalmody? But comparisons are odious. On the morrow was the sabbath,—at whose early refreshing dawn we were summoned by the warning sound of the "morning bell."

How sweetly shines this Sabbath morn!
What healing to the soul it brings!
No sounds upon the air are borne
Save gentle Nature's whisperings.

The swallow skimming o'er the green,
The loosen'd cattle loit'ring round
The hymning grove—the purling stream,
Alone disturb the calm profound.

O'er the high vault of stainless blue
Light snowy fleeces float serene;
Like hov'ring spirits, pleased to view
The stillness of the Sabbath scene.

It seems the threshold of the sky—
It seems the place of shelter—where
The weary wanderer may apply,
Secure to find true *heart's ease* there!

The sacred appointments of the day appeared to be all religiously observed, and the church services were well attended. Nothing tended to disturb the quiet of the *Travellers Lodge* at Gnadendal, but the arrival of persons keen in their anxieties to hire Hottentots for the approaching time of *sheering*. Although well aware that the specific time for securing servants at Gnadendal is on Monday mornings, yet they did not fail to try their hands at a bargain on the day distinct from the world and its pelf. It is a pleasure to record, that, in the case before us, the Hottentots were inflexible, and no business was done. Nor were things much improved to the bargain-hunters on the following day, for they had the hardihood to offer to the reaper from five to six skillings per diem (i. e. 11¼*d.* and 13½*d.*) for bending his back to the sickle. Of course was included in the offer, the run of the kitchen, and a bottle of wine, which latter may have cost something less than the fourth part of a *bawbee*. We must observe, that at the *Lodge* we met with many truly worthy farmers, who were visiting Gnadendal for a very different purpose than that of undervaluing human labour—of driving a hard bargain at the expense of those who could ill afford the sacrifice.

Since we last visited Gnadendal, we discovered many interesting improvements. The Library is contained in an excellent room set apart for a respectable collection of books in various languages. It is the best country library, perhaps, that may be in the colony. It contains globes, maps, and a handsome painting in oil colours of the Rev. Mr. La Trobe. We found the schools in tolerably good order, and the newly instituted Infant School was succeeding to admiration. The Rev. Mr. Halbeck, the well-informed superintendent of the Mission, was conducting this school. A new building has been erected expressly for this juvenile institution, and an excellent one it is. The oak-trees planted at Gnadendal are thriving to perfection. You may now ramble through the woods and enjoy the luxury of walks in a forest. The church-yard emblems of mortality are increased of late years, and testify the loss of many an exemplary missionary. It is from a Moravian church-yard that Montgomery* has imagined his beautiful burying-place of the Patriarchs.

A scene sequestered from the haunts of men,
The loveliest work of all that lovely glen,
Where weary pilgrims found their last repose.—
The little heaps were ranged in comely rows
With walks between, by friends and kindred trod,
Who dress'd with dutious hands each hallowed sod.
No sculptured monument was taught to breathe
His praises whom the worm devoured beneath;
The high, the low, the mighty, and the fair,
Equal in death, were undistinguished there,
Yet not a hillock mouldered near that spot,
By one dishonoured, or by all forgot;
So some warm heart the poorest dust was dear,
From some kind eye the meanest claim'd a tear.—
And oft the living by affection led
Were wont to walk in spirit with their dead,
Where no dark cypress cast a doleful gloom,
No blighting yew shed poison o'er the tomb;
But white and red, with intermingling flowers,
The graves looked beautiful in sun and showers.—
Green myrtles fenced it, and beyond their bound
Ran the clear rill with ever-murmering sound.
Twas not a scene for grief to nourish care,
It breathed of hope, and moved the heart to prayer.

(World before the Flood. Canto 5.)

In our walks through the village, we found the people generally engaged in garden pursuits. It is not only in reference to Gnadendal, but we have remarked in general, the little attention paid in the interior parts of the colony to the cultivation of pot herbs and sallads. The Potato too, seems to be treated with great neglect, and little are its merits prized. Nor does milk appear to be as welcome to the colonist as it ought. The unfortunate excitements (from quantity and cheapness) to drink Cape Wine and Brandy, and from a similar cause to *feed* greedily on animal flesh, worsens man wherever he is found, and is extremely prejudicial to civilization and colonial improvement. "The multiplication of cattle has brutalized the boors of South Africa, the peons of La Plata, and the

* Not—
"The maudlin, mawkish, mock Montgomery."

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Brazilians of Rio Grande, and the other grazing countries of Brazil."*

We found at Gnadendal a new establishment of striking importance—a tannery, including a new and capacious building, erected on the best principle, for the manufacture of leather. In former times the cutlery business was carried on at Gnadendal to a considerable extent, and the Hernhuters' knives, with the Hernhuters' mark, were a sort of genuine current coin in which no depreciation was feared. Our *Brummegem* or Sheffield people (who are always said to sleep with one eye open) ruined this trade. They introduced hundreds of dozens of their own manufactory to the Cape market. These were of course a much cheaper and at the same a very inferior article, but having the *Gnadendal mark* on the blade, and being advertised as Hernhuters' knives, the farmers bought, and were *taken in!* And the great evil of all this base competition was, that Gnadendal lost its fame in the annals of cutlery.

But the tanning business of Gnadendal is now in high repute, and we were astonished at the demand for the article of leather by various customers who had travelled from a distance. The truth is, many of our old tanneries at the Cape have become extinct, and good leather is absolutely a *desideratum*. In a country of hides and skins as this is, how passing strange that we must yet depend on England for the art of converting these commodities into good and wholesome leather. Tanning is, we suspect, but in its infancy at the Cape; the regular processes to which leather is subjected at home, appear little understood here, in as far as we have had the opportunity of judging. During our present rambles, we often saw cattle slaughtered principally for their hides! When cattle are raised merely for slaughter, when they are not employed in agriculture, and nothing is looked for from them, but their hides and their flesh, or perhaps their hides alone, the condition of a people becomes worse than barbarous. Let the friends of Caffer civilization direct their attention to this subject, and let it be remembered, that two-legged animals are much more wanted at the Cape than four-legged ones. Again as it regards Gnadendal—we could wish that the cottages of the Hottentots were better in construction, and neater in appearance. In many instances we beheld too much of the *McClarty* school. But a *Cottage System* is wanted for the whole colony. Where are the best designs for cottages for the poor to be found? The Editor of the Literary would surely be thankful for any communication on the subject.

As we have noticed the existence of the Traveller's Lodge at Gnadendal, (a plain cottage for the reception of visitors,) we may mention that, according to the readings on the windows, and the rude carving on the tables, many of its temporary inmates had determined, it seems, not to be forgotten. To be forgotten is, after all, as much the general lot as to die, yet few submit to this dreary particular, without a hope of some mitigation and allowance. Hence the numbers who scrawl their names on chairs, tables, trees, and walls. A word or two to such exhibitors of silly taste. Let those who would not be forgotten, *deserve* to be remembered. The achievements which tend most to raise the minds, to humanize the feelings, and improve the condition of men, are the best securities for a cherished and lasting life to their memories. There is no burial for the great benefactors of their kind. But the love of fame is an universal passion; and it would be hard if some degree of the enjoyment were not permitted to the crowd, who, wanting ability or opportunity, cannot exactly comply with the severe condition of deserving it.

After all, on second thoughts, cutting or scratching a name on a tree, a wall, or an inn window, is, in the way of monument-making, the simplest and most unpretending deed that we can think of—the humblest exercise of the love of fame—of that great passion, high and low, which will work with a pin's point, and has cumbered the earth with the pyramids. Yet how blind is our pride! how limited our foresight! Works thus insignificant, and relating to insignificant people—the labour of a minute—the merest hints of ambition have lived through more centuries than the proudest productions of human art and toil. On some of the walls of Pompeii, the scrawlings of the Roman soldiers are still visible—frail memorials, preserved by the same catastrophe that buried the town and its people, and now brought to light, when the ETERNAL CITY has scarcely a vestage left of all that is contained of great, and good, and fair. This is a comfortable reflection to the numerous tribe of *cutters out* — the "T. Jenkins'," — "Burdett for ever,"—"Annual Parliaments, and Universal Suffrage,"—"James B.,"—"Maria M.,"—"I love you,"—"Betsy Brown,"—and many, many others. Once more, in the little village of Bowness, on the Cumberland border of the Solway Frith, the traveller, if he have ardour enough to hunt for them, may see here and there a smooth tablet of free stone (fragments from the Picts' wall), set in like a picture on the unhewn front of a cottage or a barn, shewing names, Roman names, as rudely cut out, and nearly as old as those at Pompeii, and whose authors, no doubt, as little calculated upon a reader outliving the era of Rome.

There are people who have a strange fancy for trusting their names under the foundation-stone of a Bridge, or Church, or Freemason's Lodge. Now this is the worst scheme of fame that was ever invented. Fame!—it is wilfully hiding yourself from day; hoarding yourself up, in the blundering spirit of the miser, who at once secretes and nullifies his gold. You may amuse yourself with the notion that there you are snug and out of harm's way for centuries; but if nobody is to see, hear, or think of you in your solitude, you are not a whit more alive, under your stone, than in your coffin. Perhaps public men may fairly leave the business of immortality to their contemporaries. Hence distinguished men have had their appropriations in all sorts of ways. We read of *Graham's* Town, and *Caledon*, and *Somerset*, and *Worcester*, and *Bathurst*, and *Malmesbury*, and many others in this colony. Then, again, in looking about us somewhat more extensively, we touch upon *Croker* Heads, and *Pitt* Points, and *Melville* Harbour. Coming to more dashing things, we read of the *Wellington*, licensed to carry six insides. The *Waterloo*, the *Adelaide*, the *Royal William*, the True Blue, worked with *Grey* horses, the *Canning*, the *Russel*, the new *Opposition*, &c. As for the World of Fashion, it is for ever *naming* men and things. There are *Wellington* boots, and *Coburg* hats, and *Grey* habits. The tailors, drapers, milliners, and mantuamakers, are famous hands at giving sir-names to their fancy articles. The bakers and confectioners are not far

* Southey.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

behind,—but these gentlemen are beat all to sticks by the chemists, and druggists, medicine venders, the quack and lotion people. Certain personages of the lack-brain family of this colony have made sad work of the noble art of *calling names*. They thought in their sapience to provoke a sneer, and call up a grin at the expense of a reverend gentleman who had disturbed some of their favourite prejudices; and who, to say the least of it, has shewn himself a hero in the removal of

"Oppression's woes and pains."

Now, what do the witlings do?—Send the reverend divine to the tomb of all the Capulets? No. Bricks and mortar soon crumble into dust. Exalt his name on a sign post? No. This soon becomes a *post*-obit affair. The great sensible objection that we can propose to *signs* as depositories of our posthumous life, is the precariousness—the briefness of their reign. The old *Marquis of Granby* is off the hinges. The *King of Prussia* is now nobody. The *Georges* (save and except the IIId.) are deadly, dull, and dim. The *Duke of Cumberland*—poh! The *Garrick's Head—off, off!* The *Mitre—going, going!*—(*Sic Transit*, &c.) But to proceed,—our Cape bodies had no doubt determined that a city, a province—nay, an empire, cannot be responsible for our immortality. The stars are credible monuments, no doubt—and are sound funds in which to vest a name. No—these are to share their fate with the "wreck of empires, and the crush of worlds." Well, then, since "the sun, the moon, and all the stars" fade in the lapse of ages, and expire, where shall we find duration? In the world of waters it is declared at the Cape. In the sea—and as the great law of fecundity is so intimately connected with *fish*, we have Nature's guarantee for the preservation of the name. Henceforth, let the *Hottentot* of our bays be denominated *Phillipine*, and the name is handed down from generation to generation. We know of no compliment (certainly not intended by the inventors,) equal to this expression of public notice in the page of history. Well may old Latimer say,—"The Devil often sets out on a business, having for its intent the ruin of an adversary—which he so botches, that the evil which the foe intended turns out for good, and sets up that which he had intended to cast down. Thus it is, that the Devil's corn goes all to bran."

We took our departure from Gnadendal on the morning of the 8th of Nov. It was the sweet hour of prime and soft still weather, —having a charm of its own. A fine day generally affects the spirits as it does the barometer. On this occasion, although the glass had risen to a little above change, our spirits had mounted to the point of settled fair. Our conductor to Caledon was Jacob Groenewald, a young farmer, and from the friendly salutations on the road, and the unvarying cry of "*Dag, Baas Jacob*," we argued that our coachman was a somewhat popular character.

In travelling in South Africa, it is pretty well known by this time, that there is nothing very striking as to a certain description of scenery—no expanse of broad lake—no ripple of the summer stream—no green margin of the summer pool, and no peering for loop-holes in the dense foliage of some pretty cottage or 'squires mansion. Yet there is an air made balmy by the infinite variety of botanical shrubs—flowers always at hand to woo your admiration and gratify your senses—and birds and insects of such beauty and diversity, as to demand your attention, and call forth your gratitude. Then, again, there is the boundless extent,—the things which own not man's dominion—the wild and terrible—

"Rocks, mounds, and knolls, confusedly hurl'd,
The fragments of an earlier world."

Within a pleasant distance from Caledon, whose mountains are on the left of the road, we arrived at a small streamlet called *Matzes Drift*. Here we found a pretty house, newly built, and for the information of travellers, the following words in legible characters:

GEORGE NICHOLS' STORE.

We alighted at the polite request of the proprietor, who received us with a downright Scottish welcome. The place seems well chosen for business, and the varieties of the store appeared most tempting in their kinds, and apparently of the best qualities.

Here nails and muslins, side by side are seen,
There horses' collars, and a blue tureen;
Buttons and tumblers, reap-hooks, spoons, and knives,
Silks for young jufvrouws, flannels for old wives;
Shovels and stockings, hats for men and boys,
Train-oil and fenders, gloves and infant toys;
Bibles and Psalm-books, and the A, B, C
For use of schools,—and game of Totum T.
Butter and bacon, beads and leather gaiters,
Tea, coffee, sugar, chocolate, and waiters;
Tabak and snuff, and durable cement,
Jalap and salts, and *Doctor Wright's Ointment;*
Grid-irons, toasters, and fair ladies' caps,
Soap, candles, catsup, catgut, and mouse-traps—
All useful things, and joined with many more,
Make up this well-assorted country store.

The land contiguous to the house, of a cold, unpromising aspect, has been converted into a garden, and we were much struck with the happy effects of cultivation. The young trees and vegetables were prosperous, and we could readily enough discover the advantages of perseverance and industry.

We are now on our way to Caledon, a favourite village of ours, and containing within its bosom and neighbourhood, and in the district, many very worthy people. We shall come to particulars in our No. III.

RESULTS OF PHILANTHROPY.

WHEREVER we turn our eyes upon the face of this world, we perceive two sets of antagonist principles seeming to contend for the mastery, and leading, as they separately prevail, to very different results. On the one hand, we see ignorance, and vice, and discord,—the dominion of sensual objects, —want of regard to higher views than those which are supplied by fragile and passing occurrences;—and in a yet more melancholy view of human nature and human life,—tyranny,—"hatred, malice, and all uncharitableness." These, in a greater or less measure, enter into and degrade the condition of all communities of men;—and all these, with their appropriate and miserable effects, may be classed together as constituting one vast empire which is struggling for paramount dominion over the arrangements of this world. But on the other hand, we no where perceive these principles and passions obtaining unlimited dominion. On the contrary, there is a counteracting power which resists, and, in most cases, overcomes their influence; for notwithstanding all the disorder in the world, no intelligent man can doubt that there is still a mighty preponderence of good over evil. Evil principles are, in their nature, more active than good; and disease, and vice, and folly, and madness, are contagious. Black and ominous as the aspects of the world may appear, we see no reason to dread the lengthened absence of the bright shining behind the cloud. We too much forget that human life is a life of warfare; and that not to use the moral weapons placed in our hands, is to betray our trust, and surrender to the enemy. It is not to a *feast* that we are called to in

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

this world, but to a vineyard in which we are to *work*. It is the *barren* fig-tree that is cut down,—the salt that has lost its savour that is to be trodden under foot. Every harvest is precarious, and must be prepared with *labour*, and *cost*, and *care*. We have been led to these reflexions by being put in possession of the annexed paper by a friend,—On the Savings' Banks of Great Britain. It is one of the most gratifying documents that has ever come into our possession. It is the magnificent result of the combined efforts of philanthropy; and, notwithstanding the flagrant manner in which pauperism has been literally forced in England, notwithstanding the temptation which is held out to every humble man to abandon the path of industry for the ease and plenty of a pauper's life, still the native integrity of the British people has not been yet completely overthrown. The twelve millions sterling deposited, we may regard as a hostage for the good faith with which the working classes have relinquished all reliance on the succour of the Poor Laws.*

The Savings' Banks in England, Wales, and Ireland, arranged according to Counties; with the period of the establishment of each Institution, the encrease or decrease of each class of depository since November, 1829. By JOHN TIDD PRATT, Barrister at Law. Hansard and Co, London.

THE experience of past centuries has established, beyond controversy, the truth of the axiom, that whatever tends to improve the moral state of a people, will also benefit their physical condition; that every degree you raise man in the scale of intellectual beings, you transfer him at each remove, one degree farther from that state of mere animal existence, in which nature placed him, and by encreasing his wants, stimulate also his industry to meet them. Within the last twenty years, many highly beneficial Institutions have been introduced into Great Britain, calculated to improve the condition of the lower and middling classes of society. After peace had brought us breathing time to turn our view from foreign shores, and examine our own condition at home the philanthropic and vigorous minds of many amiable individuals applied the repose, which succeeded the clarion and the trumpet, to the devising such plans as would benefit their fellow-countrymen, less fortunate in the blessing of education than themselves. How many benefit societies have sprung up in that interval! societies highly calculated, *in principle*, to do much good among those who depend upon their daily labour for support, by creating a fund, on which they could draw, in the hour of sickness and disease. To this period, we also owe the dissemination of cheap works; tending, in an eminent degree, to the improvement of the lower classes, by placing within their reach, that learning which hitherto had been the almost exclusive property of the wealthy and affluent.

Among the many plans formed and matured for the benefit of our humbler countrymen, none, however, claims our attention and approbation more than the establishment of Savings' Banks; and this, whether we consider their *moral* effect upon the people, or their universal application to all classes of the community. There are many of the working classes, well-meaning and industrious, who, having a few shillings to spare, beyond the sum barely sufficient to meet the wants of themselves and families, would willingly hoard them up to meet the "*rainy day*;" but alas! how faithfully will that class of our readers confess the truth of our observations, when we remind them how often in a moment of intemperance, the little store has been invaded, and the careful savings of weeks squandered in a few hours? But this contingency is wholly obviated by Savings' Banks; and herein it is we trace their moral benefit; the depositor in a Savings' Bank is incapable of withdrawing his money within a week's notice of his intention so to do; and thus, by this wise and salutary regulation, the mechanic, who, having the *immediate* command of his savings, would, in the hour of inebriety, dissipate it in the gin shop, being thus restricted to a whole week's reflection, will most assuredly see his folly before his notice has expired. There is another advantage which these institutions possess over benefit societies—namely, that they do not exclude any person, of age, calling, or sex from taking advantage of the benefits held out; and it is no little recommendation of them that, whereas if the money was laid up in the owner's chest, subject to all the hazards we have already pointed out, it would not augment itself; while, deposited in the Savings' Bank, it is continually adding to its original amount by the interest accruing on it.

Having prefaced these brief remarks, we shall proceed to notice the work, which appears at the head of our article. Mr. Pratt is the Barrister at Law appointed to certify the rules of Savings' Banks and Friendly Societies in England and Wales, and therefore, eminently qualified for the task he undertook. He gives the number of Savings' Banks in each county, the amount of depositors and sums deposited, with their relative encrease or decrease from November, 1829, to November, 1830. We feel we cannot do justice to the work and to our readers better, than by giving them a brief synopsis of his plan.

Banks	*No.*	*Depositors*	*Deposits*
Bedfordshire	3	1,765	£ 62,990
Berkshire	10	7,138	244,909
Buckinghamshire	4	1,857	62,644

From this analysis it will appear that on the 29th of November, 1830, England contained 379 Savings' Banks, from ten of which returns had not been received. The total number of depositors were 367,812; total amount of investments £12,287,606; thus holding out an encrease of 9,582 depositors on the November preceding, and the cheering prospect of 9,582 families or individuals turned to habits of saving and industry within twelve months. There have been also five new Savings' Banks established since the date of Mr. Pratt's work, no notice of which could be taken.

WALES.

In November, 1830, there were 25 Savings' Banks in Wales, four of which have made no returns. In the remaining the total number of depositors was 10,204, and the amount of investment £314,903. We are sorry, however, to find that Wales presents a decrease in the list of depositors amounting to 156, and in the investments to that of £8,515.

IRELAND

Contained in November, 1830, 73 Savings' Banks, from nine no returns have been made, and since November, no less than *ten* new ones have been established. The returns present a list of 34,201 depositors, and an investment of 905,056. We are gratified to perceive an encrease on the last year year of 3,240 depositors, and of £59,721 in the investment. We can only add, that the whole work presents a pleasing prospect of the encrease of industry and thriftiness, and Mr. Pratt's tables will be scanned over with no inconsiderable interest by every friend to the happiness and comfort of the humbler classes of the community.

* We continue to congratulate the zealous individuals in the direction of the Cape of Good Hope Savings' Bank, on the weekly success of their valuable labours. We trust the day is not far distant, when every village in the colony shall possess its Branch Bank. We respectfully recommend the Civil Commissioners and Magistracy to take the lead in such foundations.

VESTED RIGHTS, AND PETITION FOR A REDRESS OF GRIEVANCES.

An Historical Fragment.

For more than three years previously to 1792, the abolition of the slave trade, carried on from the coast of Africa to the West-India islands, by British subjects, was warmly agitated in the parliament of Britain; and a committee of the house of commons appointed to examine witnesses during two successive sessions of parliament, collected a great body of evidence, which was printed for the information of the members. As this formed a large volume in folio, an abridgment of the whole was made and printed also, for the use of the members, and several adridgments of this abridgment were afterwards published throughout the nation. The people, in general, warmly espoused the abolition, and petitions were presented to parliament, from almost every class of persons in the kingdom, praying that this traffic, which they deemed a disgrace to humanity, and a reproach to the name of Christians, might be abolished. In 1792 the house of commons resolved, in a committee of the whole house, that the slave-trade was

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

improper to be continued; but, on account of certain considerations of expediency, determined that its abolition should be gradual, and a bill was passed, permitting the trade, under certain limitations, to be carried on till the 1st of January, 1796, after which it was to be totally prohibited. When this bill was carried to the house of lords, the peers found it inconsistent with their dignity to admit evidence which had not been taken at their own bar; and, as their examination of witnesses could not be closed during the then session of parliament, the bill was necessarily lost for that year. In the mean time the claims of certain parties, whose "vested interests" were likely to be affected by the abolition of the traffic, were represented by the following.

PETITION

To the Right Honorable, &c,

"Sheweth,

"That your petitioners are a numerous body, and, at present, in a very flourishing situation, owing chiefly to the constant visitation of the shipping of your island.

"That, by hovering round these floating dungeons, your petitioners are supplied with large quantities of their most favorite food—human flesh.

"That your petitioners are not only sustained, by the carcases of those who have fallen by distempers, but are frequently gratified with rich repasts from the bodies of living negroes,* who voluntarily plunge into the abodes of your petitioners, preferring instant destruction by their jaws, to the imaginary horrors of a lingering slavery.

"That, among the enormous breakers and surfs which roll on the shores of your petitioners, numbers of English boats are destroyed, the crews of which usually fall to their lot, and afford them many a delicious meal; but, above all, that large vessels, crowded with negroes, are sometimes dashed on the rocks and shoals which abound in the regions of your petitioners, whereby hundreds of human beings, both black and white, are at once precipitated into their element, where the gnawing of human flesh, and the crashing of bones, afford to your petitioners the highest gratification which their natures are capable of enjoying.

"Thus benefited, as your petitioners are, by this widely-extended traffic, a traffic which has never before been molested, it is with the utmost indignation they hear that there are in Britain men, who, under the specious plea of humanity, are endeavouring to accomplish its abolition.—But your petitioners trust that this attempt at innovation, this flourishing of the trumpet of liberty, by which 'more is meant than meets the ear,' will be effectually frustrated.

"Should the lower branch of the legislature be so far infatuated by this new fangled humanity as seriously to meditate the destruction of this beneficial commerce, your petitioners have the firmest reliance on the wisdom and fellow-feelings of the lords spiritual and temporal of Great Britain.

"Your petitioners know that the truly benevolent will ever be consistent,—that they will not sacrifice one part of animated nature to the preservation of another,—that they will not suffer sharks to starve, in order that negroes may be happy;—yet your petitioners are apprehensive that the baleful influence of this philanthropic mania is already felt, even within the walls of your lordships; wherefore they crave to be heard by counsel, at the bar of your august assembly, when, notwithstanding the wild ravings of fanaticism, enthusiasm, methodism, and many other *isms*, they hope to evince that the sustenance of sharks, and the best interests of your lordships, are intimately connected with the traffic in human flesh.

"Fearful of becoming tedious, your petitioners have only to add, that, should the abolition take place (which the god of sharks avert!) the prosperity of your petitioners will inevitably be destroyed, and their numbers, by being deprived of their accustomed food, rapidly diminished. But, on the other hand, should your lordships, in your legislative capacity, scorn the feelings of the vulgar, and nobly interfere, either openly, or by procrastination, to preserve this invigorating trade from the ruin that now seems to await it, your petitioners, and their wide-mouthed posterity, as by nature urged, will ever *prey*, &c."

* Humanity was outraged at the Cape so recently as 1830. A slave-ship anchored in Simon's Bay, and a slave-ship anchored in Table Bay. Each of these hells were crowded with human victims. During this period, the inhabitants of Simon's Town abstained from eating fish!!! Not so the good people of Cape Town. We visited the slave-ship in Table Bay. Our first exclamation was—

"O for a lodge in some vast wilderness."

Among the many facts which presented themselves during this visit, one was, that the ship was surrounded with myriads of fish, forming a dense mass of animated beings, eagerly seeking their prey.

THE CALCUTTA PRESS.

September, 1831.

"Reply to an article in the Edinburgh Review No. 104, and to an article in the Cape of Good Hope Literary Gazette, (re-printed in the Bengal Hurkaru and Chronicle, of May 24th, 1831,) on Sadler's Disproof of Human Superfecundity."—*(Calcutta Magazine, Sept.* 1831.)

"Marry come up," who would have thought it, that our *little unpretending Journal* could excite the attention of the *wise men of the east:* and that WE should become associated with the Leviathan of the North, the Edinburgh Review. Still firm to the principles laid down in the Cape Literary Gazette, (page 113, vol. 1,) we are by no means insensible of the value of having such opinions canvassed by a scholar and a gentleman. This is precisely the case in reference to the Calcutta Magazine; the *Reply* in question being evidently the production of a very acute thinker and lucid writer, —one who is not led astray by party principles, nor shackled by distracting theories. In justice to *our* able Reviewer, we extract the following from theReply:—"The article from the Cape of Good Hope Literary Gazette is as distinguished for candour and good feeling, (bating a little mistake in supposing that Mr. Sadler had harshly censured the *motives* of his opponents,) as that in the Edinburgh Review was surcharged with the opposite qualities, &c." It is not our intention to follow the writer in the course of his discussion, or to notice those points of difference that exist between us. In several instances it could be proven we think that the writer labours under some mental error.

In reference to the study of *political economy*, we find Dr. Whately, in his late course of lectures at Oxford, starting objections against the name of this science. The name he prefers is that of CATALLACTICS, or the "Science of *Exchanges*." Man might be defined, (and this would comprehend all our Graham's Town and Caffer friends,) "an animal that makes exchanges;" no other, even of those animals which in other points make the nearest approach to rationality, having, to all appearance, the least notion of *bartering*, or in any way exchanging one thing for another. Perhaps it might be denominated the "Philosophy of Commerce;" this, it must be confessed, is etymologically quite unexceptionable, being coincident with *things as they are*, and not when the word commerce was arbitrarily limited to *one* class of exchanges, and had no connection with *green geese and the Butchers' Shambles.*

CHINA.

By the receipt of a letter from Canton, a few papers, and files of the Bengal Hurkaru, we find the affairs of the Eastern world no less singular in their aspect than those of Europe. The greatest alarm prevails in China on the subject of some impending calamities which have been predicted as shortly to burst forth. A sort of Revelation from the gods, is now published by writing and by word of mouth, in every direction, declaring that this year in the 6th, 9th, and 10th months, a great pestilence will prevail, and cause the death of persons innumerable. Other calamities are also to spread far and wide, and these by means of *female influence.* The first intimation of the approaching judgments was made by the deified astronomer Chang-Jeen-Sze. The virtuous will be spared, but the wicked will find it impossible to escape. Those who will not believe shall see. The ground will be covered with dead bodies. At the third watch, when cocks crow and the dogs bark, a malignant god will go forth to slay by the pestilence. Those who hear their names called, must be careful not to answer.

PEKING.

A good deal of dissatisfaction prevails in consequence of the determina-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

tion of the Emperor to promote *temperance*, and suppress the use of opium. It was considered, according to the latest accounts, that besides depriving the cruizers of a fruitful source of emolument, would ruin the prospects of numerous Mandarins who, having purchased their appointments, and *vested* their capital in the trade on which they depended for a due return of the outlay. The following is an extract from the Canton Register of Sept. 2d.

An officer named Chaon-ching-wult, belonging to one of the supreme courts, has written to the Emperor against Opium, which is produced in the interior: he attributes its increase to the remissness of the officers of government, whose duty it is to suppress it. In consequence of this, a general order was issued to all Governors and deputy-Governors throughout the Empire, to exert themselves in suppressing the use of Opium, and to send in their opinions as to the best mode of doing so.

The Governor of Yun-nan province wrote back that the natives on the frontier, at the foot of the hills, in out of the way places, and, also, foreigners adjoining, grew the Poppy, and produced Opium, but he would give orders to search and prevent the continuance of the practice.

His Majesty is not at all pleased with the vagueness of Governor Yuen's reply, which he designates "empty words," and, in conclusion, commands Yuen to yield implicit obedience to the former general order, and to suggest such plans as will put the people in fear, and prevent the production of Opium: moreover, that, at the close of every year, a document, reporting progress, be sent to court.

CANTON.

The Canton Miscellany is a new periodical just started, it is published monthly at 2 dollars per number, beautifully bound in damask silk. It contains many articles of great spirit and varied interest.

FOREIGN LADIES AT CANTON.

Governor Le concerning Mrs. Kierulf's visit to Canton.

Le, Cabinet Minister, Governor, &c. to the Hong-merchants.

On the 2d day of the 4th moon of the 11th year of Taoukwang, at Luy-chow, I received a statement from the Nanhae-hëen, mentioning that the Hong-merchant, How-qua Junior, had given information that Skipper Kalen of the Danish nation, a barbarian merchant, having to settle some accounts with another barbarian, had, on the 18th day of the 3d moon, brought a barbarian wife, "one mouth," to Canton, and was dwelling in "Ewo" Factory. The said merchants and others had already given him strict orders on the subject, and he affirmed, that his taking her to Canton was a sudden and rash act, arising from ignorance and mistake. But, on the 22d day, he took the said barbarian woman, and commenced their passage away back, &c.

On this coming before me, the Governor, I examine and find that it has long been strictly interdicted to bring females to Canton to reside. Last year the English Chief violated the laws, and brought females, but they were expelled, and driven back to Macao. And I, Minister and Governor, during the 2d moon of the current year, sent a memorial to the Emperor stating the old regulations designed to guard against foreign barbarians.

(Here he quotes his own recommendations to the Emperor, which have been already translated, about foreign wives, Weileto, &c.)

Since the Imperial Will has not been received, the Memorial has not been made known.

Now the Danish Skipper Kalen, a barbarian merchant, has presumed clandestinely to take his wife to Canton to reside in "Ewo" Factory, a proceeding extarmely audacious and imprudent. It would be right agreeably to the suggestions in the memorial, to stop his trade, but, indulgently considering that the merchant, when he received orders, immediately commenced his passage and went away; therefore, through clemency, a deep scrutiny will be waived.

Uniting the above circumstance, an order is hereby issued to the Hong-merchants, to communicate forthwith my order to the merchants of all the nations to yield obedience thereto. Hereafter, those who come to Canton to trade must yield a trembling obedience to the interdicts of the Celestial Empire. If they bring foreign females into the port, they must, according to former laws, land them at Macao to dwell in *Nan mei's* house; they must not presume to take them to Canton. If they dare intentionly to disobey, the moment it is discovered, they will, according to the regulation reported to the Emperor, be sent away in custody to Macao, and the trade of the offender will immediately be stopped. Decidedly, not the least indulgence will be shewn.

If the Hong be unable to give the necessary previous cautions, and to keep up a strict watch, so that the said barbarians do again bring females to Canton, then the senior merchants, the linguists and the compradors, shall, in a body, be severely punished. Positively there will be no bending to lenity. Tremble at this. Intensely, intensely, are these commands given!

Taou-kwang, 11th year, 4th moon, 5th day. (May 16th, 1831.)

THE ENGLISH MERCHANTS AT CANTON.

A respectful remonstrance having been addressed to the Chinese government by the British residents, for the restoration of certain rights and privileges and claiming the protection of property, the following are extracts in reply.

The Foo-yuen, in reply to the merchants' remonstrance (dated July 12th 1831.)

CHOO, acting Governor and Foo-yuen of Canton, to the Hong-merchants.

A Petition has now been received from the English private merchants JARDINE, INNES, and others, sayin:

(Here follows a copy of the Remonstrance.)

This coming before me, the Foo-yuen, I have examined the subject and decide as follows:—barbarians of all nations who come to the open market at Canton to trade, ought to yield implicet obedience to the interdicts and orders of the celestial Empire. But the said nation's barbarian merchants, sometime ago, in consequence of seeking a diminution of charges, procrastinated and delayed entering the port. They, also, clandestinely brought foreign females to reside in the factories; and, by stealth, conveyed muskets and guns to Canton. These doings were really criminal acts of opposition. Soon after this, the Minister and Governor Le, stated to His Majesty the old regulations, together with some modifications which were decided on in Council, and solicited and received an Imperial order, directing that barbarians, after they had completed the sale of their goods, should not remain in Canton, to find out the prices of commodities, and form connexions with the natives. The object was to make the Hong-merchants responsible for the control of the bar barians, and to prevent their bringing foreign females, guns, and arms to Canton. Also, to disallow taking many persons to present a petition. Of all these regulations, now enacted, most of them, from length of days, had become the usage, and all the barbarians of the several nations knowingly obeyed, and adhered to them.

Now, these barbarians merchants, alone, presume to say that these regulations and commerce cannot go on together; and that the control of Hong-Merchants does not agree with old usage, and, in a whining manner, dun with their petition. Going thus far is already false and wild. But they proceed to talk about an abrupt entrance into the Company's factory a few days ago.

I, the Foo-yuen, during the first decade of the 4th moon, went, in person, to the Company's Factory, to examine and manage an affair. That Factory is on the ground of the provincial City, and is under my jurisdiction. Not only will I go in person, but, if the said barbarians audaciosuly presume to act irregularly, without due fear, I will, as I ought, also take troops with me, and open a thundering fire upon them. I will do so without feeling the least possible anxiety or regard to consequences.

Of late, many of the barbarians of that nation have not understood what was proper; and not a few, also, of such as Jardine and Innes. There is no doubt that their conduct arises from the flattery and sycophancy of the Hong-merchants; together with the mischievous suggestions of linguists and compradors, with whom they are connected. If they (Jardine, &c.) don't reform themselves, they will most certainly become the injured (or ruined) victims of these people.

This whining, disputing, and contradicting on the part of the barbarians the Emperor will not permit, and should the parties now before the celestial tribunal not *withdraw their vile calumnies* so prejudical to the people of this august country, they will find *the law imperative*, and receive from the strong arm of Woo-show-chang (the acting operator during the Emperor's pleasure,) *five and twenty* with the bamboo or cudgel, or as many with the *cat, always in fashion with the barbarians.*

The Celestial Empire in cherishing tenderness to distant foreigners has constantly stopped to shew compassion. But between the flowery Chinese and the Barbarian settlers there is doubtless a settled distinction. The dignity of the Great Emperor requires unlimited obedience and prostration.

Moreover, the petition of the Barbarians is in its phraseology proud and wilful, in its language it is confused and entangled: and in its words and ideas there is much that is not clear and conspicuous. But I indulgently consider that the writers of it do not understand proper forms and decorum.

Uniting these things, I forthwith issue this order:—When it reaches the Hong-merchants, let them immediately take the contents of the reply made by me, the Hoppo,—and continue to keep JARDINE, INNES, and the others, under strict restraint,—not allowing them to create disturbance, and again dun with petitions. Intensely—intensely! are these special orders issued. 11th year, 6th moon, 5th day, (July 13th, 1831.)

NECESSITY OF PUBLIC INSTRUCTION.

[THE present exertions which are in exercise in the world for the diffusion of knowledge, are characteristic of the times in which we live. Our earnest hope is, that such exertions may be made instrumental in counteracting the march of ignorance and superstition. But we must honestly confess, that we are not quite satisfied that "the largest measure of the greatest good" will be achieved, because the superstructure of many of the schemes afloat,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

are confessedly independent of religious instruction. In the *Foreign Quarterly*, from which an important extract is subjoined, we find enough of interest to excite our attention; but to discover at the same time the *summum bonum* to be awanting. Where religious instruction is absent, which, after all, is the sole root and the trunk of the knowlege that civilizes man, society, we *fear*, is at best but a whited sepulchure. In this knowledge are comprised all the main aids, instruments, and materials of National Education, the *nisus formativus* of the body politic, the shaping and informing spirit which educting, *i. e.* eliciting, the latent man in all the natives of the soil, *trains them up* to citizens of the country,—free subjects of the realm.

No nation, perhaps, ever went so suddenly over to the side of education as the English. "The Scotch were an educated, and therefore a moral people, and we are to become like them." It was forgot that the peasantry of Scotland did not start suddenly into an enlightened people, that they were educated under their own Priesthood, and *that* a Priesthood especially fitted for the instruction and guidance of the poor; who, in teaching them to read, taught them as well what they *ought* to read. In making these remarks, we must observe, that we are not unduly attached to any peculiar order of the Priesthood; still we think it but just to refer to an historical fact in which the labours of a certain body of men have been productive of good. We rejoice in every attempt which is made to enlighten the mind of man, or rather which enkindles the light placed in embryo therein by the Creator; still we think the progress of spiritual and worldly knowledge to be unequal, and from the great growth of the population, (unless the schools incorporate it in their systems,) the clergy are wholly unable of themselves to expedite the former in any adequate degree. It is a truth which cannot be too strongly insisted on, that, if the powers of the intellect be strengthened by the acquisition of science, professional learning, or general literature, —in short, secular knowledge, of whatever kind, without being *proportionably* exercised on the subjects connected with our future destinies, its susceptibility of the objections which may be urged against Revelation will be increased, without a corresponding increase in the ability to remove them. If the *balance* of intellectual exercise be not preserved, the almost certain result will be, either an utter indifference to religion, or else that slow-corroding scepticism which is fostered by the consciousness that difficulties, corresponding to those that continue to perplex our view of Revelation, have in other pursuits been long surmounted and removed. If we err on this subject, we hope to be put right by some of our correspondents.]

We are desirous of calling attention to some efforts that are making in Paris for the communication to the people of France of general information, and especially of that sort of knowledge which they are the most in need of. Amidst the political unquietness which characterized the last year of the reign of the exiled sovereign, and the violent agitation of parties that has distracted the career of the citizen-king, there have not been wanting men of sufficient zeal and ability to devote a large portion of their time to the advancement of the permanent interests of their countrymen, having before their eyes the certain good which the diffusion of intelligence cannot fail to produce, be the ministers and forms of government who and what they may.

The various societies that have for some years been in action in France for philanthropical purposes, are probably well known to most of our readers. But there was ample room for an association proposing to itself to inquire for, to examine, and to propagate the best methods of instruction, embracing every thing belonging to education, whether moral or physical, scientific or technical, or of what kind soever. With this view a society was formed in Paris, in 1829, under the title of *La Société des Methodes d'Enseignement*, and its labours have been regularly continued, in reviewing dispassionately old systems, in examining without scruple new theories, and in trying practically the many methods that are constantly discovered, or pretended so to be discovered, in substitution of former ones. The society, in fact, tries to bring education to something near the level of a science, and the discussions at its meetings, (at which we have been present,) are well calculated to rouse observations and excite ideas of a nature to afford strong hopes of the real progress of that science. Gratuitous lectures have been established for the benefit of persons engaged in business, in the various branches of natural history, chemistry, law, moral philosophy, public economy, philology, &c. which have been successful. A most important institution, called *L'Ecole Orthomatique*, was founded by the society in October, 1829, and has now in it about sixty boys, whose education is conducted in what the society consider to be the most rational manner, under the constant superintendence of a committee of five of its members. It is a day school, at the rate of twenty francs a month, and the instruction given at present extends to reading, writing, drawing, music, gymnastics, the French, English, and Latin languages, arithmetic, geometry, natural history, geography, and book-keeping. Arrangements are making to add instruction in higher branches of knowledge, and in matters of social utility; but the school, as it is, cannot but be regarded as a very interesting example of the improvement of which the system of teaching is susceptible. The Ecole Orthomatique is carried on on the principle, not of fear, but of love. There are no punishments of any kind, but the feeling of emulation is roused by a judicious distribution of rewards. The masters and boys do not live in a state of war, but rather like fathers and children; so that there is no necessity for the perpetual practice by the latter of those deceits and stratagems which originate from a system of terror, and seldom fail to demoralize the character in after-life. The society, justly regarding that education to be the best that conveys to the pupil the strongest sense of his moral and social duties, study rather the formation of a sound mind in a sound body, than the cramming the boy's head with a given quantum of information in a given time. We are assured that, in this school, moral offences, such as lying, are wholly unknown; and of the general disposition of the boys we judged most favourably from a visit to them in company with the president of the society, the Count de Lasteyrie. We shall never forget the joy with which this venerable and excellent man was received, at the institution that owes to him its origin, by his young comrades, for to these boys he has been always, as they well know, the comrade and the friend. Humanity owes so much to this unwearied philanthropist, that in speaking of him as the originator of the soeiety, and the mainspring of all its movements, we are sure we speak the sentiments of every one in this country who knows him, when we wish him still the enjoyment of a long and useful career for the good of his species for whom he has already done so much. The school owes much also to General Lafayette, to the Duc de Broglie, M. Lafitte, and other distinguished persons who take an interest in its progress.

But this is not all that the society has done. It has been the means also of publishing a series of excellent little works proper to be read in schools, and to belong to popular libraries, selling them at cost price, which is often as low as ten centimes, or less than a penny, for thirty-two pages of matter. So far as these publications have gone, we think the society has succeeded in furnishing, in a familiar manner, information of a practically useful character, and tending to impress sound principles on the minds of the lower orders of the people.

The society does not propose to give any religious instruction, not considering it a part of its duty to interfere with the province of the church. Without venturing an opinion whether there is in France any real want of elementary religious books, we feel assured the society has done wisely in not attempting such a task, and indeed it may be doubted whether lay associations ever do much good in taking upon themselves the business of the clergy. It would, indeed, be fortunate if the exertions of the French clergy for the intellectual improvement of their flocks were equal to the influence they still possess over a people the mass of whom, in the rural districts at least, are still attached to that ancient faith which has assuredly not become the less venerable, since its connection with the state has been dissolved under the new order of things.

A plan, projected by Count de Lasteyrie, has been for some months in agitation, for placing a popular library in each of the communes or parishes of France. We are sorry to learn that, owing to political agitation, no great progress has been made in carrying this useful design into execution, but there are hopes that the government will eventually be induced to lend it their aid. If the Perier administration should remain in office, it may probably be stimulated by the recollection of its defeat on the 12th of August last, when M. Cormenin's amendment to the address, declaratory of the necessity of providing for the people the benefit of gratuitous primary instruction, was carried by a respectable majority of the Chamber of Deputies, though an arrangement for the variation of the terms of such amendment was subsequently made. How far primary instruction could at present be provided *gratuitously*, is perhaps a difficult question; but the French government should remember that an outlay of the public money for the production of the greatest possible good that could be done to the mass of the people, would be the truest

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

system of public economy on which they could act.

Having now given some instances of the interest which is felt in France for the welfare of the lower orders, we take leave to add a few words upon the state of things in our own country in this respect. Every one must be sensible of the lamentable deficiency of useful books written with sufficient plainness and familiarity, and sold at prices cheap enough, to spread information widely amongst our poorer classes. The *Society for the Diffusion of Useful Knowledge* has, by its own admission, failed to fulfil its original intention, though it has been the means of bringing so many and so excellent publications into the world. What has been done by individuals, such as Mr. Limbird of the Strand, amounts to but very little; and though there are books in existence, more or less calculated for popular use, many of which, such as the volumes of the Dublin Kildare Street Society's Tracts have already been, in some degree, made available, still the promoters of education are at a loss what books to provide, or what to recommend. It is obvious that there is wanting some machinery for the regular and systematic diffusion of information upon a scale far more extensive than has hitherto been attempted. There is need of some uniform and comprehensive plan, that should operate with a steady force throughout the country, for the enlightening the minds of the people.

It is possible that, by association, much might be done both towards the circulation of cheap publications, and the formation of popular libraries. The existence already of societies for public instruction, (originally called Political Unions,) in various parts of the country, affords a proof of the increasing desire of knowledge, and a foundation on which an edifice of still greater good may be reared. The friends of order and peace should regard it as of high importance that the views of these Political Unions should be turned from the exclusive consideration of politics, to the comprehension of literary and scientific objects within the scope of their institutions. Nothing is less *humanizing than the constant habit of absorbing the mind in the political discussions of the day.* Persons of education cannot be insensible to the ill effects of absorption; and it must, therefore, be doubly mischievous to the ignorant, whose polemical violence is not likely to be controlled by the reflection,

"How small, of all the ills mankind endure,
That part which kings, or laws, can cause or cure!"

But the great point is, whether the cause of education is not entitled to ask something at the hands of the government, or rather of the legislature? The evil of ignorance is one of the greatest that can afflict humanity, and it is to be feared that such evil cannot be averted without the aid of a law, whereby education may be rendered compulsory. In the United States, in the Prussian dominions, and elsewhere in Germany, the law does not suffer parents so far to neglect the interests of their children, and consequently of society, as to suffer their minds to remain in a state of barbarism, after the manner of savages. So it ought to be with us. Provision should be made for affording the benefit of schools to our whole population, and it should be a penal offence in any parents to neglect to send thither their offspring. If government be instituted for anything more than a mere engine of police, it ought to be invested, in a special department, with the care of the public instruction. Should there be any who deny that the government ought to be charged with such a care, we beg to ask them why it watches over the public health—why it interferes for the protection of trade—why it executes public works and buildings—why it upholds an established religion—why, in short, it interposes in a thousand ways whereby it is anticipated that the general welfare may be advanced? To the extent of supplying the deficiency of primary schools, and enforcing their use, as well as of the establishment of popular libraries, it does appear to us that the interposition of the legislature is imperatively called for by the necessities of the country, and the result of such interposition would, we are convinced, be a happier one than could be produced by any other measure of social amelioration.

It is understood that a bill has been prepared by direction of the Lord Chancellor, for the setting on foot, among us, of Parochial Libraries, to be charged on the parish rates. A well-digested measure of this kind, whenever it may be brought forward, will assuredly tend to strengthen the Whigs in the confidence of the country, but would do still more if accompanied by an Education Bill. The ministers are, we trust, aware that much disappointment has existed at the slow progress of the promised relief from the taxes that impede the diffusion of knowledge, and they should, above all things, beware of allowing an impression to get abroad, that they are somewhat indifferent to the whole subject of public instruction. A government whose tenure of office depends on popular favour, ought not to be slow to take the lead in measures of so decidedly a beneficial, as well as popular character. The tide of public opinion is flowing so strongly against the ancient system of closing from the people the avenues of truth, that those who govern either England or France in the nineteenth century cannot safely carry "*le juste milieu*" as their motto, but must in this respect drink deep, or taste not, of reform. The work of destruction is likely to proceed with rapidity; but it is the mission of governments not only to destroy, but to fulfil. What task can be more noble—what ought to be more grateful—than that of dispelling the mists which blind the eyes of the ignorant, and opening upon the people that pure and steady light of knowledge, which is so inexhaustible, and continually increasing, a source of human happiness?—*(Foreign Quarterly for October.)*

THE POLISH EMIGRANTS.

It is stated in one of the late numbers of the *Advertiser*, that 40,000 of the brave Poles had refused to accept the *tender mercies* of the Tyrant of Russia, and were about to emigrate to America. History affords a parallel in a single family case. The unrighteous invasion of Switzerland by Buonaparte, is a stigma on his name which can never be effaced. This history may be read in Coxe's Travels, in Plantar's History of the Helvetic Confederacy, and in Zschokke's Invasion of Switzerland by the French, in 1798, translated by Dr. Aiken, and is strikingly represented in James Montgomery's Wanderer of Switzerland.

ARGUMENT.

A Wanderer of Switzerland and his family, consisting of his wife, his daughter, and her young children, emigrating from their country, in consequence of its subjugation by the French in 1798, arrive at the cottage of a Shepherd beyond the frontiers, where they are hospitably entertained. After many interesting conversations by the parties, we come to

CHAPTER VI.

The Wanderer informs the Shepherd, that after the example of many of his countrymen flying from tyranny, it is his intention to settle in some remote province of America. The dialogue is thus continued:

Shepherd.

"Wanderer! whither wouldst thou roam?
To what region far away,
Bend thy steps to find a home,
In the twilight of thy day?"

Wanderer.

"In the twilight of my day,
I am hastening to the West;
There my weary limbs to lay,
Where the sun retires to rest.

Far beyond the Atlantic floods,
Stretch'd beneath the evening sky;
Realms of mountains dark with woods,
In COLUMBIA's bosom lie.

There in glens and caverns rude,
Silent since the world began,
Dwells the virgin solitude,
Unbetray'd by faithless man;—

Where a tyrant never trod,
Where a slave was never known,
But where Nature worships God
In the wilderness alone;—

—Thither, thither would I roam;
There my children may be free;
I for them will find a home,
They shall find a grave for me.

Shepherd.

"Long before thy sun descend,
May thy woes and wanderings cease;
Late and lovely be thy end;
Hope and triumph, joy and peace!

As our lakes at day decline,
Brighten thro' the gathering gloom,
May thy latest moments shine
Through the nightfall of the tomb!"

Wanderer.

"Though our parent perish'd here,
Like the Phœnix on her nest,
Lo! new fledged her wings appear,
Hovering in the golden west.

Thither shall her sons repair,
And beyond the roaring main,
Find their native country there,
Find their SWITZERLAND again.

There in regions far and wide,
We will pierce the savage woods,
Clothe the rocks in purple pride,
Plough the vallies, tame the floods;

There, unenvied and unknown,
We shall dwell secure and free,
In a country all our own,
In a land of Liberty!

Mountains! can ye change the will?
Ocean canst thou quench the heart?
NO!—I feel my country still,
LIBERTY! where'er thou art!"

ON THE EMIGRATION BILL.

(AS AMENDED BY THE COMMITTEE.)

Ordered by the House of Commons to be printed, 13th April, 1831.

"WE have Colonies of boundless fertility and extent, which no enemy can reach, which may remain bound by the tie of interest to the parent state for centuries. Such is the settlement of Southern Africa, which presents a field of colonization that cannot be exhausted."—*(Edinburgh Quarterly Journal of Agriculture, Nov.* 1831.)

The state of the labouring class, both in the South of England and in Ireland, is becoming every day of more pressing importance. The following evidence, as given by the Rev. J. Beard, a clergyman and magistrate of the county of Bedford, and resident at

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Cranfield, is extracted from the Parliamentary documents. Many others might be quoted

"Have you many persons out of employment during the winter? About one-fourth in dead time of the winter.—In what manner are the poor employed during the winter time by the parish? In digging gravel, and taking care of the roads.—Can you state what rate of wages they receive when so employed by the parish? Eight shillings per week the married men, with families; a single man, until this last week, 3*s*., 3*s*. 6*d*., and possibly 4*s*.—What proportion of your able-bodied labourers in your parish were out of employment last year? I should think from the month of November to the end of January nearer 30 than 20 out of 130."—"Can you state any particulars as to the employment of labourers on the roads in the parish of Kempston? The last year on the mere gravel digging, that parish expended £750; and I am sure I am not saying too much when I state I could get the same gravel dug for £50.—Can you state what the wages paid to the labourers were in that parish for that work? The married men 8*s*. per week, making up their families to a specified amount."—"You state that many of the men are employed on the road in some of the parishes in your neighbourhood? There are.—Are they so employed for the purpose of giving them employment, or because the roads require that number to repair them? Merely to keep them employed."—"Yon state in the parish of Cranfield there are now about one-fourth of the labourers out of employment? Yes; it is always the case nearly from the middle of November to February. I can answer for the last twelve years: there are more out of employment now than there were previously.—How do you account for there being more out of employment now than when you first became acquainted with the parish? The farmers are poorer."—"Are there any arable lands thrown out of cultivation? No; the truth is there is a great deal more labour got for the money.—The poor people work cheaper? Yes; the poor people work cheaper, a great deal cheaper, the competition of labour is so great."—"What is the food of the labourers in your part of the country? Nothing but bread. What have they to drink? Water.—They have no cheese? No.—No tea? Very little. I have watched twenty-one men dine together; I have seen twenty of them eat bread with what we call seam, which is a little fat rendered down.—No potatoes? No.—Where did you see them dine together? At the gravel-pit.—What have they in their cottages when they dine there? They very rarely do.—What have their families? From what I have seen, I should think the women bread and tea."

One cause of the general wretchedness of the poorer labourers, arises from the excessive immigration of Irish labourers into Britain. The effect of their competition, is to bring all the labourers within the sphere of action down to their own level of misery and wretchedness. In Glasgow alone, more than one-sixth of the population alone is native Irish. In the whole tract from Port Patrick to Glasgow, the person who has hitherto been taught to admire the humble but decent habits of the Scottish peasantry, meets hundreds of men in the strength of youth, in rags and naked feet, asking alms upon the highway; and what is the consequence to the Scottish peasantry? The best of them are seeking a new home in the forests of the New World. For the Scotch in particular, knowing that great numbers of their brethren have settled in America, and adverse to great transitions, take the shortest way to a new home, to which they are to be welcomed by their old friends and countrymen.*

Various schemes have been agitated in Parliament, and through the medium of the Press, for meliorating the condition of the labouring classes of England. Many of these have been of an Utopian nature, and ephemeral in their duration. But there are three which are above all others calculated to stand the test of experience; these are the cultivation of waste lands, the allotment of land to cottagers, and emigration. We have to do with the latter.

Lord Howick, on the 22d of February last, moved for leave to bring into Parliament a Bill to facilitate voluntary Emigration to his Majesty's possessions abroad. His Lordship then stated that for some time past in this country the supply of labour had greatly exceeded the demand; and that while this state of things existed at home, the scarcity of labour in the colonies was so great, that in Australia, agricultural labourers obtained 5*s*. a day, whilst mechanics were paid at a much higher aate; in some cases an artificer, such as a wheelwright, optained 15*s*. per day.

The bill, as amended by the committee, authorizes the appointment of commissioners and a secretary under the crown, which commissioners shall act under the instructions of the Secretary of State, and repoit their proceedings twice in the year to him, to be laid before both Houses of Parliament. A meeting of the rated inhabitants of any parish in England or Wales, may be called by a requisition delivered to the overseer of the poor, by one or more persons assessed for poor-rates, to the extent of one-twentieth of the whole assessment; such meeting to deliberate and decide upon the propriety of applying to the commissioners to contract for carrying into effect the voluntary emigration of any person or persons chargeable to the rates, or likely to become chargeable, and willing to emigrate, which shall be carried in the affirmative by the votes of two-thirds of the rate payers, or by the vote of one or more persons assessed in more than the half of the whole assessment; and which shall be finally settled by either two-thirds of the rate-payers, or one or more persons paying more than the half of the whole assessment, as above stipulated, inscribing their names in a book to be kept for this purpose; which minutes of proceedings shall be laid before one of His Majesty's Justices of the Peace, to be by him laid before the commissioners.

After these preliminaries are completed, the commissioners are to contract with the overseers of the parish for the removal, to any of his Majesty's possessions abroad, for a sum to be specified in such contract, of any person or or persons having a legal settlement in such parish, and willing so to emigrate; and the overseers shall repay the sum agreed on in that contract out of the poor-rates of the parish within two years.

By this bill, the commissioners have power to contract with any private persons, for the voluntary removal, from any part of the United Kingdom of Great Britain and Ireland, of persons desirous to emigrate; the sum of money necessary for conveying them to the places fixed upon, being specified in a contract, and which shall be repaid to Government within ten years. Government is from time to time to take all proper and necessary measures for effecting the voluntary removal to His Majesty's possessions abroad, of all persons in respect of whom any such contracts may be made, and providing for the maintenance and support of such persons during the voyage, and from the time of their disembarkation until the period of their arrival at the place of their ultimate destination, and to supply them, in the first instance, with the means of obtaining their own subsistence.

The Lords Commissioners of the Treasury have power to issue such sums of money for this purpose, as shall afterwards be fixed by acts of Parliament. And Government is to provide all necessary rules and regulations for ascertaining that all persons about to emigrate are of sufficient age to exercise their own judgment respecting such proposed removal,—have received fair and impartial representations of the probable consequences of such removal, and are freely assenting thereto; and for preventing any contracts being made for the removal of infirm, weak, or sickly persons, or persons of imbecile understanding; or for the removal of young children unattended by their parents, or by some adult relative, or other responsible persons, charged with the proper care of such children. All the minor regulations are to be left to the commissioners.

Any emigrant being of the age of eighteen years or upwards at the date of the contract for removal, who shall be disembarked in any of His Majesty's possessions abroad, and who shall return to the parish from which he was removed, shall be indebted to the parish in a sum equal to that which was stipulated for his removal in the contract; and which shall be held to be a just and lawful debt, and be recoverable accordingly. The act is to continue for five years.

Such is a general abstract of the Bill for facilitating Emigration,—a bill in which there is much to applaud, and little to condemn; and we are surprised at the tardiness of Government in passing it into a law. This, surely, cannot have arisen from the opposition which the bill met with when first introduced. It was then beset by a host of opponents; but the objections brought forward, when subjected to dispassionate investigation, will be found to be shallow and futile. At the debate upon the bill, it was contended that it would have the effect of burdening the country with new and oppressive taxation; that it did not do to inter-

* This subject is very considerably enlarged in the two last numbers of the Quarterly Journal of Agriculture, a work of more than ordinary interest at the present moment. The Editor having advanced many reasons in No. 14, why Australia was preferable to Canada for emigrants, is answered by Mr. Fergusson, of Woodhill. "I cannot bring myself for a moment," says he, "to put Tasmania, New Holland, &c. in competition, however high the eulogiums which my respected friend the Editor of the Journal of Agriculture, has passed upon Australia. A pestilential and impure moral atmosphere hangs over these colonies, which will require a very long period to dispel; and although this can be certainly best effected by a wholesome infusion of character from home, it must prove a heavy sacrifice to those individuals who undertake the task." See Mr. Fergusson's admirable aecount of Canada, in the columns of the above mentioned Journal. It is curious enough, that the Hobart Town Papers of a recent date, are greatly alarmed at the reported determination of government to "purify the moral atmosphere" of Van Dieman's Land, by cutting off the supplies of convict labour. They talk of their *vested rights* in work-houses, jails, and hulks, and argue the complete ruin of the colony, unless these places shall disgorge their inmates on the shores of New Holland.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

fere with the market rate of labour; and that there were means of relief at home; that the annual increase of the population was about 200,000 souls, and that unless it was proposed by the bill to carry off this number annually, all such bills would fail of producing the effect anticipated. And besides these, there have been other objections urged,—too ridiculous to be mentioned.

But the first point to be determined, is that of the colonies to which emigration shall be directed. The British colonies should, in preference to all others, be selected. Emigrations to them would improve their present condition, would keep the emigrants themselves attached to the interests of the mother country, and would be beneficial to both, by the one receiving in exchange for its raw produce the manufactured goods of the other. The following Table, taken from a Parliamentary document, shows the number of persons who have emigrated to the different British colonies in each year, from 1821 to 1829 inclusive, and from this it will be seen, that by far the greatest number have emigrated to the Canadas.

Years.	British North American Colonies.	British West Indies.	Cape of Good Hope.	New South Wales, Van Diemen's Land, and Swan River.	Total.
	No. of Persons.	No. of Persons	No. of Persons.	No. of Persons.	No. of Persons.
1821,	12,470	1,772	404	320	14,966

NATURAL HISTORY, &c.

ON THE PRODUCE OF BEES.

It is not to be expected that many will attend to bee-husbandry, merely for the sake of pleasure; but profit may induce others to follow that employment during their leisure hours. Often has the industrious labourer, or mechanic, been relieved from embarrassed circumstances, by the toil and labour of a swarm of bees when he could avail himself of no other mode of relief. Not only are bees of immediate profit to their owners: but were they encouraged to the extent of which the pasture of the United Kingdom could permit, they might become even a source of national wealth. It is estimated by persons of learning, that the pasture of Scotland could maintain as many bees as would, on an average, produce 4,000,000 pints of honey, and 1,000,000 lb. of wax. Were this quantity tripled for England and Ireland, the produce of the empire would be 12,000.000 pints of honey and 3,000,000 lb. of wax annually.—The income that would thus arise from honey, at the very moderate price of 5s. per pint, would amount to L.3,000,000 Sterling, and the wax at 1s. 6d. per pound would produce L.225,000 Sterling,—affording, in round numbers, a total of L 3,225.000 annually. The rearing of the bees must therefore appear to be an object worthy of the consideration of all who feel an interest in the welfare of their country. As there are few concerns more profitable than bees, in favourable seasons, considering the small expence that attends them, I humbly beg leave to lay before my readers the following estimate:—Suppose a person to commence with only two hives, which may cost L.3, 10s. Sterling; and allowing each hive, on an average, only to double their number annually, they would increase as follows in a period of ten years:—

1st year,	.....	2 hives.
2d do.	.....	4 do.
3d do.	.....	8 do.
4th do.	.....	16 do.
5th do.	.....	32 do.
6th do.	.....	64 do.
7th do.	.....	128 do.
8th do.	.....	256 do.
9th do.	.....	512 do.
10th do.	.....	1024 do.

At this rate, two hives would produce one thousand and twenty-four swarms in the period of ten years, which, at a very moderate calculation, would be worth L. 1, 15s. Sterling each; so that there would be a clear profit of L. 1792 Sterling, for a little attention to the rearing and proper management of the bees,—allowing the second and third swarms to pay for the hives, stools, labour, and incidental losses. It may be supposed by the above estimate, that the seasons are favourable; but allowing fifty hives to fail, from various causes, there would still remain L. 1704, 10s. Sterling of clear profit. The year 1824 and 1825 were very favourable for bees: the latter was remarkably so. Almost every hive that year swarmed once, many of them twice, and a few even three times; when the store was collected, they weighed from twenty-five to forty lb. each hive. Notwithstanding, I read in the public papers, that honey, to the value of L. 240,000 Sterling, had been imported into Great Britain in the course of this same year, 1825, a most extraordinary sum, and one which, in my humble opinion, might have been easily saved to the nation, if a stricter attention had been paid to the proper encouragement of our own bees. With regard to the profit arising from bees, it ought to be considered, that almost the whole income arising from the sale of honey and wax is clear profit, as they are, at least in Scotland, free from rents and taxes; and the culture of them does not impede or injure any other operation; nor do they require the same constant attendance which most other things, in the train of rural employment, calls for; as one person, with a little assistance at swarming-time, might oversee five hundred hives. Nature having supplied them with magazines richly stored with food, and enabled them to provide for themselves in due seasons, they put their owners to little or no expense in that article,—which cannot be said of any other of our servants. It is often the case, when a man buys a beehive which proves a bad one, that he is led to think that bees will not thrive with him at all, and that it will be vain for him to try them any more. I cannot say any thing, either for or against success in the first trial, but will insist upon good management; and as it must be allowed that bees, when properly managed, are more profitable than many other speculations, it is my humble intention, in the following pages, to give some plain and easy directions for managing these very useful insects through the several seasons of the year; that they may prove of advantage to their owners as well as to the country at large; leaving the more curious than useful description of the formation of the bee, its nature, generation, and other properties, to wiser heads than mine.—*The Bee Garden, or a Treatise on the Management of Bees, by John Wallace, Gardener, Dalguise, Perthshire,*

XERES AND ITS WINES.

The vineyards of Xeres, the nurseries of *sherries*, lie scattered; but supposing them all to be concentrated, they might occupy about 6 miles square. They are mostly planted upon slopes. The wine growers produce a cheap light wine called Moquer, which they mix with the Xeres: wines so mixed are called inferior sherries, and as such in the English markets. The export of sherry wine, and others under the same denomination, from Xeres and Port St. Mary, has been for the years following as under:

In the year	1821, there were exported	1,499 butts.
	1822, ...	11,508
	1823, ...	12,476
	1824, ...	15,059
	1825, ...	21,297
	1826, ...	no return.
	1827, ...	20,150
	1828, ...	26,901
	1829, ...	17,839

The export of 1830 was expected to fall 14,000 butts. The price varies much, from £15 to £65; but as the lower price sherries form the bulk of the export, the average must be stated low—say £26 per butt. The value of the sherries exported is therefore £452,000 sterling—the duty upon the export is £504,600; so that if freight, and the profit of the merchant in London be added, the consumption of sherries exceeds one million sterling yearly. The grape that produces the wine of Xeres, is a green grape; it is allowed to become perfectly ripe, being plucked just before it begins to shrivel; this, in average years, is on the 9th Sept. After the plucking, those growers who are most attentive to their wines, *place the grapes in baskets, exposed to the sun* 48 *hours,—turning and sorting them all the while,* according as they appear to require his attention. It has often been said that sherry is a compound wine, but this is a mistake. The *best pale and light golden sherries* are made from the pure Xeres grape, with only the addition of two bottles of brandy to a butt, which is not more than one 250th part. This brandy is of an excellent quality; it is imported from Catalunia. Neither are the deep golden and brown sherries of the best quality, compound wines, though they may be called mixed wines. The difference is thus produced:—If a butt of brown sherry be wanted, a butt of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

light sherry is boiled down to 1-5th part of its bulk, till it acquire a deep brown colour, and one half of this quantity is added to a butt of the best pale sherry, of course removing from it as much as makes room for this additional 10th part of a butt of boiled wine. When it is said that a butt of light sherry is boiled down, it is not to be understood, that this is a wine of an inferior kind; it is wine produced from the Xeres grape, planted upon a lighter soil, and producing a lighter wine.

Sherries, when adulterated, are not usually adulterated by the London wine merchant, with the exception of those extremely inferior wines, which, from their excessive low price, no one can expect to be genuine wines, and which are probably mixed with Cape. But the class of wines which pass under the denomination of "low priced sherries," are not adulterated in London, but at Xeres—by the grower, not by the exporter. It may always be laid down as a fact, that genuine sherry, *one year old, cannot be imported under* 30*s. per dozen;* and, if to this be added, the profit of the merchant, and the accumulation of interest upon capital on older wine, it is obvious that genuine sherry, 4 years old, cannot be purchased in England *under* 45*s. per dozen.* [The above article is abridged from "Spain in 1830, by H. D. Inglis, 2 vols." a work replete with information. At page 111, vol. 2d, will be found a summary of the management of the vine producing sherry. The Malaga wines are noticed in the same volume, page 190.]

MALAGA RAISINS.

The raisins exported from Malaga are of three kinds; the muscadel, the bloom, or sun-raisins, and lexias. The muscadel raisins of Malaga are the finest in the world. In the preparation of this raison no art is used; the grape is merely placed in the sun, and frequently turned. The bloom or sun-raisin is a different grape from the muscadel; but the process of preparing it is the same; like the other, it is merely sun dried. The lexias acquire this name from the liquor in which they are dipped, and which is composed of water, ashes, and oil; these, after being dipped, are also dried in the sun. In the year 1829, the number of boxes of muscadel and bloom raisins exported was 220,000; each box containing 25 lbs.—eight millions of pounds in all. In the year 1824, seventy-five ships cleared from the port of Malaga for England, with fruit In 1830, up to the first of Nov. 34 vessels had cleared out. It is supposed that Cadiz having been made a *free port*, will have the effect of reviving the export fruit trade of Malaga.—*(Inglis.)*

PRICKLY PEAR.

Every where in the neighbourhood of Malaga the acclivities not occupied by vines, are covered with the prickly pear, which is *cultivated* chiefly for the sake of the *cochineal* which breeds upon it.—*(Ib.)*

LITERARY EXTRACTS.

WEALTH OF THE ANCIENTS.

In Polybius is found a description of Ecbatana, at a period subsequent to the capture of that place by Alexander; and, afterwards, in the reigns of Antigonus and Seleucus.

"The magnificence of the place," he says, "was such in every part, as to give a high idea of the power and wealth of those by whom it had been erected; for, though the wood of it was all cypress or cedar, no part of it was left naked; yet the beams, the roofs, and the pillars that supported the porticos and peristyles, were all covered with plates, some of silver and some of gold. The tiles, likewise, were all of silver. Though the place had been three times plundered by those we have named, before Antiochus arrived, there was still remaining, in the temple of Ena, some pillars cased with gold, and a large quantity of silver tiles, laid together in a heap. There were also some few wedges of gold, and a much greater number of silver. These were coined into money, and amounted to the sum of about five thousand talents."*

Ptolemy Philadelphus, the second king of Egypt after Alexander, is stated by Appian,† upon the authority of official documents, to have possessed treasure to the enormous amount of seven hundred and forty thousand talents: either Roman talents or the small Ptolemaic talent. If the former, which were about equal to the Attic talent, be rendered into money of the present day, it will give the amount as one hundred and seventy-eight millions. If the smaller talent, which seems most correct, be taken, it will amount to at least one quarter of that sum. Though an account of this kind may appear exaggerated, yet there seems no reason to doubt its general veracity The revenues of the Ptolemies were excessively large, and the countries over which their dominions extended were, by the collections, completely drained of all their wrought gold and silver; and the tributes were collected by the farmers of the revenue with the assistance of an armed force, composed, not of regular soldiers, but of organized bands of robbers.

Some idea of the degree of rapacity in extracting revenue under Ptolemy may be formed by comparing the tribute drawn from the provinces of Cœlesyria, Palestine, and Samaria, under Cyrus, as given by Herodotus, and that extorted by the successor of Alexander, as given by Josephus. At the time of Cyrus, the island of Cyprus, was included in the province of Cœlesyria, but in the time of Ptolemy was separated from it. In the first instance, the tribute paid was three hundred and fifty talents.* In the latter instance, it was farmed to Euergetes for eight thousand talents; but, if the taxes were farmed by a Jew he was to pay double that amount, and moreover supply to the royal treasury the money required to redeem the confiscated goods of such persons as had not paid their taxes.†

During the period of the Macedonian empire, the precious metals were spread in great abundance over the whole eastern shores of the Mediterranean; and if there had not been a very large portion of them hoarded up in the royal treasury, their value must have fallen much lower, in comparison with other commodities, than was actually the case.‡

The extension of the Roman empire, until it comprehended almost the whole of the known world, if it tended to diminish the production of the precious metals, powerfully attracted them, from Asia and Africa, to its own metropolis. It is thus that the enormous fortunes of individuals which are related by the historians are to be accounted for. The descriptions of such fortunes, it is true, are not confined to their mere metallic wealth, but include their lands, houses, slaves, and furniture, and also money lent at interest on mortgages, or other securities. But unless the metallic wealth had increased in a prodigious degree, that remarkable rise in the prices of other commodities could not have been experienced which is noticed by all writers. As one among other instances, we know that the house of Marius,§ at Misenum, was purchased by Cornelia for seventy-five thousand drachmas,‖ and a few years after sold to Lucullus for five hundred thousand two hundred drachmas.¶

The fortunes of private individuals may be judged of by a few select notices to be found in contemporary authors. Crassus is said to have possessed in lands *bis millies*,** besides money, slaves, and household furniture, estimated at as much more.†† Seneca is related to have possessed *ter millies*.‡‡ Pallas, the freedman of Claudius, an equal sum. Lentulus, the augar, *quater millies*. §§ C. C. Claudius Isidorus, although he had lost a great part of his fortune in the civil wars, left by his will four thousand one hundred and sixteen slaves, three thousand six hundred yoke of oxen, two hundred and fifty-seven thousand head of other cattle, and in ready money *IIS. excenties* ‖‖‖‖

†† Though Crassus had several silver mines and estates of great value, which were profitably managed, yet his revennes from those sources are represented as inconsiderable, when compared with those he derived from his slaves. He had a large number of them, whom he educated, who were taught to become readers, amanuenses, book-keepers, stewards, and cooks. Besides this he made interest of his money, at a high rate, receiving for the use of it one per cent. at the end of each month. It is recorded as a saying of his, "that no man could be accounted rich who was not able to maintain an army out of his own revenues." It should seem that when he was desirous to from a powerful party in the state, he could be occasionally as profuse as he was habitually avaricious; for on one accasion he gave an entertainment to the populace, who were seated at ten thousand tables; and at another time gave them a supply of bread-corn for three months.—*Plutarch, Life of M. Crassus.*
‡‡ £2,421,875 sterling. §§ £3,229,166 sterling.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

The emperors were possessed of wealth in a proportion commensurate with their superior rank and power. Augustus obtained, by the testamentary dispositions of his friends, *quater decies millies.** Tiberius left at his death *vigesies ac septies millies*,† which Caligula lavished away in a single year.

The expenses of the government, and the debts and credits of the most eminent individuals, seem to have been on the same colossal scale. Vespasian, at his accession, estimated the money which the maintenance of the commonwealth required at three hundred and twenty-two millions nine hundred sixteen thousand six hundred and sixty pounds.

The debts of Milo amounted to *HS. septengenties*.‡ Julius Cæsar, before he held any office, owed thirteen hundred talents; when, after his pretorship, he set out for Spain, he is reported to have said, *Bis millies et quingenties sibi deesse, ut nihil haberet;* that is, that he was two millions and eighteen thousand pounds worse than nothing. When he first entered Rome, at the beginning of the civil war, he took out of the treasury to the amount of one million and ninety-five thousand pounds sterling, and brought into it, at the end of that war, four millions eight hundred and forty-three thousand pounds He is reported to have purchased the friendship of Curio, at the commencement of the civil contests, by a bribe of four hundred eight-four thousand three hundred and seventy pounds; and that of the consul L. Paulus, the colleague of Marcellus, by one of two hundred seventy-nine thousand five hundred pounds ||

Anthony, on the ides of March, when Cæsar was killed, owed three hundred and twenty thousand pounds, which he paid before the kalends of April, and squandered of the public money more than five millions six hundred thousand pounds.¶

Many other instances might be found of vast masses of wealth being collected, of large debts being contracted, and of prodigious sums being expended, either on public occasions, or in private indulgences of the dress, the tables, or the furniture of the Romans, just after the acquisition of universal empire. At that period the treasure, which had been acquired by conquest, had not been generally diffused in the hands of numerous individuals, nor had much of it been consumed by the friction which the practice, soon after extended, of converting large quantities of it into coined money, necessarily occasioned.—(*Jacob.*)

CHOLERAPHOBIA!!!

Is there any human calamity, any divine visitation, which does not give grounds for the speculations of the mercenary?—A sovereign expires;—and tailors and drapers expend half their capital in advertisements of cheap mourning; while rival newspapers cover the walls of half *the* capital with promises of half-a-hundred extra pages in honour of the royal obsequies, and an article on the lying-in-state, instead of lying about the state!—A horrible murder sets the provinces in an uproar; and an exhibition is immediately opened, at sixpence per head, of the sack in which the body was found, and of the oyster-knife which did the deed. Thurtell's progress was dramatized at a minor theatre, with the identical gig and horse; and Maria Martin and Corder, of Red Barn memory, were exhibited in wax work in a travelling van. But of all the prolific horrors ever put forth to paralyze the public mind into idiotism, is that of the Cholera. Far be it from us to treat with levity of so awful a scourge of the human race; but be it equally far from us, and all our countrymen, to be bamboozled into the purchase of paraboue clogs, because the Cholera Morbus is at Hamburgh; or into arraying ourselves in fleecy hosiery, and poisoning ourselve with cajeput on the first symptom of a stomach-ache, because the Grand Duke Constantine died last year, fourteen hundred miles from our metropolis. We cannot take a walk along the Strand, but CHOLERA MORBUS!—**Cholera Morbus**!!—CHOLERA MORBUS!!!—stares us in the face on fifty placards, from fifty different shop-windows. The hosier recommmends his merino stockings,—the glover, his lambswoolled beavers,—the hatter, his waterproofs,—the shoemaker, his cork soles,—the tailor, his double-milled,—the upholsterer, his portable bedsteads,—the tinman, his portable baths,—the chemist, his fumigations, his cloves, peppermint, mustard, opium, linseed, &c. &c. &c.—the distiller, his French brandy,—the baker, his gingerbread nuts,—the undertaker, his patent coffins,—all under sanction of the terrors of the CHOLERA MORBUS!—We are recommended to go and laugh at a new farce,—because mirth and hilarity are the surest preventatives of the Cholera; we are advised to give our attention to a new preacher,—under the impending national visitation of the Cholera. Some dozens of books of Indian travel, which have slept unmolested in divers city warehouses, have been recently dragged from oblivion and puffed into notice, because their several indexes contain the popular watch-words of "Cholera Morbus;" and more than one M. D. unknown to the college, and unheard of except among the bilious coteries of Cheltenham, have suddenly risen in value, like the price of camphor,—cent.-per cent.!

This must not be! Let us not forestal the chastisements of Providence. If the advent of the Cholera Morbus on our shores is fated "to raise the price of dry goods and tobaccos," do not let us anticipate the rise of pig-tail by this unreasonable depression of spirits. Let us not emulate the chambermaid recorded by Steele, who fell to crying because Mr. Trismegistus said there was going to be an eclipse. By eating our customary food and wearing our customary apparel, we shall maintain our accustomed cheerfulness. A panic such as that which is beginning to arise among us is the worst of epidemics. We do hereby protest against such of our kinsfolk and acquaintance as shall present us on New Year's Day with "The Cholera Disarmed," or "A Treatise on the Prevention of Cholera," by way of a new annual; and against any of our friends who shall bestow on us, as a tribute of affection, one of those little varnished cases, which stand like the box of Pandora in the chemists' windows, labelled "Specifics against Cholera." We have very little doubt that this eastern genius lies hidden, like the Bottle Imp, in one of the cut glass bottles of these fashionable liqueur cases.—*(Court Journal.)*

GROWTH OF A COUNTRY TOWN.

It is matter of analysis for the fashionable science of political economy to discover how a country town has grown or by what cement it is united. There is a church, that is the ordinary foundation. Where there is a church there must be a parson, a clerk, a sexton, and a midwife. Thus we account for four houses. An inn is required on the road. This produces a smith, a saddler, a butcher and brewer. The parson, the clerk, the sexton, the midwife, the butcher, the smith, the saddler, and the brewer, require a baker, a tailor, a shoemaker, and a carpenter. They soon learn to eat plum puddings, and a grocer follows. The grocer's wife and parson's wife contend for superiority in dress, whence flows a milliner, a mantua-maker. A barber is introduced to curl the parson's wig, and to shave the smith on Saturday nights, and a stationer to furnish the ladies with paper for their sentimental correspondences; an exciseman is sent to guage the casks, and a schoolmaster discovers that the ladies cannot spell. A hatter, a hosier, and a linen draper follow by degrees, and as children come into the world they begin to cry out for rattles and gingerbread. The parson gets idle and gouty, and gets a curate; the curate gets a wife and twenty children; and thus it becomes necessary to have more shoemakers and tailors, and grocers. Alas! too happy people! for in the mean time a neighbouring apothecary, hearing with indignation that there is a community living without physic, places three blue bottles in a window, when on a sudden the parson, the butcher, the inn-keeper, the parson's wife, and the grocer's wife become bilious, and find that they have got nerves, and their children get water in the head, and teeth, and convulsions. They are bled and blistered till a physician finds it convenient to settle; the inhabitants become worse and worse every day, and an undertaker is established. The butcher having called the tailor names over a pot of ale, Snip to prove his manhood knocks him down with his goose. Upon this plea an action of assault is brought at the next sessions. An attorney sends his clerk over to take depositions and collect evidence; the clerk finding a good opening sets all the people by the ears, becomes a pettyfogging attorney, and peace flies the village for ever. But the village becomes a town, acquires a bank, a mechanics' institute, a circulating library, and a coterie of old maids; and should it have existed in happier days, might have gained a corporation, a mayor, a mace, a quarter sessions of its own, a country assembly, the assizes, and the gallows.—*Dr. Maculloch.—Hobart Town Courier.*

Progress of Manufactures in Australia.—The following very interesting sketch of the state of the useful arts in this flourishing colony, is abridged from the annual speech of Sir John Jamison, the President of the Agricultural and Horticultural Society of New South Wales, as reported in the *Sydney Gazette* of October 16, 1830:—"Mr. S. Lord, after many years perseverance, has succeeded in manufacturing coarse cloth and blankets, which are very durable, and are readily sold to the extent of the supply. Mr. Robert Cooper, besides his splendid distillery, is engaged in erecting a building for the manufacture of cloth, and has sent to England for skilful manufacturers and machinery. His success cannot be doubted. It is amongst the drawbacks to our prospecity, that we have not yet manufactured all the coarse cloth, blankets, flannels, &c. necessary for our own use, and it may be apprehended, that the durability and superiority of our wool will not be known so as to be justly appreciated, until it is manufactured free from the mixture of inferior European wools: The manufactories of Messrs Dickson, Wilshire, Mackie, and Aspinal, already make soap and candles, not only sufficient for the consumption of the population of New South Wales, but also for export to Van Diemen's Land. The soap, in quality, is allowed to be as good the best English, and candles are approaching to European perfection. A discovery has been made by Mr. Mackie, that the ashes of the mangrove tree, which grows wild on most parts of the sea coast, are as good a subcarbonate of soda as Spanish barilla, and these trees are so numerous, that the supply must be quite inexhaustible. The price of the best soap, in consequence of this advantage, ought never to be more than one farthing per pound above that of tallow, now from 2*d.* to 3*d.* per pound the course of last year only, Mr. Aspinal paid £1200 for colonial barrilla, used in his manufactory. To Mr. Wilshire is due the credit of establishing the first tan-yard; he last year tanned and manu-

factured 2000 hides, 5000 kangaroo skins, 8000 sheep skins, and 7 rolls of parchment of 60 skins each. Mr. W. had so many competitors, that there is enough of leather prepared for colonial use, and a surplus of green hides exported to England; he last year paid no less than £500 to persons for collecting mimosa bark. Flax enough is obtained from New Zealand, at a cheap rate, for colonial purposes, and a surplus for exportation." Sir John concludes this branch of his subject by emphatically observing, "I hope the period is not far distant, when we shall manufacture all the woollen goods we require, distil our spiritous liquors, brew as much beer as we want, and, above all, make the whole of the wine and oil we stand in need of." The newspaper from which we have quoted the above, is itself a proof of the advance of Australia; it is of as large a size, as well edited, and as well printed, as the most respectable of our English journals. It appears thrice a week.—*Mechanics' Magazine, September* 1831.

The following, says the *Colombia Spy*, has been sent to us as something which has never been published. We insert it, therefore, as original:—

MYNHEER'S BREAKFAST AND BACCOON HUNT.—In de morning ven you kits oop, I dakes a rite; unt vent you kums tre oder vour mielt I trink a chill of shinn; den ven you kits tre mielt furder, I trinks anuder chill of shinn; unt ven you ish peen kum to my brudder My callsh vun oder mielt stones furder, I trink a tird chill. But I tell you vat I eats for mine breakefast:

25 Ekks—3 piskets,
1 tuzen picklet Herrinks,
1 yung chicken,
2 oder tre puntches liddel Rettishes,
haaf tuzen liddel pisket,
1 ret Kappiges unt finegars,
15 Kups of Koffee,
1 oder 2 chills of shinn,
wid oder nig nags.

Unt I dels mi brudder Mycallsh if he ish cot any coot cidersh? unt he asked me 'yish he's cot sum excellent zour beer, unt he's sorri its peen all gone.' Den my horse Tobbins unt me kit mount our satlles upon our pellies, wid mi brudder Mycallsh hors on him, unt rite as if de ferry tivele was before us, to hunt de Harracoon, unt I dels mi brudder Mycallsh if I vill climp de dree oop, unt shaak town de Harra coon? so ven we hat peen shase in goot vile, he climp de dree oop, unt I catsh him pehints; but de tivel skin mate vaater in mine eyes, unt plint me so I dumble from de pottom of de dree to de top, shlaam pang, vlat on my breeches pehindt unt my brudder Mycallsh stopoy 'mi dog Fowler.' 'Get out youu tivels skin? Vat is it you?' 'To be sure it is.' 'Be youu tead?' 'To be sure I am, for mi collar pone is proak. So we catsh nobody, but vun dumble unt prake my pipes unt topacco, pesites spill all my shinn pottles in a hundred pit into the pargan. —*New York Evg. Journal.*

QUALIFICATIONS OF A WIFE.

These are set forth in the "Worcester Journal 1761" to the following effect:—

Great good-nature, and a prudent generosity.

A lively look, a proper spirit, and a cheerful disposition.

A good person, but not perfecty beautiful,—a moderate height,—complexion not quite fair, but a little brown.

Young by all means—old by no means.

A decent share of common sense, just seasoned with a little repartee—a small modicum of wit, but no learning: no learning, I say again and again (either ancient or modern) upon any consideration whatever.

Well, but not critically, skill'd in her own tongue.

In spelling a little becoming deficiency; and in the doctrine of punctuation (or what is generally call'd stopping) by no means conversant.

A proper knowledge of accounts and arithmetic; but no sort of skill in fractions.

A more than tolerably good voice, and a little ear for music—a capability of singing (in company,) but no peculiar and intimate acquaintance with minims, crotchets, quavers, &c.

Ready at her needle, but more devoted to plain work than to fine—no enemy to knitting.

Not always in the parlour, but sometimes in the kitchen—yet more skilled in the theory, than in the practice of cookery.

Fonder of country dances than minuets.

An acquaintance with domestic news, but no acquaintance with foreign.

Not entirely fond of quadrille, but a little given to whist.

In conversation a little of the lisp, but not of the stammer.

Local Taxation of England and Wales.—By a Return laid before the House of Commons in the last session of Parliament, it appears, that in the year ending the 25th of March, 1827, the amount of local taxes levied on the real property of England and Wales was:

For Highway Rates, . . .	£1,121,834.
Church Rates, ...	564,388.
Relief of the Poor, Country Rates, &c.	7,803,465.
	£9,489,687

Which, on the annual value of the real property, ending the 5th April, 1815, namely, £51,893,423, is 3s. 8d. per pound, or about 18⅓ per cent.

POPE GREGORY AND THE PEAR-TREE.

HUGO BON COMPAGNO was one of the gayest of the gay children of the south. He had archness and vivacity—a bright eye and a ready tongue. He was the favourite of the neighbours, and was predestined by the monk who taught him Latin, to make a great figure in the world. Hugo had formed a close friendship with a youth about his own age,—the son of a gardener; in all respects his inferior, save in that plastic quality of temper that moulded itself to the will of others, and which by its docility made, very frequently, a far deeper impression on those who knew him, than the more apt and vivacious qualities of his patronizing companion. However, the two lads were firm friends, and in the day-dreams of boyhood, ere the warm impulses of our nature become chilled in the school of selfishness—ere, in our progress through the world, we imperceptibly imbibe so great a portion of its clay—the youths had but one hope, saw but one fortune for both. Wealth, if they gained any, was to be equally shared by them—honours, if they came, must be participated by either. So dreamt they in the delicious time of youth, so lived they in one of the liveliest spots of Italy,—at a village some few miles from Bologna. The world, as yet lay before them, an undiscovered country; they saw it, as the great navigator saw in his dreams, the distant yet unknown land: a halo of glory was about it—it was rich in fruits and flowers, and spicy forests and mines of gold.

At length the time arrived, when this romantic region was to be explored. Hugo was to go into the world.—At the period of which we write, the church was the surest road to honor: and Hugo, as we have before implied, had that keen and subtle temperament, that untiring perseverance, and that aptitude for book-learning, which in those days were considered the indispensible requisites for one who, in ostensibly devoting himself to God, sought to grasp at temporal sway; and who, as he bowed with a seeming inward reverence to the Cross, leered with a miser's eye at Mammon and his heaps. Hugo was devoted to the church: he quitted his native village, and grown beyond childish years, and having cast away "all childish things," he became a monk, and in his function pored over that awful volume, so blotted with crime, so stained with tears, so confused, so scrawled with error—that mystery of mysteries—the human heart. Thus he laboured, all his thoughts and feelings attuned to one purpose—worldly ambition. His home, his relatives, the companions of his youth, the scenes of his boyhood—all, all were forgotten—the monk had killed the man.

"Well, Hugo," said Luigi, with a saddened air—"to-morrow you quit us: to-morrow you leave the village, and the saints alone know, if we shall ever meet again."

"Meet again, Luigi, and why not?—you will come and see me—I shall sometimes come here. We shall see one another often—very often."

"Yes—see one another! But you will only be to me as the ghost of a dead friend!"

"The ghost of a friend! Can I ever forget Luigi—my earliest playmate—the brother of my heart, though not of my blood?—Trust me, I shall ever love you."

"A monk love!—a monk has neither parents, nor friends!"

"No: he loves, with an equal affection, all mankind!"

"Aye—and only with all, must Luigi take his share. Farewell, Hugo, and the Virgin bless you:" and Luigi turned away with ill-concealed emotion, and endeavoured to proceed with his work Hugo was likewise sensibly affected by the sincere passion of his friend. And let not the reader too hastily condemn the scene as weak and puerile—hitherto Luigi, although he had known and conceded to the superiority of Hugo, yet felt proud of the excellence that had cast its favour upon himself. He now saw in it the cause of separation; he now felt that he was the humble Luigi, the gardener, destined to eat from his daily toil—and that Hugo, his earliest and choicest friend, was to be severed from him to pursue a path, it might be, of glory and renown. Luigi continued at his work—

"What are you going to plant there?" asked Hugo.

"A pear-tree—and it is said to be of a rare kind."

"Stay, let me help you," rejoined Hugo; and approaching Luigi, he assisted him in planting the young shrub, for it was little more. Whilst thus employed, they uttered not a word—each drew a sombre picture of the future, and for the time, Hugo felt that he could give up all hopes of the power and splendour, promised to him in his dreams, and in those reveries more delicious, though often as equally vain, as the visions of the night—that he could forego all temporal pomp, all spiritual dominion, rather than wound the honest heart beside him.—For a moment, the genius of the place seemed to ask him—"Why not abide here in the home of thy father—why not rest with us, and get thy food from the earth—why pant for the commerce of the world, 'as the hart panteth after the water-brooks?'" Ere the young tree stood supported by the earth, this feeling had subsided, as it had never risen, and Hugo stood again about to say farewell to Luigi, who looked at him with a look of mingled sorrow and distrust.

"Luigi," exclaimed Hugo, with sudden animation—"let this tree be as a covenant between us. As it stands, it is no unapt type of your friend. The rich earth is about its roots, and the 'dew will lie upon its branches;' with the blessings of the saints, it may put forth swelling buds and leaves, and rich and odorous fruit—and men may pluck refreshing sweetness from its boughs, and rejoice beneath their shade. So may it grow up, and so may it adorn the land that doth sustain it: and, Luigi, it may be that it may pine and shrink, and never put forth one green leaf—or blight may eat its buds, and canker gnaw its heart, and so, cut down, it may be cast upon the fire, and so may perish. Thus stands your friend: I shall be planted in the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

church, Luigi, -in that soil, rich with the flesh and blood of saints—heaven may rain its dews upon me, and I may put forth glorious fruit—and, Luigi, (the voice of the speaker became slightly tremulous)—these hopes may be a melancholy mockery of my fate—for I may perish, unknown, unhonoured, unregretted. I know not how to account for it, my mind is possessed by a sudden superstition—I feel, and it is an odd, perhaps an unchristian fancy, that this tree will be the symbol of my destiny: if it flourish, I shall prosper; if it fade, Hugo will decay too. But, however it may be, Luigi, the hearts of our youth shall, in their friendship, be the hearts of our old age. And though we shall meet, yes often meet, yet here I promise, that there is no time so distant, no state so high, hat even though, parting here as youths, we never meet but as grey-headed men—that here embracing in this humble garden, we next encountered in the halls of kings—I give my solemn word that you shall be to me the same Luigi, I the same Hugo."

Luigi grasped the hand of the speaker—"Heaven prosper you, Hugo—and forget not your friends—Remember, remember the pear-tree."

Hugo quitted his paternal home; years passed on, and whilst Luigi, a happy and contented man, tilled his grouud and propped his vines, and saw his ruddy offspring flourishing around him—whilst he enjoyed that great gift of Paradise, "a country life," and lived in an atmosphere of serenity and sweetness, Hugo was toiling through the devious path of *church-craft*, a childless man. He was a *politician* and a *priest*—then, more than ever, twin-flowers upon one stalk—he had advanced in dignity, and had almost within his grasp, that bright reality, the shadow of which had shone like a star upon his tide of life, and tempted him to ford all depths, to dare all dangers, to hold all toil as nought.

And Luigi lived on, and became an old man. His children's children frolicked under the shadow of the pear-tree, which shot up, and spread out, as though some spirit were specially charged to tend it.

"Ha!" cried Luigi, "'tis a rare crop:" as two of his grandchildren, perched in the boughs, plucked the fruit, and threw it into the laps of their little sisters, who piled it in two large baskets—"'tis a rare crop," repeated Luigi, "and if Hugo bear put half as much, there are few richer among the brotherhood. He said, as this tree flourished, so should he prosper: he was a true prophet; though 'tis well he left something behind to inform me of his increasing greatness—it seems I should never have known it from himself."

Hugo had, shortly after his departure, forgotten his friend, who, however, continued to tread the same humble, happy path, in which he had at first set out. He had had nothing to disquiet him, no losses, no family afflictions; the dove, peace, had always nestled in his cot—and it was not until the old man was bending downwards to the grave, that misfortune threatened his hearth-stone.

A man of high birth and immense wealth had built a magnificent palazzo in the neighbourhood of Luigi's cottage. This man was connected by marriage, with the family of Hugo. He was purse proud and despotic, making of his gold a sword against the poor. One day, it was his arrogant whim that the cottage of the gardener interfered with the beauty of the prospect from the palazzo. It was almost instantly conveyed to Luigi, that he must seek another abode, as the land on which the house was built, together with the gardens, belonging to his potent neighbour, were to be devoted to other purposes. The intelligence fell with a heavy blow upon the old man. To leave the cottage—the roof under which himself, his fathers were born—to quit his gardens, his trees, things which, next to his own children, he loved with a yearning affection—the very thought of it appeared to him a kind of death. He refused to quit—he remonstrated—implored: it was of no avail—the cottage interfered with the prospect.

One evening the old man, half bewildered, had returned from a fruitless journey to the palazzo. He sat down in his garden, and looked with swimming eyes upon his mirthful children (heedless pretty ones, whose very happiness gives a deeper melancholy to a house of sorrow); shocked and wounded by the tyranny of his landlord, he glanced at Hugo's Pear-Tree—(for so he always called it.) The old man leapt from his seat—his resolution was taken—he would go to Rome—he would, as a last hope, strive to find some part of his boyish playmate Hugo, in the wrinkled, politic churchman. All things were soon ordered for his journey, and he quitted the cottage, bearing with him a small basket, filled with the finest pears plucked from Hugo's tree. Luigi arrived in Rome—and now, with a sinking heart, now with a confidence based on honest pride, he sought the presence of the Holy Father. Appearing before the servants of his Holiness, Luigi asked for an audience of Messer Hugo Bon Compagno? When reminded of that unbecoming familiarity, Luigi replied, that he knew not Pope Gregory XIII., but was a dear friend of Hugo's, and therefore demanded to see his companion, not caring, he said, to trouble the pope.

To this Luigi obstinately adhered, continually urging, with great earnestness, that he should be admitted to the presence of his early comrade. There was a simplicity in the old man's manner that for once won upon the minions of the great; and the strange demand of Luigi being reported to his Holiness, he was with great ceremony ushered before the sovereign Pontiff—before the man who was courted by emperors, flattered by kings. All retired, and the rustic and God's vicar upon earth were confronted.

How changed, since the friends had last met!—Then they were, at least in fortunes, almost equal. Now, one was bent beneath the load of empire—worshipped as one only "a little lower than the angels"—the triple crown upon his head—St. Peter's keys within his hand. What has the poor gardener to shew against all these?—a basket of pears!

"Now, my son," said Pope Gregory—"you sought Hugo Bon Compagno—you find him in Gregory the Thirteenth. What ask you at his hands?"

"Justice, most holy father—justice and no favour."

"Speak."

"I made with another, in my time of youth, a mutual compact of kindness and protection—we vowed that whichever should prosper in his fortune, should serve and assist the other."

"It was a Christian promise. Well? Stand you in need of succour?"

"Most grievously—oppression has come upon me in my old age."

"And your friend forsakes you in your need? Have you witnesses to the compact of which you speak?"

"Yes—this basket of pears!"

"Pears!" cried the pontiff, and light darted from his eyes as he fixed them earnestly on Luigi—

"We planted the tree on which they grew—'Let this tree be a covenant between us'—were the words of my companion. He and the tree have flourished: for forty years that tree has never failed; for every year it hath brought forth a crop of luscious fruit—and I have sat beneath that tree and wondered how it could be so bountiful to me, when he who helped to plant it, he who was bending beneath his honours and his wealth, had forgotten to send me even a single pear."

"Luigi—Luigi,"—exclaimed the pontiff, and with a face crimsoned with blushes, he threw his arms about the rustic!—*Their grey heads lay on each other's shoulder.* Thus they continued for some moments, and then Luigi, stooping to the basket, presented a pear to Gregory: he took it, and looking at it, burst into tears.

Luigi kept his cottage.—*(Monthly Mag.)*

REPORTING PROGRESS—BRIGHTON BADINAGE.

IN the days of our grandmothers of powder-and-pomatum memory, it is well known that every dowager having daughters to dispose of in the markets of Ranelagh and Pantheon, was fortunate in two strings to her bow,—or rather in two beaux to her belle. Instead of allowing Miss Priscilla or Miss Maria to waste her charms on the desert air of London, when London was out of town, or on the airless vacuity of their country seat, when the County races had done their best and worst for the unmarried beauties of the neighbourhood, the family physician was coaxed into declaring Papa's "bunions, corns, and callosities," a genuine fit of the gout; Bath was peremptorily prescribed; and Prissy became the heroine of the pump room, and the toast of York House. Jaded and faded belles were instantaneously renovated by the atmosphere of King Bladud's city; and the second-rate society of London rose like a balloon, by inflation, when permitted to expand itself among the coteries of Bath.

The French Revolution—(that sweeping clause of the Bill of human pains and penalties,)—the French Revolution, which shook the reign of Folly to its centre, and replaced her cap and bells with the *bonnet rouge* and tri-color, struck the first blow at that gaudy Pagoda which Fashion had elevated as her temple on the banks of the Avon. During the wars which followed, the Furies which, with their torches, were loosed upon the earth, soon spread ruin and havoc in this and similar resorts. There was no more Bath,—no more Tunbridge,—no more Nash,—no more pantiles,—no more nothing. Cheltenham attracted a few nabobs and half-pay Captains; Harrogate a few Yorkshire magnificoes and genuine scorbuties; but there was no longer a Vanity Fair among the watering places, where the damaged goods of London could be disposed of at half-price at the close of the season; and where the echoes of May Fair fiddle-faddle, and the shadows of the Phantasmagoria of St. James's, could be heard and seen to the best advantage.

To remedy these deficiencies, Brighthelmstone, like Venus of old, arose from the scum of the sea; and was, for some time, peopled by the scum of the earth,—by the aristocracy of Whitechapel, and the rank and fashion of Holborn Hill. But the popular idol of the day, the heir apparent, "*the* Prince," having conceived a predilection for its shingles, the Pavilion afforded a new altar for the worship of fashion; hills were levelled, and sands substantiated, to render its London road as straight as the aim of a pea-shooter; the shops and stage-coaches of this marine suburb of the Metropolis soon multiplied with compound interest: the fishing village became a town—a city—a winter world for the great, and a summer world for the gross; a refuge for retired cits, widows with limited jointures, and spinsters on the look-out for both. Boarding-houses, and houses for the bored,—parades for loungers, and loungers for parades,—"rose like an exhalation" from the West cliff to the East. New squares, new terraces, new streets, gardens, crescents, and places, clustered in swarms around the grand mosque of the Pavilion. All the sycophantic limpets of the *beau monde* attached themselves to the Regent's rock; and aspiring citizens clung, like barnacles, to the stern of the Royal yacht. Brighton was found the most convenient sanctuary in which Majesty could take refuge from its cares of state; and divers of the aristocracy, who were covetous of an excuse for getting rid of the provincial hospitalities of Christmas,—good old white-bearded Christmas,—established their winter residence under sanction of his late Majesty's partiality.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

We do not imagine that Bath, in its best days,—before it became a by-word as the emporium of flashy gentility,—ever exhibited such a choice of fashionable society as Brighton at the present time; nor do we anticipate any chance of a decadence in its popularity. The convenience of its distance from the Metropolis, and the peculiar advantages attendant on its intercourse with the continent, secure the predilection of the secondary classes; while its exclusive visiters are not molested, as in Bath, by the necessity of sharing their pleasures with the profane and uninitiated. There are now as many "sets" at Brighton as at Paris; as many in proportion, as in London. The Duke may enjoy his treble-refined dinners,—their Majesties a more extended hospitality;—Lady A——, her circle of "matchless,"—Lady B——, of mixed acquaintance. *Lady* Sophia is enabled to spread her nets among heirs apparent, and an infinite variety of the "commonly called;" while *Miss* Sophia is fortunate enough to select her partner from a host of bold dragoons and galloping lancers. Nay, we ourselves discover so wide a field for our lucubrations in the originalities of Brighton, that we must needs make it the subject of a series of papers.

Some twenty or five-and twenty years ago, it is well known that Brighton presented an unexceptionable ladder of promotion to those who were on the look-out for a bean-stalk, whereby to climb into the Ogre's place. Persons of aspiring views, doubtful fashion, and decided subserviency, were accustomed to bathe themselves into the notice of a prince, with whom the scanty attractions exhibited at that period, by this most celebrated of modern bathing places, afforded an inadequate substitute for the pleasures of society. The Pavilion was not then sufficiently enlarged to admit of the establishment of a select circle beneath its roof; the Continent, still closed against the wanderings of the illustrious idle, did not yet seem to place Brighton on the high-road to Paris; and the lions and tigers of the menagerie were accordingly occasionally let loose for the diversion of a royal hunt. By adminstering dexterously to the ennuis of hour, many contrived to establish a claim on the illustrious ennuyé. Subsequent knighthoods, and other trifling doles of the small coin of royal patronage, have been traced back to a good story or a good song, sung or said on a rainy day, at Brighton; and more than one detachment of the awkward squad has been detected in the Carlton-House coteries, and pointed out by the malicious, as belonging to "the Pavilion set." On this hint, great was the influx of the *place-hunting and time serving.* Shovel-hats were seen scudding along the Steyne, which would gladly have taken shelter in the sanctified seclusion of Hastings of Sandgate; and many a dowager, ambitious of a small commissionership for one of six younger sons, annually bestowed on the Marine Parade the tediousness of her untirable and unimpeachable whist, who would have infinitely preferred the half-crown circles of Worthing or Ramsgate.

His late Majesty, who has been pointed out by that malevolent re-action of the public voice, so terrible to the memory of kings, as "exclusive" and captious in the dispensation of his notice,—as a man devoted to sensual and selfish, seclusion,—was known, for a long series of years, to the Brighton visiters, as the most urbane and amiable and forbearing of hosts. Till driven into retirement by the increasing symptoms of a painful infirmity, he was in the habit of extending his hospitality, winter after winter, to all persons, of respectable character and degree, aspiring to his notice. We remember an instance of his Royal Highness's entering into conversation, while still Regent, with an obscure lieutenant of infantry, who had been included in the general invitation extended to the regiment quartered in the town; and, pleased with the intelligence of his remarks, seating himself near the young officer for the greater part of the evening. On another occasion, a gentleman of high reputation, a captain in the East India Company's naval service, was induced to tender to his Royal Highness's acceptance two Chinese lanterns, of unusual magnificence, for the decoration of the Pavilion. The offering was graciously accepted; but, a few days afterwards, a fine horse was led to Captain ——'s stables from those of the Regent; and he was himself shortly afterwards included in a dinner invitation,—an honour occasionally repeated during his stay at Brighton.

Such instances of royal condescension were sufficient to bring together a motley congregation of major-generals on the search for the Guelphic,—Irish deans, country baronets, Sussex squires, and an infinite variety of *vicars of Bray,* of all counties, classes, and persuasions; and whereas that select circle of persons of rank, attracted in some degree by similar pretensions, became accessible, in a similar manner, to a still lower grade of adventurers, Brighton was seen to afford an admirable stepping-stone for the ambitions of every order of society. Nothing is more common than for the frequenters of the place at that epoch, (returning at the present time) to declare, after gazing with envy on the aristocratic splendours of the new squares and hotels, that "Brighton is spoiled?—that it has lost all the sociability which used to render it so pleasant in former days." These murmurs, being interpreted, simply express that its circles having been widely extended,—thanks to the charm of that very sociability they were wont to find so charming,—it has been found necessary to enlarge the meshes of the net, in order to favour the escape of some of the lesser fry; and to filter away impurities with greater care. Among such a host of pretendants as have gradually swelled the lists, selection becomes necessary as well as desirable; cloaks and pattens gave way to flys,—flys to carriages; and the "sociability" of Brighton, like that of other places, now extends to pine apples and champagne. The small boarding houses, so consonant with the inclinations of half pay majors and maiden ladies of diminutive independence, are eclipsed by the stately splendour of the Clarence; and the one pastry-cook, with his thimblefull of citric-acid ice, has given way to ——————, but we exceed! A renewal of the habits of courtiership of former times has alone directed our pens towards the aspect of the society of modern Brighton; and, in an ensuing number, we may be tempted to enter more particularly into the minutiæ of the picture.—*Court Journal.*

SELECT NOTICES.

Apology for John Knox.—The most complete condition of polity can exist without pictures or statues, and men are made more happy by the enjoyment of their privileges, than by any of the flowers of fancy. The political sciences, however, are considered as the mere drudgery of homely life, and where they are most cultivated, they pass unnoticed by ordinary minds. The Appollo Belvedere is known to many thousands more than are acquainted with the 39th article of the British Magna Charta; yet, that article has done more real good to the world than all that ever grew under the magic hand of Phidias and Praxiteles.—*(Chenevix.)*——*Temperance Societies.*—The Duke and Duchess of Breadalbane have signed the Temperance list, and interdicted the use of ardent spirits at the Castle. Temperance Societies are forming in all parts of England, and ladies attend the public meetings.——*Highland Society.*—Lady Mackenzie, of Gairloch, has been elected a member without the ceremony of ballot.——*Scientific Expeditions.*—The new expedition ordered by the present Board of Admiralty, is intrusted to the command of Capt. Fitzroy, who has recently sailed in the *Beagle,* from Plymouth. After a visit to the southern shores of South America, Capt. F. will cross the Pacific, and make observations upon the various coralline islands, with which that ocean is studded near the Equator. He will also visit N. S. Wales, cross the Indian ocean, and return by the Cape of Good Hope. Capt. F. was employed in the vessel he now commands, under the orders of Capt. King. The *Etna,* Capt. Belcher, has also sailed for the Coast of Africa, to resume the survey of that Coast to the South of Cape Verga.——*The Ettrick Shepherd.*—Hogg was discovered in Mr. Irvine's Church in London, in January last. He was wrapped in tartan, and was paying devout attention to the preacher's powerful discourse.——*Burns.*—Extraordinary exertions were making in London at the beginning of the year to celebrate the birth-day of Burns'. It was expected that all the Scottish *literati* would be present. It is a singular fact that Hogg's birth-day (25th Jan) is the same with Burns. Genius found the one at the plough, and the other at the sheep-fold. At this Scottish Literary dinner, Sir Jas. Malcolm was to preside. The following is a list of the stewards, Lord F. L. Gower, Sir M. S. Stewart, Sir G. Warrender, Sir J. Hay, Sir G. Murray, Sir J. McIntosh, Sir J. Read, Sir J. Shaw, Sir. P. Lawrie, Sir J. Rennie; the Members of Parliament, Messrs. Grant, Bulwar, McKillop, Mackinnon, Traile, and Scott; literary men, Messrs. Sotheby. J. Campbell, Lockhart, Hook, Galt, Cunningham, Pringle, Croker, Coleridge, Jerdan, Maginn, Fraser, Logan, &c.—Artists, Messrs. Wilkie, Chantrey, Spottiswoode, Stuart, Marchison, Cruikshanks, Murray, Wardrop, Hastie, Richardson, Miller, Boyd, Furguson, Anderson, Martin, Fullarton, Capts. Hall and Blair, and Sir. M. Shee.——*Bonaparte* used to say that "impossible" was the adjective of fools.——*Chinese notion of dancing.*—When Commodore Anson was at Canton, and gave a ball on some court holiday, a Chinese, who very quietly surveyed the operation, said softly to one of the party—"Why d'ont you let your servants do this for you?"——*George the III.* was one of the most upright monarchs that ever sat on a throne; he curtailed his prerogative in two most essential points; and added another bond to keep the key-stone of the arch immoveable.—*(Chenevix.)*——*The Kingly Power.*—There is a superior solidity ever belonging to the power of the Crown, as compared with any other body of men, or party, or even with either of the other branhces of the legislature. A party has *influence,* but properly speaking no *power.* The Houses of Parliament have abundance of power, but as bodies, little or no influence. The Crown has both power and influence, which, when exercised with wisdom and steadiness will always be found too strong for any opposition whatever, till the zeal and fidelity of party attachments shall be found to increase in the proportion of the increased influence of the executive power.—*(Fox's James.)*——*Cholera.*—A Dr. *Duterte,* a French Physician, writes to the French Academy of Sciences, that he will give himself up to be guillotined, if his remedy for the cure of Cholera fails in a single instance.——*Tithes.*—Dr. Meyrick, whose minute acquaintance with the ancient history of our country is well known, (see his Work on Ancient Armour in the Public Library,) has at a County Meeting at Hereford, denied that Tithes can be traced to a divine origin. He accounts for their origin in this way. A Saxon king murdered his brother, and, to get rid of the clamour of the people who inveighed against the atrocity, the royal culprit had recourse to the clergy. The latter agreed to exercise their influence in his favour, provided they received an adequate permanent compensation for so great a benefit. The terms were complied with, and the wages of this transaction are still paid under the appellation of Tithes.——*Hours of Mortality.*—It has been proved beyond dispute, that the mortality of mankind is greater at some hours than at others. The largest number die between 2 and 3 o'clock in the afternoon; less from the latter hour until 8 o'clock in the evening; fewer again from 12 to 1 A.M; fewer

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

still from 8 to 10 A.M; and fewest of all from 10 o'clock P.M. to 3 o'clock A.M.——*Signs of the Times.*—A large room has been opened in London by a Political Union, and in the rules for the formation of a Library and public discussions, the *Sabbath* has been voted as not worthy of observance. Fox, the Unitarian Preacher, was the leading speaker, and argued stoutly in favour of *non observance.*——*National Industry.*—The great pyramid of Egypt, was considered by antiquity, as one of the wonders of the world. The masses of which it is constructed are enormous: they were collected at a considerable distance from their present site: they now cover more than eleven English acres, and are piled up to the height of about 700 feet. The construction, according to Diodorus Siculus, employed 36,000 workmen; according to Herodotus, 100,000, during 20 years. Now, if all the steam-engines which Britain possessed in 1820, had been employed to raise from the quarries the materials used in building the great pyramid, to collect them, and to place them in their present situation, they could have performed the task in 18 hours! Therefore, the mechanical power of British steam engines is to that of the Egyptian monarch, Cleops, inversely as 18 hours to 20 years, or very near ten thousand times as great!——*Book Trade, 31st Dec.*—The trade is extremely dull: little doing in the publishing way, except a few wretched novels, and the periodicals. In London alone, 600 letter-press printers are out of employment. In the country there are thousands in the same predicament.—*Edinburgh Post.*——*How to discover genuine Macassar Oil.*—Rub a deal box with it at night, and if it turns out a hair trunk in the morning, all's right.——*Tea.*—In 1745, the Scottish Lady P. buttered a pound of green tea, sent her as an extraordinary delicacy, dressed it as a condiment to a rump of salted beef, and complained that no degree of boiling would render these foreign greens tender!——*Clerical Learning.*—The Bishop of Lincoln, in a late charge delivered at a Visitation, says—"I do not think that I shall be charged with fixing too high a standard of qualification, when I say, that the candidate for the ministry ought to be thoroughly conversant with the Greek Testament; with the chronology of the Scriptures, and connection of profane with sacred history; with Jewish antiquities; with Natural Theology; with the Evidences of Christianity, and with the Doctrines of the Church as propounded in the Articles and Liturgy." The Bishop observes in his charge, that his predecessor, Bishop Tomline's list of Theological Works, recommended to students, is deficient, and adds the following: Prideaux's Connection, Horne's Introduction (an excellent book,) Paley's Natural Theology, Burnet on the Articles, and Butler's Analogy.——*Bell's Life in London.*—This paper, on the authority of Mr. Wakefield, is read with great avidity by all the rogues, pick-pockets, thieves, and house-breakers of London and Westminster.——*Pamphleteering.*—The writers of such are all on the alert. The three grand subjects—the Cholera, the Burkings, and the Church.——*Emigration.*—In the expectation of a coming storm, a number of highly respectable families in various parts of England have sold off, and proceeded to Canada.——*The Colonies.*—While Europe is awaiting revolution in all its kingdoms, it is singular that the other quarters of the globe are assuming an unexampled tranquility. The settlers in Canada, Nova Scotia, New South Wales, Van Diemen's Land, and the Cape, are all going on smoothly, safely, and swimmingly; rearing bullocks, taming buffaloes, training vines, planting potatoes, and shearing sheep.—*(Monthly Magazine.)*——*A Novelty.*—A Master McKean has started a new set of faculties, which throw the entire old system into the shade. He can, with his eyes blindfolded, and his back turned to the experimenter, tell the colour, and all external properties of any designated object whatever. A piece or pieces of money, keys or trinkets of any description may be produced by any of the company, and he will instantly tell how how many there are—whether composed of gold, silver, brass, steel, or copper! the date and value of the coins, and describe every other article very minutely, even should there appear a spot on them. His next feat is, he will ask the favour of any lady or gentleman of the company to speak softly within themselves, so that they may not be heard by those who sit on the right or left, and he will instantly repeat them, although at 100 yards distance.—*(Ib.)*——Sir Walter Scott is still under quarantine at Naples. *Gazette d'Augsbourg, 27th December.*——Contents of the *Quarterly* for January:—1. Madame Junot's Memoirs; 2. Origin of the Latin Language and Roman People; 3. Wiltshire Emigrants to Canada—Condition of the Labouring Classes; 4. Senior's Letter on the Irish Poor; 5. State and Prospects of Ireland; 6. Béranger's Songs; 7. History of English Dramatic Poetry; 8. Tour in England, Ireland, and France, by a German Prince; 9. Progress of Misgovernment.——*Temperance Soiree.*—At a meeting of the members of the Temperance Society in the Calton Convening Room, Edinburgh, 17th Dec. upwards of 400 persons partook of tea and coffee. Capt. Knox occupied the chair. The healthy and happy faces of the company presented a cheering and joyous spectacle. The meeting was altogether one of the most interesting ever remembered in this city.—*(Edinburgh Post.)*——*Visit to the King.*—The Rev. Dr. Burns, of Paisley, has published an interesting account of a recent visit to the King. The description is worthy of the Vicar of Wakefield, or of the Annals of the Parish. The visit was made in order to present to His Majesty a new and elegant edition of Woodrow's Church History, which was dedicated to the King. A long conversation took place on general subjects, all of which are detailed, and are highly complimentary to the good sense and shrewdness of King William. On turning over the pages of the work presented, and turning up successively the engravings of Sharp, *Claverhouse*, Lauderdale, Carstairs, &c. remarks were made on each, and the King seemed extremely well informed in their respective histories, and the bloody persecutions of the days of Charles the II.——*The Bishop of Winchester.*—So generally was the death of this Prelate credited in London, that the choir of St. Paul's Cathedral, of which he was formerly Dean, performed a funeral anthem in commemoration of his Lordship's supposed decease.

AXIOMS

Given in couples, as Members pair off one on each side the Question.

1. Cholera is contagious
   Cholera is non-contagious.
2. Cholera is to be cured by brandy and bleeding.
   Cholera is caused by dram-drinking and depletion.
3. Cholera is a natural production of the soil, and has never been absent from it.
   Cholera is contraband goods; it has been smuggled into the country, and was never seen in it before.
4. Cholera is a chamelion; it thrives on air alone. Where there is anything to eat it dies.
   Cholera comes of living too well.

Now of Reform!

1. Reform will be the ruin of us all.
   Reform will be the salvation of us all.
2. Without Reform you must have Revolution.
   With Reform you cannot escape Revolution.
3. Whether the Peers repudiate Reform or not, Reform will repudiate the Peers.
   The only safety of the Peerage is to be found in a salutary Reform.
4. The King will make as many Peers as Lord Grey and Reform may require.
   The King will not make a Reforming Peer if it costs him his throne.

Slavery.—The late Rev. Matthew Tate, of Beaufort, in South Carolina, made his will a short time ago, and three days previous to his death he added to it an exceedingly long codicil, in his own hand writing, in which there is the following paragraph:—"I enjoin it upon my executors to publish it in all the newspapers in Charlestown, that I departed this life under the full persuasion, that if I died in possession of a slave, I should not conceive myself admissible into the kingdom of heaven."

SOMETHING CURIOUS.

From the London Literary Gazette.

Two young Frenchmen, brothers, of the name of Verreau, have lately returned from an expedition into the interior of Africa. One of these interesting naturalists, who is scarcely eighteen years of age, has spent above twenty months in traversing the savage region which lies north of the country of the Hottentots, between Cape Natal and the west coast above Saint Helen's Bay. We shall not attempt to relate the privations and the dangers which these travellers incurred from the natives of this zone of Africa—blacks, as ferocious as the wild beasts among whom they dwell. We will only mention some of the curiosities they collected in their expedition. Men, quadrupeds, birds, fish, plants, minerals, shells, they have studied, and brought home specimens of every thing. They procured, in hunting, tigers, lions, hyenas, a beautiful burbalus, a purple antelope of singular elegance, a variety of other specimens of the same family, two giraffes, monkeys, polecats, some very curious rats, an ostrich, birds of prey which have never yet been described, and a great number of other birds, of all sizes, colours, and species. They have made a collection of nests, which might furnish a subject for an interesting essay; roots, bulbs, and other vegetable productions of a remarkable organization, or of uncommon size; serpents, a cachalot, and a crocodile of a hitherto unknown variety. But the greatest curiosity is an individual of the race of the Betjouanas. This man, who has been preserved by the methods used by naturalists to prepare such specimens as they intend to exhibit in their original form, is of low stature, black skin, the head covered with a short and thick wool. He is armed with a lance and arrows, clothed in an antelope's skin, with a head-dress composed of porcupine quills, adorned with glass beads, seeds, and small bones. An ornament, which we do not know how to describe, as we should be at a loss for suitable expressions to characterize this peculiar article of the dress of the Betjouanas, particularly struck us.—*From a Foreign Journal.*

TO CORRESPONDENTS.

We decline the insertion of *A College Youth*, because, if the writer be really such, the publication of his letter would do no credit to the Cape College. Besides, we think our highly-talented Correspondent, *The Bystander*, unanswerable in reference to the Wines of the Cape, and it appears to us the highest presumption on the part of *A College Youth* to offer his peurile remarks on the subject. The *reduction of quantity*, the favourite idea of *The Bystander*, seems about to be realized. The very extraordinary rains which have fallen at so early a period of the year, must be greatly influential in lessening the vine-crops.

We agree with *Censor*, but we apprehend as far as we know ourselves, that his remarks are not applicable to us. The following extract from our Correspondent's letter, may do no harm to our brethren of the Press. "An Editor, in my estimation, is bound to strike out all passages of personal abuse; all charges of base motives; all violent and unwarrantable expressions. He is, in fact, placed in a situation tantamount to that of the Speaker of the House of Commons."

LITERATURE, CRITICISM, SCIENCE,

AND THE ADVANCEMENT OF USEFUL KNOWLEDGE.

No. 5. Vol. II.] CAPE TOWN: TUESDAY, MAY 1, 1832. PRICE, { 20 *Shillings* per *Annum*.

RAMBLES AMONG THE MOUNTAINS,

No. III.

We entered the village of Caledon on the afternoon of Friday, the 11th of Nov. We found almost every place of occupation in the hands of the Visitors who had come to this *Montpelier* of the Cape of Good Hope, to invigorate enfeebled constitutions,—prevent gout,—reduce corpulency,—cure nervous and chronic weakness,——hypochondriac and bilious disorders,—in a word, to study the art of prolonging life. Many persons, however, migrate to Caledon for purposes very distinct from the above-mentioned motives. The pure love of *game*, and the *house-keeping* satisfactions of slaughtering and *salting down* for the *home* concerns of the family, very frequently tempt certain of the Cape Town inhabitants to journey among the mountains. Every thing is *fish that comes within their net;* hence the glories of a return home laden with spoil. Such scenes remind one of the good old times of the *Court of Circuit*, and the treasurers of its *victualling department*.

We procured lodgings at the house of a widow lady, a most excellent and industrious woman, left with a family to grapple with the demon of poverty. This, it appeared, she had done with that moral courage which a firm reliance on the christian dispensation invariably supplies. Hence the Morning and Evening sacrifice of the family, and the visits of Mercy to the distressed poor in a neighbouring cottage. Hence, also, the emblems of peace and innocence before the house, in the flowers, —lilies and roses, and a few evergreens which adorned a small parterre. It has been said, and there is a world of homely, ay, and of legislative knowledge in the observation, that whenever you see a flower in a cottage garden, or a bird-cage at the window, you may feel sure that the cottagers are better and wiser than their neighbours; such humble tokens of attention to something beyond the sterile labour of life, soothes the spirit, and civilize equally with the exertions of philanthropy, and the ministrations of the pulpit.

We paid several visits on the following day, and shared in the hospitalities of many an old acquaintance. The Field-Cornet, Mr. Otto, made an early offer of his services. This gentleman is an honour to his country, and the office which he so admirably sustains. Mr. O. is remarkably conversant with our language, and is one of the first fruits of the Government School at Caledon. This school, which had gone to decay soon after the retirement of Mr. Blair, is happily now restored under the direction of a new master. We were not invited to visit *the school*, (at all times an object of eventful interest in a village,) but many opportunities occurred of examining the pupils *out of doors*, and it is a pleasure to record our opinion that the teacher had evidently done his duty. Relative to the instruction of the slave population or the Hottentots, we discovered no means in exercise.*

Nor did we find any of this important class of the people at divine service on Sunday morning, the 13th, or any provision made for religious instruction for them, or the youth of the village, by any other service than the one above-mentioned. The congregation on this occasion was not large, but was composed of several respectable families and country farmers. At the commencement of the service, two young persons had seated themselves with books in their hands on the vacant seats, (of which there were many,) towards the entrance of the church. They were in modest but extremely genteel attire. From this situation they were removed by one of the office-bearers: they left the church. We afterwards discovered that their rank in life did not entitle them to the place they had chosen to occupy. They were the daughters of a *slave* woman—the one free, the other still in bondage. From our own knowledge of the parties, we can vouch for the intelligence, industry, and correct demeanour of the young persons in question.

The church service (wholly in Dutch) was respectably performed by the minister: the traveller is little prepared to hear the Dutch language spoken in *broad Aberdeen Scotch* in South Africa. At first, we took it for the "unknown tongue." The minister is, as we understand, from Aberdeenshire, a district in Scotland that is said to be extremely unenlightened, although possessing a College and a theological chair.* We take the liberty of recommending a discourse, once a week at least in English, in the Colonial Churches. Caledon is especially visited by many of the English, and all indeed from Cape Town who sojourn at the Hot Baths, are acquainted with our language. Besides, how incalculably advantageous would such a service prove to the Government English

* In 1825, there was a Slave School in existence in the village, which was exceedingly prosperous. The inhabitants took much interest in its success, and the minister and his family were indefatigable in watching over it, and taking a share in its labours. In 1826, a stir was made in the House of Commons, and in the papers, on the necessity of *preparing* the slave, by the inculcation of Knowledge, for the reception of his civil rights. An alarm spread, and not a slave was permitted to learn wisdom. This fact needs no comment.

* See Evan Magazine for July, 1831, in which notice is given of the opening of an Independent Chapel and of "the greatly neglected district in the North of Aberdeenshire," and religious destitution of a dense population.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Schools. How greatly would the teachers be assisted by such an appointment!

We have thought it our duty to notice church matters, as we invariably have done in all our peregrinations, because we fully believe that we must look to no humbler influence than religion, for the permanent peace of colonies or empires. All the statutes that ever loaded the shelves of legislation, and all the weapons of the *flogging system* that ever *attempted* to enforce them, could not fabricate a peaceful community out of an irreligious people. The heart is the spring of good and evil; the scriptures, sacredly applied, alone can reach it. From the pulpit, in its wise and honest zeal—in its eloquence—chastened courage and scriptural faithfulness and integrity, must go forth the spirit that reconciles and heals. Thus much for the Church—the *Established Church.* But we would not exclude from our esteem those pious auxiliaries—the Missionaries, whether *lay* or otherwise. It is the glory of our Protestantism, that *any man who understands religion may teach it*—may "cast out devils" when, and where, and how he wills. A difference of opinion on this head, may have prevented the present incumbent of Caledon from calling in the aid of those excellent farmers in this district, who were wont to teach and exhort. Caledon is a district of great extent, the farmers widely scattered—and undergoing many, many privations.

In the absence of some apostle for this district, to *go about* as did St. Paul and his illustrious compeers, it were natural to suppose, that any order of respectable men would be hailed by the christian church for promoting its advancement; and sorry are we, that tolerance is not given to the whole of the pious wishes of many of the farmer teachers. We have witnessed the exertions of such at the gatherings of slaves of christians, (not only in the village of Caledon,) but in the wilds and solitudes of the country: we have listened to their animated discourses with delight; and though in some instances the language may have been *uncourtly*, yet we prefer a cottage with a warm corner, to the most finished dome where we might *shiver* amidst the *proportions* of columns and pilasters:—and according to the judgement of Fenelon and Quintilian, true oratory is that persuades by the fittest means. We remember Blair's Sermons in possession of unbounded popularity;—they are forgotten; and on examining them we shall find that they deserve to be forgotten. One is astonished at the dry, hard, cold artificial style of Robertson, could ever have been received with so much favour. His matter, his researches, learning, disquisitions, and calm philosophical judgment, will preserve his fame, and give a standard value to his works, as history.

Caledon, like every village left to itself, is looking poor and wan. Placed as it is in a most delightful situation, with abundance of water, (properly managed,) and famed for an unequalled salubrity of climate, it ought to have been the most thriving little place in the colony. We think we can guess at a few of the causes of its neglected condition and extreme poverty, and as we are truly attached to this part of the colony, we shall in faithfulness point them out.

* * * * * * * *

It was with some difficulty we could try the Hot Baths of Caledon, every room being fully occupied. Mr. Brink was, however, kind enough to make way for us, and we did not fail to participate in the luxuries of these singular waters. They raise the thermometer to 118 degrees, (32. 2 of Reaumur; 47. 77. Centig.) The water contains iron and sulphur, and has a slight chalybeate taste. On the cholera, that one subject of public interest, hot baths are said to be invaluable as an antidote. The following extract is from the Monthly Magazine, of the present month, contains a translation of a letter from Dr. Ucelli, a Russian physician and surgeon, in which the author states, that he has found baths of hot water or steam, together with warm fomentations and acidulated beverages, quite effectual, of themselves, for the cure of the cholera. "Amongst upwards of 2000 patients," he says, "who were under my care, the mortality never exceeded 8 or 9 per 100, and these were principally cases to which I had been called in late, and in which the disease had consequently made considerable progress."

"Scarcely is the patient well seated in the (vapour) bath, when a moist vapour invests his whole frame, and soon a most abundant perspiration causes the vomitting, diarrhœa, and colic to cease. Returning to his bed, the perspiration continues, and in such abundance as to bathe not only the sheets but the very mattresses; this is accompanied by a sensation of exquisite pleasure terminating in sleep, and on his awakening, the patient finds himself perfectly recovered."

THE TRIUMPHS OF MIND.

WARRIORS over-run nations, annihilate and create empires, and, for a season, are the idols of their followers, the terror of their foes. But unless their deeds be sung and recorded by the aid of letters, their memory, in a generation or two, fades away, leaving no trace of their existence. Poetry, eloquence, history, possess an embalming power, which the worm cannot destroy. The felicities of thought, embodied in disciplined language, defy the grave, and laugh at the vicissitudes of centuries. In the most barbarous periods of the world, there has always been some sacred temple in which the vestal fire of the mind has been duly tended, and its productions hoarded with pious care.

But the triumphs of the mind over difficulties is a subject of delightful interest, and these are well illustrated in one of the publications under the superintendence of *The Society for the diffusion of Useful Knowledge.* Volume the third, now before us, is a charming little work, and should be circulated far as the "Indus to the Poles." Under the head—*Humble Station no Obstacle*, and *Self-education*, are many delightful facts. From these we have not failed to make a few gleanings, to which we have supplied a few supplementary notices.

The *moral* to be deduced from these references, is that "what one soul has been, all souls have the possibility of becoming, and most may be, if they will form the resolution, and use the proper means. *Each has the choice before him of being the jewel or the clod!* It will be always our own fault if we prefer sordidness to glory, ignorance to illumination, and extinction to immortality!"

The late Professor HEYNE, of Gottingen, was one of the greatest classical scholars of his own or of any age, and during his latter days enjoyed a degree of distinction, both in his own country and throughout Europe, of which scarcely any contemporary name, in the same department, could boast. Yet he had spent the first 33 years of his life, not only in obscurity, but in an almost incessant struggle with the most depressing poverty. He had been born, indeed, amidst the miseries of the lowest indigence; his father being a poor weaver with a large family, for whom his best exertions were often unable to provide bread.——ÆSOP, PUBLIUS SYRUS, and TERENCE, were originally Slaves. EPICTETUS, the celebrated Stoic Philosopher, was born in the same condition, and spent many years of his life in servitude. PROTAGARUS, too, another of the Greek Philosophers, had been commonly a *Coolie*, before he applied to study.——The celebrated Italian poet METASTASIO, was the son of a common mechanic, and used, when a boy, to sing ballads in the streets. ——The father of HAYDN, the great musical composer, was a wheelwright, and filled the occupation of sexton, while his mother was a house-maid in a nobleman's family.——The father of OPIE was a working carpenter in Cornwall.——The parents of Dr. PRIDEAUX, who afterwards rose to be Bishop of Worcester, were in such poor circumstances, that they were with difficulty able to keep him at school till he had learned to read and write; and he obtained the rest of his education by walking on foot to

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Oxford, and getting employment, in the first instance, in the kitchen of Exeter College.—— The father of INIGO JONES, the great architect, who built the Banquetting House at Whitehall, &c. was a cloth-worker.——SIR EDWARD SAUNDERS, Chief Justice of the Court of King's Bench, in the reign of Charles II. was originally an errand-boy at the Inns of Court, and gradually acquired his knowledge of the law, by being employed to copy precedents.——LINNÆUS, the founder of the Science of Botany, was for some time apprenticed to a shoemaker. ——The famous BEN JONSON worked for some time as a bricklayer or mason; "and let not them blush," says old Fuller, in his *English Worthies*, "let not them blush that have, but those that have not a lawful calling." ——JOHN FOLCZ, the old German poet, was a barber.—— CORNELISZ, the Dutch painter of the 16th century, was obliged, while in his own country, in order to support his large family, to betake himself to the profession of a cook.——Dr. MADDOX, who in the reign of George II. became Bishop, first of St. Asaph, and then of Worcester, was in early life a pastry cook.——The late Dr. MILNER, Dean of Carlisle, and Professor of Mathematics at Cambridge, was originally a weaver, as was also his brother JOSEPH, the well-known author of a "History of the Church." Of the same profession was also, in his younger days, the late Dr. J. WHITE, professor of Arabic at Oxford.——The celebrated JOHN HUNTER, one of the greatest anatomists that ever lived, scarcely received any education until he was 20 years old. He continued for some time learning to make chairs and tables.——SIMPSON, the well known Mathematician, was the son of a working stuff weaver, and worked at his father's business for many years.——The astronomer, JAMES FERGUSON, of Keith, in Banffshire, worked in the fields as a day labourer with his father.——FRANKLIN was the son of a tallow-chandler, and was born in poverty and obscurity. ——We must not forget BUNYAN, the deservedly immortal author of the *Pilgrim's Progress*, a work suited to all hours and every mood of man. He was the well-known mender of pots and kettles at Bedford.——Dr. ALEX. MURRAY, the author of the History of European Languages, was originally a shepherd with his father, in the shire of Kirkcudbright.——SHAKSPEARE'S father could not write his own name, and our great dramatist was link-boy and holder of horses at the doors of the theatres.——The history of ROBERT BURNS is well known; the Ayrshire ploughman will out-live the pyramids. ——The late talented Editor of the Quarterly Review, WM. GIFFORD, was originally a shoemaker.——Similar in some respect to Gifford's early history, was the late THOMAS HALCROFT, who wrought as a shoemaker with his father, while his mother dealt in greens and oysters. ——ROBERT BLOOMFIELD, author of that delightful little work, the *Farmer's Boy*, and other poems, was a shoemaker.——The Rev. THOS. SCOTT, the late rector of Aston Sandford, Bucks, was employed, in early life, in the most laborious parts of the work belonging to a grazier. Poor Scott, soon after his views were directed towards the Church, from being suspected of Methodism, was refused ordination by the Bishop. On returning homewards from this unsuccessful application, "I travelled" (as he relates,) "by a circuitous route, a great part of the way on foot, and the rest in various vehicles. At length I reached Braytoft, after walking 20 miles in the forenoon; and having dined, I put off my clerical clothes, resumed my shepherd's dress, and sheared eleven large sheep in the afternoon!" How unlikely that Thos. Scott would ever again appear before the world! Yet this excellent man, nothing disheartened, pursues the bent of his soul, becomes a popular minister of the Church of England; and produces a work which, probably, no theological publication can be pointed out, which produced, by its sale during the author's life time, an equal sum. If we connect the retail price of the English and American editions of Scott's Family Bible, about one hundred and ninety-nine thousand nine hundred pounds sterling of money has been put into circulation.

We conclude this article with one more reference. It is a glorious one.

ALEXANDER WILSON.

Alexander Wilson, the Scotch weaver, who went to the United States without a friend, a wanderer in a strange country, never, perhaps, read a line of Buffon or Cuvier. Nevertheless, at the age of forty, he taught himself to draw and colour after the designs of nature, such as he found them amid the forests and mountains: he sought information concerning her works at her own hands; in seven years he travelled ten thousand miles, such was the good man's enthusiasm in pursuit of a knowledge of the native birds of that continent; and he has succeeded in producing an account of them, which has thrown almost all other books on the subject into the shade.*

ORIGINAL CORRESPONDENCE.

CHOLERA NOT CONTAGIOUS.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—One of the Cape Newspapers states that the Cholera is contagious, that it has been proved so, and that all well-informed medical men are of this opinion. Now, this is a very downright and decided assertion, an "off hand" specimen of Editorial knowledge in the settlement *of* a point upon which the faculty are still undecided; yet, however felicitous such decision may be on doubtful subjects, assertion does not always carry conviction; and, I think, were the writer better informed on the subject, he would have paused before making so sweeping an assertion as the above.

'Tis true, indeed, that many eminent medical men maintain that Cholera is a contagious disease, while, on the other side, men equally as eminent, maintain the contrary opinion; among the latter, are Doctors Johnson, Carmichael, Davy, Bell, Zoubkoff, Hawkins, Searl, Zoude, Walker, and a host of others, many of the naval, military, and most of the Indian surgeons, together with a large proportion of the faculty in those parts of Russia, Prussia, and Austria, where the Epidemic prevailed, and who, therefore possessed the best opportunity of forming an opinion; there is also to be added the official reports of the various Commissions sent to Russia and Poland, to ascertain the nature of the disease, and *all* concur in pronouncing it non-contagious. With such an overwheming body of evidence, no one surely will be presumptuous enough to maintain that the point has been settled.

* See his 4 vols. in the Public Library.

It is not my intention to enter into the merits *of* the case; I will merely say, that many ingenious speculations have been put forth. Many pamphlets published on both sides, which, like all metaphysical discussions, only tend to involve the point in greater obscurity; but as far as I can judge in such a collision of opinions, the *non-contagionists* are nearest the truth, as they bring forward facts and proof in favor of what they advance, while the other party are satisfied with assertion.

One very remarkable circumstance which appears by the official returns is, that in those situations where the most rigid quarantine had been established, the disease had extended itself, while in other situations where no such regulations were enforced, the disease had not appeared, although within the sphere of its influence; therefore, in most of the continental towns where the first alarm had subsided, such restrictions were remitted; being found from experience inefficient and useless.

The principle of quarantine thus defective, the details are no better; for, supposing (argumenti gratia,) Cholera to be contagious, the regulations of quarantine are by no means calculated to ensure safety, or prevent the spread of an infectious disease.

For instance: 'tis found that Cholera prevails in a certain sea-port town; now, 'tis reasonable to suppose, that the articles most calculated to convey the contagion, (if such were the case,) would be those in communication with individuals, as wearing apparel, bedding, &c.; 'tis also but reasonable to suppose, that articles of merchandize, usually locked up in stores, apart from the habitations of man, are those least likely to carry disease; and, when intended for shipment, their exportation is effected by the agency of healthy individuals.

Suppose that a ship starts from such an infected port, and after a passage of some months, reaches her destination, by a very strange anomaly, in a few days after her arrival, the passengers, with their clothes, are allowed to land; while the cargo, the part which has the least, or no communication with any one aboard, is subjected to a most rigid scrutiny and fumigation, unattended by any other effect, save that of deteriorating the articles submitted to such process.

In the supposition that Cholera had prevailed during the passage, the arti-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

cles most likely to receive and transmit the infection, (if the disease were such,) would be those in contact with the individuals, as clothes, bedding, sails, ropes, junk,—articles constantly handled; which, however, are generally allowed to escape without scrutiny, while all attention is directed to the cargo, a part that has lain quite out of contact either at the infected port or aboard the ship.

This view of the inadequacy of quarantine regulations will satisfactorily account for their abandonment in most of the continental countries, where they had been hastily adopted in the first moments of alarm.

Instead, therefore, of enforcing quarantine cordons, or such like restrictions, which have been found totally inadequate to stop the progress of Cholera, attention should rather be directed to the employment of those means the most calculated to check the inroads of disease, among which may be reckoned the immediate removal of all putrifying animal matter, which tend to corrupt the atmosphere, the strict adoption of cleanly habits, the purifying gullys, sewers, and drains, ventilating houses, boxes, cupboards, &c. &c.

Inculcating on individuals the necessity of regular diet, temperance, the avoiding of any irregularity or exposure to cold, which, in the event of the visitation of an epidemical disease, might become exciting causes; but above all, to keep the mind free from alarm, as fear or despondency has been found a principal agent in generating Cholera, an effect of the influence of mind on body, which philosophers have in vain attempted to explain.

Now it must be clear that, being in a panic *oneself*, or the alarming other people with the *idea* of Cholera being a highly contagious disease, is not a *rational or discreet* mode of proceeding, and will only serve to produce the opposite effect of that intended; while, on the contrary, the inculcation of extreme cleanliness, moderation in eating and drinking, early hours, and a cheerful mind, will be found the best antidote to an epidemical disease, wherever such may exist.

April, 1832.

I am, Sir,
Yours, &c.
AN OBSERVER.

LITERATURE.

Memoirs of Lord Burghley, by the Rev. E. NARES, D.D.

The character of Burghley still remains a problem, notwithstanding the three quartos of the Regius Professor of History at Oxford. The circumstances of the times in which he lived were, undoubtedly, favourable to his particular genius for public business; for it is by no means probable, that had he to act as a minister in the present day, he would have been able to maintain a footing for a single hour, seeing how opposed our existing institutions are in their nature, to those which were so aptly suited to the dissembling and intriguing policy of Burghley. Lightly, however, as we think of his probity, and convinced as we are of his zeal in the cause of the Reformation, we still are assured that Burghley would have felt a pang on his death-bed, had he foreseen that a day would arrive in England, when his name would be degraded into the shibboleth of a party.

Some of the precepts which Burghley left to his children are, for the beauty and force of the language, as well as for the deep knowledge of the world which they display, well worthy the greatest attention. But we confess that, in not a few of these precepts, do we discover the feelings of one who considered *self* as the first object of every man's care. The effect, therefore, of his recommendations must have been, to contract the springs of generosity in the minds of his children —to deaden their best sympathies— and to fill them with suspicion of their fellow creatures. The following are the most striking of these precepts.

"'When it shall please God to bring thee to man's estate, use great providence and circumspection in the chusing thy wife; for from thence will spring all thy future good or evil. And it is an action of thy life, like unto a stratagem of war; wherein a man can err but once. If thy estate be good, match near home, and at leisure; if weak, far off and quickly. Enquire diligently of her disposition, and how her parents have been inclined in their youth. Let her not be poor, how generous soever; for a man can buy nothing in the market with gentility. Nor chuse a base and uncomely creature altogether for wealth; for it will cause contempt and loathing in them. Neither make choice of a dwarf or a fool; for by the one thou shalt beget a race of pigmies, the other will be thy continual disgrace and it will yirke thee to hear her talk. For thou shalt find it to thy great grief, that there is nothing more fulsome than a she-fool.

"'Bring thy children up in learning and obedience, yet without outward austerity. Praise them openly, reprehend them secretly. Give them good countenance, and convenient maintenance, according to thy ability; otherwise thy life will seem their bondage, and what portion thou shall leave them at thy death, they will thank Death for it, not thee. And I am persuaded, that the foolish cockering-up of some parents, and the over stern carriage of others; causeth more men and women to take to ill courses, than their own vicious inclinations.

"'Marry thy daughters in time, lest they marry themselves. Suffer not thy sons to pass the Alps, for they shall learn nothing there but pride, blasphemy, and atheism. Neither, by my consent, shalt thou train them up in wars, for he that sets up his rest to live by that profession, can hardly be an honest man, or a good christian: besides, it is a science no longer in request than in use; for soldiers in peace are like chimneys in summer.

"'And touching the guiding of thy house, let thy hospitality be moderate, and according to the means of thy estate, rather plentiful than sparing, but not costly; for I never knew any man grow poor by keeping an orderly table; but some consume themselves through secret vices, and their hospitality bears the blame: but banish swinish drunkards out of thine house, which is a vice impairing health, consuming much, and makes no show. I never heard praise ascribed to the drunkard, but for the well-bearing of his drink, which is a better recommendation for a brewer's horse, or a drayman, than for either a gentleman or serving-man. Beware thou spend not above three or four parts of thy revenues; nor above a third part of that in thy house; for the other two parts will do no more than defray thy extraordinaries, which always surmount the ordinary by much. Otherwise thou shalt live like a rich beggar, in continual want, and the needy man can never live happily or contentedly; for any disaster makes him ready to mortgage or sell; and that gentleman who sells an acre of land, sells an ounce of credit—for gentility is nothing else but ancient riches. So that if the foundation shall at any time sink, the building must need follow.

"'Live not in the country without corn and cattle about thee: for he that putteth his hand in his purse for every expense of household, is like him that keepeth water in a sieve.

"'Be not served with kinsmen or friends, or men entreated to stay: for they expect much, and do little.

"'Let thy kindred and allies be welcome to thy table: grace them with thy countenance, and farther them in all honest actions: for by this means thou shalt so double the bond of nature, as thou shalt find them so many advocates to plead an apology for thee behind thy back.

"'Beware of suretyship for thy best friends: he that payeth another man's debts, seeketh his own decay.'"

A General System of Gardening and Botany; containing a complete Enumeration and Description of all Plants hitherto known: with their genuine and specific Characters, &c. &c. —Founded upon Miller's Gardeners' Dictionary, and arranged according to the natural System. By George Don, F.L.S. In four vols. Vol. I. 4to. London: C. J. G. and F. Rivington. 1831.

THE study of botany, and the branches of knowledge which are subsidiary to that science, may now be said to form a necessary part of general education in Britain. For this, which we deem no unimportant advantage, our country is in great measure indebted to the policy which has recently begun to influence its medical coporations; for, by requiring from every candidate for the faculties which they confer, sufficient evidence of a certain proficiency in botany, these bodies have, by this time, succeeded in sending into every town, and almost every hamlet in the empire, a good practical botanist in the character either of physician, surgeon, or apothecary. The influence of such an agency has been prodigious. In all the large towns, and in a considerable number of the minor ones, Horticultural Societies are established. We

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

have been astonished, when we read in the descriptions of the annual botanical exhibitions at various places throughout the country, the account of the occupations of the persons who contend for the prizes. In one place we discover the office of president of a horticultural society filled by a *working weaver*: the best and largest cherries in the West of England, one year, were the produce of the care and ingenuity of an industrious *cotton spinner*. Numerous, and indeed ludicrous, testimonies may be adduced to show the enthusiams with which horticulture is pursued by all classes of the community. A worthy mechanic, in one of the manufacturing districts, lately turned the roof of his house into a kitchen garden, and kept his family in fresh vegetables during the entire season. The finest bed of tulips (for its size) we ever beheld, says Louden, had for its site the narrow back yard of about a twelfth-rate house in the purlieus of London.

Hitherto the great obstacle to the cultivation of botany has been its nomenclature. At first sight, it would appear that an impediment of this nature was merely a pedantic wantonness, proceeding from that love of mystery which has so uniformly characterized the learned in all ages. But a few moments' reflection will satisfy all reasonable minds, that the technical language of botany, difficult to acquire as it may be, grows out of, and is inseparable from, the genius of the science itself. The study of it can never be located in any given country; its objects are as much Russian and German, or even African, as they are English. Botany allows no distinctions of territory; its field is the world of nature from pole to pole Such being the case, it is obvious that the pursuit of botany must be carried on by infinite divisions, all of which are contributing to one common end. Hence a community of ideas between the botanists of one empire and those of another, becomes absolutely indispensable; and from this necessity springs that universal language which is fixed to no clime, but nevertheless is understood in every country.

We cannot, therefore, expect that this great difficulty will ever be removed; and it only remains for us to adopt such measures as may be best calculated to diminish it. For this purpose various contrivances have been resorted to, particularly in this country. Plans without number have been proposed and acted on, for the purpose of engaging the young mind in the pursuit of botany. A great deal of success has attended these efforts; for, after the employment of great labour and diligence, the mysterious veil in which this science had been so long wrapped, was drawn aside, and all its beauty exhibited familiarly to the contemplation of the unlearned. As one of the most important instruments for carrying on this great moral revolution, we have to notice the great work, of which the first volume is just published. It certainly comes forth in the objectionable form of a costly publication: but when we come to consider the nature of its contents, we shall be satisfied that he who trusts exclusively to its pages for acquiring a competent knowledge of botany, will find that, in the long run, he will have but little grounds for self accusation for having violated the strictest principles of economy.

"Miller's Gardeners' Dictionary," in the Public Library, so famous during the last fifty years, as being a standard work for the horticultural profession in general, may be said literally to have survived its own utility. There was a charm in the simplicity and enthusiasm of the author, which made his book popular when it could no longer be said to be wholly instructive. Still it was in all its parts so substantially constructed—so tried and proved by the revolutions of time—that there could be no doubt about the propriety of choosing it as the foundation of any new system of popular horticulture, which the state of modern improvement required. The present work, therefore, may be fairly described as comprehending all that can be considered in Miller's performance, as worthy of attention in the present day; as including such portions of all the modern systems of plants as could be conveniently combined together: and as containing an account, not only of all the genera and species of plants hitherto enumerated, but of a considerable number from the *Lambertium Herbarium*, of which botanists have as yet seen no description. In Mr. Don's Dictionary, then, we have a complete history and account of every species of plant, of which it is possible that a botanist can be called on to express an opinion. This account is given in so clear and intelligible a manner, that it is made perfectly comprehensible to a mere beginner. Here the student, the general reader, and the man of science, may learn not only the name and history, but also the character and affinity of any genius or species, with all its properties, places of growth, time of flowering, mode of culture, and its use in medicine and domestic economy.

The arrangement of this work, and the contrivances which are appended for the purpose of an easy and prompt reference to any part of its contents, are, in their completeness and accuracy, fully worthy of the information to which they lead.

THE COLUMBIA RIVER.

Mr. Ross Cox has just published two very agreeable volumes, entitled Adventures on the Columbia River, including a residence of Six Years on the western side of the Rocky Mountains. The Columbia river empties itself into the Pacific, in latitude 46° 19 N. and longitude 124° W. The author, with requisite number of clerks, mechanics, *voyageurs*, &c. left his native country in 1811, to collect furs, and oppose the monopoly of the Hudson's Bay Company, and the North West Company. The party established themselves on the river above-mentioned, at the side of the American Continent. Like many other projects which have since captivated men's minds, vanished into air the speculation ended in disappointment.

We shall refer to a few of the incidents mentioned in these unaffected volumes. The reader will be surprised at the nonchalance with which the author discusses the merits of horse-flesh as a substitute for beef.

"Custom had now so far reconciled us to the flesh of this animal, that we often preferred it to what in Europe might be regarded as luxuries. Foals or colts are not good, although a few of our men preferred them. A horse for the table should not be under three years, or above seven. The flesh of those which are tame, well fed, and occasionally worked, is tender and firm, and the fat, hard and white; it is far superior to the wild horse, the flesh of which is loose and stringy, and the fat yellow and rather oily. We generally killed the former for our own table, and I can assure my readers, that if they sat down to a fat rib, or a rump-steak off a well-fed four-years old, without knowing the animal, they would imagine themselves regaling on a piece of prime ox-beef."

As one of those eccentric adventures which sometimes occur in life, we may notice among the fresh arrivals which increased the party of our fur-collectors, the "amiable and accomplished" Miss Jane Barnes. This lady had been barmaid at an hotel in Portsmouth, where several additional officers of the company stopped before setting out for America: one of the gentlemen prevailed upon her to accompany him on the voyage, and from being in the rank of a serving woman, she felt herself, upon her appearance among the Flat-heads, suddenly raised to the rank almost of an idol.

"The Indians daily thronged in numbers to our fort, for the mere purpose of gazing on, and admiring the fair beauty, every article of whose dress was examined with the most minute scrutiny. She had rather an extravagant wardrobe, and each day exhibited her in a new dress, which she always managed in a manner to display her figure to the best advantage. One day her head, decorated with feathers and flowers, produced the greatest surprise; the next, her hair, braided and unconcealed by any covering, excited equal wonder and admiration. The young women felt almost afraid to approach her, and the old were highly gratified at being permitted to touch her person. Some of the chiefs having learned that her protector intended to send her home, thought to prevent such a measure by making proposals of marriage. One of them in particular, the son of Comcourly, the principal chief of the Chinooks, came to the fort attired in his richest dress, his face fancifully bedaubed with red paint, and his body redolent of whale oil. He was young, and had four native wives. He told her, that if she would become his wife, he would send one hundred sea-otters to her relations; that he would never ask her to carry wood, draw water, dig for roots, or hunt for provisions; that he would make her mistress over his other wives, and permit her to sit at her ease from morning to night, and wear her own clothes; that she should always have abundance of fat salmon, anchovies, and elk, and be allowed to smoke as many pipes of tobacco during the day as she thought proper; together with many other flattering inducements, the tithe of which would have shaken the constancy of a score of the chastest brown vestals, that ever flourished among the lower tribes of the Columbia.

"These tempting offers, however, had no charms for Jane. Her long voyage had not yet eradicated certain Anglican predilections respecting mankind, which she had contracted in the country of her birth, and among which she did not include a flat head, a half naked body, or a copper-coloured skin, besmeared with whale oil.

"Her native inamorato made several other ineffectual proposals; but finding her inflexible, he declared that he would never more come near the fort while she remained there. We shortly afterwards learned that he had concerted a plan with some daring young men of his tribe to carry her off while she was walking on the beach, (her general custom every evening while the gentlemen were at dinner,) a practice which, after this information, she was obliged to discontinue.

"Mr. Mac—— at first intended to have brought her with him across the continent to Montreal; but on learning the impracticability of her performing such an arduous journey, he abandoned that idea, and made arrangements with the captain for her return to England, by way of Canton. A few words more, and I shall have done with Miss Barnes. On the arrival of the vessel at Canton she became an object of curiosity and admiration among the inhabitants of the "Celestial Empire." An English gentleman of great wealth, connected with the East India Company, offered her a splendid establishment. It was infinitely superior to any of the proposals made by the Chinook nobility, and far beyond any thing she could ever expect in England: it was therefore prudently

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

accepted, and the last account I heard of her, stated that she was then enjoying all the luxuries of eastern magnificence."—vol. i. pp. 287—290.

Our author, in the course of his wandering, met with another of those romances of real life, which sometimes set the powers of imagination at defiance. The history of Mr. Johnston is not indeed one of a very extraordinary nature, but it will be read with interest.

"The history of this gentleman is remarkable. He was a member of a highly respectable family in the county of Antrim, and in early life moved in the most fashionable circles in Ireland. A circumstance, however, which blasted his early hopes of happiness, induced him to abandon his native country, and about twenty-eight years before this period he arrived in America. After wandering for some time about the continent, he made his way to St. Mary's Fall, where he shortly became a great favourite with the Indians, and entered extensively into the fur trade. The chief had only one child, a daughter. She was a beautiful and interesting girl, and, although sought for as a wife by many of the youthful warriors, she declined all their offers. Her father was old and infirm, and wished her to marry before his death, but still his affection for his daughter was so great, that he would not exercise his parental authority in compelling her to choose. It soon, however, became apparent that Mr. Johnston was the object of her choice. For some time previous as he told me himself, he began to experience the truth of St. Pierre's opinion, that "man without woman, and woman without man, are imperfect beings in the order of nature." On learning therefore, that he had found favour in the sight of this youthful Indian, he at once came to the resolution of rendering both himself and her perfect. Her father consented, and they were married according to the rites and ceremonies of the tribe. Death shortly after deprived the old man of his command; and Mr. Johnston, whose wisdom and courage were highly admired by the Indians, was unanimously elected his successor.

Some years after his union with the chief's daughter, an extensive property fell to him in the north of Ireland, to which place he repaired in order to take possession. While there, offers of a tempting nature were made to induce him to reside in the country of his nativity, but his fealty to the "Lady of the Lake" could not be shaken; and the moment he had finished his business, he hastened back to St. Mary's. His family consisted of two sons and two daughters, and a Miss Campbell, an interesting girl, whose father had a few years before been shot in a duel by a Mr. Crawford. One son was employed in a public department in Canada, and the other was an officer in a local corps. The mother received us in a friendly manner at the door, but did not join us at the breakfast or dinner table.

"Mr. Johnston has extensive plantations of corn, potatoes, &c. with a beautifully arranged and well-stocked fruit and flower garden. During the late short war with America, he induced one thousand Indian warriors (of whom he took the command) to join the British forces, and rendered important services while so employed.

"He suffered severely for his loyalty; for, during his absence with the army, a predatory party attacked his place in the hope of obtaining a large quantity of valuable furs, which they were informed he had in his stores, but which a short time before his departure he had fortunately removed. Disappointed in their hopes of plunder, they burned his house, out-offices, &c. destroyed the greater part of his valuable stock, and carried away every portable article they could find.* At the period, therefore, of our visit the buildings were quite new, and were constructed with much taste. The furniture was elegant, and the library select and excellent.

"Mr. Johnston possessed a highly cultivated mind, much improved by extensive reading. He had made many excursions round the shores of Lake Superior, and along the banks of its tributary streams, in which scientific researches imparted a pleasing variety to the business of an Indian trader. His collections of specimens were varied and well selected; and if the result of his inquiries be published, they will, I have no doubt, prove a valuable addition to our geological knowledge of interior America."—vol. ii. pp. 300—303.

The portions of America hitherto but little known to us, are well described in these volumes, and supply many very suitable hints to Missionary Societies. The work has no pretensions to literary polish, but it conveys a great mass of useful intelligence, in a clear and agreeable style.

* "I met Mr. Johnston a few years afterwards in England, and was happy to learn that he had succeeded in obtaining from government, compensation for the losses he had sustained on the above occasion.

ORIGINAL POETRY.

By A Lady.

A FABLE.

Two Swallows on a portal stood,
Which graced a Temple rais'd to Egypt's lore,
Pruning each other's wings in sportive mood,
As many Swallows may have done before.

Quite undismayed they seem'd,
At the vast pile of art which met their view;
As if with pert indifference they deem'd,
Such to their travell'd sight was nothing new.

Braving the fiery day,
The Bird of Pallas from her covert came;
And ask'd in somewhat a disdainful way,
"Whence such intruders? and their vulgar name?

Why they had made their home,
Where only wisdom had a right to dwell?
And where how few had ever dared to come,
The noiseless solitude around might tell.

She, as a gifted Bird,
Loved its lone grandeur at the starlight hour;
When nothing save the mountain breeze was heard,
And the wild insect in his heathy bower."

"Hold thy conceited strain,"
Exclaim'd the elder of the migrant pair;
"Wisdom herself would teach thee to refrain,
Couldst thou but lend her thy reluctant ear.

The time, the hour is past,
When learning only blazed from classic halls;
And cloister'd science like a meteor cast,
Her transient lustre on the Monk's dark walls."

Back the proud Night-bird flew,
Rebuked at what she heard the Swallow say;
Let us improve the Traveller's moral too,
For truth unveil'd has chas'd pedantic lore away.

April 30th, 1832.

PRACTICAL OBSERVATIONS ON MALIGNANT CHOLERA,

As that Disease is now exhibiting itself in Scotland.

By D. M. Moir, Surgeon.

Mr. Blackwood has just published a pamphlet on Cholera, by Mr. Moir, (the title of which we have given above,) which has been composed during the last few months, under circumstances so favourable to the acquisition of practical information and experience, that we doubt not it will be of the greatest utility to the profession, as well as to the public in general. The author has seen the pestilence in its most terrific form; and he has been called upon to watch the various stages of the disease, during its existence in Musselburgh, administering to the sufferers according to the most approved methods of treatment. Having no theory to support, his observations have been made with no object but that of practical utility; and we trust that they will have the effect of simplifying the views of a disease which, as Mr. Moir says, has been hitherto involved in needless complication.

Mr. Moir declares his conviction, that the Malignant Cholera *is contagious*. He says that not a single case has occurred, where communication with the infected could not be readily traced out. He proceeds:

"The fact is, that Cholera will nowhere abate, or pass away, while a victim susceptible of its influence remains, provided such be exposed to its contagion: and no doctrine more dangerous or destructive to the safety of society can be promulgated. Until all are made aware of the risk to which they are exposed—adopt every means of prevention—and keep beyond the pale of contagion, the disease will propagate itself—and appear—and re appear with renewed force."

Assuming that Cholera is a contagious disease, Mr. Moir proceeds to state the best means to guard communities from its approach. He recommends, of course, the formation of a Board of Health, medical and civil, to whom should be entrusted all matters relating to the feeding and clothing of the poor—arrangements for the fumigation of infected dwellings—and the speedy sepulture of the dead. He says that on no account should the coffin be carried on shoulders. He recommends moderation in eating and drinking—but the diet should be nutritive and invigorating, as such conduce to ward off bowel complaint.

Mr. Moir considers the Malignant Cholera, if not a disease of direct debility, at least one which is dangerous only to debilitated constitutions:—

"This debility may be always traced to one of three great causes, or to their combination;—to exhaustion of nervous power, produced either,

First, by intemperate habits;
Secondly, by scanty nutrition;
Thirdly, by natural delicacy of constitution.

Diarrhœa is the first undoubted symptom of this complaint; and Mr. Moir thinks it such a decisive one, that he would be very much inclined to doubt the nature of the case in which it comes

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

not as a promonition. He recommends that,—

"Whenever the alvine discharges have exceeded three or four in number, or come away with unnatural violence, either one grain solid opium, or thirty drops laudanum, should be exhibited to an adult, in a table-spoonful of brandy, diluted with half that quantity of water."

The second stage puts on three distinct varieties of aspect, which may be thus severally described :

First.—Diarrhœa, with full pulse, and violent spasmodic affection of the muscles.

Second.—Diarrhœa, to which vomiting has supervened, accompanied with spasms—the pulse still retaining tone and distinctness.

Third.—Vomiting and purging of an almost colourless fluid—subsiding pulse—and spasms of more or less violence.

Blood-letting may be practised when the sufferer falls into a state of collapse ; but this is the only stage and variety of the disease in which blood-letting produces certain and unequivocal benefit. As a general rule from twelve to eighteen ounces may be abstracted with benefit.

We must refer our readers to the pamphlet itself for a variety of particulars which cannot be separated from the mass of evidence which Mr. Moir has laid before the public.

"LIBERAL NOTIONS."

From the earliest of my recollection, I have always entertained liberal notions of men and things. I have such a thorough and hearty contempt for meanness of spirit, and for people of narrow ideas, that I can scarcely regard them with common patience. My father and mother, and my hard-hearted schoolmaster, endeavored to chain down my aspiring spirit, and to degrade my soul, by instilling into my youthful mind narrow and confined ideas; but I was incapable of receiving them, and I spurned them as a duck, when she shakes her feathers, scatters the water from her back. I do really think that common arithmetic had a tendency to fill the mind with mean and pettifogging notions. There is something so ridiculously contemptible in that silly accuracy of adding, subtracting, multiplying, and dividing, even to the niceness of a single farthing. I never in my life could make a sum in arithmetic precisely right, and what in the name of common sense can a trifling half dozen or so, one way or other, signify? That exceeding accuracy of calculation shews a narrow mind. My schoolmaster told me, that if I did not do my sums right, I should never be able to keep a set of books. Contemptible fellow! Did he imagine that I was ever going to let myself down to the meanness and sordidness of book-keeping? Look at those fellows who keep books! What a mean, dull, clodpated race of mortals they are,—no wit, no fire, no imagination, no spirit, no humour among them. Look at them lumbering up to the city by coach-loads every morning from Islington, Pentonville, Somers' Town, Paddington, Chelsea, Highgate, Camberwell, Peckham, and from ten thousand other places; and then lumbering back again in the evening, so stupified with book-keeping, that they can hardly tell the difference between beef and pudding. They spend their whole lives among figures, and so they never make a figure in life. But if I was disgusted with common arithmetic, how much greater was my contempt of fractions—bits, pieces, odds and ends, cheese-parings, hair-splittings! People may well call them *vulgar* fractions. Why, if I was too liberal to care for ten or a dozen, one way or other, was I likely to care two straws for fractions, —for halves, quarters, eights, and sixteenths?—Nonsense! I told the man so to his face. "Sir" said I, "give me leave to tell you, that I shall not chain myself down to your trumpery fractions; I have had plague enough to learn your common rules, and I will not stoop my aspiring spirit to calculate sums less than a farthing. Give me the generosity and nobleness of spirit that is above the meanness of calculation."

I believe the man was struck for a moment at the grandeur and sublimity of my ideas, for he looked upon me with emotion and astonishment, while a smile of admiration was playing upon his features; but presently, summoning up the whole schoolmaster within him, he replied: "All this is pretty talk—very pretty talk, indeed, but how am I to shew my face to your father, if I neglect to teach you what you are sent here to learn. I am absolutely robbing your father."

"Well, sir," said I, "rob my father if you like, I am not so narrowminded as to concern myself about that."

"The boy is mad," said the fellow. Ah, that is the way I have always found it through life. Whenever any individual at all superior to the common run of mortals dares to act and speak from the generous impulses of a noble nature, forthwith all the low-minded sordid sons of calculation exclaim "He is mad!" Poor narrow-souled wretches! They have no notion of any thing that is free and generous; they are made to draw in harness—to follow a leader—never to act from the impulses of a towering spirit!

A few months after I had left school, my father said to me, "Bob," and I said "Yes, Sir." "It does not appear to me, Bob," said my father, "that you are much the better for school." "No, Sir,' replied I, "nor to me neither. I think it a great mercy that I am none the worse. That mean-spirited fellow was always endeavouring to instil into me his own narrow notions, and making such a ridiculous fuss if a sum was not right to a farthing! Oh, Sir, I could not bear such beggarly notions. What is a farthing, more or less, to a gentleman, and a man of liberal ideas?"

My father shook his head, and said, "Now, my dear Bob, let me talk seriously to you." Then I shook my head in return, and said "Now, my dear father, pray don't."

"But my dear Bob," said my father, "how do you expect to get through the world, without a little prudence and consideration?" "Why as to the matter of that, Sir," replied I, "I may get through the world sooner without prudence than with." "But," said my father, "it becomes a matter of importance that you should now choose a profession." "On that point," I said, "I am perfectly indifferent; but whatever profession I adopt, I hope and trust I shall carry into it the liberal ideas of a man of high spirit." What think you of the church?" "The church! Why, there are some men of liberal notions in it, but yet they are under some kind of restraint, and it would not suit my liberal notions to undergo an examination by a bishop's chaplain: those fellows are sometimes apt to ask a variety of impertinent questions, which no man of liberal notions would care to answer. Then the style of dress—very bad—always black, —no, sir, that would never do. Besides, Sir, there are many pleasant amusements which a clergyman is debarred from, which no man of liberal notions would choose to surrender. No, Sir, the church will not do." "The Law?" "As far as my observation has gone, I have fancied that the law contracts the mind; besides, Sir, law depends so much upon precedents and antiquated notions, and ridiculous out-of-the-way old fashioned acts of parliament, that ought to be buried out of sight and forgotten. Then, you know,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

there is no getting on at the bar without a great deal of labour and study, and poring over disgusting and wearisome books, which by no means meet the views of a man of liberal notions. Really, Sir, with all due respect to you and my grandfather, I must take the liberty to say, that I have no such very high opinions of the wisdom of my ancestors. Old people, Sir, are much addicted to entertain narrow views of things; and law has so much to do with antiquity and by-gone notions, that I must decline it as a profession." "Well, Bob, as you please; but you must do something,—what think you of physic?" "Don't like it, Sir,—can't bear the smell of drugs. Then to have a gilt Galen's head, or pestle and mortar, over one's door, a transparency in the shop-window, advice gratis to the poor,—to be called out of one's bed, or away from one's dinner,—especially if I was dining out, as men of liberal notions are very apt to do,—or to be called out of church, and suddenly woke in the midst of a sermon. To be accountable for all the crotchets and caprices of jalap—bah. No, Sir, physic will never do for a man of liberal notions." "But, Bob, you positively must do something." "Must I, Sir, I am sorry for it; that word *must* is very annoying to a man of liberal notions." "What do you think of keeping a shop?" Can't think of it at all, Sir;—bowing behind the counter to whimsical customers, when I am longing to kick—What's the next article? —Oh, no, no! shopkeeping will never do for a man of liberal notions."

So I could never make choice of a profession from that day to this. What a pity it is that the state does not make provision for gentlemen of liberal notions! so that they need not be under the galling and degrading necessity of stooping to some trumpery profession or peddling employment to avoid starvation. I am really quite disgusted when I look round upon my old school-fellows, and see some of them riding in carriages, and others established in lucrative professions, who were once not half so well off as myself. They are rich, to be sure, but they are not to be envied, for they have exceedingly contracted notions of things. Once they were hearty, generous, high-spirited fellows, singing loud songs, and drinking deep cups; but now they are grave as judges, as sordid as Jews, and as starched as old maids. They turn their backs on their old friends, and all their souls are absorbed in making money. Sometimes, indeed, when I find my coat out at elbows, and my finances scarcely equal to a dinner at an "ordinary," I am tempted to wish that I had adopted some profession, and had given a little attention to the meanness of money-getting. But, however, I must not complain; I do now and then feel a little inconvenience of want, and a little mortification for want of a clean shirt and a whole coat.—Still I have retained my independence and my liberal notions of men and things. And what is life without liberality of sentiment? Oh, I despise the vulgar everyday, common-place people that pass you by shoals in the public streets, elbowing their way along, and looking so greedily and avariciously, as if they were born merely to gather together sordid pelf and filthy lucre. They despise my threadbare coat and greasy hat, they look contemptibly on my old brown and black trousers, and think foul scorn of my gaping shoes; but they do not see my mind—they know nothing of the towering genius that dwells within. They do not know that the man whom they despise is a man who despises them. I have often thought of illuminating the world on the subject of things in general, and of giving them new views of religion, politics, and society; but those mean and sordid booksellers, one and all, set their faces against every thing that is liberal. They talk about the march of intellect, but they do not care a fig for intellect They merely print and publish just for what they can get. They have no sympathy with the towering aspirations of mind. I had a most excellent design for a work, that should convince all mankind that they were a pack of fools, and that should produce such a glorious change in the constitution of society, that talent and liberality should reign triumphant; I communicated my design to a publisher, and what was his answer? Blush, Britain, blush for the meanness of thy intellectual tradesmen! "I dont think it will sell," said the fellow. "Why then," said I, "give it away." The man stared at me, and said, "What shall I get by that?" There, gentle reader, there is a specimen of the sordidness of booksellers. "What shall I get?" When I see such narrowness of soul, and such degradation of mind, my heart bleeds for humanity, and I almost blush to call such wretches my fellow-creatures. I must confess that this interview had such an effect upon my nerves—I do not know what my nerves are, but I know that they were shocked;—it had such an effect, I say, that for a long while I could not apply to another publisher; but at length I did, and to another, and another. They were all in the same story, just as if they had conspired together to thwart my views for the welfare of the human race. I will not mention names, for I do not wish to hold them up to the contempt and derision of mankind. I am sorry to say that their meanness has compelled me to have recourse to a mode of instructing the public which I should not have adopted by choice, but to which I am driven by necessity—I allude to inscriptions on walls and stable-doors, by means of a simple instrument, called a piece of chalk. But the worst of this mode of public instruction is that there is not room enough for an elaborate argument, or even a well-turned period. One is compelled to confine oneself to a certain sententious brevity, which convinces none but those who were convinced before.

Now it is very mortifying to a man who is capable of governing an empire, not to have sixpence in his pocket, and to have no opportunity of convincing the world how much he is their superior. I have conversed with men of all sentiments, but I have found in them all a certain narrowness of mind, and limination of idea.—There have been few, very few, that have come quite up to my notion of liberality.—Some people are liberal in one thing, and some in another, but none, except myself, have I yet met with perfectly liberal in every point of view, and upon every topic of human interest. I have endeavoured, and I think successfully, to keep my mind free from all narrow prejudices, and it is often a consolation to me, when my breeches want mending, that I have no prejudices. No, I scorn them—I don't mean breaches, but prejudices. The man that is prejudiced is blind to beauty and deaf to truth. I am guided only and always by pure reason. There is not, I will venture to say, one person in a thousand, who is in all his actions and sentiments guided by pure reason. People are slaves to prejudices, confined and limited in their views. Indeed, how can people take liberal views who do not take comprehensive views of things. Men of business are confined to their shops or counting-houses, men in the law are like horses in a mill, moving in a dull round of precedents, medical men see none but the sick and the sad, the hypochondriac and the diseased, and what should they know of the world? As for parsons, all the world knows that they must be fools and idiots by virtue of their office, they absolutely know nothing, ten times less than nothing; they walk through the streets blindfold, they go to Cambridge and Oxford expressly for the purpose of learning ignorance; all that they know is which side their bread is buttered on, and all that they desire is to have it buttered on both sides. As for statesmen, ministers, members of parliament, commons, and lords, they all have their prejudices, they are confined to narrow views of things—they do not know the world, they do not see it, they have no time to look at it, they have no time to attend to it. They must take things merely by report and at second hand. There is in a word no man who can thoroughly understand human life and human nature so well as a man of liberal notions, altogether without prejudices, who has nothing else to do than to walk about the streets from morning to night. H. N.

LITERARY EXTRACTS.

INDIA.

From the late Bishop Middleton's Correspondence.

STATE OF SOCIETY IN CALCUTTA.

NEVER was there known such a migration as there will be this season. Almost every body in the higher class of our population here is going home. If I live to see it, there will not probably, at a dinner of 40 persons, be more than two or three who were resident in Calcutta at my arrival. There is something melancholy in the thought, though here *people care very little for each other*. Like those who meet at a watering-place in England for a few weeks, an intercourse of *civility* is nearly all that can be expected. Nobody is here at home.

BOOKS.

When I first knew this place (Calcutta), the auction catalogues, published almost daily, contained, indeed, a great quantity of books, but very seldom one which, if I had it not, I should wish to possess. But now very frequently I pick up books in the best and highest walks of literature.

THE FREE PRESS.

* * * * * * * We have now in India that monstrous *despotism*, and tremendous engine of *corruption*, which some call the *liberty of the Press*. The Government, in an evil hour, authorized it; and now *they* do not know what to do with it.

REPORT OF A COMMISSION OF INQUIRY ON THE COLLEGE MUSEUM OF EDINBURGH.

AFTER conferring a merited eulogium on Professor Jameson, to whose zeal this museum is

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

mainly indebted for its extent and completeness, the Commissioners observe,—

But in regard to the management of this museum, we have received various communications and complaints from scientific individuals, which directed our particular and anxious attention to the subject; and a committee of our number was specially appointed, to consider both the management of the museum, and the right of property in the specimens it contains.

The museum of Natural History in the University of Edinburgh, appears to us, after minute inquiry, to be the property of the crown, but secured for the University.

In support of these opinions, it is argued that the privileges, such as exemption from duty, &c., granted by government to articles specially sent to the museum—the confusion which would be occasioned on the death of the present keeper, were his executors to claim a right to any of the articles publicly exhibited—the professor's own admission, that he cannot consider any of the specimens, even though contributed by himself, after being placed there, as his private property—and lastly, the salary from the crown, which is allowed to the keeper for the maintenance of the museum, plainly implies that it is the property of the crown alone, for the benefit of the university. In case of such claims being revived, it is recommended that the matter should be brought to trial by the law officers of the crown.

The next topic which the Report touches upon, is the management of the museum.

We apprehend that the museum ought not to be merely an appendage of the class of Natural History, and that the use and benefit of it ought not to be confined to the students of that particular class. On the contrary, we are of opinion that the use of it, for the purpose of study, ought to be afforded to all students who may receive permission to that effect from the professors whose classes they are attending; and that the privilege of access to the museum should be granted to students in general, under proper precautions.

The commissioners then deprecate the power assumed by the keeper, of excluding individuals who wish to take drawings of the specimens, for publication, unless the work or the person meets with his approbation—a privilege which the professor excuses on the ground, that "he might be held responsible, as a man of science, if the publication were unscientific," and "that the reputation of the establishment might be affected by the publication of disreputable works." The result of this arbitrary power of control has been the securing a monopoly, and preventing free discussion on the management of the establishment, thus materially retarding the progress of scientific enterprise.

Part of the fund for the maintenance of the Museum at Edinburgh, arises from sums paid for admission, which are even exacted from all students of the University, except those of the class of Natural History.

On this regulation the Commissioners express a just and strong opinion.

So far as we have been able to investigate the matter, no regulations have been produced to us from any competent quarter, authorizing any sum whatever to be charged for admission into the Museum. But even if it should appear that the keeper really did receive such authority as he might reasonably think sufficient to enforce a payment generally by persons asking admittance, there is not the slightest evidence that it was intended or contemplated that such a rule should apply to all the students of the University, except those attending the class of Natural History of which the keeper is at present the professor; there is no evidence that was originally stated that the professor so intended to interpret and act upon the authority which he received, from whatever quarter it came. The result of the rule is plainly to make the Museum in every respect an appendage to the class of Natural History.

It is then recommended that the rooms should be thrown open to the public on the same conditions as obtain in the splendid collections on the continent, a measure which, while it would not injure the museum, would be a means of instilling into the minds of the public a love of nature, and a pure moral taste, besides inducing individuals to send contributions to the establishment. The Commissioners conclude with the following remarks:—

We consider all the various reasons stated to us in justification of the present system of management to be entirely groundless or unworthy of an academic establishment. In the great space occupied by the buildings of the New College in Edinburgh, it would be perfectly easy to afford ample accommodation to individuals desiring to make drawings or accurate examinations of particular articles; and although the funds for the annual expenses of the Museum are not so large as the extent of the collection requires, yet some of the funds appear to be employed in purposes not so legitimate and necessary as a salary to an under-keeper or assistant, part of whose duty should be to afford assistance, under proper regulations, to persons of scientific acquirements desirous to examine or to give descriptions and illustrations of parts of the collection.

ASTRONOMY.

THE present year will be famous in the annals of astronomy,—the predicted return of two comets, and a transit of Mercury over the sun's disk, on the 9th of May. Let the astronomers of Britain therefore bestir themselves,—keeping in remembrance the fame of Newton, of Halley, and of Herschel,—if they cannot eclipse the fame of our continental neighbours, let them at least share the laurels with them, ere they become a reproach and a by-word among the nations of Europe. The Astronomical Society of London, though recently established, will act, as they have hitherto done, with spirit and independence; but what will the Astronomical Society of Edinburgh do? Why, they will also do as they have hitherto done—and that is absolutely nothing! They are in possession of some fine instruments, were they only in the hands of a proper observer.—*Edinburgh Post.*

EDUCATION OF NATIVES OF INDIA.

The following is an extract from the evidence of the Hon. M. Elphinstone, before the Lords' Committee on East-India Affairs, 26th March, 1830:—

Having filled different official situations in various parts of India, have you formed any opinion, as to the native race which is most capable of improvements; or do you consider them all in the same light in that respect?—I do not conceive that the difference is very great. Some are more tied down by religious prejudices than others, and consequently less accessible to improvement. Do you conceive that, upon the whole, those religious prejudices are in any degree diminishing under the present system of government?—Amongst some few of the educated classes only, I think, they are. Do you see any probability of that diminution of prejudice extending itself further among the other classes of society, either from the effect of education or any other circumstances?—A very great probability, from the effect of education. How does it appear to you that the objects of education can be most extensively and usefully effected?—By the encouragement to the greatest extent of village schools; by the printing of books for the use of those schools, and of books of entertainment and instruction for the lower class of people; by the foundation of colleges for higher branches of knowledge, and by the publication of books in those departments of instruction. Probably more by a systematic education of the natives for office than by any other means that can be attempted. Are the brahmins or other persons who possess authority among the natives favourably or unfavourably disposed to the extention of education amongst them?—In general I should think they are rather unfavourable, though some individuals have exerted themselves to promote it. But you do not apprehend such a degree of resistance from them as would ultimately defeat the object?—I do not; as long as they do not perceive the inseparable connexion between the diffusion of education and the destruction of the superstition on which their power is founded.

FLOWERS.

FLOWERS are for the young and for the old; for the grave and for the gay; for the living and for the dead; for all but the guilty, and for them when they are penitent. Flowers are, in the volume of nature what the expression, "God is love," is in the volume of revelation. They tell man of the paternal character of the Deity. Servants are fed, clothed, and commanded; but children are instructed by a sweet gentleness; and to them is given by the good parent, that which delights as well as that which supports. For the servant, there is the gravity of approbation, or the silence of satisfaction; but for the children, there is the sweet smile of complacency, and the joyful look of love.

So, by the beauty which the Creator has dispersed and spread abroad through creation, and by the capacity which he has given to man to enjoy and comprehend that beauty, he has displayed, not merely the compassionateness of his mercy, but the generosity and gracefulness of his goodness.

What a dreary and desolate place would be a world without a flower! It would be as a face without a smile—a feast without a welcome. Flowers, by their sylph-like forms and viewless fragrance, are the first instructors to emancipate our thoughts from the grossness of materialism; they make us think of invisible beings; and by means of so beautiful and graceful a transition, our thoughts of the invisible are thoughts of the good.

Are not flowers the stars of earth, and are not stars the flowers of heaven? Flowers are the teachers of gentle thoughts—promoters of kindly emotion. One cannot look closely at the structure of a flower without loving it. They are emblems and manifestations of God's love to the creation, and they are the means and ministrations of man's love to his fellow-creatures; for they first awaken in the mind a sense of the beautiful and the good. Light is beautiful and good; but on its undivided beauty, and on the glorious intensity of its full strength, man cannot gaze; he can comprehend it best when prismatically separated and dispersed in the many-coloured beauty of flowers; and thus he reads the elements of beauty—the alphabet of visible gracefulness. The very inutility of flowers is their excellence and great beauty; for, by having a delightfulness in their very form and colour, they lead us to thoughts of generosity and moral beauty, detached from and superior to all selfishness; so that they are pretty lessons in nature's book of instruction, teaching man that he liveth not by bread or for bread alone, but that he hath another than an animal life.—*The Amulet*, pp. 155—157.

Prince Puckler Muskaw.—We perceive that the *Quarterly Review* has unmasked, with good effect, some of the numerous impositions in the "Tour of a German Prince." That illustrious traveller, the most memorable Germany has produced since the days of Baron Munchausen, was no favourite during his residence in the upper circles of this country, where the peculiarities of his connexion with the Hardenberg family were well known. His transparency's fairy-tale name (pronounced in German, *Pickler*,) was usually familiarized by the London world into "Prince Pickled Mustard," a title eminently characteristic of his acrid and pungent turn of mind.

Emancipation.—Upwards of four hundred slaves were emancipated by the government of Martinique, upon the anniversary of the king's fete, St. Philip's day.

INDIA BOARD.

An Account of all Offices, Places, and Establishments belonging to the Board of Commissioners for the Affairs of India, with the Amount of their Allowances as they stood on the 1st April, 1814, and the 1st April, 1830.

Annual Rate of Salaries paid at Lady Day, 1814.

President	£5,000
Two Commissioners	3,000
Secretary	1,800
Assistant secretary	1,350
Nineteen clerks	10,650
Solicitor, librarian and assistant, office keeper, housekeeper, and four messengers	1,530
	£23,330

Annual Rate of Salaries paid at Lady Day 1830.

President	£5,000
Two Commissioners	3,000
Secretary	1,800
Assistant secretary	1,200
Twenty-seven clerks	12,000
Solicitor, librarian and assistant, office keeper, house keeper, four messengers, and a porter	1,315
	£24,315

THE POET'S VISION.

In the *Commercial Advertiser* for April 4th, there is an extract from "Darwin's Botanic Garden," a poem published in 1786, nearly half a century ago, which was composed, it is said, at least 20 years before the date of its publication. The extract in question refers to Steam. The following one is not less remarkable, and discovers a remarkable spirit of prophecy on the part of the poet.

Visit of Hope to Sydney Cove, near Botany Bay.

"Where *Sydney Cove* her lucid bosom swells,
And with wide arms the indignant storm repels;
High on a rock, amid the troubled air
Hope stood sublime, and wav'd her golden hair;
Calm'd with her rosy smile the tossing deep,
And with sweet accents charm'd the winds to sleep;
To each wild plain she stretch'd her snowy hand,
High-waving wood, and sea-encircled strand.
"Hear me," she cried, "ye rising realms! record
Time's opening scenes, and Truth's prophetic word.
There shall broad streets their stately walls extend,
The circus widen, and the crescent bend;
There, ray'd from cities o'er the cultur'd land,
Shall bright canals, and solid roads expand.
There the proud arch, colossus-like, bestride
Yon glittering streams, and bound the chafing tide;
Embellish'd villas crown the landscape-scene,
Farms wave with gold, and orchards blush between.
There shall tall spires, and dome-capt towers ascend,
And piers and quays their massy structures blend;
While with each breeze approaching vessels glide,
And northern treasures dance on every tide!"
Then ceas'd the nymph—tumultuous echoes roar,
And joys loud voice was heard from shore to shore.
Her graceful steps descending press'd the plain,
And PEACE, and ART, and LABOUR, join'd her train."

AN APOLOGY FOR THE SCOTTISH BAGPIPE.

The PIPE is a most ancient instrument of music. It was well known to the Trojans and Greeks, among whom there were different sorts for Dorian, Lydian, and Phrygian measures; but the addition of a bag and accompanying drones or burdens, must have been an invention of subsequent time. Theocritus, who flourished 385 A. C., mentions it in his Pastorals, and Procopius describes it as having both the skin and wood extremely fine. Pronomus the sheban, is said, by Pausanias, to have been the first that played the different measures at once on one pipe.

There is at Rome, a fine Greek sculpture, in basso relievo, representing a piper playing on an instrument bearing a close resemblance to the Highland bagpipe. The Greeks, unwilling as they were to surrender to others the merit of useful inventions, acknowledge, that to the barbarians, i. e. the Celts, they owed much of their music, and many of its instruments. The Romans, who no doubt, borrowed the bagpipe from the Greeks, used it as a martial instrument among their infantry.* It is represented on several coins, marbles, &c.; but from rudeness of execution, or decay of the materials, it is difficult to ascertain its exact form. On the reverse of a coin of the Emperor Nero, who thought himself an admirable performer on it, and who publicly displayed his abilities, the bagpipe is represented. An ancient figure, supposed to be playing on it, has been represented, and particularly described by Signor Macari, of Cortona, and it is engraved in Walker's History of the Irish Bards, but it does not, in my opinion, appear to be a piper. A small bronze figure found at Richborough, in Kent, and conjectured to have been an ornament of horse furniture, is not more distinct. Mr. King, who has engraved three views of it, and others, believe it to represent a bagpiper, to which it has certainly more resemblance than to "a person drinking out of a leathern bottle."

The bagpiper, of a rude and concordant construction, is in common use throughout the East, and that it continues the popular instrument of the Italian peasant, is well known. In this country, it is the medium through which the good Catholics show their devotion to their Virgin Mother, who receives their adoration in the lengthened strains of the sonorous Piva. It is a singular but faithful tradition of the church, that the shepherds who first saw the infant Jesus in the barn, expressed their gladness by playing on their bagpipes. That this is probable, and natural, will not be denied, but the illuminator of a Dutch missal, in the library of King's College, Old Aberdeen, surely indulged his fancy when he represented one of his appearing angels likewise playing a salute on this curious instrument. The Italian shepherds religiously adhere to the laudable practice of their ancestors, and, in visiting Rome and other places to celebrate the advent of our Saviour, they carry the pipes along with them, and their favourite tune is the Sicilian Mariners, often sung in Protestant churches.—*(Logan.)*

* Varro calls it Pythaula, a word of Greek derivation, and not dissimilar to the Celtic piolmhala, pronounced piovala.

GRATITUDE IN A SLAVE.

A lady residing at the Mauritius, many years ago, emancipated a slave whose good conduct and fidelity she wished to reward: being in affluent circumstances, she gave him, with his freedom, a sum of money which enabled him to establish himself in business; and being very industrious and thrifty, he soon became rich enough to purchase a small estate in the country, whither he retired with his family:—years passed away, and whilst he was rapidly accumulating money, his former mistress was sinking into poverty; misfortune had overtaken her, and she found herself in old age, poor, solitary, neglected, and in want of the common necessaries of life:—this man heard of her unhappy condition, and immediately came to the town and sought her out in her humble abode: with the utmost respect he expressed his concern at finding his honoured lady in so reduced a state, and implored her to come to his estate, and allow him the gratification of providing for her future comforts. The lady was much affected at the feeling evinced by her old servant, but declined his offer; he could not, however, be prevailed on to relinquish his design: "My good mistress," said he, "oblige me by accepting my services; when you were rich you were kind to me; you gave me freedom and money, with which, through God's blessing, I have been enabled to make myself comfortable in life, and now I only do my duty in asking you to share my prosperity when you are in need." His urgent entreaties at length prevailed, and the lady was conveyed, in his palanquin, to the comfortable and well-fur-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

nished apartments assigned to her by his grateful care; his wife and daughters received her with the utmost respect, and always shewed, by their conduct, that they considered themselves her servants: deserted by those who had been her equals in station, and who had professed themselves her friends whilst she was in affluence, this good lady passed the remainder of her days in comfort and ease, amid those who had once been her dependants.—*(Recollections of the Mauritius, by a Lady.*

THE *CREDIT* SYSTEM—NATIONAL DEBT.

THE unredeemed capital of the permanent funded debt, on the 5th of Jan. 1831, according to returns made to Parliament, amounted to	£757,486,997
The amount of terminable annuities for lives and terms of years was, at the same time, 3,297,375*l.* per annum. Estimating these annuities at their market value, the capital which they represent may be stated at - - - - - - -	56,055,375
The amount of Exchequer bills outstanding, including those issued to pay off the dissentient proprietors of 4 per cent. annuites - -	27,271,650
Total amount of capital, funded and unfunded, of the National Debt, on the 5th of January, 1831 -	£840,814,022

The sum required to defray the annual charge on the above is as follows:

Interest and charges of management on the permanent funded Debt	£24,377,379
Amount of terminable annuities for lives and terms of years - -	3,297,375
Sum required to defray the interest of Exchequer bills, as estimated in the Treasury return - -	675,000
Total annual charge in respect of the funded and unfunded debt -	£28,349,754

Now to what do we owe our strength and our immunity? The sovereignty of law: the incorruptness of its administration; *the number and political importance of our religious sects, which in an incalculeble degree have added to the dignity of the establishment; the purity, or at least the decorum of private morals, and the independence, activity, and weight, of public opinion?* These and similar advantages are doubtless the *materials* of the fortress, but what has been the cement? What has bound them together? What has rendered Great Britain, from the Orkneys to the Rocks of Scilly, indeed and with more than metaphorical propriety a BODY POLITIC, our Roads, Rivers, and Canals being so truly the veins, arteries, and nerves, of the state; that every pulse in the metropolis produces a correspondent pulsation in the remotest village on its extreme shores! What made the stoppage of the national Bank the conversation of a day without causing one irregular throb, or the stagnation of the commercial current in the minutest vessel? I answer without hesitation, that the cause and mother principle of this unexampled confidence, of this *system* of credit, which is as much stronger than mere positive possessions, as the soul of man is than his body, or as the force of a mighty mass in free momotion, than the pressure of its separate component parts would be in a state of rest—the main cause of this, I say, has been our NATIONAL DEBT. What its effects on the Literature, the Morals and religious Principles, have been, I shall hereafter develope with the same boldness. But as to our political strength and circumstantial prosperity, it is the NATIONAL DEBT which has wedded in indissoluble union all the interests of the state, the landed with the commercial, and the man of independent fortune with the stirring tradesman and reposing annuitant. It is the NATIONAL DEBT, which by the rapid nominal rise in the value of things, has made it impossible for any considerable number of men to retain their own former comforts without joining in the common industry, and adding to the stock of national produce; which thus first necessitates a general activity, and then by the immediate and ample credit, which is never wanting to him, who has any object on which his activity can employ itself, gives each man the means not only of preserving but of encreasing and multiplying all his former enjoyments, and all the symbols of the rank in which he was born. It is this which has planted the naked hills and enclosed the bleak wastes, in the lowlands of Scotland not less than in the wealthier districts of South Britain: it is this, which leaving all the other causes of patriotism and national fervor undiminished and uninjured, has added to our public duties the same feeling of necessity, the same sense of immediate self-interest, which in other countries actuates the members of a single family in their conduct toward each other.

ANECDOTE.—COLERIDGE.

By the late Dr. Currie, of Liverpool.

A gentleman of a liberal education had, according to the fashion of the times, indulged, himself, some years ago, in speculations on the improvement of the human race, and the perfectibility of man. By long, deep and solitary meditation on these subjects, his mind became unsettled, and his reason gave way. He seemed to himself to want nothing but power to make mankind happy; and at length he became convinced *that he had a right to that power.* The consequence of this rendered it necessary to confine him; and about two years afterwards he was removed by his friends from the situation in which he was originally fixed, and placed under my care. At the time of which I speak he was become perfectly calm; he was on general subjects rational, and on every subject acute; but the general hallucinations were as fixed as ever. In occasional discussions of his visionary projects, I had urged, of my own suggestion, the objection, that when men became so happy as he proposed to make them, they would increase too fast for the limits of the earth. He felt the force of this; and, after much meditation, proposed a scheme for enlarging the surface of the globe, and a project of an act of parliament for this purpose, in a letter addressed to Mr. Pitt, very well expressed, and seriously meant, but which, if published, would appear satirical and ludicrous in a high degree. Having had occasion to mention his situation to his brother, a man of letters, he proposed that an experiment should be made of putting the quarto edition of Malthus's Essay into his hands; to which I assented. It was given to him last autumn, and he read it with the utmost avidity and seeming attention. In my visits I did not mention the subject to him, but desired the keeper to watch him narrowly. After finishing the perusal, he got pen, ink, and paper, and sat down, seemingly with an intention to answer it, or to write notes upon it. But he did not finish a single sentence, though he began many. He then sat down to read the book again aloud, and finished this second perusal in a few days, not omitting a single word, but stopping at times, and apparently bewildered. I now spoke to him, and introduced the subject, but he was sullen and impatient. He became very thoughtful, walked at a great pace in his airing-ground, and stopped occasionally to write, if I may so speak, words, but more frequently numbers, with a switch in the sand. These he obliterated as I approached him. This continued some days, and he appeared to grow less thoughtful; but his mind had taken a melancholy turn.

One afternoon he retired into his room, on the pretence of drowsiness. The keeper called him in a few hours, but he did not answer. He entered, and found the sleep he had fallen into was the sleep of death. He had "shuffled off this mortal coil."

At the moment that I write this, his copy of Malthus is in my sight; and I cannot look at it but with extreme emotion.

THE EXILE.

(From the Amethyst.)

The exile on a foreign strand,
Where'er his footsteps roam,
Remembers that his father's land,
Is still his cherished home.

Though brighter skies may shine above,
And round him flowers more fair,
His heart's best hopes and fondest love
Finds no firm footing there.

Still to the spot which gave him birth,
His warmest wishes turn,
And elsewhere, own through all the earth,
A stranger's brief sojourn.

Oh! thus should man's immortal soul,
Its privilege revere;
And mindful of its heavenly goal,
Seem but an exile *here.*

'Mid fleeting joys of sense and time,
Still free from earthly leaven,
Its purest hopes, its joys sublime,
Should own no *home* but heaven!

SOCIAL LIFE AT HOME.

Society, in the true meaning of that term, is much more limited in this country than in France, or perhaps, than in any other nation calling itself civilized. We all live upon a scale of expenditure, which has no example upon the continent; we lay out fortunes in the mere decoration and furniture of our houses; we must have equipages; our costume, both for males and females, is enormously costly; the meats and vegetables served at our tables, are purchased at a price three or four-fold greater than they would amount to upon the continent; and hence, though an opulent people, we live, even in private, to the utmost extent of our means, and therefore it is that we are not, and cannot generally be, a social community.

If by society be meant the frequent and unrestrained meeting of many families, who are in equal, or nearly equal classes of life, and who communicate freely with each other upon all matters in which they feel a common interest, thus developing individual character, and influencing, by their example, the manners of the country to which they belong, it is manifest that we have no such institution in England. It has sometimes happened, as the author of this work* remarks, that a distinguished person,

* State of the Country in 1831.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

such as a late celebrated duchess, whom he characterises under the fictitious name of Lucia, is raised to the throne of fashionable life, and is enabled to impart to it for a while a determined tone; she is surrounded with the elite of all parties, and under her commanding influence all the inferior restraints upon intercourse are broken down. Men of different ranks in life meet together in her presence, conversation is unfettered, wit gives out all its brilliancy, talent all its energy, knowledge all its treasures, wisdom all its instruction, and cheerfulness exhausts its power of entertainment. When the late king first entered life as the Prince of Wales, he also had his court, at which society, varied, it is true, and sometimes not the most virtuous, might have been found. But for a long period, there has been no predominant influence of this kind exhibited in the fashionable world, and consequently no society.

Nevertheless, it would seem to a reflecting mind, that we are possessed of many of the elements, of which society of the best description is composed; and when they are brought together in any considerable force, as they sometimes are, by accidental circumstances, we may perceive that we want only a repeal of the old non-intercourse system, a free trade, as it were, in the exchange of ideas, to rival, if not to surpass, our more fortunate neighbours in this respect. The education of our young men, whether destined for the senate, the learned professions, the field, or the ocean, is now much more generally attended to, and infinitely better directed, than it was before the peace. Confined by the war for a lengthened period to their own country, they had no opportunity of correcting their prejudices, or of polishing their manners. They indulged to satiety in every gratification. They were exceedingly selfish, uncourteous to women, homely in their dress and appearance and in all their ideas. The young men of the present day are the reverse of all this. They are well read in all the necessary, as well as the elegant branches of literature; foreign travel has given simplicity and ease to their manners; their taste is sound upon most points; they are courteous towards the amiable sex, and they no longer drink to intoxication. A party of men will not now consume half a dozen bottles of wine, who, twenty years ago, would have taken to their share half a dozen bottles each.

The change that has taken place among the naval and military men is particularly obvious. Schooled in the trying scenes of the late war, dispersed in all parts of the world, and, we may say, commanding wherever they appeared, their minds have been prodigiously elevated above the rank which their predecessors attained. Hence every military man, and almost every naval officer, is now an author. He can write, and write well. Every garrison town has its library; so also, we believe, have most of the ships of war in commission. In the intercourse of the world, the sailor and the soldier are no longer distinguishable by professional peculiarities of character, from the ordinary mass of gentlemen. The education of our ladies is also conducted, generally speaking, upon an admirable system, such as is adapted to make them attentive to the duties which usually fall to their share, and to render them interesting as intellectual companions.

PUBLIC REVENUE.

The amount of the nett produce of the public revenue at the accession of successive sovereigns:—that is to say, of the produce actually paid into the Exchequer, after deducting the expenses of collection.

On the accession of	James I.	1603	£600,000
- -	Charles I.	1625	896,819
- -	the Commonwealth	1648	1,517,247
- -	Charles II.	1660	1,800,000
- -	James II.	1685	2,000,000
- -	William and Mary	1688	2,001,855
- -	Anne	1701	3,895,205
- -	George I.	1714	5,691,803
- -	George II.	1727	6,762,643
- -	George III.	1760	8,523,540
- -	George IV.	1820	46,132,643
- -	William IV.	1830	47,139,873

Primary Existence of Metals.—Although the globe on which we live presents but few traces of metallic veins on its surface, and at the period of its creation probably presented even fewer than it does at present, it is, nevertheless, an undoubted fact, that so soon, and progressively, as what may be called the arts of life took place of the primitive rudeness of nature, mankind appear to have discovered and turned to account the various metals within their reach. Nor should the observation, however trite, be discarded, that it is a striking illustration of the providence of the Creator, that those metals which are the most useful are likewise the most abundant, though it must at the same time be remarked they are the most difficult of access.

Mineralogists have started the puzzling question—whether all the mineral treasures which have been extracted from, and those at present existing in, the bowels of the earth, were formed like the materials, amidst which they mostly lie, at the creation, or whether they may not, at least in many cases, have been the production of subsequent periods, either resulting from some of those singular phenomena, which are obviously attributable to a deluge, or from chemical changes perpetually going on according to fixed laws throughout all the regions of nature with which we are acquainted? The discussion of this subject, interesting as it is, belongs, however, rather to geology and chemisiry than to the arts of working in metal.

Abundance and Value of Coal to Britain.—Evelyn, in the sixteenth century, complained most pathetically, that nature had thought fit to place the most accessible iron ore immediately beneath our most extensive and flourishing forests. After describing some sylvan giants, he exclaims, "What a pity such goodly creatures should be devoted to Vulcan!" How often do we accuse Providence when our own short-sightedness alone prevents us from perceiving the admirable beauty and economy which runs through all the arrangements of nature! The "wasting ore," which our amiable philosopher seemed to regard merely as the bane of those noble wood-growths which he so enthusiastically admired, has of late years been shown to exist most largely and opportunely with the coal formations in general. The following reflections of Dr. Colquhoun, on this important fact, are of a character widely different from the lamentations of the author of Sylva. "To such perfection has the process of manufacturing iron by the coke of pit-coal now been carried, that this mineral has not only almost entirely superseded the employment of wood, but it has been the means of advancing the manufacture itself in this country, to an extent which is unparalleled in the history of any other age or nation. It has now been ascertained by long experience, that there is no other fuel which is so well fitted at once to supply the heat of the furnace, and at the same time to endure the powerful blast which is incessantly forced upon it. It may now be said to be essential to our iron manufacture, which would, indeed, be almost annihilated were the supply of it withdrawn. How great a source of admiration and gratitude must it always be to regard the immense profusion in which this valuable mineral discloses itself, and the intimate connection and neighbourhood which subsists between it and the ore of iron! How important are its inexhaustible treasures to the country, which must otherwise have been compelled either to relinquish the manufacture of iron, or lay under wood immense tracts of what are now fertile corn-fields, in order to supply, at an enormous expense, a much more imperfect fuel for the furnace! Nor is it possible to omit contemplating one of the momentous consequences of such an order of things, those subterranean labourers who, in many districts of the island, pursue with incessant toil their invaluable occupation. A shaft is sunk, wide excavations are opened up, and tier above tier, at various depths below the surface of the earth; and sometimes below the bed of a river, or of the ocean itself, a succession of extensive sheets are seen to penetrate the bowels of the earth: so that in a tract of country which for ages may have been regarded as an unproductive waste, numerous villages, with their busy throng of inhabitants, find an existence, which would never have been theirs but for the fruitful source of wealth that is yielded by the coal mine. And thus it happens, in many parts of this industrious and enterprising country, that a dense population are making the bosom of the earth to resound with the pickaxe below, while the surface is opened by the plough above, or, it may be, is furrowed by the rapid keels which bear abroad the commerce of Great Britain."

Cast Iron.—In 1827, Mr. Deeble, a metropolitan engineer, obtained a patent for an ingenious method of casting metal blocks for the purpose of forming caissons, jetties, piers, quays, embankments, lighthouses, foundations, walls, or other such erections. These blocks, which are hollow cases, so cast as to fit into each other by grooves and dovetails, and other

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

contrivances, would from masses of exceeding strength in combination. There is, however, one fatal objection to their adoption in situations where they might be most useful: the sea water, by some unexplained process, so alters the nature of cast iron, that its cohesion appears to be quite destroyed. Cannon, which have been fished up after lying long in the sea, have been found converted through their substance into something resembling plumbago, and admitting of being cut with a knife.

Among the architectural purposes to which cast iron has already been most successfully applied, may be mentioned pillars, as well fluted as plain, for the support of galleries in our places of worship. Those who have paid any attention to the cumbrous, unsightly columns which occupy so much space, and so obstruct the view in most old churches, must perceive at once the beauty and utility of the light and elegant metal shafts which have so generally superseded them.

Genius of Blacksmiths.—It is in villages remote from the large towns that the blacksmith may be seen to assume not merely his real importance as a mechanic, but his relative consequence as a member of society, by presenting that *factotum* character, which not only indicates that he is an indispensable artificer in iron and even steel, but which has led to his figuring in poetry, romance, and even music; for who has not heard of the "Harmonious Blacksmith" of Handel, the "Wayland Smith" of sir Walter Scott, and the "Wat Tyler" of Robert Southey? Besides the appropriate business of farriery, including the doctoring as well as the shoeing of horses, the anomalous avocations of cowleech, dentist, parish clerk, precentor, and newsmonger in general, have been collateral distinctions of the village Vulcan ever since, and, indeed, long before Shakspeare's celebrated passage was written, in which Hubert is made to say,—

"I saw a smith stand with his hammer, thus,
The whilst his iron did on the anvil cool,
With open mouth swallowing a tailor's news;
Who, with his shears and measure in his hand,
Standing on slippers (which his nimble haste
Had falsely thrust upon contrary feet),
Told of a many thousand warlike French,
That were embattled and rank'd in Kent."
King John.

And it so happens, that at the very moment of transcribing this page, an anecdote of so singular a character, as connected with an individual of this fraternity, is travelling through the newspapers, as irresistibly to tempt its preservation in this place, as more likely to reflect honour upon the craft in the estimation of most persons than the most notable incident in the life of St. Dunstan himself.—"At the late electioneering canvass for the Lanark district of burghs, between Mr. Gillon and Mr. Monteith, a poor blacksmith in Peebles, of the name of Alexander Brodie, was waited upon by Mr. Monteith's party, and actually offered 1000 pounds for his vote; but this the honest man firmly declined, and, in spite of all entreaties to the contrary went and voted gratis on the side which his conscience told him ought to be supported. So great was the admiration excited by this instance of integrity, that one of Mr. Gillon's most distinguished friends lately presented to Mr. Brodie a handsome silver snuff-box bearing the following inscription, which is alike creditable to the donor and receiver:—

"To Alexander Brodie, blacksmith, member of the town council of Peebles, this box is presented, as a mark ot respect and esteem for the unrivalled instance of sterling worth and incorruptible integrity exhibited by him during the recent canvass for the representation of that burgh, by one of Mr. Gillon's oldest and most attached friends, Sir James Dalzell, Bart., of Binns. Aug. 23. 1830."

This slight digression from the craft to the character of the blacksmith may be the more readily excused, even by the most choleric reader, when it is recollected that in our enlightened times, instead of the trite terms "blacksmith and jobsmith in general," the maker of horse-shoes paints on his sign-board "veterinary forge," at the least: and there is, or at least was a few years ago, over a common horse shoeing blacksmith's shop adjoining the Eglise de St. Sulpice, at the end of the rue Feron in Paris, the words "*artiste vétérinaire!!!*"

ANTI-MASONIC NATIONAL CONVENTION.

(From an American Paper.)

Mr. Hopkins, from the Committee next hereafter mentioned, reported as follows:

The Committee to whom it was referred, "to take into consideration the true nature of masonic oaths or obligations, and to report whether they are, or are not, religiously, morally, or legally binding; and whether they are, or are not, in collision with the higher obligations of allegiance and duty, which every good citizen is under, to support the constitution and laws of his country," respectfully report:

That the terms of this reference, being general, embrace all masonic obligations whatever. In the application of the subject to the oaths as revealed, it appears to the committee, that the matter of those oaths may properly come under the following considerations, namely: 1st. Of oaths which respect matters merely frivolous. 2d. Of those, if any there be, which respect matters entirely lawful and proper, and not unimportant. 3d. Of those, which by their natural tendency and operation are hostile to social order, good manners, or equal right, but without requiring any specific offence. 4th. Of those, which are directly illegal, whether that illegality is expressed in terms, or is afterwards deduced, as an unexpected consequence. Ilegality in oaths may be of many different kinds: the object of them may be either directly criminal, or they may lead to breaches of prior duty, obligation or contract, or of political allegiance. Respecting all these, the inquiry is whether they are religiously, morally, or legally binding.

And first, as to their legal obligation, the committee report; that none of these being oaths authorized or required for any purpose known to the laws, they are not legally binding in any possible case.* The remaining questions concern their obligation in conscience.

An oath is defined by moral writers as an act of religion § by which the affirmant appeals to the Supreme Being, to witness the truth of what he affirms to be true, or his fidelity in the performance of that, which he promises to perform. Such a transaction presupposes the infirmity of all human sanctions. It applies to the thoughts and intents of the heart; and therefore it appeals to him who knows them. It presupposes, also, that the being who is appealed to, is both able and disposed to punish perjury. The universal adoption of oaths, by all nations, to sanction such public and solemn engagements as the laws cannot sufficiently reach; such for example, as fidelity to governments, the observance of treaties, and truth in giving testimony, is a proof, that a sense of the sanctity of oaths, is deeply graven upon the heart of man. Grotius observes, that in every nation, and in every age, an oath has always been of the greatest weight in promises, contracts, and agreements.* If the use of solemn oaths is found thus universal, and thus necessary to man, in his social condition; and if it is past doubt, that "there is a God who governs the world," and has planned the existence of social order, then we arrive, even without the aid of revelation, to the conclusion, that the use of oaths is a part of the divine economy, and that the breach of them will be a subject of special punishment.

The Committee, thus quoting the authority of the most distinguished guides in the philosophy of morals, wish to repeat the remark, that they all, both Pagan and Christian, speak in effect of an oath, as an "act of religion." The Committee submit, therefore, that they have properly referred to the great principle of religious obligation, though reporting to a body, whose members may be supposed to differ much in their particular creeds. The very terms in which this subject is referred, embrace the moral and religious bearings of the question. The resolution treats the subject as a question of conscience; and questions of conscience can have little meaning, except as they regard the responsibility of man to his final judge.

A farther explanation may seem to be called so. Now, that divisions exist, and excitement operated, regarding the merits of freemasonry, the mere unsupported conclusions of this Committee or this Convention, adopted upon recent views of the question, might fail, perhaps justly, to command universal confidence. This has induced the Committee to have much recourse to authorities, whether sacred or profane; and they mean not to advance any important proposition in morals, without the most ample support of the inspired, or of the wise and good, who wrote before freemasonry existed.

An oath, then, is truly a transaction between man on one part, and his Almighty Judge on the other. It is a transaction in which, according to the general economy of divine Providence, the special power of that Judge is called into exercise, to give effect to such necessary and important engagements of men, as can, in no other manner, receive a sufficient guaranty.†

All these principles apply to lawful oaths, taken for some useful and important purpose. But the first question now to be considered, regards those oaths which are for objects merely trifling or worthless. If the position is established, that an oath effectually calls into exercise the avenging power of the Supreme Being, to punish falsehood, (and on any other supposition, all oaths are a fraud and an imposture,) then it follows, that oaths for trifling and vain objects, are a direct act of irreverence towards that power. They are, then, a practical perversion of one of his great engines for the support of human society; and a defiance of that penalty which every oath supposes so be imprecated. In whatever degree an oath for a high and important purpose, is sacred, in that degree, the use of it for any low, base, and worthless object, is a profanation. But the case under consideration, supposes these oaths to be already taken;

* See opinion of Marcey, J. in The People vs. Jewett, at Lockport, 1830.

§ They all seem to follow Cicero's definition in the third book De Officiis: Est enim jus jurandum affirmatio religiosa; quad autem affirmate, quasi Deo teste, promisseris, id tenendum est. See also Grotius de Jure Bel. et Pac. Lib. II. Cap. XIII.

Puffendorf, Droit de la Nat. Lib. IV. Chap. I.
Domat's civil law, Book III. Tit. 6. §. 6.
Paley's Moral Philosophy, Book III. Chap. 16.
Rutherforth's Institutes, ch. XIV.

Opinion of Trott, afterwards Ch. Just. of South Carolina, under the colonial government in 1. Hall's Law Journal, p. 2. The precise definition in the text above, is rather gathered from all than copied from any one.

* In the chapter before cited. In this chapter he has collected a great number of examples to show the reverence of almost all nations for all oaths. But Barbeyrac, in his notes on Puffendorf, says, that the Peruvians used no oath, but a simple averment before the Inca. He cites Garcilaco de Vega for this fact, in his history of the Incas.

† Un serment n'oblige pas, si Dieu ne l'accepte. Puffendorf as above cited, § VIII. (An oath obliges not, if God does not accept it.)

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and the question is, what is the further duty of those who have taken them, and how they may best escape the danger of further offences against conscience.

The Committee have not brought this branch of the subject into view, because it is in itself exceedingly important; but rather, because being obliged to examine a great mass of oaths of very various import, it seemed to be their duty to present the subject in due method; and because the conclusions to be drawn from this branch, will tend to throw light upon others.

If an oath for a vain or worthless purpose, is a transaction with the Supreme Judges, then he is a party to that transaction, *considered as a binding one;* then he is a party, not to punish the trifling, or unlawfulness in taking the oath, but he is a party to see it executed, or to punish the non-execution.

But can the power of the God of all worlds, be thus called into operation by the caprice of man, to execute the vain engagements which folly may prompt?

The Committee know of no divine or human authority, for saying that such an engagement, considered strictly as an oath, is binding. Puffendorf, who wrote 100 years before masonry existed, has expressly stated his opinion, that "oaths oblige not when they are absurd and impertinent."* Doubtless, they are immoral and most offensive to our God and Judge; but on proof is perceived that He will punish the offence considered, as a breach of the oath, and because he requires the observance.

A very different question remains, when we consider what is due for reverence to that high and holy name, which we invoke in every lawful oath, and which we profane in very one that is unlawful. No man who has unhappily taken a light oath, will, when his heart becomes better instructed, lightly break it. But still it is not truly an oath: it binds not, *as such:* the breach is not moral perjury: but a useless, or light breach, seems to be again taking the name of God in vain, and to be renewed irreverence. Such an oath ought not to be violated without cause; but the Committee, on the most attentive consideration they can give the subject, and aided by the best authorities in morals, believe that for good ends, with justifiable motives, any vain oath may be disregarded; and that very often it is a duty to disregard it.

A single case will exemplify the views of the Committee, by practical application. It is a most prominent point of masonry, when arrived at the sublime degree of master, that MAHAH-BONE signifies "marrow in the bone." It is one of the landmarks which never change with time or place. As *bone* has always signified *bone,* (seemingly in Hebrew, in the time of King Solomon, and in all languages, ancient and modern, since his time,) it remains that "mahar." signifies "marrow." Now the candidate has, in effect, in every form of solemnity, and under most awful penalties and sanctions, bound himself never to reveal the fact that "mahar," so signifies. Mean, and disgusting, and worthless as this falsehood is, no good man would causelessly trifle with the oath he has taken. But when masonry is found to be a great political, social, moral, and religious evil; when it is found to control government, and leave to the people the shadow only of power; when it sanctions murder, and then resorts to perjury to cover blood; when it avowedly perverts the administration of justice, in civil and criminal cases; when, to sanction these things, it quotes the names of prophets and apostles, who spoke as they where moved by the inspiration of the Holy Spirit; and, when it covers all, by the pretence of mysteries and secrets of solemn and momentous import; then it becomes, not merely allowable, it becomes a duty, to expose the base reality of these holy secrets, to hold up these solemnities to the scorn of men; and to set the bloody and sacrilegious monster in the pillory of public odium, and contempt. Then it is a virtue in masons, to tell the world, that their institution contains nothing more solemn, than the disgusting story of the dead body of Hiram Abiff; and nothing more instructive, than the information that "MAHAH," signifies "MARROW."

(To be continued.)

* Car ils (les serments) u'bligent pas, non seulment lorsqu ils concernment les chooses illi cites, mais encore losqu'ils sent absurdes et impermittens Puffendorf, as above, § X.

THE ETTRICK SHEPHERD ON THE NIGER QUESTION.

To the Editor of the Evening Post.

SIR,—I observe that a paragraph has gone the round of the Newspapers, stating that a certain German, (I have forgot his name,) was the first that started the probability that the river Niger ran southward into the bights of Benin and Biafra. But honour to whom honour is due. Old Mr. Salmon, in his History of all Nations, written a hundred years ago, and published in 1743, distinctly states the fact that these rivers form the mouth of the Niger. He calls the country Nigritia, and says it derives its name from the river that flows through the middle of it, and in his map of the country, the river has much the same course as it is now proved to have, save that a principle branch comes from the South. He is no doubt a very incorrect, but he is a curious and interesting writer, and I send you a few extracts from his third volume:

"This mighty river empties itself into the Atlantic ocean by several mouths, of which the three largest are the Rio Grande, the Gambia, and the Senegal, and as the mouth of the river Grande lies in eleven degrees North Latitude, and the Senegal in sixteen, consequently, it is upwards of three hundred miles between the most distant mouths of this river, and all the country between, except the rising grounds, is annually overflowed, as the Delta in Egypt is by the Nile, and much about the same time, as these rivers rise in the same latitudes, and the rains that swell them falling at the same time."

A little further on he says:

"The chief negro town, which Historians and Geographers frequently mention as the capital of a mighty empire, is Tombut, situated in 15 deg N. L. and 6½ West of London! But I cannot learn that this or any of their towns consist of any other or better buildings than our ordinary cottages, having clay walls and thatched roofs. Such towns or villages stand pretty thick in that part of the country which the Europeans are acquainted with, and, it is thought, if their lands were as well cultivated, they would yield as good crops of grain as those of Egypt do which have the like advantages of being overflowed annually by the Nile as they are by the Niger."

This is certainly not a little curious, how the fact should have been established so long ago, and afterwards lost and disputed. This old Geograper and Historian appears, by some means or other, to have had a considerably correct idea, even of the distant provinces on the Niger, for he says in another place:

"The language of the several Negro nations who come down to the mouths of the Niger to trade with the Europeans, is not understood by them, nor even by the nation on the coast."

This evinces the great distance from which these tribes descended the river to traffic, and conveys as correct an idea of the country as could be given at this day.—Your publishing of this in your next paper, will oblige, your's ever,

JAMES HOGG.

I'll make them Sing—The precentor of one of the city churches of Glasgow, during the life of the late incumbent, having requested a day from a professional brother in Paisley, thought it but fair to state, that as the congregation esteemed the service of the lips a thing of no moment, he was not unfrequently allowed (tho' obliged) to sing a *solo* of 16 or 20 lines. Undaunted, though surprised, by the announcement of a practice at once so heterodox on the part of the congregation, and trying to its leader, the Paisley brother entered the bench, uttering the emphatic and portentous words. "I'LL MAKE THEM SING." Already had the last note of the church bell died on the ear—and already had the congregation, with the exception of a few of its fashionables, assembled, when the Rev. Doctor (for he was a Doctor) entered the pulpit, and read from one of the Psalms the usual number of lines for the morning's exercise of praise. Now was the moment of excitement—now was the time for putting the boasted prowess of our amateur to the test, and he shrunk not from the task. Up, and at his post, by the time the two first lines were read as a signal for commencing—his voice, clear and shrill, passed from note to note, till he had finished the two lines without any assistance. Determined against being thwarted in his purpose, he paused and said, "the congregation don't seem to understand this tune,—I'll try another." Again did he sing the two first lines, but the echo of his own voice was the only sound that reached his ear. Again he paused, and said, "they don't understand this one either,—I'll try another." No sooner did he commence the two first lines the third time, than the tongues of the listeners were loosed, and a thousand voices swelled the notes of praise!

SELECT NOTICES.

Learned Animals.—Leibnitz tells us of a dog in Germany that could pronounce distinctly 30 words. Goldsmith informs that he once heard a raven whistle the tune of "the Shamrock" with great distinctness, truth, and humour.——*March of Politeness.*—The present French Ministers, if they cannot make themselves more popular than their predecessors, seem determined, at least, to be more polite. It was formerly the custom, on days when Ministers did not receive, merely to announce the fact in these words—"The Minister for Foreign Affairs (as the case might be) cannot receive to day;" but now the announcement is made in the courteous style of an invitation card, and runs thus—"The Minister is deprived of the pleasure of receiving to-day." Politeness costs nothing, and, yet, how valuable it is to those possessing it, and to those who experience it. The most unkind act, if politely softened down, loses half its sting.——*Affectionate Solicitude.*—Lady M——, some years ago, went to visit her children when at school. Previously to her departure, she appeared in much agitation. "Look how affectionate my mother is," exclaimed one of the young M—y's, addressing his brother: "how loath she is to leave us."—Pooh, you flat," replied Lord S——, "She's debating whether she shall give us a shilling or sixpence!"——*Duelling.*—By the Mexican laws, if a man kills another in a duel, he becomes answerable for all his debts. If we had a similar law for Great Britain and Ireland, "affairs of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

honour" would be of rare occurrence.——*A Compliment.*—When the ambassador of Henry IV. of France was in England, he was at court on a birth-day, and on Queen Elizabeth's asking him how he liked her ladies, he replied very gallantly, "It is hard, madam, to judge of *stars* in the presence of the *sun*."——A corpulent lady of fashion, who is remarkably partial to waltzing at Almack's, is designated by the Tabbies of that assembly *the steamer*.——In Spain, before any barrister, attorney, or notary is admitted to practice, he is obliged to swear that he will defend the poor gratis. That this gratuitous labour may be more equally divided, thirty are every year appointed from each class to defend the poor in civil cases, and every one is accounted poor who can swear himself worth less than 4000 reals (40*l.*) In criminal cases the accused is entitled to make choice of any barrister in Madrid to defend him. ——*Lord Tenterden's First.*—The vile sin of punning is so contagious that it has already infected even the gravity of the English Bench. The other day, in the course of the trial of an action for a tailor's bill in the Court of King's Bench, it appeared on the defence that none of the clothes supplied fitted defendant. "Then," observed the Lord Chief Justice, with one of his beningnant smiles, "we must proceed according to the 'lex talionis,'—the *plaintiff* must be *non-suited*."—— No article of provision has fallen in price, in London, equal to fish, which is full fifty per cent. cheaper than it was ten years ago.——*Taking Tithe in Kind.*—A clergyman of Chichester, some time since, was asked by the parishioner to be one of the sponsors at the baptism of his child. This was refused, it being contrary to the Rubric. The father stated that the child was his tenth, and requested the minister to be godfather himself, as the tithe belonged to him. The rev. gentleman acceded to the request, and continues to treat the child as his own.——An old Scotch landed proprietor, or laird, who piqued himself much upon his pedigree, and had a sovereign contempt for men who had come to greatness through successful industry, was one night in company where a young lady from Glasgow happened to descant a little upon what her father, her grandfathers, and her great grandfathers, had done as civil rulers in that city. After enduring this for a little, the laird at last tapped the fair speaker gently on the shoulder, and said to her, in an emphatic but good-humoured tone, "Wheest, my woman; nae Glasgow folk ever had grandfathers."——*Sir Walter Scott.*—When the baronet was urged not to prop the falling credit of his acquaintance, he replied, "The man was my friend when my friends were few, and I will be his now that his enemies are many."——*The Wonders of the Press.*—The French Globe mentions, as the most extraordinary instance of rapid communication, that the ordinances of the 19th November, were published in the Standard twenty-three hours after the departure of the Courier from Paris.——Nothing attracts the notice of a stranger, when first walking the streets of Madrid, so much as the extraordinary number of shops appropriated to the sale of combs. Throughout Spain, but especially in Madrid, the comb is an indispensable and important part of every woman's dress, and a never failing accompaniment of the mantilla. A fashionable Spanish comb is not less than a foot long, and eight or nine inches broad; and no lady considers from nine to fifteen dollars (price £2, to £3,) too much to give for this appendage; consequently, every tenth shop, at least, is a comb-shop.—— *Silk Worms.*—It has been calculated that no less than fourteen thousand millions of silk worms annually live and die to produce the quantity of silk which is consumed every year in England alone.——*Lord Byron's Works.*—Murray's complete edition of Byron, now publishing, and to be completed in 14 vols. cost the publisher in copyright alone £25,000.——*Present prices in Canada.* —Wheat, 4s. per bushel; good boiling Peas, 3s. 6d.; Rye, 3s.; Buck Wheat. 2s. 6d.; Indian Corn, 2s 6d.; Oats, 2s.; Potatoes, 6s. 3d.; Brandy 9d per quart; Port Wine, 1s. 3d.; Tea, 3s. 6d. per lb.; Beef and Mutton, 2d. per lb.; Fat Geese, 1s. 6d.; best Fowls, 1s. 3d. per couple; wages for servants, £3 per month and *keep*. Apples, 1s. per bushel, Cider, 5s. per barrel.—(*Quarterly Review, No.* 92.)—— *Anatomy.*—The Professors and Lecturers on Anatomy in London, have discontinued their lectures, until some measure shall be devised by Parliament, for a supply of "subjects" under the sanction of law, and without the risk of giving encouragement to murderers.——*Working a Passage.*—As the Honiton packet was leaving a port in Wales, on her voyage to Lyme, the master perceived a swarm of bees settle on a rock which the rising tide would soon have covered. He sent a boat with a tub, which was sugared for the purpose and took the bees in, and brought them aboard. They took readily to their new habitation; and on removing them to a hive at Lyme Cobb, it was perceived that they had commenced a comb. During the voyage they flew ashore for honey, and followed the vessel again, which was at times sailing with a strong breeze.——*Burns.*—The works of Burns are under translation by Goethe, the German Poet, at Berlin.——*Vote of Thanks.* —At a late meeting in London for religious purposes, it was resolved—That this meeting deeming that the best thanks which christian men can receive for their labours, to be the testimony of their own consciences, forbear making any acknowledgements of the services of the Chairman this day, or of the officers or other friends who have carried on the business of the society during the past year.——*A polite Editor.*—The World Newspaper expresses great contrition in one of its numbers, for having omitted to put *Esquire* at the end of the name of a Secretary to a public charity. ——*Curious Document.*—Ministers have at this moment, it is said, in their possession a list of 1,500 individuals in or near London, whose private fortunes would pay off the national debt. Of course the list is only interesting, or of value, as indicating the mass of wealth in the country; as one could not have imagined, at first sight, that the private fortunes of any 1,500 individuals in the empire could be to such an extent.——*Newspapers, &c.*—A Return of the total number of Stamps used for printing Newspapers and other Publications, for the ten years ending 5th January, 1831.

Year ending	Newspapers. 4d.	Newspapers. 2d.	Almanacks. 1s. 3d.

The Age of Personality.—It is remarked in a Number of the *Quarterly Review* recently published, that the best songs of Béranger, (the most complete *chausonnier* of modern France, or of modern Europe, since the death of Burns) are those which are tinged with personality,—whether of a satirical or laudatory kind. It is singular, and singularly unfortunate, to how many genuises of the age the same comment may apply. How many men of talent have sparkled of late years amid the personalities of the Reviews, who will not bequeath a single original work to posterity!—and how much of the eloqnence of our modern Senate depends on those personal allusions, those whips and scorns, which a political antagonist is compelled to endure unwincing? Several periodicals maintain their popularity by the unsparing use of proper names, combined with considerable literary merit; and from "The man of the Times," down to Signor Paulo in his motley, most of the distinguished personages of the day may be said to emulate the trait ascribed to the author of "Le Roi d'Yvetot." Lord Byron described *his* times as "The age of Cant." We are inclined to define our own "The age of Personality."

CAPE OF GOOD HOPE.

THE POKER CLUB.*

(From a Correspondent.)

A new Club has been formed in Cape Town under the above title. The following is an extract from the *programme*, for the periodical discussions of the month of May.

1. The late Henry Mackenzie used to say, "I should hate to have been born in a town." And Dr. Goldsmith observes in his Essays, "I have remarked that men born and bred in a town, contract not only *effeminacy* of body, but of *thnking*." The validity of these sayings to be tried.

2. On the causes of the decline of the *Literary Society*, and whether it did not receive a mortal stab on a certain occasion, when *free discussion* was ousted from the Society.

3. Is it true as related by some naturalists, that men in a savage state, will outrun the fleetest wild beast; that a man of ordinary strength and good walking powers, will, in a series of successive daily stages, out-travel the best road-horse, and that brutes look with awe on the divinity of the human countenance?

4. On the advantages and disadvantages of giving printed publicity to the annual receipts and disbursements of the Commercial Exchange, South African College, and the subscription Churches of St. George's and St. Andrew's.

5. To account for the un-reading habits of the Cape Colonists, and to suggest the best manner of teaching the adult gentlemen in office, that the perusal of a good book is a source of great amusement as well as profit.

6. On the nature and properties of economy, and to compare the *Cape tailoring* charges with the following *advertised* scale of the London practitioners.

"Clothes per contract of the *first quality*, and by the first *cutters out.*

Three suits per annum,		£15 15 0
Four suits,	do.	20 0 0
Five suits,	do.	24 0 0
Six suits,	do.	27 10 0

Vide London papers for January.

* The name adopted by the members of this club is not original. A *Poker Club* was established in Scotland many years since. Its founders were Lord Elibank, (famous for his paradoxes,) John Home, David Hume, and Adam Furgusson. It was called the *Poker Club*, because its purpose was to *stir up* and encourage public spirit and free enquiry in Scotland.—Ed.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

7. Is it true, that when we sit still our thoughts sleep; that fancy does not operate so well as when it is put in motion by that of the legs?

8. Why do wild geese fly in a string? Or why, as they frequently do, in the form of the letter V.?

9. Why is it that men subscribe to public documents with great readiness, and yet feel a reluctance to *pay* their vows and promises?

10. On the best mode of punishment, (so as to bring the offender to repentance,) on him who makes a practice of defacing books and papers, by the nonsense of his marginal pencil marks.

11. The best means of relieving the Bible and School Commission from its burthen of £150, and whether the Commission could be led to have *faith* in the *Savings' Bank*.

12. The true end of legitimate Government being to ensure

1st. Personal Security,
2d. Private Property,
3d. Public Decorum,

Is not the foundation of Temperaece Societies an attempt to institute *a new order of Government*?

13. Are the human ears *immoveable*?

14. To shew by argument and example, whether the extreme of poverty or riches does not tend to destroy the moral principle in the individual.

15. As there appears to be some discussion on the subject of the "grand *effect*" produced by the "*noble* organ" and choral band, during the performance of "*Divine* Service" in the Episcopal Church, all of which "delight the *senses* of the enraptured spectator," would not the *effect* be increased by the contrivance of some band of instruments after the manner of the *Panharmonicon*, which used to pour forth an "enormous volume of liquid sound" in Spring Gardens, and was wont to *go* for half-an-hour, being wound up like a musical snuff-box? By this means, a great saving of *lungs* would take place, and consequently, the lives of the "generous choristers" would be prolonged.

16. Is it a fact, that fiddlers and dancing masters—the *musicianers* of every order and degree, find an early grave, while on the other hand painters and drawing masters enjoy a venerability of years?

17. Who was Junius? Was he Mr. Burke? Lord George Germaine? General Lee? Mr. Macaulay Boyd? Mr. Wegg? Mr. Glover? Sir Philip Francis? Earl Temple? or the Earl of Chathum?

AN ARCHDEACON *FEELER.*

THE clergy of the Church of England, were they even more numerous than they now are, have not the advantages which I have ascribed to the former, [the Reformed Church,] and while all other denominations have a regular discipline and systematic government, the Episcopal Church has, alas! no ecclesiastical head, and her ministers, or *her missionaries*, are left to grope their cheerless and solitary way through a maze *of difficulties* and dangers, without encouragement, without protection, without a guide! The difficulties and the temptations to which a minister of the gospel may be thus exposed, can be only understood and appreciated by those who have experienced them. Too weak to resist the overwhelming tide of colonial prejudice, he is exposed to the temptation of seeking an ephemeral popularity by the most dangerous compliances, or the alternative of incurring an odium, the consequences of which it is impossible to foresee. In the *absence* of this shield of ecclesiastical protection, it were unjust not to add that a kind and generous Government does all that can be done in such a case to supply the defect.—(*Extract from the Rev. W. Wright's "Slavery at the Cape of Good Hope."*)

I CANNOT TELL.

A Conversation on the Shores of Green Point.

The tide is now beginning to rise. What is the cause of this phenomenon? What produces the alternate ebb and flow of this vast mass of water, which take place so regularly twice every four-and-twenty hours? Is it an operation of the sea itself, or is it owing to an influence extending from distant worlds? You know that it is the latter, that it is caused by the attraction of the sun and moon. And what is this attraction? No one can tell: we only know it by its phenomena; we know that it exists; that by its influence the worlds throughout the universe are guided in their revolutions; that if this influence were withdrawn, the creation would run rapidly into ruin. The planets and suns would start from their orbits; the beautiful regularity of their motions would cease, and they would fly at random, and in disorder through the wilds of space. Yet we know nothing of gravitation itself; we know it only by its laws; we know that it extends to the most distant stars, and that, perhaps, there is not a single celestial orb which is not connected by it to the others; but what its essential nature is we can have no conception. And how many other things are there which we know only by the phenomena they present? What is the electric fluid? I cannot tell. I am aware that it causes the thunder and lightning; that it will strike a tower, and split it from the top to the bottom; that it kills man and animals; and that I can collect it by means of a machine, and exhibit it in a variety of beautiful experiments; but, after all this, I know not what the electric fluid is. And what is magnetism? Why does a loadstone attract iron? I cannot tell Why does a magnetised needle point to the north? I know not; but I know, that by its having such a property, that wide ocean before us can be traversed with as much certainty, and vastly more advantage, than if its place were occupied by solid earth. Some writers have objected that the globe on which we live has an undue preponderance of sea; but this is another example of human presumption. If it had come by chance it might have been too great or too small; but if our world was made by the Almighty, (and what else *could* have made it?) it must be as he intended, and therefore it must be right. But what is the fact? Could we have communicated with distant countries by land as we do by sea? Could we have brought the produce of the Tropics to the Thames? Could we have compassed the earth from east to west, and from north to south? Could we have calculated on the time in which we should reach the Antipodes? Look at our central Africa and New Holland, and and see how difficult it is to penetrate into the interior of those countries. On a little reflection, indeed, you will perceive, that were it not for the vastness of the ocean, we would be in great comparative ignorance of the earth, and that its great extent of surface is another proof of the wisdom with which all is planned.

THE PUBLIC LIBRARY.

PURSUANT to advertisement, the Annual General Meeting of the Subscribers took place on Monday, the 30th ultimo.

HENRY CLOETE, Esq. Advocate, in the Chair.

The Report, which was read by the Chairman, was ordered to be printed. The prosperous state of the Institution seemed to afford general satisfaction, and the admirable selection of books of the last year, does great honour to the committee, the members of which received the thanks of the Meeting, and were subsequently re-elected as office-bearers for the ensuing year. Among the company we observed the following gentlemen, along with many others.

Reverends,—Dr. Adamson, Mr. Faure, and Professor Pears.

Doctors, M. D.—Murray, Dyce, and Graham.

Professor,—J. R. Innes.

The Army,—Majors Cloete and Hammond; and Captains Hare, Blair, and Alexander.

Visitors from India,—Sir Robert Colquhoun, Sir Charles D'Oyly, Col. Prendergast, Dr. Nicholson, Major Griffith, Capts. Poole, Lindsay, Majoribanks, Burroughs, and Messrs. C. and G. Bayley, Bracken, Burgoyne, McDonnel, &c.

Merchants,—Messrs. Hawkins, Collison, Ross, Chiappini, Christian, Pillans, Tennant, McDonald, Greig, G. Thompson, A. Thomson, Ansdell, Russouw, &c.

Law,—The Hon. Sir J. Truter, and Messrs. Merrington, Cadogan, and Barker.

Civil Servants,—A. Oliphant, Esquire, His Majesty's Attorney General,—The Hon. Mr. Stewart,—The Hon. J. W. Stoll,—Baron de Lorentz,—Messrs. William Wilberforce Bird, Marshall, Hamilton, Bance, Wylde, Chase, and McNamara.

Departments,—Messrs. Petrie, Watt, Horne, Sanford, and Cooper.

Messrs. Dowson, Gregory, Dobie, Blore, Reeves, Dixie, and R. P. Jones.

TO CORRESPONDENTS.

A Friend to Ecclesiastical Discipline, who has addressed us, as he has recently done the *Advertiser*, has mistaken our views altogether, nor are his inferences fair as it regards our views of religious education, in a late number. Moreover, he errs in reference to certain "ecclesiastical claims" which he alleges "the Bishop or Bishops of Calcutta have on this colony." Is he ignorant that Bishop James, when he visited the Cape, was permitted, by a special commission from the Crown, to exercise his *episcopal* functions in Cape Town?

Nota Bene. The particulars in reference to the Loyal and Patriotic Address of the Lutheran Community at the Cape of Good Hope, and which appeared in the Cape Newspapers, were filched from our columns. The Anti Slavery Reporter of London, also, made very free with our articles, without the least reference to the source from whence it gathered its information.

We regret that Rural Rambles have been necessarily curtailed in the present Number.

RAMBLES AMONG THE MOUNTAINS.

No. IV.

It is characteristic of a grumbling age or people, to be continually telling us that there is nothing worth seeing in South Africa; that there is an unvaried sameness throughout the country. Our opinions are very distinct on the subject. From the vast *extent* of the country, and the innumerable repetitions of mountain, hill, valley, and ravine, the scenery naturally partakes of the duplicate and the triplicate. But these should only induce our gratitude, whilst we lament at the same time, that such an extent, such ample provision every where created for human population, should remain unoccupied, except by reptiles of all orders and degrees. Again it should be recollected, that although the objects of survey, animate and inanimate, continue the same, yet the impressions made on the mind by these objects, and the reflections growing out of these impressions, are as various and often as opposite, as the characters of the observers, or the features of their faces. Even the same, or very similar objects, strike the same class of people—for instance, poets, in a very different manner. Thus, the summits of the highest mountains in the old and new world—the Alps and the Andes, excited very dissimilar trains of thought in two contemporary poets of first-rate genius.

Byron—

> ——————— Above me are the Alps,
> The palaces of Nature, whose vast walls
> Have pinnacled in clouds their snowy scalps,
> And throned Eternity in icy halls
> Of cold sublimity.

Campbell—

> ——————— Afar,
> Where Andes, Giant of the Western Star,
> With meteor standard to the winds unfurl'd,
> Looks from his throne of clouds o'er half the world.

Then, again, there is this special claim in favour of South African travel. Your are not harrassed by the Douane, the Passport, and the Police. You are not liable to be cheated by vetturini, poisoned with filth, infected with malaria, worried by beggars—or murdered by Bandits. But we forget that we are at Caledon for a change of air, and promised to devote a few more thoughts on the village and country in general. Had we the choice perfectly at our own command, we should prefer an annual visit to this district. Not that the things which own man's dominion are pressingly inviting, but God has done much; more than a folio edition of His works being legible in it. We may remark, in addition to what we have already said in Nos. 1 and 2 of our Rambles, on the vast importance and beneficial influence of bodily exercise, change of scene, pure air, and temporary relaxation.* We dwell on the subject, because we are daily witnessing around us, countenances "sicklied o'er with the pale cast of thought," the decay of health and premature death; and all this arising from a constant city life, sedentary occupations, inactivity, late hours, and the habit of drinking ardent spirits. There is, as we must all have found, a condition or state of body and mind intermediate between that of sickness and health, but much nearer the former than the latter. It is daily and hourly felt by all classes of the community. It is not curable by physic, though it makes much work for the doctors, if not for the undertakers. It is that Wear and Tear of the living machine, mental and corporeal, which results from over-strenuous labours or exertions, conducted in anxiety of mind, and in bad air. It bears some analogy to the state of a ship, which, though still sea worthy, exhibits the effects of a tempestuous voyage, and indicates the propriety of re-caulking the seams, and overhauling the rigging. It might be compared to the condition of the wheels of a carriage, when the tyres begin to moderate their close embrace of the wood-work, and require turning. Lastly, it bears no very remote similitude to the strings of a harp, when they get relaxed by a long series of vibrations, and demand bracing up. Now the only antidote to the Wear and Tear system, is a change of air, rural relaxation, and bodily exercise. The physical effects of travelling is most perceptible in the state of our corporeal feelings. If they were previously in a state of morbid acuteness, as they generally are in ill health, they are rendered less sensible. The eye which was before annoyed by a strong light, soon becomes capable of bearing it without inconvenience; and so of hearing, and the other senses. In short, the morbid sensibility of the nervous system, generally is obtunded or reduced. This is brought about by more regular and free exposure to all atmospheric impressions and changes than before, and that under a condition of body, from exercise, which renders these impressions quite harmless. The next effect of travelling among the mountains, is its influence on the organs of digestion. The appetite is not only increased, but the powers of digestion and assimilation are greatly augmented. A man may eat and drink things while travelling, which would make him quite ill, in cooped-up life. We have alluded in a former number of our Rambles, to the still greater effects of travelling, in the influence

* This subject is delightfully handled by Dr. James Johnson, in his little work, entitled—*Change of Air; or the Diary of a Philosopher in pursuit of Health, &c.* The kindness of a friend has enabled us just to take a peep at the volume.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

which it exerts on the blood—its moral effects are no less important.

We are quite aware that the accommodations for travellers in this colony are none of the best, but we trust the day is not far distant when we shall find such improved, and places properly *set apart* for those who take excursions. What on earth is there to prevent that delightfully pleasant little fishing village on the shores of Hottentot's Holland, from becoming the Brighton or Worthing of the Cape? But more of this on a future occasion. We had almost forgotten, a second time, that we are still at the Hot-Baths of Caledon.

Again, these Baths, and the village, require *patronage*. We do not like the word, but we use it for want of a better. The history of the term *patronage* would be amusing, especially as connected with the historical records of this colony. In looking over the columns of the Cape Gazette, we find a "newly invented plough" exhibited "under *the patronage*," &c. The *English Spelling-books* and *Reading made Easy*, are "used under *patronage* of the School Commission." The "organ at Stellenbosch plays choice music under the *patronage*," &c. Mr. Villet shews "a species of the monkey tribe to the public, through the *patronage* of His Majesty's Fiscal." Mr. de Lima, "under *patronage* of the authorities, is tolerated to teach the Hebrew, Greek, Latin, Arabic, Malay, Malabar, and *other* oriental languages,—also, French, German, Spanish, and Dutch!"—"Mr. Schwartz having been favourably reported to His Excellency the Governor, is *patronized* by him to perform the operations of corn-cutting." In a word, arithmetic, mathematical science, play-acting, the distribution of bibles and tracts, the selling of pincushions, and horse-racing, are all under *patronage*.

What we mean is, that the Baths should be so provided as to afford all the accommodations of an inn; and the village present a few lodging-houses, in which all persons may be received who are able to pay their way. As it is, the *patronage* of a somebody, must procure a covert for your head, and provisions for your body. There may be a prejudice against you, and then as the people of this colony herd their sentiments together, woe be to your comforts, and farewell as to accommodation. A good English Hotel at Caledon, would supersede all these evils, and introduce a necessary reform in the village. The presence and constant residence of a magistrate of *mind*, would also promote the good of the place. We do not mean one who should reside in the suburbs, but on the spot. He should be an educated man, and command the respect and confidence of all classes and complexions, by his firmness and *decision* of character. He should be a man of public spirit, and watch over the interests of man, woman, and child. Such an one would prove a tower of strength to religion, and be the life's-blood of the village school. He would circulate books, and institute a library. He would attend to the *just* distribution of the *water*, and better the condition of the *wines*. He would moreover protect the inhabitants from the *high prices* at present charged for "execrable stuff." He would secure to the people a *constant* and a *wholesome* supply of bread and meat. The distribution of these in the way of sale, would not, under his jurisdiction, depend on the *humour* and *favour* of *monopolists*. He would keep the roads in good order, and take especial care that the Church-yard, and *paths leading to the Church*, should not be corrupted by weeds; the gardens would be made, by his *example*, to exhibit proofs of industry and civilization. Under his inspection and advice, there would be no more running about and *interceding* for a potatoe, a cabbage, or a spoon-full of milk. The Prison would be under his constant inspection, and he would take care to prevent its being, as in former days, the Bastile in miniature. In a word, he would be to Caledon, what an admirable and deeply-lamented friend of ours was to the inhabitants of Dhuboy, in India. Let the magistrates of the colony read as follows:

"Address of the Inhabitants of Dhuboy, to the English Magistrate, *James Forbes*, on the morning of his final departure:

"Alla! Thou conferrest power and greatness on the sons of men, according to Thy pleasure: by Thee the nations of the earth are created; their kings and rulers are ordained by Thee!

"Dhuboy, famed among the cities of the East, was happy when this English Sindar resided in her darbar: his disposition towards the inhabitants was with the best consideration. He afforded shelter to all, whether they were rich or poor; he delivered them from trouble, and restored them to comfort. ALL CASTS WHO LOOKED UP TO HIM, OBTAINED REDRESS, WITHOUT DISTINCTION AND WITHOUT PRICE. When he took the poor by the hand, he made them rich: under his protection the people were happy, and reposed on the bed of comfort. When he superintended the garden, each gardener performed his duty; rills of water flowed to every flower. So EQUAL WAS HIS JUSTICE, that the tiger and the kid might drink at the same fountain. Under his administration, the rich dared not oppress the poor, for his eyes were open on the great and small!

"Alas! if our protector forsakes us, we shall be disconsolate as a widow; we shall mourn the loss of a father, and weep as for the death of a mother! Alla! in Thy mercy restore him to us!"*

STEAM, AND ITS APPLICATION TO THE ARTS OF WAR.

"Steam will govern the world next, and shake it too before its empire is established."—(*Southey.*)

SOCIETY has its critical periods, and its climacterics; no change, no development can take place at such seasons without inducing some peculiar and accompanying danger; and at all seasons it is liable more or less to its influenzas and its plagues. This is one of its grand climacterics. A new principle, "*a novum organum* has been introduced;" the most powerful that has ever been wielded by man. It was first *Mitrum* that governed the world, and then *Nitrum*, both have had their day; gunpowder as well as the triple crown.

Our attention has been directed to this subject by the perusal of the following notice from a London paper of February last.

ARMED STEAMERS.

"The large steam vessels which are now in progress of building, in Sheerness, Chatham, and Woolwich dock-yards, are to carry two bomb cannons, mounted on pivots, so as to swivel and command an extensive range without altering the course of the vessel. This will enable a steam vessel to be put in the best possible position, relatively to an enemy's armed vessel, so as to protect the paddle wheels free from shot. One cannon is to be so situated on the aft part of the deck, as to range entirely over the arc of the stern, and as far forward as the paddle boxes will permit. The other is to be mounted before the wheels, and will command an arc on each side, from the bow to the forepart of the casing of the wheels; the latter prominence will, however, interrupt much of the service of this piece of ordnance. The calibre of the cannon is ten inches, and the weight upwards of 84 cwt."

We may observe in this instance,

* The Address was composed in the Hindoo language, translated into Persian, and written on paper spotted with silver, and flowered with gold.

as well as in many others, how, in the order of Providence, all things have their due time appointed. Our country was at one time threatened with an invasion of gun-boats, and—(alarmed shall we say, or amused?) with tales of rafts that were to work their way by wheels from the ports of France; and of balloons that, by means of condensed gas, were to transport armies across the channel through the air. But, if steam navigation had been brought to its present state only half a generation sooner, or even half that term, the conquest of England would have been attempted as well as designed, and the battle must have been fought on British shores. By a series of merciful interpositions, which no rightly constituted mind can review without gratitude and awe, our country was preserved in national independence through a long eventful struggle. No English woman, let us never forget, saw the smoke of an enemy's camp; and while every other country in Europe was overrun by invasion, England alone never felt the hand of the spoiler.

Relative to the arts, inventions, or the application of such by the British, as means of national attack or defence, it has been said, that other nations may adopt the same means; but it must be observed, that every invention turns not to the account of those who the best know how to use it, and the advantage which each nation derives from it, is in exact proportion to previous acquirements. Thus, while the spear, the arrow, and the sling, will serve every purpose of marshalled savages, England is preparing engines, which, on the first occasion that calls her steam artillery into action, will be as much superior to the ordinary cannon, as this was to the strings of the Genoese bowmen on the day of Crecy. Thus too, while the Indian canoe is still ignorant of top-gallant-sails, the most enlightened of Europeans have begun to discard the uncertain impulse of the winds, and have succeeded to and fro against the elements, from the Thames to Table Bay and the Indus, by means of imprisoned vapour.

Again, as long as other nations are not so well provided with ships and steam-engines as Britain is, her superiority must be increased in a tremendous ratio. By the certain steerage of vessels which mock the winds, and run against the tides, no harbour, no river is secure. Coasts may be molested, and cities ravaged with comparative impunity. The whole art of maratime warfare, appears about to undergo a change.* The steam inventions appear at an epocha where little is left to England to be performed at sea. But the old nations may revive, and the still more new rivals may start up into naval existence. America may prepare her fleets, and the young Republic, flushed with the hope of youth, will be more pliant to novelty than her elders of Europe. It is probable, should war break out (which may Heaven avert!) from the United States, the first great expedition, winged and armed by steam, will steer to meet the navy of her mother country. Do we fear such a conflict? No, not even with anxiety. The same qualities whereby we have won in the old mode of warfare, will again, we hope and trust, win it in the new. Bring into battle what weapons you may, it is, under God's good Providence, by the sinewy arm, and the heart of proof, that the victory must be decided.

THE POKER CLUB.

A Comparative Apology for His Majesty King PHARAOH, *with some reference to* MOSES, *Secretary to the Anti-Slavery Society of* 1500 B. C.

WE are indebted to a friend, for a copy of the following address delivered at a late meeting of the Society, at its Room in *Mustard-and-Pepper-street:*

GENTLEMEN,—It is a remarkable fact, that the further we are removing from ancient times, the better we are becoming acquainted with the events connected with the history of such times. Thus, if we look to the history of Cromwell, we find this man was really a military commander of some distinction; and doubtless, when a century or so has gone by, Bonaparte will be acknowledged to have been a person of considerable ability. But my business on the present occasion, is to prosecute some inquiry into a few of the peculiarities of Pharaoh's history. "In these days of modern philanthropy," it is surely not amiss to direct some attention to the Anti-Slavery Societies of former ages; and my reasons for a specific enquiry on the present occasion, are simply as follow:—

Having often heard Pharaoh censured for enslaving the Hebrews—having often heard the expressions, "Egyptian slavery," "Egyptian bondage," "Egyptian oppression," as well as "Egyptian darkness," it came into my mind a few days since, to examine what kind of bondage the Hebrews were held in, and what excuses Pharaoh could have made to himself for such a course towards that people.

The result of my inquiry was rather surprising to myself; and led me to make some remarks on the case under the above title.

Let me not, however, be misunderstood. I do not mean to justify the conduct of Pharaoh towards Israel. My apology is not absolute, but comparative. I only object to the practice of representing the slavery of Israel as the *hardest* ever endured; and of Pharaoh as the most unjustifiable of all slave-holders. It is not correct. And the people of every country where slavery is tolerated, and especially slave-holders, would do well to borrow their proverbs respecting slavery and oppression, from a different quarter than ancient Egypt.

If I am not mistaken, these two facts can be fully made out, from the Hebrew account of their bondage;—first, that it was not so hard as several kinds of modern slavery; and secondly, that Pharaoh not only had more plausible, but better reasons for his course, than many modern slave-holders have. In proof of the first, I adduce the following facts:—

1st. The Hebrews were allowed to live separate to themselves, and retain their own manners, customs, and religion. Exod. ix, 26. They formed a community by themselves. Their slavery was rather *political* than personal. They were held as *public*, not as *private property*. The labour exacted from them was for the *benefit of the state*, rather than of individuals. Exod. i. 9-14.

2. They were not *bought and sold*, transferred from hand to hand, and removed from place to place, as caprice or profit might dictate. They formed family connexions as they pleased, which were not broken in upon. The education and management of their own

* The more this subject is contemplated, we shall come to the positive conclusion, that a short period must introduce an incalculable change into the art of war, by the application of this power, not merely to propel ships, but to lance projectiles. The first use of steam artillery, will probably be in fixed batteries, as was that of the usual artillery. But, as knowledge progresses with accumulated velocity, the improvements of steam artillery will march most rapidly. We often complain of the laziness of the human mind in South Africa; but an extraordinary instance of this laziness is, the tardy application of gun-locks to cannon at *home*. Gun-locks have been applied to muskets for some centuries, in every country where gun-powder is known, and to place them on the touch-hole of a cannon, would have been no great effort of genius. Yet, 20 years have hardly elapsed, since that improvement took place, and in the single navy of Great Britain.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

children were left to themselves; and all the endearments of the *domestic circle*, were untouched; the temporary attempt to destroy their male children excepted, which I shall notice presently.

3. They remained where they were first settled, in the *best part* of the land of Egypt. Genes. xlvii. 4-11. Exod. ix. 26.

4. They not only were allowed to retain the property which *they* brought into Egypt, but greatly increased it during their stay. Genes. xv. 14; Exod. xii. 38.

5 They lived well by their own confession;—so much so, that they afterwards lamented the loss of their good living; and had almost returned to slavery for the sake of it. Exod. xvi. 3; Num. xi. 4-6.

6. They were made to labour; but their great increase is against the notion that their labour was so very oppressive as some suppose. Exod. i. 9-14. Experience proves that oppressive labour, especially on the part of females, operates against a great increase. But the increase of the Hebrews while in Egypt I think unparalleled.

7. It does not appear that they were shut out from any of the common modes of improvement and education. The various works performed—as spinning, weaving, and embroidery; working in wood and iron; in gold, silver, and brass; even to the cutting and setting of diamonds, with many other things connected with the erecting of the tabernacle—prove a very considerable knowledge of the ornamental, as well as useful, arts. Exod. xxxv—xxxix. Num. vii. The direction to *write* parts of their law upon their door-posts and on their gates, Duet. xi. 18-20, seems to imply that the *great mass* of the slave population, if not all, could *read and write*. The notice of writing the names of officers Num. xi. 26, of writing the law on pillars, Duet. xxvii. 3, of writing a copy of the law upon stones, Joshua viii. 32, of the king's writing out a copy of the law for his own use, Duet. xvii. 18, agree with the opinion that *reading and writing* were common among the people.

8. The attempt to destroy their male children was the darkest feature in the case. We shall have occasion to refer to this again, in noticing Pharaoh's excuses and reasons. In this place I must notice, that the whole facts of the case favour the opinion that the number destroyed must have been very small. The first attempt to effect it totally failed. The attempt to drown them, appears to have lasted but a short time. It was not, we may infer, in operation at the birth of Aaron; as nothing is said about a difficulty in saving him. Moses was but three years younger, Exod. vii. 7. It was in force at his birth. Exod. ii. 2 3. At three months old he was cast out, but was immediately rescued and adopted by the daughter of Pharaoh. No other case is particularly mentioned. From Acts vii. 20, it seems probable some others were cast out. In all probability, the same sympathy which led Pharaoh's daughter to save and adopt Moses, led her to prevail on her father to abandon the cruel practice. We can indeed hardly conceive of her indulging the full tide of female and maternal kindness for the infant Moses, and not make an effort to save others from the watery grave from which she had rescued him. That the practice was abandoned—that but few were destroyed—I think nearly certain, from the fact that there were 600,000 men contemporaries with Moses when they left Egypt, and that the number of Israelites immediately after leaving Egypt, Exod. xii. 27, compared with their number on entering, Gen. xlvi. 27, only about 215 years before, shews that they doubled, in less than every fifteen years—an unusal increase. The above statement, I think, proves that Egyptian slavery was much milder than the slavery which has been often practised since, and is now practised by many who *profess* Christianity.

The following facts, drawn from the Hebrew records, will shew, I think, that Pharaoh had what he probably thought *good reasons* for holding that people in bondage;—reasons, which at least will bear comparison with what pass for good reasons now:—

1. The Hebrews were received into Egypt at a time of unexampled scarcity, when likely to perish; and were, with their flocks and herds, supported free of cost, Genesis xlv. 10-11; while the Egyptians, who raised the grain laid up in store, Genes. xli. 34-35, had to sell their flocks, herds, and even themselves, for food for their families. Genes. xlvii. 15-24. While the obligation of Pharaoh to Joseph for his foresight and ability is fully admitted, it is thought that some bounds ought to be set to the returns made to him, and especially to his whole kindred. His being made prime minister, the cordial welcome given to his family in their distress,—giving them as a residence the best district in Egypt, Genes. xlvii. 11—supporting them from the public store for about six years, (what they carried to Canaan cost them nothing, as Joseph returned their money, Genes. xlii. 25. xliv. 1,)—and their prospect of a *free trade* with Egypt with Joseph prime minister there, might with some reason be thought a pretty liberal reward. Not many good deeds get better pay.

2. At the end of the famine, instead of returning to Canaan, as might naturally have been expected, the Hebrews continued to occupy the land of Goshen. Joseph never forgot that he was a *Hebrew*, or lost any just and proper opportunity of advancing the interests of his own kindred. While Egypt owed much to him in many respects, various things were so managed, perhaps accidentally, that the Hebrews had decidedly the advantage, as to wealth, ease, and the means of improvement, over the Egyptians. The close of the famine found the Egyptians without money, flocks or herds, or even personal freedom, Genes. xlvii. 12-26, and under an engagement to give Pharaoh one fifth part of all their produce.

On the other hand, the Israelites were full handed, had lost nothing, were in possession of the best part of Egypt, and had under their management the cattle of Pharaoh, Genes. xlvii. 6, and as all the cattle of the Egyptians had come into Pharaoh's hands, the Hebrews no doubt received a good portion of Pharaoh's fifth, in payment for managing them for him.

They had full employment, of the very kind they preferred, Gen. xlvi. 33-34; no wonder therefore they were willing to have remained where they were.

Joseph continued to direct the affairs of Egypt for about seventy years after the famine; and we may well suppose, that with the advantages which the Hebrews enjoyed over the Egyptians, they must, as to comfort, wealth, and improvement, have been greatly in advance. This may not have been much noticed at first; but it could not but excite notice at the time of Joseph's death, or soon afterwards.

A King that ascended the throne after the death of Joseph, saw how things were proceeding, and had as much zeal about the interests of his Egyptian kindred as Joseph had for his Hebrew. The case was, however, one of peculiar difficulty. Things had gone on so long, that it was not easy to make a change; yet many things might naturally have led Pharaoh to think a change absolutely necessary. Judging from the Hebrew records, I think it likely that Pharaoh saw, or thought he did, that one of three or four things must take place.

Either, 1st, he must expel the Hebrews; or, 2, he must amalgamate them with the Egyptians, so as to form a promiscuous people; or, 3, see his own people made slaves in their own country by the Hebrews; or 4, prevent that by making slaves of them.

To accomplish the first, might have been no easy matter. It would, in all probability, have led to war. The Hebrews would have most likely called in the aid of the Edomites, or some other of their kin, and the ruin of Egypt might have followed; or if effected, where could the Hebrews have gone? They had been absent from Canaan about one hundred years; and there was little probability that the Canaanites would allow them to return. They would have most likely roved about on the borders of Egypt, and made inroads for plunder.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

As to blending them with the Egyptians, and forming them to the same manners, customs, and religion, this was still more difficult than the other.

Nothing is harder than to *change the religion* and habits of a people. Israel had now been in Egypt above a hundred years. Joseph had married an Egyptian. Yet the original prejudices of both nations, as well as their religious principles, were nearly, if not fully, as much at variance as at the first. Gen. xliii. 32. Exod. viii. 26. Scarcely any inter-marriages took place; and as to religion, the one was an abomination to the other. To think of force was idle. Their prejudices, religion, as well as their complexions, *(the Egyptians were Africans, black;* the Hebrews, from Mesopotamia, *fair;)* made the thing hopeless. To expect Pharaoh to sit down and contemplate a progress of things that tended directly, as he might naturally suppose, to a struggle, and threatened the loss of his throne, and the slavery of his people, is to expect more than was likely. The only alternative, Pharaoh might easily suppose, was to prevent this by adopting a new policy towards that people. He might easily persuade himself, that it was but fair that Israel should make some return for all they had received for above one hundred years. He may have thought he was justified in gradually employing the Hebrews in building cities and in field labour; while he raised the military character of the Egyptians, and made such preparations as would enable him to suppress any opposition to his plans.

The conduct of Israel to the Shechemites, Gen. xxxiv. 25-27, and their late attempt to plunder the inhabitants of Gath, I Chron. vii. 20-23, might make him feel justified in providing against similar treatment. If this state of things did not justify his conduct, Pharaoh might think it came very near to do it. He still found them increase; and more rapidly than when leading the easy life of shepherds. Under apprehension of the scenes that might follow a great increase of their numbers, soured as they were by his change of policy towards them, he was wrought up to the cruel purpose of destroying their male children. The thing was cruel; but, while it cannot be too strongly condemned, we ought in all reason to recollect, that the exposing of infants has been done by many nations. The polished Greeks and Romans, until Christianity put a stop to it, often exposed their *own* children. The same is done now by Pagan nations in the East. Pharaoh was a Pagan, and his conduct towards the infants of Israel was not worse than others have observed towards their own. There is a tribe in Hindostan who for ages have destroyed their female children, and, if I am rightly informed, do it now.

Moses did what was right, and acted by Divine direction: this need not, however, prevent us from reflecting how Pharaoh, a Pagan, would naturally view his conduct. Moses was saved from death by the daughter of Pharaoh: he was educated at Court, and in the very best manner. Soon after he was grown up, he was found *interfering* with the *policy* of the *government* towards the Hebrews. He fled, and remained abroad till the death of the king. But the new king was hardly seated on the throne, before the Reformer re-appeared, and, being joined by the leading men among the Hebrews, presented himself at Court, and demanded that the slave population should be allowed to go three days' journey into the wilderness, to sacrifice. The man, the time, the manner, as well as the demand, were all likely to offend His Most Gracious Majesty King Pharaoh. It is not needful to go over what took place at the several interviews. Pharaoh, pressed by the plagues, tried to compound the matter. At one time he offered to let the men slaves go, detaining the women and children as hostages for their return. He proposed that they should sacrifice and keep the feast in the land. While Moses readily complied with Pharaoh's request to remove the plagues, he abated not one whit of his first demand; but rather rose than fell in it. He declared that they must take their families, their flocks and herds, with them, that they would not leave *one hoof* behind. It did not admit of a doubt, that they had no intention of returning to slavery. They were for being *free*, they took the liberty of judging in this matter for themselves. Might not Pharaoh have feared that Moses had in view to keep them for awhile in the wilderness,—provide them with arms,—train them to military service,—and then return to Egypt with his six hundred thousand slaves transformed into warriors, breathing vengeance for their supposed wrongs? And may not a mistaken notion of his own safety have urged him to resist the demand?

Or, admitting that Moses intended to lead them to Canaan, might not Pharaoh have really concluded that the scheme was little short of madness? To attempt with a nation of slaves, without arms, without any experience in war, without provisions, to cross the desert and attempt to dispossess the seven nations of Canaan, amounting to perhaps ten times their number; a warlike people, well armed, with a country filled with towers and cities "walled up to heaven!" was there ever such an attempt? A man in Moses' situation, educated in expectation of a throne, might be willing to attempt any thing rather than live in obscurity. Ought Pharaoh to let a people under his authority be led on such an enthusiastic errand? Might he not think it was his *duty* in *kindness* to them, to keep them where they were, —and to give them enough to eat, and wear, and *do?* And might he not think that all their *talk about being free*, and complaining about their work, was produced by the *intermeddling* of *Moses* and *Aaron*? It really appears to me that he might happen to take up notions of that kind; and feel not a *little* provoked at Moses and Aaron, for spreading *discontent* among his slaves.

But there were still other difficulties. The Hebrews formed the great body of labourers in his kingdom. Moses insisted on taking them all off on the same day. What a state of things this was calculated to produce in his kingdom! Would it not ruin it? And would it not ruin the Hebrews? They had been raised in slavery—and were *unfit* for self-government. He had found it necessary to employ overseers, and even to call in the *aid* of the scourge to overcome their idle habits. For a people with such habits, to be turned free *all at once!* Might not Pharaoh think it would ruin them?—that they could not govern themselves?—that they would starve? and think that kindness to them would forbid turning them loose, as Moses demanded?

But we have no reason to think that Pharaoh was *wholly* without regard to the *value of property*.

The Hebrews, as his labourers and artificers, were very valuable property. There were 600,000 labouring men, besides the women and children. From their doubling in less than fifteen years, there must have been a great many children. It will be a moderate calculation, to suppose that the men above the age of twenty, formed one-fourth of the whole. There were then 240,000 in all. Estimate these at three hundred *dollars*,* it amounts to 720,000,000 *dollars:* not to mention their cattle, and other property, which were very valuable. Now is it to be wondered at, that Pharaoh felt reluctant to lose so much property? Nothing was said about *buying* their freedom. He was required to give all up,—not to bear a *part* of the loss, and they the rest—he was to bear the *whole!* we can easily conceive how Pharaoh might have persuaded himself, that to lose so much property, and be deprived of all his labourers, —and have to set his own people to all the hard work in the city, and in the field, to which they were not accustomed, was really *rather too much.*

He might very possibly have thought, that if it was wrong at first to enslave the Hebrews, *he* at least was not to blame for it: that it was done long before he was born; that he found them in slavery and held them *as property;* that the whole habits of the Egyptians were such now, that the evil of slavery was a *necessary* evil; that they could not do without it; and that it was hard to make him pay for the faults of his forefathers; and to give up what he had received as property by inheritance.

There is another point deserving notice. Natural and personal rights were not then so well understood as now. Perhaps few, if any, then maintained the doctrine, that personal "liberty is an unalienable right," which no man has a warrant either to take or withhold from us, under the plea of a right of property. Less was given to Pharaoh, as to knowledge, than to us, and less was therefore to be expected.

As to the supposition that the miracles wrought made Pharaoh altogether inexcusable in refusing to comply with the demand, I admit it But is it not *equally* true that those plagues, while they prove God's displeasure against Pharaoh and the Egyptians for enslaving Israel, go directly to prove the general truth, that all who enslave others, or hold them forcibly, do what is *offensive* to God? Pharaoh may have persuaded himself that Moses wrought his miracles by magic. Pharaoh was an ignorant Pagan. *We* believe *God* wrought the miracles; and the general truth is plain—*God hates oppression.*

To conclude my apology, I repeat that I fully believe that Pharaoh did wrong in enslaving Israel—in persevering in it; and that, however plausible his excuses, they availed nothing. *The thing was wrong.* He only added sin to sin, and made matters worse by his delay. The event proved that it would have been better for Egypt never to have enslaved Israel. It would have been better to have given up his state at any one time that could be named; for not only did they go out, but they *spoiled* the Egyptians; and the attempt to force them back, involved the whole army, with Pharaoh at its head, in ruin.

All this is admitted. Yet I say, Egyptian slavery was not so hard as some *other* cases of slavery;—and Pharaoh's excuses are, I think, better than what have satisfied, and now satisfy, many.

* Spanish dollars.

AN ALMOST PARALLEL CASE.

The Temperance Society perfectly in order at its late Meeting at the Commercial Exchange.

The London papers of a recent date report the particulars of a very interesting meeting, entitled "*The Labourer's Friend Society.*" Lord Morpeth presided, and was supported by many noblemen and clergymen, and among the latter, many of the Bishops. In the course of Lord Kenyon's speech, a person in the body of the room here rose amidst loud cries of "Chair," "Hear him," and great confusion.

The Noble CHAIRMAN said that the arrangements which had been made by the Committee were that the resolutions should be first disposed of, and the meeting addressed by the gentlemen to whom they were intrusted; and that after the business of the day had been thus disposed of, any individual should be at liberty to address the meeting—(hear, hear).

The individual still continued to persist in his vociferations, and demanded to know if the meeting was a public one, as, if so, he had a right to speak.

Lord MORPETH said that the meeting had been called by the friends of the Society, and that he was sure he spoke the sentiments of the great majority of the meeting when he requested the gentleman would allow the business of the day to be proceeded in according to the arrangements which had been made—(loud cheers).

After silence had been partially restored, the resolution was put by the Chairman, and was carried without a dissentient voice.

The Noble Chairman then rose to put another question, but the same individual who had before disturbed the harmony of the meeting, again rose, and considerable confusion prevailed. Loud cries of "Police" ensued, and, after many conciliatory attempts by Lord Mor-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

peth proving ineffectual, he was removed from the room, and the resolution was then put and carried unanimously.

LITERATURE.

NIMROD ON THE HORSE.

We had guessed this book—*Remarks on the Condition of Hunters, the Choice of Horses, and their Management, by Nimrod*, to be a work designed wholly for the Tallyo's. We have been greatly mistaken; it is really a useful book, and affords abundance of 'good entertainment."

On the subject of the horse, who is there so unobservant as not to see how identified this quadruped is, with all that relates to human life? "The very name is familiar, and endeared even to infancy." (We are using the language of *The Bystander*, a gentlemen to whom this Journal is under very considerable obligations.)—"The child begins with a rocking-horse; the boy to a poney; the youth a hackney; and the man advances to a hunter. The imperial diadem of Persia was acquired for Darius, by a horse. Bucephalus is said, in history, to have been the peculiar care of Alexander the Great, who built a town to his memory. Homer, in his sublime Iliad, consigns to everlasting fame the white horses of Rhesus, and the immortal steeds of Achilles. All history attests the solicitude of mankind, from the Prince down to the Arabian robber, about the breeding, rearing, and value of the horse," nor indeed, as Nimrod very justly observes, has the subject been considered beneath the notice of inspiration itself; for grand and sublime as have been the allusions to him by ancient and modern authors, they all fall short of, and are lost in the majestic language applied to him by Job (chap. 99.) "He paweth in the valley, and rejoiceth in his strength: the glory of his nostrils is terrible. He swalloweth the ground with fierceness and rage, neither believeth he (for joy) that it is the sound of the trumpet." The horse has also given birth to many beautiful similies Juvenal compares a degenerate person of quality, to a broken-down race horse; and Tibullus elegantly introduces an old worn-out racer, to shew the transition of all human glory. The tongue of an empty-pated fellow has been humourously compared to a race-horse, has going faster for the less weight it carries.

The writer before us, has given us an alarming catalogue of the diseases of the horse: these he has been pleased to term "the curses on good horse flesh," without perhaps taking into consideration how many of these have been conduced by carelessness, wantonness, cruelty, and brutality. It is true, the author alludes to the sufferings of horses as *necessarily* connected with the introduction of *moral evil* in the world: still he has not alluded to those sufferings which are connected with man's dominion over the brute creation. The following is his language, and it is well expressed:

"It is the idea of mortality that apologises for *our* sorrows, and renders the present condition of humanity, in the smallest degree intelligible. The sufferings of animals must ever remain a paradox; but here I had better put a finger on my lip—for I believe we are told God gives no account of his conduct to us children of men. However, that they are not exempt from the *general curse* is too apparent to admit of cavil. Virgil speaks of the moaning of cattle in a state of nature; and thus says St. Paul: "For we know that the whole creation groaneth in pain together until now."

Among the first natural tormentors of horses, Nimrod reckons the fly. This is introduced to expose the *misconceived notion of a summer's run giving rest to a horse.* Let us adopt his own words:

"I am not going to descant upon every species of the fly, from the gnat which plays in the sun beam to the pestiferous *zimb** which depopulates countries, and whose distant hum strikes terror into the rhinocerous and elephant, and makes them coat themselves in mail to resist him: but simply of those well-known insects which so unceasingly annoy our horses and cattle in hot weather in this country. Now we all remember (indeed we can never forget it) the hot summer of 1826. Hot as one of its most oppressive days was, I could not persuade myself to remain in the house; and on the ninth of July, when the sun was at its height, walked down to one of my meadows, in which there were a brood mare, two two-years olds, and two yearling colts. There was water—a running brook—in the meadow, and there was also plenty of shade. But where did I find these suffering animals? Did I find them in the shade, *sub tegmine fagi?* No; the æstrus was there. Did I find them in the water? No; the blood-suckers were there also.—I found them crowded together in the middle of the field; at one time rubbing each other's heads together; to get rid of the smaller flies from their ears and eyes—the latter highly inflamed; then stamping their feet with violence against the ground; then walking a sort of figure not very unlike that of a modern quadrille; and lastly—all patience under their suffering being exhausted—galloping from one end of the field to the other as hard as their legs could carry them. Let me ask you, reader, do you call this rest?"

And all these sufferings, the author might have added, are greatly aggravated by the ingenious devices of man's cruelty. Partaking as the animal creation does in the woes of fallen humanity, it must not be forgotten, that the irrational creatures have a claim upon us, as they are the care of Providence. The Universal Parent exercises a tender concern for the lowest of the brute creation, provides for them, and resents the cruelty and injustice which are offered them. "He feeds the ravens." "The young lions ask their meat from God." "He careth for oxen." "A sparrow falleth not to the ground without our heavenly Father."

"He hates the hardness of a Balaam's heart."

The dumb ass spake, and reproved the cruelty and madness of the prophet. The tender care and compassion of Divine Providence over the lower race of creatures is affectingly manifested in the provisions of the Jewish law—"Thou shalt not muzzle the ox when he treadeth out the corn." "Thou shalt not see thy brother's ass or his ox fall down by the way, and hide thyself from them; thou shalt surely help him to lift them up again." "If a bird's nest chance to be before thee in the way, in any tree, or on the ground, whether they be young ones, or eggs, and the dam setting upon the young, or upon the eggs, thou shalt not take the dam with the young, &c." Nathan's story of the ewe lamb presents an interesting picture of kindness to the animal race.

In reference to legislative interference, a proportion of the British Parliament did itself immortal honour, with Lord Erskine at its head, by the introduction of a Bill—*Against cruelty to Animals.* It commences "Whereas it has pleased Almighty God to subdue to the dominion, use, and comfort of man, the strength and faculties of many useful animals, and to provide others for his food, and whereas the abuse of that dominion, by cruel and oppressive treatment of such animals, is not only highly unjust and immoral, but most pernicious in its example, having an evident tendency to harden the heart against the natural feelings of humanity," &c. Then follows the Bill itself, the enactments of which, are in perfect accordance with the *just rights* of the animal creation.

The introduction of *Steam* will be, doubtless, a great relief to the *groanings of the Horse.* In this colony, such remedial measures are not, we suspect, very near at hand. This noble animal must therefore be still in bondage (in reference to Cape Town,) to the tyranny of his *Sunday* taskmaster, whose whole of pleasurable life consists in *racing* to and from Wynberg, and the half-way house: or else be doomed to the daily drag of a single four-wheeled affair, with all the

* The *Zimb* of Bruce, a native of Abyssinia.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

et ceteras of the family! We conclude these remarks with Mr. *E. L. Bulwer's* last effusion, entitled,—

STANZAS TO MY HORSE.

Come forth, my brave steed! the sun shines on the vale,
And the morning is bearing its balm on the gale,
Come forth, my brave steed, and brush off as we pass,
With the hoofs of thy speed, the bright dew from the grass.

Let the lover go warble his strains to the fair—
I regard not his rapture, and heed not his care;
But now, as we bound o'er the mountain and lea,
I will weave, my brave steed, a wild measure to thee.

Away and away! I exult in the glow
Which is breathing its pride to my cheek, as we go;
And blythely my spirit springs forth—as the air
Which is waving the mane of thy dark flowing hair.

Hail! thou gladness of heart! and thou freshness of soul!
Which have never come o'er me in pleasure's controul—
Which the dance and the revel, the bowl and the board,
Tho' they flush'd and they fever'd, could never afford.

To the splendour of solitude speed we along,
Thro' the silence but broke by the wild linnet's song;
Not a sight to the eye—not a sound to the ear—
To tell us that sin and that sorrow are near.

Away—and away—and away then we pass,
The blind mole shall not hear thy light hoof on the grass;
And the time which is flying, whilst I am with thee,
Seems swift as thyself—as we bound o'er the lea.

A Guide to the Orchard and Kitchen Garden; or an Account of the most valuable Fruit and Vegetables cultivated, in Great Britain, &c. By George Lindley, C.M.H.S. Edited by John Lindley, F.R.S., &c. Longman, Rees & Co. London, 1831.

This most practical work is well worthy the attention of our landed proprietors at the Cape. Such a book as this, with the Quarterly Journal of Agriculture, Mr. Louden's admirable publications, and a few others of equal import, should be attached to our newly-formed *Agricultural Society.* The publication under present notice, is evidently the production of a man of a strong and philosophical turn of mind; for, although its object is only to describe the valuable Fruit and Vegetables of Great Brtiain, which it does in such a minute, accurate, and detailed manner, that the merest child could scarcely mistake the Fruit described, it possesses much higher claims on our approbation—which, however, are modestly embodied, in a long introduction, in an account of the most general and practical principles of Vegetable physiology. These principles are not stated in a separate and independent form, but are introduced merely as illustrative of the necessity of adhering closely to the most approved modes of cultivation pointed out in the work. The necessity of cultivating gardening upon proper principles, indeed, cannot be stated in detail in stronger terms than in the language of this author:

"All our fruits, without exception, (says he,) have been so much ameliorated by one circumstance or another, that they no longer bear any resemblance in respect of quality to their original. Who, for instance, would recognise the wild parent of the Coe's, or Green Gage Plum, in the savage Sloe, or that of the Ribston and Golden Pippin Apples in the worthless and acid Crab? or what resemblance can now be traced between the delicious Buerré Pears, whose flesh is so succulent, rich, and melting, and that hard, stony, astringent fruit, which even birds and animals refused to eat? Yet these are undoubted cases of improvement resulting from time and skill, patiently and constantly in action."

Were our great ancestor to look back into this world and find that some of the dearest objects of his solicitude had degenerated into worthless crabs, and that they had again been reclaimed by the care and attention of his sons, his astonishment would indeed be great. But Adam required not the aid of vain philosophy, for the Fruit of Paradise was perfect. In these degenerate days, however, "knowledge is power," a truth which our ancestors would not rightly appreciate.

Vegetable physiology is a subject but ill understood among practical gardeners, although there is no one more deserving their attention, or that would better reward them. All that the practical gardener cares about is the simple fact, that such is the result of putting a plant in a particular kind of earth, or of transplanting it at a particular season;—the character of the plant or the principles upon which the result may depend form no part of his knowledge. Works, however, of the description of the present, together with the rapid march of knowledge, must soon diffuse more extensively among our working gardeners the great principles upon which their art is founded; and we cannot see why they should not, with this knowledge, become all but as happy as their great ancestor in Paradise. As mere matter of knowledge, the details of Vegetable physiology are most curious and interesting, of which we may give the following from the introduction as an example:

"Evaporation takes place in plants to an inconceivable degree in certain circumstances. It is known by the experiments of Dr. Hales, that a Sunflower plant will lose as much as 1 lb. 14 oz. by perspiration in twelve hours, and that in general "in equal surfaces and equal times a man would perspire 1-50th, the plant 1-165th or as 50: 15;" and that taking all things into account, a Sunflower perspires 17 times more than a man. The same most accurate observer found that a Cabbage perspired in 12 hours 1 lb 9 oz.; a Paradise stock in a pot 11 oz.; and a Lemon plant 8 oz. Guettard states that he found Cornus Mascula perspire twice its own weight in a day, and Mr. Knight has remarked a Vine in a hot day losing moisture with such rapidity, that a glass placed under one of its leaves was speedily covered with dew, and in half an hour the perspiration was running off the glass. In damp or wet weather this evaporation is least; in hot weather it is greatest. This loss has all to be supplied by the moisture introduced into the system by the spangioles, and hence if the spangioles are destroyed, and evaporation takes place before they can be replaced, a plant must necessarily die."

The great object of the work, however, is to describe all the varieties of Fruits and Vegetables in Great Britain, in such a manner that no one can mistake them, and to point out the modes of cultivation applicable to each—likewise, the comparative value of each kind of Fruit—the aspects that it requires—the different names under which it is known in England and elsewhere—the books in which a faithful figure may be found—the purposes for which it is best adapted—and the seasons when it is in the greatest perfection. Mr. Lindley has done all this, so far as we have gone into his work, in a most able and satisfactory manner.

ORIGINAL CORRESPONDENCE.

To the Editor of the Cape of Good Hope Literary Gazette.

PORT LOUIS, 1832.

SIR,—I have occasionally obtained a sight of your Journal, and I rejoice with a few others in this Island, that the state of society at the Cape, (the advanced and civilized state of society at the Cape,) enables you with others of your compeers, to advocate the cause of oppressed humanity, without "fearing what man can do." This is not the case in this * * * * island * * * * * *

It was my lot some few years distant, to reside in the West Indies—Jamaica. In the course of a little tour on a certain occasion with Mr. Hunter, son of the late Dr. Henry Hunter, a clergyman of distinction in London, we saw much that oppressed our spirits. On one occasion, a poor creature had died of the wounds inflicted on his body by a merciless overseer—a native, I regret to say, of the village of Pennycuick, near Edinburgh. Poor *Jos*, (that was the name of the slave,) was a remarkably intelligent creature, and seized with avidity, though well stricken in years, every thing relative to the freedom of the human family.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

The governess of a newly-arrived overseer from England, had brought with her a pin-cushion, on which was represented an African scene of punishment,—and the words, "*Am I not a man and a brother?*" The wife of poor *Jos* introduced this cushion to the notice of her husband, and *Jos* used to *sow* that daily toil, which others *reaped*, exclaiming continually, "Am I not a man and a brother?" The repetition of these words greatly annoyed the overseer, who, because *Jos* would not desist, eventually flogged poor *Jos*, which punishment caused his death: his children being witnesses of his dissolution. The charge made against him was that of *impertinence*. The relation of this circumstance greatly affected our spirits;—we parted—(death parted us)—but not till my lamented friend had presented me with the following effusion of his lofty soul, which faithfully describes the particulars of the case.

I am, Sir,
Yours gratefully,
EDINBURGENSIS.

THE OPPRESSED SET FREE.

The bleeding slave was bound,
And the task-man o'er him stood,
Whose lash sent forth its hollow sound,
Midst groans, and tears, and blood.

By ——— thus laid low,
God! 'tis an aged slave,
Whom the villain strives by ev'ry blow
To scourge back from the grave.

His hoary hairs are stain'd,
With his blood that gushes fresh;
And the bonds with which his limbs are chain'd,
Enter into his flesh!

"Oh, spare me! master, spare!
This flesh which thou hast torn;
And the sinews which the scourges tear,
In thy service have been worn!

"Master! my words were wrong,
Thy just resentment smother,
I had forgot the *gory thong*—
When I said I was thy *brother!*

"Hear me! my master, hear!"
And he spake with trembling breath,
"Oh, pity my last and aged tear—
Your slave is sick to death!"

His sons are forc'd to stand
Around their dying sire,
Till beneath the *licenc'd* tyrants' hand,
The fainting slave expire.

And did their silent prayer,
Their hearts' deep bursting groan,
Not peal up through their dark despair,
Before the Eternal's Throne?

ENGLAND! the God whose hand,
Avengeth not amiss;
Upon thy proud and guilty land
Will lay his scourge for this!

"BROTHER! thy drooping head
Raise, ere thy spirit go;
Hark! to the far-off sounds of dread,
Which paralyse thy foe!

"Rapid from SHORE to SHORE,
Deepening upon the wind,
Comes pealing with *triumphant power*
The THUNDER of the MIND.

"Where'er a tyrant's felt,
Mark, how the lightnings play!
And, quick as thought, each chain they melt
Fast from the Slave away."

The Slave rais'd up his head,
Nor did his spirit go,
Till it heard the *coming* sounds of dread,
That paralys'd his foe!

Peal on thou MORAL STORM!
Lightnings dash down the chain!
That none who bear man's God-like form,
Shall e'er be Slaves again!

SCIENCE.

BORING FOR WATER.

UNDER the superintendence of a Committee of scientific gentlemen, experiments have lately been making in the Fort, for perforating the soil to the living water, by the process of boring. We believe, the Funds expended, have been provided by the Asiatic Society. The first attempts were, we understand, necessarily unsuccessful,—because the precaution of *tubing* was omitted. This indispensable precaution has, we believe, been observed, in a later attempt, which unfortunately, however, has been interrupted, by the breaking of the boring rod. Skill and money cannot be devoted to an undertaking, of which the successful issue would be more conducive to the prosperity of India.

We think it therefore right, to re-publish from the *Times*, as connected with the subject, the following advertisement to which chance has directed our notice.

The art of *tapping* the earth, and extracting from its hidden recesses, a perennial gush of water, has now in England attained maturity. It would be an reproach, therefore, to the British Government and community, if the benefits of this useful art were not generally introduced into these Provinces. We would suggest that the authorities at home should send out some recruits for the corps of Sappers and Miners, expert in all the details of the process and use of the necessary implements and machinery. We would also suggest that the Agricultural Society should devote part of its funds, and encourage contributions, for the special purpose of introducing the practice of the art in question. We would recommend the Society to indent for several sets of the most approved machinery and implements applicable to the purpose.

We learn with much satisfaction, that active preparations are in progress, for effecting a settlement, for 20 years, of the land-revenue in the Western Provinces,—as a preliminary to a fixed settlement. It is in those provinces that the vivifying art referred to would confer the greatest blessings, and we doubt not, but that even as a pecuniary speculation. the purchase of apparatus, and the hire of a gang of expert borers, would yield a liberal profit.—*(Calcutta Magazine.)*

Boring the Earth to the Main Spring for Water.—John Goode, 14, St. Swithin's Lane, sole inventor and patentee for boring the earth for water, begs leave most respectfully to inform the nobility, gentry, and the public in general, that he has INVENTED, in addition to his former plan, a METHOD whereby he is enabled to PROCURE double the quantity of WATER, at the same expense. J. G. undertakes to find a supply of water in any situation, and if it does not succeed, he makes no charge. This invaluable discovery, from the pureness of the water, and the enormous expense it saves by working engines, &c. for the benefit and comfort of mankind, of greater value than any discovery since the creation. The cost of a well boring will not be more than what has been charged by the water companies for the supply of water for one year. The process of the invention is making rapid strides, by J. G. sending tools, with a label on each tool, stating how they are to be used, to every quarter of the globe, so that the most inexperienced person may use them. References to wells bored, where the engines may be seen constantly at work:—Mr. George Smart, saw mills, York road, Lambeth; Mr. Taylor, wool scribbler, Cowper-street, City-road; Mr. Kirk, dyer, Osborn-place, Whitechapel; and a number of others, too numerous to be mentioned in an advertisement, which may be seen by applying for prospectuses as above. Tools for exportation. Persons going to foreign parts cannot lay their money out better than by taking a set of tools with them. J. G. has likewise invented a machine which will raise water to a great height where the water lies much below the surface. The said machine will require no attendance. Particulars as above.

NATURAL HISTORY.

ANIMAL KINGDOM.—I. REPTILES.

ALL the serpents live on animal substances, and digest slowly in consequence of the weakness of their membraneous stomach. Accordingly they eat but seldom, especially during the season of cold; one repast suffices them for many weeks, and they never drink, for their thick and scaly skin permits transpiration with great difficulty

In our European climates they pass the winter in a state of lethargy. In the rigorous months, while overwhelmed in this death-like sleep, they remain concealed in holes in the earth, coiled up, and many of them entwined together, until tney are awakened by the genial temperature of the returning spring, and reanimating influence of the sun.

At this time they change their epidermis, for these animals undergo a moulting every year, from the effect of which the most external of their teguments dries up, splits, detaches into strips, or even comes off in a single piece, preserving the form of the body.

The serpents very seldom attack man without provocation; on the contrary, they usually appear to dread his presence. Although cunning, they are timid and fearful, apparently mild in their manners, and patient or quiescent to excess.

Their spontaneous movement from one place to another is rather slow, in consequence of their complete want of limbs; but by rolling on themselves, the head being elevated above the ground, and the body let go suddenly, after the manner of a spring, they can dart occasionally a considerable distance, and with much force, from the place which they occupied with their circumvolutions.

Twisted round a tree, the boa, or the pythons of enormous length and prodigious force, await, in ambuscade the arrival of its fated victim, which it immediately envelopes in its tortuous folds, and strangles in its murderous embrace. The smaller serpents climb up trees in search of birds which they devour even on the nest.

It has been almost universally believed that by certain special emanations, by the fear which they inspire, or even by a sort of magnetic or magic power, the serpents can stupify and fascinate the prey which they are desirous to obtain. Pliny attributed this kind of *asphyxia*, to a nauseous vapour proceeding from these animals; an opinion which seems to receive confirmation from the facility with which, by the assistance of smell alone, the negroes and native Indians can discover serpents in the savannahs of America. Count de Lacépède seems inclined to adopt this notion in his History of Serpents.

P. Kalm assures us, that being fixedly regarded by a serpent hissing, and darting its forked tongue out of its mouth, the squirrels are, as it were, constrained to fall from the summit of the trees into the mouth of the reptile, which swallows them up. According to the report of many travellers, one would think that by the effect of some charm, the durissus and boiquira, those redoubtable rulers of the teppes

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

of America, possess the power of forcing their prey to fall in their mouths. At their aspect, it is said that hares, rats, frogs and other reptiles seem petrified with terror, and far from attempting to fly, will precipitate themselves upon the fate which awaits them. Even at a sufficient distance for escape, they are paralyzed by the sight of their tremendous foe, and deprived of all their faculties in a manner that appears wholly supernatural.

ORNITHOLOGY.

We alluded in our last Number, to Alexander Wilson, the Scottish weaver, whose name is of deserved celebrity for his work on American Ornithology. The following is an extract from one of the volumes,—on the *Habits of the Mocking Bird.*

The plumage of the mocking bird, though none of the homeliest, has nothing gaudy or brilliant in it; and, had he nothing else to recommend him, would scarcely entitle him to notice; but his figure is well proportioned, and even handsome. The ease, elegance, and rapidity of his movements, the animation of his eye, and the intelligence he displays in listening and laying up lessons from almost all the species of the feathered creation within his hearing, are really surprising, and mark the peculiarity of his genius. To these qualities we may add that of a voice full, strong, and musical, and capable of almost every modulation, from the clear mellow tones of the wood-thrush, to the savage scream of the bald eagle. In measure and accent, he faithfully follows his originals. In force and sweetness of expression he greatly improves upon them. In his native groves, mounted on the top of a tall bush, or half-grown tree, in the dawn of a dewy morning, while the woods are already vocal with a multitude of warblers, his admirable song rises pre-eminent over every competitor. The ear can listen to *his* music, to which that of all the others seem a mere accompaniment. Neither is the strain altogether imitative. His own native notes, which are easily distinguishable by such as are well acquainted with those of our various other birds, are bold and full, varied seemingly beyond all limits. They consist of short expressions of two, three, or, at the most, five or six syllables; generally interspersed with imitations, and all of them uttered with great emphasis and rapidity, and continued with undiminished ardour for half an hour, or an hour at a time. His expanded wings and tail glistening white, and the buoyant gaiety of his action, arresting the eye, as his song most irresistibly does the ear, he sweeps round with enthusiastic ecstasy—he mounts and descends as his song swells or dies away; and, as my friend Mr. Bartram has beautifully expressed it, "He bounds aloft with the celerity of an arrow, as if to recover or recal his very soul, expired in the last elevated strain." While thus exerting himself, a bystander destitute of sight would suppose that the whole feathered tribes had assembled together on a trial of skill; each striving to produce his utmost effect: so perfect are his imitations. He many times deceives the sportsman and sends him in search of birds that perhaps are not within miles of him; but whose notes he exactly imitates; even birds themselves are frequently imposed on by this admirable mimic, and are decoyed by the fancied calls of their mates: or dive with precipitation into the depths of thickets, at the scream of what they suppose to be the sparrow-hawk.

The mocking bird loses little of the power and energy of his song by confinement. In his domesticated state, when he commences his career of song, it is impossible to stand by uninterested. He whistles for the dog; Cæsar starts up, wags his tail, and runs to meet his master. He squeaks out like a hurt chicken, and the hen hurries about with hanging wings, and bristled feathers, clucking to protect its injured brood. The barking of the dog and mewing of the cat, the creaking of a passing wheelbarrow, follow with great truth and rapidity. He repeats the tune taught him by his master, though of considerable length, fully and faithfully. He runs over the quiverings of the canary, and the clear whistlings of the Virginia nightingale, or red bird, with such superior execution and effect, that the mortified songsters feel their own inferiority, and become altogether silent; while he seems to triumph in their defeat by redoubling his exertions.

This excessive fondness for variety, however, in the opinion of some, injures his song. His elevated imitations of the brown thrush are frequently interrupted by the crowing of cocks; and the warblings of the bluebird, which he exquisitely manages, are mingled with the screaming of swallows, or the cackling of hens; amidst the simple melody of the robin, we are suddenly surprised by the shrill reiterations of the whip-poor-will; while the notes of the killdeer, blue jay, martin, baltimore, and twenty others, succeed with such imposing reality, that we look round for the originals, and discover with astonishment that the sole performer in this singular concert is the admirable bird now before us. During this exhibition of his powers, he spreads his wings, expands his tail, and throws himself around the cage in all the ecstasy of enthusiasm, seeming not only to sing but to dance, keeping time to the measure of his own music. Both in his native and domesticated state, during the solemn stillness of night, as soon as the moon rises in silent majesty, he begins his delightful solo; and serenades us the livelong night with a full display of his vocal powers, making the whole neighbourhood ring with his inimitable melody.

LITERARY EXTRACTS.

TOUR IN HOLLAND.

(Family Library, No. 23.)

THE following passage gives an account of one of the most useful institutions in the world,—an institution which keeps Holland almost entirely free from paupers. There can be no doubt, that if such a system were introduced into Ireland, of course with modifications, it would produce the most beneficial effects:—

The beneficent society and the charitable and disinterested subscribers to the agricultural establishment of Frederick's-oord, is another proof of the active benevolence and humanity which distinguish the people of Holland. It is no speculation founded on the remotest chance of profit, but solely on that of relieving the distresses of their unfortunate fellow-subjects. Of this small canton or district (which *oord* signifies) Mr. Jacob, the Comptroller of Corn Returns, has collected a detailed and most interesting account from the published reports of its progress and condition. This benevolent institution, whose object is to lessen the burden of pauperism, and improve the moral habits of the juvenile portion of it, is indebted for its origin and successful progress to the intelligence, the zeal and indefatigable benevolence of General Van den Bosch. This officer, when in Java, purchased an estate, and made the pursuit of agriculture his study. A Chinese mandarin with a number of emigrants from that country settled by chance near him. The General soon observed that, with all his labour and care, the crops of his Chinese neighbour greatly exceeded his own; he therefore took lessons of the mandarin, and such was the successful result, that, when he returned to Europe, the Estate, which had cost him twenty-five thousand rix-dollars, he sold for one hundred and fifty thousand.

The General, on his return to his native country, published a little tract on the practicability of instituting a general pauper establishment in the kingdom of the Netherlands. It happened that the king was in 1817 occupied with a plan for bringing into productive tillage an extensive waste of heath land between Maestricht and Breda. The attention of his Majesty was drawn to that of the General. A society was set on foot at the Hague, for the intended experiment, under the patronage of the king, of which Prince Frederick, his second son, was nominated president for life. Twenty thousand individuals became members, and their contributions amounted to seventy thousand florins, or £5,833 sterling.

The first operation was to purchase an estate near the town of Steenwyk, on the confines of Friesland, Overyssel, and Drenthe, consisting of about one thousand three hundred English acres, together with two thousand six hundred acres of heath land, for which the society paid the sum of fifty-six thousand florins, or about £4,666. The river *Aa*, or *Au*, which runs through it, was made navigable for boats into the Zuyder Zee. Buildings for fifty-two families, to consist of six to eight individuals each, a storehouse, a school, and a spinning-house, were speedily erected.

All these operations were commenced early in September, 1818, and ere the 10th of November following, fifty two indigent families sent by the communes entered upon their new habitations. To each family was granted seven morgen or fourteen acres of land. The whole outfit of each family, made on a minute estimation, was one thousand seven hundred florins, or £141 13s. sterling, which was to be repaid to the society in sixteen years, while the annual rent, with which the colonists were to be charged, was settled to be equal to the interest of the outfit; and such was the success of this small establishment, that, after a few years' experience, it was found that the annual excess of produce over subsistence, of each fifty-two families established at Frederick's-oord, amounted to one hundred gilders or florins, or £8. 6s. 8d. sterling.

Loans were now raised for extending the system, to be advanced by the king in his individual character, or by the government, or by the communes, or charitable corporations, or by individuals, each loan limited to five thousand one hundred gilders, or £425 sterling, the exact outfit of three families; the advantage of thus grouping them together was, that two of them were to consist of six paupers each, and the third of six orphans or foundlings, not under six years of age, with a married couple, or a woman only, to take charge of the children. For every such sum the contributors had the privilege of sending three such families.

Sixty guilders were to be paid back yearly to the contributors, for the maintenance of each child, which in the orphan and poor-houses was found to cost nearly double; and it is reported that these twelve paupers do more than maintain themselves.

The first principle of this society is, that no colonist shall, even for the shortest period, be unemployed; and with this view they are under the inspection of the different officers, who exercise their respective duties with the strictness of military precision. General van den Bosch, as superior director, superintended in person the whole Establishment. A sub-director presided over one hundred families; a quarter master over twenty-four families a section-master over twelve, who was required to be a practical agriculturist. 'Thus the whole mechanism,' says Mr. Jacob, 'resembles that of an army divided into sections, companies, battallions, and brigades.' They were employed in various kinds of labour, as the preparation of lime from shells, making of bricks, building dwellings, barns, &c. but the greater portion is employed in field labour; the chief

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

implements are the spade and the hoe, at which they soon become sufficiently expert. Every kind of labour is performed by the piece, nothing by the day. The women are employed in spinning and weaving. The amount of their earnings is regularly kept, and a card given which procures at the public store food and other articles at fixed prices. The labour with spades of six individuals in digging fourteen acres, and repeating the operation when required, the sowing, and harvesting, may be supposed to occupy but a certain portion of the fifty-two weeks; the rest is chiefly employed in preparing the composts for manure, and on this, in fact, the success of the colony almost wholly depends.

WOMEN.

ENGLISH AND FRENCH.

Independently of the brilliant exceptions which burst out in the shape of authoresses in either of the countries now under consideration, it must be confessed that, in everything truly valuable, Englishwomen present an average very much superior to the rival nation. In many of the frivolous attainments, indeed, they may not be so accomplished; nor are they so dexterous in the quackery which shows off trifles to the best advantage, and makes the worse appear the better cause. More beauty they have, but not the art of parading it; more understanding, but not the skill of making a display; more knowledge, but not the cunning to whip it up into froth. It is a necessary consequence, that women should be superior in mental endowments, where the men are superior, and where a business and a pleasure of those men, a task performed by duty and by love, is to improve the sex whom they honor

The instruction which is generally bestowed, in points of French education, materially consists of personal more than mental acquirements; dancing, drawing, music, manners, are attended to—literature, history, serious occupations, are neglected. To captivate, rather than to attach, is the evident end to which all study is directed. The reverse of this is English education, for the embellishments hold the second rank, and the principal care is directed to the things which give the greatest value to the mind.

An English and a French woman are, in fact, destined to different functions in the system of society—to move in different orbits, to illumine different spheres. The element of the one is modest retirement—the end and object of her existence is to be a valued wife and mother. The ambition of the other is to shine like a meteor—to attract all eyes, and some hearts—and if she aspires to be a wife, it is that she may enjoy the freedoms of matrimony. To be a mother is little among her wishes, for children, without adding to beauty, take up much of the time which else had been devoted to pleasing. A single word most magically designates the essence of the British fair, and that word is MATRON. In all the dictionaries of both languages there is not one so opposite to the nature of a French woman

Every nation has its own ideas of happiness, and Paris is said by the French to be the paradise of women. To those who make the happiness of the sex consist in the free indulgence of every wish, and every wish to be of vanity, this opinion may seem true; but what is woman in such an elysium as this would be? A doll to carry silks and jewels—a puppet to be dangled by coxcomb children—an idol for licentious adoration—reverenced to-day, discarded to-morrow—always justled out of her true place by sensuality or by contempt—admired, but not respected—desired, but not esteemed—ruling by fashion, not by affection—imparting her weakness, not her constancy, to the sex which she would govern—never more than half a mother, or than half a wife. These, surely, are not the enjoyments of which an English female would compose her life; she craves something better than all this. As a wife, she would partake the cares and cheer the anxiety of her husband—she would divide his labours by her domestic diligence, and spread cheerfulness around him. For his sake she would share in the decent refinements of the world, but without being vain of them, for she places all her pride, all her joy, all her happiness, in the merited approbation of the man whom she honors. As a mother she is the affectionate, the ardent instructress of the children whom she had tended from their infancy, training them up to thought and virtue, to meditation and benevolence—addressing them as rational beings, and preparing them to be men and women in their turn. If there be upon earth a true and Christian paradise for females, an elysium of virtue and reason, it is Britain, and there it is that the sex has attained in every point the highest station yet reached by women upon earth.—*(Chenevix.)*

THE BISHOP OF WINCHESTER'S ADDRESS TO THE CLERGY.

EXTRACTS.

The clergy which shall be fitted to maintain its position, and to secure respect amidst a population such as this, must be a clergy of no ordinary attainments or character. It must not be a clergy resting on established privileges or ancient usage. It must not be a clergy, contented with a decent mediocrity of character, anxious only to avoid offence, willing to swim with the stream, and endeavouring rather to repress than to satisfy inquiry. It must, on the contrary, be a clergy which shall daily vindicate its claims by the benefits it confers on every portion of society. It must be a clergy capable of inspiring respect by the sanctity of its character, and capable of compelling respect by the soundness of its wisdom. It must be not merely a clergy dignified by the learning of schools, but fraught with the learning which commends itself to every man's understanding by its practical usefulness. It must be not merely a clergy respectable in point of morals, but a clergy venerable from peculiar holiness and purity. It must be not merely a clergy fitted to move among the laity with decency, but a clergy habitually raised above the laity by the spirituality of its feelings, and the sanctity of its habits—a clergy which lives above the people committed to its charge, and forms, as it were, the medium between them and heaven.

Such should be the clergy of the Established Church, and such must the clergy of the Established Church be found, if they are to retain, in a time of political convulsion, their hold on the affections of the people; and thus it is that by being true to their own principles, they may save their own privileges, and make them the means of preservation to the country at large.

* * * *

The religion that will stand in a day of political tempest, must be a religion built upon a rock; a religion that shall rest on nothing but what is firm, and strong, and, like the word of God, unbending. It must not be a religion upheld so much by its union with the state; resting its claims for support on the patronage of the great, and the rich, or even of the learned. It must not be a religion claiming to be obeyed on account of its tendency to promote public peace and order; for in such a day as that all distant claims like these, would be insufficient to command attention for a moment. It must be a religion which commends itself to every man's conscience; a religion which shall show that the forms by which it is invested, and the means by which it is maintained, are merely accessories; its ornaments, not its essence; means which may be desirable but which are not indispensable; and means which it is justified in using, by their obvious necessity. It must be a religion too, which shall speak as from God; which shall require nothing more than He requires, but which shall require that absolutely and positively, as His due. It must be a religion likewise, which shall have adapted itself carefully to every condition of men. Which shall have entwined itself round the heart of the child with the association of his early home; which shall have caught the wandering affections of the youth, and drawn them to the worthiest and the surest object of pursuit; which shall have accompanied man through all the trials of his course; and in prosperity and adversity, in sorrow and in joy, shall have proved, that it held within itself the real substance of his happiness.

* * * *

Let us remember that the channel which separates our country from the continent of Europe, has marked us out as a specific people. We are distinct; it is our privilege to be distinct; and we have suffered whenever we have allowed this natural distinction to be merged in conformity with the politics or the morals of other countries. The constitutional character of our sovereigns differs from that of other monarchs. The individual who fills the throne, will gain nothing by imitating or adopting the usages of foreign courts. A peculiar line seems marked out for him to fill; less brilliant perhaps, but more beneficial; less calculated to feed the vanity, but no less capable of satisfying the honest ambition of a patriotic and enlightened mind. Other sovereigns may possess a power less checked, less modified than his, but none wield a sceptre, round which the moral influence of public opinion is more amply bound, or which possesses more extensive means of doing good.

In the same way, our clergy, our people have each a separate and peculiar character to maintain; a character which they inherit from their forefathers—a character endeared by associations of respect and affection—and a character which it is their interest as well as their duty to support.

Let these, then, be to each the points round which they rally. Let the clergy be what the Church of England intends them to be; men who have duly weighed the nature of the office they undertake; who have felt the vows which they contracted at the time of their ordination; and who labour to exhibit in their lives and conversation, that holy and devout spirit which breathes through the Liturgy.

Let the people be, what the English people profess to be, a Christian people and a Protestant people. Let them remember the sobermindedness and firmness which distinguished their ancestors; Let them remember that the nation's character assumes to be free from the violent and irregular sensibilities of some, as well as from the apathy and languor of others of their neighbours; let them remember that temperance and moderation have been the noblest features in our past political struggles; and that of all weaknesses, rash and inconsiderate imitation of others is the most deplorable and the most pernicious.

THE REGENERATION AND PROSPECTS OF ITALY.

By DE SISMONDI.

(From Dr. Lardner's Cyclopedia, No. 27.)

When Charles VIII. entered Naples with his victorious army, on the 22d of February, 1495, and overthrew the ancient system of Italian politics, he gave the signals for all the calamities which afterwards precipitated the peninsula under the yoke of the transalpine nations. The Italians continued to regard themselves as the first people in Europe, but they had almost every where lost their liberty: of the five republics which they could still reckon, four were narrow aristocracies. When Napoleon Bonaparte was appointed to the command of the French army in Italy, on the 23d of February, 1796, he began to effect a regeneration which gave to the Italian nation more liberty than it had lost. It is the participation of numbers

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

in the government, and not the name of republic as opposed to monarchy, that constitutes liberty: it is, above all, the reign of the laws; publicity in the administration, as well as the tribunals; equality; the removal of all shackles on thought, on education, and on religion. Five millions and a half of inhabitants in the kingdom of Italy were put in possession of a constitution which secured to them all these advantages, with a participation in the legislature and in the vote of taxes. They had recovered the glorious name of Italians; they had a national army, the bravery of which rendered it daily more illustrious. Six millions and a half inhabitants of the kingdom of Naples received institutions less advanced, it is true; but even there the law had succeeded arbitrary power; public and oral evidence had succeeded secret information and the torture; equality, the feudal system; education, instead of retrograding, had been rendered progressive, and thought, as well as religious conscience, had recovered freedom; finally, 2,000,000 of Piedmontese, 500,000 Genoese, 500,000 Parmesans, and 2,500,000 Tuscans and Romans,—in all, 5,500,000 Italians,—were temporarily united to France. They partook of all the privileges of the conquerors: they became with them accustomed to the dominion of the law, to freedom of thought, and to military virtue,—secure that at no very distant period, when their political education should be accomplished, they would again be incorporated in that Italy to the future liberty and glory of which they now directed their every thought.

Such was the work which the French accomplished by twenty years of victory: it was doubtless incomplete, and left much to be desired; but it possessed in itself the principle of greater advancement: it promised to revive Italy, liberty, virtue, and glory. It has been the work of the coalition to destroy all; to place Italy again under the galling yoke of Austria; to take from her, with political liberty, civil and religious freedom, and even freedom of thought; to corrupt her morals; and to heap upon the uttermost degree of humiliation. Italy is unanimous in abhorring this ignominious yoke: Italy, to break it, has done all that could be expected of her. In a struggle between an established government and a nation, the former has all the advantages: it has in its favour rapidity of communication, certainty of information, soldiers, arsenals, fortresses, and finances The people have only their unarmed hands and their masses unaccustomed to act together: nevertheless, in every struggle during these fifteen years in Italy, between the nation and its oppressors, the victory has remained with the people. At Naples, in Sicily, in Piedmont, in the states of the church, at Modena and Parma, unarmed masses have seized the arms of the soldiers; men chosen by the people have taken the places of the despots in their palaces. The Italians, every where victorious over their own tyrants, have, it is true, been every where forced back under the yoke with redoubled cruelty by the league of foreign despots. Attacked before they could have given themselves a government or formed a treasury, arsenals, or an army, by the sovereign of another nation, who reckons not less than 30,000,000 of subjects, they did not attempt a hopeless resistance, which would have deprived them of every chance for the future. Let those who demand more of them begin by doing asmuch themselves.

Italy is crushed; but her heart still beats with the love of liberty, virtue, and glory: she is chained and covered with blood; but she still knows her strength and her future destiny: she is insulted by those for whom she has opened the way to every improvement; but she feels that she is formed to take the lead again: and Europe will know no repose till the nation which, in the dark ages, lighted the torch of civilisation with that of liberty, shall be enabled herself to enjoy the light which she created.

Slave Population.—By the official returns from our colonies, it appears that the decrease in our slave population, for the last ten years, amounted to upwards of 15,000.

A NEW VIEW OF LORD BYRON'S CHARACTER.

(From a Letter of Captain Medwyn in the Literary Gazette.)

Byron, like the poet in the Symposium, was only great in his moments of inspiration; he was else an ordinary mortal. His conversation was frivolous and obscene; his letters slovenly in the extreme, and teeming with vanity, persiflage, and calembourg. His life, according to Mr. Moore, and if we except his devotion to Greece, was marked by few noble or generous actions; and yet we have 1600 quarto pages about one who had renounced his country, who was a libertine in love, and an ingrate in friendship. He was, as he confessed himself, a true disciple of La Rochefoucald—self-interest, the primum mobili, the main-spring of his actions; his common maxim and constant observation was, that "Every body hates every body."

Among the most blameable of his actions, of which Mr. Moore could not have been ignorant, was his conduct to the mother of Allegra. That person, whom I had the pleasure of knowing, a young, beautiful, interesting, and highly educated girl, was abandoned by him, and supported by Shelly, who paid her pension at Florence. He tore from the mother the unfortunate fruit of this amour, and would have willingly made her over to a stranger; he left this lovely child, on quitting Romagna, to the care or carelessness of strangers; and, a thing never heard of before even among Italians, immured an infant in a convent. Her fate might have been foreseen. He desired she should be brought up a Catholic--a strange mode of proving his own religion, or of shewing his affection for her. He complained at Pisa of the child's temper—she repaid him with her mother's just hate, and could never suffer his caresses. Poor Clara! And yet, when I met her at Pisa, after the child's and Shelly's death, he talked of irs being dangerous for them to meet, and—but she abhorred him too much. In his will he made no provision for her. Francisca, who has been called his Fernarina, who had thrown herself into the Leagune in the fervour of her passion for him, he mercilessly thrust out of the house. The Countess Guiccioli could not fix his inconstant mind; he made her miserable by his low intrigues and infidelities at Pisa, if not at Genoa, and went to Greece principally to shake off the connexion that was become irksome to him. Of Lady Byron I shall not speak. The real cause of their separation is only positively known to two persons, and probably will ever remain a secret, though the abominable calumniating reports that have gone abroad concerning it are all foreign from the truth. According to Lord Byron's own account, it was not Dr. Lushington, but another lawyer, (whom he suspected to be the author of the critique in the Edinburgh Review,) who, when his separation cause was before the Chancellor, made some unwarrantable allusions respecting him. I have seen Byron, more than once, in a whiteness of fury on this topic, and heard him vow, that if ever he came to England, he would call to account that personage, whose name I shall not mention. His daughter Ada he disinherited.

Byron's words had almost always a double meaning; the smile that played about his mouth was generally out of harmony with the rest of his features—in his most serious moments there was a laughing devil in his eye. The great object of his panegyric, whom he flattered for twenty years, was made the subject of one of his most virulent and sanglante satires—I speak of Mr. Rogers, and refer to Mr. Barry and Lady B. for the verses. Shelly became unpopular. Though, in private, Byron could not refuse his admiration to his talents and virtues (of the first of which he made no small use), he had the meanness, in his preface to Marino Faliero, formally to disown any acquaintance with him; and, during the burning of his body on the sea shore (my description of which was taken verbatim from Mr. Trelawney, an eye-witness), swam off to his yacht, such was his sensibility; A few more words for Mr. Moore. The conflagration of the autograph Memoirs was a fine piece of charlatanism. The reason of their transfer from Mr. Murray to Mr. Longman, and from Mr. Longman back to Mr. Murray, needs no comment. Mr. Moore cannot deny that the substance of them is incorporated in his work, itself confusedly full of extracts from these very Memoirs. In fact they were any thing but captivating, worth absolutely nothing (I am not speaking of what they fetched or might fetch;) and would have scarcely filled 200 pages, such as we have a specimen of in the flaming and feverish journal kept at Ravenna. Well might they be committed to the flames, as it was their fate, instead of being quietly inured, to rise again from their ashes in the shape of five octavos, or two prodigious quartos, phœnix-plumed like one of Mr. Moore's angles—a rara avis, destined, instead of £2000, to produce £6000. Poor Mr. Murray! But John Bull is the most gullable of all animals, and takes for gosple-truth every puff in every newspaper, though glaringly and barefacedly the production of some self-complacent bibliopolist. Mr. Moore's ingenuity in authorship is admirable; and, when I consider the difficulty of the task, it is not the seven years' labour, but the accomplishment, that is miraculous. After all, it should have been called Mr. Murray's Life of Lord Byron; his lordship styled it Messrs. Moore's and Murray's Byron. It is from such materials—from a bookseller, that we are to judge of a great poet—from the Lintott of this age? Where is Lord Byron's Journal in Switzerland? where his Letter to Mrs. Leigh? His correspondence with Lady Melbourne on the subject of his marriage? With Messrs. Hobhouse, Shelley, D. Kinnaird, Scrope, Davis, &c. &c.? but more than all, with his early, his only friend, as he once confessed, Lord Clare? Where are his papers left with Mr. Barry, that Mr. Hobhouse recommended that banker not to give up—(perhaps Mr. Hobhouse has some new illustrations, some dissertations on Lord Byron in embryo of his own)? Why have we not the relation of his voyage to Greece, and correspondence with Mr. Trelawney, who accompanied him, and was at Missolonghi a few hours after his deccase? And yet Mr. Moore tells us that only one person to whom he applied refused him information! These were the genuine sources from which a Life of Lord Byron should have been drawn; not from his communication with the publisher.

He owned that he had not the faculty of describing any thing that he had not seen; he might, with a certain latitude (with some exceptions), have almost said, any thing that he had not done. When he rushed into the cabin with the question, "How does a man feel who has just come from the commission of a murder?" he had probably been brooding over some scene like that of the dungeon-visit in the Corsair, and was endeavouring in vain to screw up his imagination to the sticking-place! It may be said, indeed, that all his characters were impersonifications of himself; occasionally over-drawn and overcoloured, it is true, or with the oscuro predominating over the chiaro; yet still bearing in their general outlines some distinguishing likeness to the original. It is from them that the mind of Byron should have been analysed: he might have been thus dissected, nerve from nerve; and such anatomy we looked for from his biographer. If we open Childe Harold, the Corsair, the Giaour, but, more than all, that Casti production, Don Juan, we are reminded of the author in every page. The subjects, too, that he chose always have some relation to the type of that which was within him.

A PENITENTIARY IN AMERICA.

The following is an extract from the Journal of a Tour in the States of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

New York, &c. by James Fowler. The author appears to be a man of discernment, and his views are entirely practical. There is a great variety of information, both of a curious and amusing character, acattered over the pages of this volume. The subjoined is an account of an excellent institution established with a view of forming a *Penitentiary*. It is well worthy the attention of the magistracy of this colony, in as much as it points out the true ends of punishment, viz:—REFORMATION.

"About six o'clock I applied at the door for admittance, which was granted on my paying twenty-five cents, and one of the keepers commissioned to conduct me over the establishment. We first visited the cells, which the convicts leave at half-past five in the morning. These gloomy abodes are about seven or eight feet long, by four feet wide, and perhaps about seven feet in height. They are lighted from windows in the roof of the passage into which they open through ponderous iron-doors. All the furniture which they contain is a hammock, which is let down in the day-time, a stool, and a Bible upon a shellf in one of the corners. From these we passed on to the work-shops, where the convicts were busily employed in their avocations; tailoring, shoemaking, weaving, machine, button, cabinet-making, &c. coopering, and smith's work in general. These various manufactures, besides what are requisite for the prison, are furnished to all the principal stores in Auburn, and sent to different parts of the State. My guide afterwards conducted me to the cooking apartment, where some of the convicts were engaged in preparing the morning's repast for the rest, and which I presently saw arranged with great neatness in the general eating room; it consisted of coffee, Indian corn bread, and boiled fish. At half-past six they were summoned by a bell to partake of it, upon which occasion I had a good opportunity of observing some of the most striking characteristics of the system. The convicts were arranged in separate corps, 'moving in a single file, with a slow lock step, and erect postare, keeping exact time, with their faces inclined towards their keepers (that they may detect conversation, of which none is ever permitted) all giving to the spectator somewhat similar sensations to those excited by a military funeral.' In a short time all were seated at the different tables, in the most orderly and regular manner, and, upon a singal being given by the keepers, with one simultaneous movement commenced their meal. Had I not witnessed the scene, I should have supposed it morally impossible for such a number of individuals to be assembled together, for such a purpose, with so little noise and confusion. It was very interesting, though at the same time a very painful and humiliating spectacle, and various were the reflections which hurried across my mind whilst looking round upon these imprisoned victims of crime, of almost every grade and malignancy. Some appeared calm and resigned, or sensible of the guilt and degradation of their situation; others displayed an entire indifference to their fate, whilst in a few I marked the black impressions of obdurate cruelty, ferocity, and revenge, demonstrating but too plainly the justice of the doom which had overtaken them.

"Breakfast concluded (and there did not appear, on the part of the Keepers, the smallest disposition to hurry over the ceremony; all were allowed sufficient time, and materials too, for a hearty repast) the prisoners rose again in like order, and were forthwith marched back again to their different workshops and employments: here, the guide informed me, they were kept until twelve o'clock, when they were again summoned to dinner, after which they resume their labour till six, when their daily toil is done; they are then marched off to their separate cells, each carrying his supper with him, and eating alone, if not in darkness, his last cheerless meal. There is a chapel within the prison, which the prisoners regularly attend every sabbath; a Sunday school has also been established: and in the hospital every attention is paid to such as require it.

"The severity of the punishment here exercised consists in preventing every kind of intercourse of one convict with another; whether at their work or at their meals, they are compelled to observe the most absolute and uniform silence; not the slightest attempt at communication would escape notice, and every offender against this tenacious and positive requirement is punished by flogging—an alternative, however, rarely needed. I observed the young and old, and every description of character, mixed indiscriminately together, but from which, with the restrictions imposed, no evil consequences can possibly arise. A decided majority, upon leaving the prison, have become reformed and useful members of society. It is altogether conducted upon an admirable principle, and reflects the highest credit upon the projectors and the country; affording at the same time, an exalted contrast, when compared with *our* miserable receptacles for this class of society; *in them* if *reformation* take place, it is by miracle; *here* frequent, and *the end and object of the institution.*"

A PICTURE OF THE PRIVATIONS OF A SCOTTISH STUDENT.

Alexander Adam, an eminent grammarian and writer on Roman antiquities, was born at Coats of Burgie, in the parish of Rafford, and county of Moray, about the month of June, 1741. His father, John Adam, rented one of those small farms which were formerly so common in the north of Scotland. In his earlier years, like many children of his own class, and even of a class, higher removed above poverty, he occasionally tended his father's cattle. Being destined by his parents, poor as they were, for a learned profession, he was kept at the parish school till he was thought fit to come forward as an exhibitioner, or, as it is called in Scotland, a bursar, at the University of Aberdeen.—He made this attempt, but failed, from the alleged inferiority of his acquirements, and was requested by the judges to go back and study for another year at school. This incident did not mortify the young student, but only stimulated him to fresh exertions. He was prevented, however, from renewing his attempt at Aberdeen, by the representations of the Rev. Mr. Watson, a minister at Edinburgh, and a relation of his mother, who induced him to try his fortune in the metropolis. He removed thither early in the year 1758, but, it appears, without any assured means of supporting himself during the progress of his studies. For a considerable time, while attending the classes at the College, the only means of subsistence he enjoyed consisted of the small sum of one guinea per quarter, which he derived from Mr. Alan Macconnochie, (afterwards Lord Meadowbank), for assisting him in the capacity of a tutor. The details of his system of life at this period, as given by his biographer, Mr. Henderson, are painfully interesting. "He lodged in a small room at Restalrig, in the north-eastern suburb; and for this accommodation he paid four pence a-week. All his meals, except dinner, uniformly consisted of oat-meal made into porridge, together with small beer, of which he only allowed himself half a bottle at a time. When he wished to dine, he purchased a penny-loaf at the nearest baker's shop; and if the day was fair, he would despatch his meals in a walk to the Meadows or Hope Park, which is adjoining to the southern part of the city; but if the weather was foul, he had recourse to some long and lonely stair, which he would climb, eating his dinner at every step. By this means all expense for cookery was avoided, and he wasted neither coal nor candles; for, when he was chill, he used to run till his blood began to glow, and his evening studies were always prosecuted under the roof of some one or other of his acquaintance." There are many instances, we believe, among Scottish students, of the most rigid self-denial, crowned at length by splendid success; but there is certainly no case known in which the self-denial was so chastened, and the triumph so grand, as that of Dr. Adam. Ere he had yet reached his twenty-first year, he was employed as a teacher in George Watson's Hospital at Edinburgh, an institution designed for the support and education of a certain number of boys. In 1761, when he was exactly twenty, he stood a trial for the situation of head teacher in this establishment, and was successful. In this place he is said to have continued for about three years; during which period, besides discharging the duties of his office, he was anxiously engaged in cultivating an intimacy with the classics—reading with great care, and in a critical manner, the works of Herodotus, Thucydides, Xenophon, Cicero, and Livy. At the same time he began to make a collection of books connected with the studies which he afterwards prosecuted with so much success. His views were now directed towards the Church, and it is said that he was on the eve of being licensed as a preacher of the gospel, when suddenly a prospect opened before him of becoming assistant, with the prospect of being eventually the successor, of Mr. Matheson, rector of the High School. It would appear that his pretensions were fortified on this occasion by the influence of Mr. Kincaid, provost of Edinburgh, whose son he had for some time attended as tutor. It was not till 1771 that the increased infirmities of Mr. Matheson threw the whole of this charge into the hands of Mr. Adam: the retired rector was then permitted to draw the whole of the salary given by the town, (about £30) besides £20 given by Mr Adam out of the school fees, the remainder furnishing as scanty provision for the man who performed the duty.'

DISCIPLINE AND CORPORAL PUNISHMENT.

"WITH respect to the modes of enforcing discipline in our standing armies, we would willingly draw a veil over them, which no hand should be permitted to raise till it should be lifted on the system recently introduced. There is no gratification in describing such punishments, as picketting, riding the wooden horse, flogging, til the wretched criminal almost died under the lash, or any other of the barbarous inflictions which our English soldiers owed to the tyranny of their German masters. Far moresatisfactory is it to learn, that the wisdom and good feeling of later times have laboured to infuse among soldiers a sense of HONOUR, which renders *one hundred* lashes more painful to a prisoner now than a *thousand* were to his precursor in crime. May the humane, yet politic, system be persevered in.—(*Glegg's Military Commanders.*)

THE CAT-O'-NINE TAILS.

This destructive instrument, so vile an implement of degradation, must have been the studied invention of a cold, malignant heart, existing in the bosom of one who lived and feasted upon the woes and miseries of others—who delighted in inflicting torture, and erected the triumph of his vengeance upon the fall and ruin of others. It must have been his glory to oppress; his pride to goad; his delight to tantalize and make unhappy. Could any but a cruel and despotic mind have devised such an effectual means of degrading and debasing human nature as the cat-o'-nine-tails? If the author had arisen from the dark abyss of despair—where there is every thing that awful retribution can devise to punish unrepented iniquity—he could not have contrived a more corresponding instrument. It never could have been the invention or offspring of a man who had one spark of humanity—one jot of love for his fellow-creatures—one thought, but that on

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

which to feed his vindictive spirit. Dire malignity must have been the creed of its inventor. Its inefficacy has been proved beyond disputation, and stands unrefuted; yet, do we not hear daily the cries from our ranks? The press had advocated its abolition; so has the protestation of practical military men. The monstrous and cruel absurdity of the system loudly calls for abolition, and the substitution of a more humane code of punishments, that will degrade and oppress less, and consequently will not destroy our national pride. Let us ask the advocates of the debasing system (should there be any) one simple question;—Can they point out a solitary instance, for these last fifty years, where flogging has elicited that which this mode of punishment is intended to elicit? The answer is,—they cannot.

(*John Shipp.*)

A SOLDIER DISGRACED.

On Friday morning last, the third battalion of the First Regiment of Grenadier Guards mustered at the usual place in the the King's-mews Barracks, at Charing-cross, when a private belonging to the battalion, named Cooke, was brought out from his place of confinement to hear the minutes of a Court Martial read over which had been held upon him. Cooke, it appeared, was a very bad character. He had only lately come out of Brixton House of Correction, where he had been confined a twelvemonth for desertion; he had also been punished for other offences. The present charge against him was for stealing one of his comrade's clothes and selling them, for which offence he was found guilty, and sentenced by the Court to be drummed out of the regiment as a disgrace to the Army. The drum-major immediately stripped the lace and buttons from his jacket, and he was marched to the barrack gates, the drummers and fifers at the same time playing the "Rogue's march," and ejected for ever as unworthy the name of a British soldier. The sentence appeared to give great satisfaction to the whole battalion. Cooke was one of the worst characters in the regiment.—*Morning Herald, 20th Feb.* 1832.

A NEWSPAPER EXPOSE! OR, MATTERS LEARNT BY INFERENCE.

In that celebrated collection of jokes, formed by the late immortal Mr. Joseph Miller, deceased, we are told of a capital expedient hit upon by the host of a tavern near the Royal Exchange, to quicken the operations of certain sluggish readers, who pored daily over his papers for an unconscionable length of time, to the utter discomposure of all the other quidnuncs in the room, who were anxious for a peep at those 'best public instructors,' as Lord Chancellor Brougham once thought proper to style them:—he stuck over the fire-place this brief but significant notice, 'Gentlemen learning to spell are requested to use yesterday's paper.' His hint had the desired effect; the dilatory were shamed into expedition; and the broadsheets ever after circulated from box to box with most delightful rapidity.

This occurred more than half a century ago, when newspapers appeared only thrice a week, and were not one-fourth of their present enormous size—a size, moreover, which is daily encreasing, and has already grown 'out of all reasonable cess.' Even while I am writing, the prospectus of a new journal is laid before me, which, by way of recommendation, we are told will be printed with a small type, and be 'twice the size of the Times.' Mercy on us! how in the name of patience, is any one to become acquainted with even a tithe of its contents? To peruse the whole would occupy the most ready reader 'from morn till noon, from noon till dewy eve; and, as few people are either able or willing to divide the whole of their days to such a purpose, the chances are that some of its most captivating articles will be overlooked and unperused.

Permit me therefore, Mr. Editor, to offer a few hints, by attending to which, they who have but little time to spare, may become acquainted with the contents of a newspaper, without undergoing the labours of perusing it; and understand what is going on in the world, just as well as those patient drudges who 'prey on garbage,' by wading through every thing they meet with. I am an old hand at these matters, Mr. Omnibus, having for twenty years past looked into every paper every morning, from the Times and Chronicle down to the Ledger and Advertiser; and I shall now endeavour to atone in some measure for this reprehensible waste of time, by imparting to the novice in newspaper-reading a few rules, which will enable him, with unerring sagacity, to comprehend, by a glance at the first line of a paragraph, the exact purport of the whole.

For instance, when you find it stated that 'Last week, as a man was ploughing in a field at Hounslow,'—you need not trouble yourself to proceed, for be assured that he either turns up a sword much corroded by rust—a skeleton, which fell to pieces the moment it was exposed to the air—or an urn, brimful of Roman coins. By the by, 'tis surprising that virtuosi find the last-mentioned articles so scarce, for it really seems as if no clod-hopper ever stuck a spade into the earth, without discovering two or three bushels of them.

'There is now in the garden of Mr. Jones, of Enfield,'—This terminates, to a moral certainty, with an account of a gooseberry nine inches in circumference—a pear-tree blossoming in December—or some equally important horticultural phenomenon, which you of course must feel highly grateful to the editor for communicating.

'Last week, a man in the employ of Mr. Simpkins, of Watling-street, undertook, for a trifling wager,'—read no farther, or you will be sickened with the information that some cannibal has devoured six pounds of candles, a like quantity of yellow soap, a raw leg of pork, and half a dozen rats; washing down the savory meal with a gallon of Calvert and Co.'s double X.

'On Monday, as the Liverpool Mail was descending a hill'—You may at once perceive that this is introductory to the horses taking fright, the coach being upset, several passengers dangerously hurt, and the guard killed on the spot, having a wife and twelve small children to lament his untimely end.—N. B. No blame whatever attributable to the coachman, who is a remarkably careful driver.

'A young woman employed in the spinning factory of Mr. Snooks, inadvertently going too near the machinery,'—her clothes, of course, became entangled, she is drawn in, and nearly torn to pieces, surviving about half an hour after being extricated.

'Yesterday morning, an elegantly-attired female was observed pensively loitering along the bank of the Regent's Canal,'—Any one may perceive with half an eye the catastrophe which this interesting commencement is destined to produce. The lady throws herself into the water, and being dragged out, walks sullenly off, refusing to divulge either her name, or the cause of the 'rash act.' Or, as a more tragical wind-up, we are told that 'the vital-spark was extinct,' and the body lies at the bone-house to be owned,—of course, in a state of pregnancy. Mem. It is observable, that on these occasions every drab becomes 'an interesting female,' and all the ladies are 'elegantly attired.' 'One would surely not look frightful when one's dead,' is, I am aware, a sentiment common to all female minds; yet, methinks, 'tis a sad needless piece of extravagance, thus to be dressed all in their best when on the point of plunging into a muddy pool.

'An affecting instance of the precarious tenure of human life, occurred yesterday in this town. Mr. Smith retired to bed, after eating a very hearty supper of pork-chops,'—Of course, next morning he is found "a slovenly unhandsome corpse." Verdict, apoplexy.

These specimens may suffice to shew the nature of my proposed plan, and I therefore refrain from adducing farther instances, although nothing would be more easy than to select half a hundred of those every-day paragraphs, the end of which may as infallibly be inferred from the beginning, as the catastrophe of a modern comedy from the opening of the first act. There are, however, certain others, which scarcely any experience will enable the quidnunc to be on his guard against, and by which the most wary are often entrapped. I allude to those deceitful articles which decoy you into their vortex by hanging out false colours; those specimens of the puff oblique, the reader of which, while he fancies that he is about to enjoy an interesting anecdote of Lord Grey, or Queen Adelaide, or some other distinguished character, suddenly discovers, to his great chagrin, that he has been seduced into the perusal of a dissertation upon a brilliant jet blacking, patronised by the most polished society, or a sauce of so piquant a flavour, that it would incite a man to devour his own father. A few examples of the kind are annexed, which I have obtained from a distinguished manufacturer of such things:—

'ANECDOTE.—'Are you going out, Sir George,' said the accomplished and beautiful Countess of Skeggs to her husband, on seeing him pull on his gloves. 'No, my love,' replied the Earl, 'but I am about to make use of Rowland and Son's Macassar oil, for preventing baldness; and I am compelled to put on my gloves first, or the palms of my hands would in a few moments be thickly covered with hair.' N. B. This inestimable oil is sold in bottles at 4s. 6d. each, and may be had,' &c.

'A REMARKABLE FACT.—Just before Prince Leopold left England to assume the throne of Belgium, he chanced to join a tea and-turn-out party at Lady Lydia Limber's. The conversation naturally turned upon the important public events in which the Prince was about to be engaged, when on a sudden he exclaimed, ''Pon my soul, Lady Lydia, your Hyson is remarkably fine!'—'Yes, your Highness,' replied her Ladyship, and the reason is, that I purchased it at the shop lately opened by the Genuine Tea Company, Wapping Wall, where nothing but the real article is ever sold, and where purchasers may depend upon being well supplied. N. B. A green door, and two Chinese in the window.'

MR. HAZLITT in one of his essays on Shakspeare, says, that he does not in all his author's plays remember a more exquisite passage than one which occurs in the 3d Act of Macbeth, where the guilty Thane makes the following pathetic reflection, after having accomplished his brutal purpose:—

"Duncan is in his grave;
After life's fitful fever he sleeps well;
Treason has done its worst; nor steel, nor poison,
Malice domestic, foreign levy, nothing
Can touch him farther."

It must be allowed that these lines are poetically beautiful, yet the concluding assertion is not literally true. Macbeth in his agitation seems to have forgotten the beings called body-snatchers or resurrection-men, who doubtless removed the corse of Duncan, since it is an indisputable fact that hundreds of graves are annually disturbed for this purpose. Nothing is better calculated to prevent so unpleasant a proceeding, than the Patent Iron Coffin, manufactured by Dismal and Dull, Monument Yard, who will be happy to bury any of their friends on the shortest notice.

'SINGULAR OCCURENCE.—A certain wealthy gentleman, who accumulated his immense fortune by speculating in schemes and shares, had occasion a few days ago to sell out a few thousands from the funds, but on signing his name at the Bank for that purpose, he was charged by the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Clerk with being an impostor, and carried before the Lord Mayor for an attempt at forgery. It however appeared, that when the gentleman invested the money, he was unable to write his name, and therefore merely made his mark; but on the present occasion he wrote a beautiful hand, having taken six lessons at 2s. 6d. each, of Mr. Martinus Scriberus, who will undertake, by a method peculiar to himself, to convert the vilest scrawl into a fine running hand in the space of half an hour.'

To guard against such specious impostors as these, no fixed rules can be laid down: in fact nothing but long and incessant practice in the profitable occupation of Newspaper reading, will impart the requisite skill; but with another common species of humbug, there will be less difficulty. I mean those valuable morsels, composed either of sheer lies or sheer nonsense, or both, which editors are wont to compose on the spur of the moment, to fill up a vacant corner, or to have the pleasure next day of contradicting them. Of these, three specimens shall suffice:—

"There is now living near Leicester, an old woman named Winifred Jenkins, whose age is generally supposed to be about 350 years, but as the parish register goes no farther back than 1506, her precise age cannot be ascertained. She hears and sees remarkably well, has lately cut a new set of teeth, and last week ran in a smock-race, out-stripping all her competitors She perfectly remembers the battle of Bosworth Field, and helped to strip the killed and wounded as they lay on the ground."

"INVALUABLE RECIPE.—A correspondent informs us that the following has been found an infallible remedy for the Cholera Morbus. Mix fifty grains of arsenic with a bottle of Glen-Dronach whiskey, and take a wine-glass full every night and morning. In a short time, the complaint will be entirely removed—also, the patient."

"HORRIBLE AND APPALLING OCCURRENCE.—The play at Covent Garden on Monday was the 'Gamester,' and the customary period for the termination of the piece having elapsed, without the usual attendant bustle, the check-takers were at length induced to enquire into the cause, when, horrible to relate, the whole of the audience were found stone dead from the tremendously heart-rending effects of Miss Kemble's performance. Even the box-keepers and fruit-women lay insensible in the lobbies, and were not recovered without much difficulty. The lights were all extinguished; and it is remarkable that every watch in the theatre had stopped at the same moment, viz. three minutes before ten,—supposed to have been caused by Mrs. Beverley's scream of agony at her husband's death. The musicians in the orchestra, as having been most exposed to the influence, were found converted into petrifactions—fiddles and all."

I pass now to a consideration of the eloquent style in which the editors are accustomed to convey their sentiments upon the various subjects which fall under their notice, although I often wonder how they manage to express them at all, or how they contrive to exist three days, when I reflect upon the violent and contending emotions to which they are continually exposed. At one moment we find them overwhelmed with grief for the death of a dowager, and at the next convulsed with mirth at the antics of a comedian; now filled with rage at the oppressions of some tyrant, and anon with horror at the ravages of a tempest, which they literally "shudder to communicate." By way of experiment, I will attempt an outline of the style in which an accomplished newspaper genius would describe the latter event,—giving merely the leading expressions, and leaving the reader's imagination to supply the deficiencies:—

"The storm at Barnet on Saturday night was tremendous. Towards evening—gale of wind—truly appalling—stack of chimneys—aged couple in bed—beam providentially fell across—damage beggars description—houses partially unroofed—recollection of the oldest inhabitant."

This last embellishment is never omitted, though I don't see that it proves much. Old men have proverbially weak memories, as well as 'most weak hams,' and there may consequently have been a hurricane ten times as terrific, a fortnight before, without their recollecting a syllable of the matter.—Now let me endeavour to give an imitation of their dramatic 'criticisms,' premising that, with the exception of frantic religious disputants, there are no writers upon the face of the earth so utterly void of common sense, and so completely unacquainted with the subject they pretend to meddle with, as the majority of those 'gentlemen of the press' who pen articles upon the Theatres.

'Last night, that never-failing votary of mirth, Charles Mathews, took his benefit at Old Drury. The doors were beseiged at an early hour, and on being thrown open, the house was filled almost to suffocation by an overflowing audience. Harley, who is in himself a host, was greeted on his entree in the most gratifying manner, the house rising en masse, and testifying by repeated cheers their satisfaction at the manner in which he had catered for the amusement of a generous and enlightened public, by bringing into action the elite of the corps dramatique. The coup dœil presented by the *tout ensemble* at this moment was peculiarly imposing. In the course of the evening some pathetic passages from the works of our immortal Bard, Mr. Moncrieff, were recited by the British Melpomene, Mrs. Harlowe, and apparently with very great effect, for we remarked that the boxes were all in tiers, and the pit extremely low, during the delivery. It is whispered that negociations are on foot for the performance of a new comedy, from the elegant and successful pen of Mr. Grigg:—Green Room report speaks highly of its merits.'

What say you, reader? Is not this something like the style of those twaddling articles which, month after month, and season after season, you have seen in the Newspapers, dignified with the title of criticisms on the drama? Twenty years have I taken note of them, and do most powerfully aver, that for one such article which rises above the character of this imitation, there are at least twenty which, if possible, sink below it. They would seem to be composed in general by vulgar men-milliners, or barbers out of employ.

But it is time to bring this paper to a close, lest I become as insufferably tedious as the subject of my remarks. I shall, therefore, merely solicit the reader's attention for two minutes longer, while I advert slightly to the elegant style in which editors of newspapers are wont to express their sentiments, and the novel unhackneied quotations with which they generally illustrate them. Thus, when a balloon goes up, we are always assured it majestically ascended, bearing with it its aerial voyagers. A felon is never simply condemned to be hanged, but to undergo the awful sentence of the law; and is not, as of old, turned off, but launched into eternity, a victim to the offended laws of his country; while his accomplices are not transported, but expatriated—a much prettier word, and not equivocal. People formerly died; now they pay the debt of nature, or terminate their mortal career. A house takes fire, and is burned; next morning we learn that it ignited, and fell a prey to the devouring element, which raged with unexampled fury, threatening destruction to the whole neighbourhood. Pick-pockets are always light-fingered gentry; deserted children are little innocents; soldiers and sailors, are gallant sons of Mars and Neptune; lawyers, gentlemen of the long robe; clerks, gentlemen holding official situations; bagmen, commercial travellers; day-labourers, operatives; mechanics, the productive classes; watchmen, guardians of the night; and ——, ladies of easy virtue. People at one time lacked money, but now it is nothing more than a scarcity of circulating medium. Vinegar is pyroligneous acid. In former days things rotted; but now they are in a state of decomposition. A boy bitten by a cat, is attacked by one of the feline species in a rabid state, and the part instead of being cut out, simply undergoes excision. Days of rejoicing are invariably ushered in with the ringing of bells. A beast who gets drunk daily, is said to sacrifice to the rosy god. At public dinners the tables groan under every delicacy of the season. A man who is shipwrecked, falls a prey to the infuriated waves, and sinks to rise no more. An old woman is missed from her home, and forthwith the neighbourhood is in a frightful state of excitement. During thunder-storms, it is no longer lightning, but a corruscation of electric fluid, which does all the mischief. Every petty assault is a diabolical outrage, and every petty thief an atrocious miscreant. Then, as I have before remarked, their quotations are so apt—so delightfully novel:—let but an actor succeed in a new character, and we are assured it was a palpable hit; he dances, and, lo! he moves upon the light fantastic toe; he re-appears after an illness, and 'Richard's himself again;' he quits the stage, and it is sadly to be feared that we ne'er shall look upon his like again. He retires into the country—of course to enjoy the *otium cum dignitate*. Another of the company takes a theatre, and immediately there ensues a dreadful note of preparation; things go wrong, and they immediately suspect there's something rotten in the state of Denmark; or style the report a weak invention of the enemy; he gets into prison, and we are told that he is in durance vile; he dies there, and is deposited in the tomb of all the Capulets.

'Something too much of this,' as the gentry in question would remark; and you, Mr. Editor, are doubtless impatient for me to conclude, 'thinking my prattle to be tedious.' Therefore,

'Imagine I have said farewell already,'

OLD PARR.

SELECT NOTICES.

Colours.—The ancients did not posseas the secret of oil painting, which was invented by John of Bruges, but their colouring is beautiful and durable. Ours fades considerably in the course of a century. This is said to be the fault of the Dutch, who adulterate the chemical compositions required; or perhaps of the Indians, who are as great cheats as themselves. It is said that M. Colbert did every thing in his power, but without effect, to procure better materials. The evil, it seems, is general; for the colours in Italy are as bad as our own.—— *Present Number of Steam Engines.*—It appears that the number of steam engines in action in this country, may be reckoned at 10,000; and one with another, each may be estimated to be equal in power to 20 horses; that each horse will do the work of six men, and that consequently the acting powers of our steam engines are equal in effect to 200,000 horses, or 1,200,000 men. This calculation having been made several years ago, it may be readily believed that the number is now much greater.——*Sharp Retort of a Quaker.*—A Quaker being evidence on a trial, was asked by one of the magistrates, who had been a carpenter, why he would not take off his hat? "It is a privilege," said the witness, "we, as Quakers, are allowed."—"If I had it in my power," said the angry justice, "I would have your hat nailed to your head."—"I thought," returned the Friend, "that thou hadst giving over the trade of driving nails."—— *Recipe for a Sore Throat.*—Take a glass of olive oil, and half a glass of spirits of turpentine, mix them together, and rub the throat externally, wearing flannels round it at the same time. It proves most effectual when applied early. Sweet oil will answer the purpose equally well.——*Rome.*—Some one telling the famous Jerome Bignon, that Rome was the seat of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

faith; "That is true," said he; "but then faith is like some people, who are never to be found at home."——*Great Eaters.*—Theodoret relates, that a woman of Syria was in the habit of eating thirty fowls a-day without being satisfied. A person named Phagon, in presence of the Emperor Aurelian, is said to have devoured a boar, a sheep, and a pig. The Emperor Claudius Albinus eat, one morning at breakfast, five hundred figs, a hundred peaches, ten melons, a hundred becaficos, forty oysters, and a large quantity of raisins. The emperor Maximian became so fat in consequence of excessive eating, that his wife's bracelets only served him for rings.——*Cure for a Pain in the Ear.*—Put a small clove of garlic, steeped for a few minutes in warm salad oil, into the ear; it must be rolled up in muslin or thin linen. In a short time the garlic will be reduced to a pulp, and having accomplished its object, should be replaced with cotton, to prevent the air giving cold.——*Running for the Plate.*—A bell was formerly the prize ran for; hence the expression of "bearing away the bell."—Subsequently, a silver cup was given to the winner, which was the origin of the word "Plate;" a word still used even when money only is given.——*A Rum-un.*—Who was the orator born without hands, who delivered a speech that has been reduced to print, and who, although he never could have a son or daughter, may have left a large progeny behind him? Do you give it up? —Balaam's ass.——*Conscience.*—Mr. A———, who always indulges himself in speaking unceremoniously to persons of the highest rank, said, the other day, to a certain Marquis, "What answer can you give to the populace who so justly complain of your endeavours to trample on their rights?"—"None," said the Marquis, "I clothe myself in the mantle of my conscience." "Then your Lordship wears very *light clothing this cold weather*," rejoined the other.——*Rats.* —There are no rats in the district of Buchan, in Scotland, and if they are brought thither they do not live. There are no serpents nor venomous insects in the Orkneys; and in the isle of Guernsey, there are no serpents, toads, or spiders.——*How to keep away Moths.*—To prevent moths from attacking woollen clothes, or worms from destroying books, place in the drawers or corners of the shelves, some of the roots or blades of the sweet flag. *Economy.*—A gentleman who had remarked how magnificently a friend of his lived upon a small income, observed, that with such slender means, to make so respectable a figure was much to his credit. "Yes," replied a gentlemen, "and to the credit of all his tradesmen."——The returns to Parliament state the total expenditure of the military and naval departments for 1829, at £18,458,774, and for 1830, at £16,746,074. The estimated expenditure for last year, 1831, was £17,252,963.——*Wonders never Cease.*—It is announced that excellent wrapping paper may be had from shavings boiled in mineral alkali—100 lbs. of wood and 12 lbs. of alkali producing a ream of paper!——*Snuff-taking.*—Voltaire once remarked, "They talk of men subduing their passions; attempt only to draw a man from taking snuff, who has been accustomed to it!"——*Medicine.*—Medicine has been defined to be the art or science of amusing a sick man with frivolous speculations about his disorder, and of temperising ingeniously till nature either kills or cures him.——*Cure of Lock Jaw.*—A cure of this affection, hitherto supposed impracticable, has been performed on a horse, by simply using the muriate of soda, or common table salt, with severe bleeding. The horse took about 5½ pounds.——A scientific publication, printed in Paris, gives the following receipt for dyeing the eye-brows: —Sulphor of lead, two ounces, quick lime, pulverized, one ounce. A camel's hair brush slightly dipped in this is to be rubbed over the eye-brows, and they are then to be combed with a fine comb. To dye the hair a fine black colour, it is to be combed regularly every day with the following solution:—Nitrate of silver, one drachm; distilled rose water, eight ounces. The composition is to be well mixed in a mortar.——*Residences of Great Men.*—Visitors to Rotterdam have the mortification, on enquiry for the house which was so long the residence of Erasmus, to find that it has been converted into a *gin-shop*.

New Church Bells.—Another Church Bell of glass has been cast in Sweden: its diameter is 6 feet, and its tone is said to be, beyond comparison, finer than that of any bell-metal.—*Athenæum.*

London Missionary Society.—In consequence of the resolution of several branch associations of the London Missionary Society, to withdraw their support if any slave-proprietor held office in the Society,—Alers Hankey, Esq. banker, has been induced to tender his resignation as the Treasurer of the Society.

MR. RICHARD LANDER.

WE rejoice to find that Lord Goderich and the Government's countenance of Mr. Lander, has not been confined to honorary distinction. That enterprising and singularly deserving traveller, has been appointed to a situation in the Customs, sufficient to enable him to pass the remainder of his days in comfort and respectability.

NEW ISLANDS IN THE PACIFIC.

THE beautiful simplicity of uncivilized life has been often the theme of a certain description of men. Kotzebue is one of such, and that good man Captain Beechey, led away by hear say evidence, would be almost inclined to follow in his steps. Now comes out an interesting fact of a very recent date.

Capt. Warden, of the American service, has just published an account of a group of six newly-discovered islands he fell in with in 1830, on his return from New Zealand to Manilla. He has given them the name of Westerfield. The inhabitants are *black*, of good stature, and robust, and their manners *apparently* pacific. They had no arms, were quite primitive in their habits, fancied their own group of islands the whole world, from one of which they imagined Captain Warden must have come; they evinced a desire for thieving, and the Captain having sent some of his crew on shore, they attacked the party, in number 21, and killed all but five, who regained the ship. He gave the island the name of Massacre Island, on account of this carnage. Six months afterwards, in September, he visited the islands, and found that one of the party supposed to be massacred still survived, who came off shore and joined the ship. This sailor stated that all the islands are under the control of one chief, who issues his orders to the chiefs of the islands, who have under them inferior chiefs. All children but those of the chiefs are murdered, and the natives act with the extremest jealousy to their wives, killing them on the slightest suspicion. The sailor, whose name is Leonard Shaw, says that the natives have not the slightest notion of a Divine Being, and that his escape from the fate of the other sailors, was owing to his concealment at first, and his then instructing them in little arts of civilization.

CAPE OF GOOD HOPE.

THE LATE MR. FALLOWS, ASTRONOMER ROYAL.

(From the Transactions of the Royal Society.)

The Reverend Fearon Fallows was a distinguished cotemporary of Sir John Herschel at Cambridge, and throughout his life an ardent cultivator of astronomical science. In the year 1821 he was appointed Astronomer Royal at the Cape of Good Hope, to which place he immediately proceeded, though provided only with a small transit and an altitude and azimuth instrument, a clock, and a few other absolutely necessary appendages of an observatory. In the course of the two following years he completed a catalogue of 273 southern stars, which was published in our Transactions for 1824. The delays which subsequently took place in the building of the observatory, which was not completed before 1828, and the want of those capital instruments which were required to put it into complete operation, although they did not interrupt or check either the industry of his research or the accuracy of his observations, yet by making them necessarily imperfect, deprived them of a very considerable part of their value.

When the mural circle at last arrived, and when he at length imagined himself in possession of the means of effecting the great object of his ambition, by making the catalogues of the stars of the southern hemisphere rival, in accuracy and completeness, those of the northern, he found new difficulties meeting him in the derangements occasioned in so large an instrument, by embarking, disembarking, and fixing it, thus producing errors which were nearly irremediable in the absence of the original maker, or of any superior artist. In the midst of these harassing discouragements he was attacked by severe illness, and at the same time deprived of his assistant by a similar cause, yet even under these afflictions he continued true to his duty; and in a letter to one of his friends a short time before his death, he describes himself as being carried daily in a blanket by his servants from his sick room to the observatory for the purpose of winding up his clocks and chronometers. His disease at last assumed the form of an incurable dropsy, and he died a short time before his intended embarkation for England, whither at last he had reluctantly consented to return, when his recovery at the Cape was pronounced to be hopeless.

In the course of the year 1829 he made, in conjunction with Captain Ronald and Mr. Johnstone, a very complete series of pendulum observations, which were published in our Transactions for the year 1830: and the Lords of the Admiralty are in possession of a very extensive series of astronomical observations made during the last seven years of his life, which it is to be hoped that, before long, they will couse to be given to the public.

GEOLOGY AND MINERALOGY OF THE COLONY.

WE invite the attention of the friends of science in this Colony, to an Advertisement on the Wrapper of the present Publication. This *first collection* of the Geology and Mineralogy of Southern Africa, the labour of many years, we should be sorry to find deposited elsewhere than the Cape. It would be a rare acquisition to the South African Institution. The varieties are very great, and among the twelve hundred specimens there is scarcely a duplicate. Should this Collection not find a purchaser, we understand it is the intention of the proprietor to forward it to London.

NOTES OF THE MONTH.

(BY VIVIAN.)

THE Press of the Colony, has presented during the last month, many interesting documents.

THE ADVERTISER.

The *sallies* of the Editor which are occasionally brought to our notice, are perfectly delightful. We allude especially to his prowess of the 16th and 19th of May. We wonder by what peculiar felicity he is enabled to desert the trammels of custom, to break the spell by which others feel themselves bound, and to maintain a career so perfectly uncontrolled and independent. On

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ordinary topics, his conceptions are generally luminious, but in the two papers in question, he has placed his ideas in such a flood of light, that they illuminate all around them. Without the least affectation of frivolous ornaments, without quitting his argument in pursuit of imagery, his imagination becomes the perfect handmaid of his reason, ready at every moment to spread her canvas and present her pencil. But what pleases us most, and affords us the highest satisfaction is, to find such talents enlisted on the right side of man's *common interests*, irrespective of colour or rank. His last *sortie* in question, like the rapid burning of the mountain grass, has broke out upon and consumed the wretched foe. Yes, by his natural expression of triumphant indignation, the enemy has been laid prostrate by the force of his arguments, and trampled in the dust, This is our *verdict, on public* grounds alone.

THE SOUTH AFRICAN.

We shall make no remark or "argumentation" on the following interesting *goods and chattel* paragraph, extracted from this paper of the 4th ultimo, beyond observing, that it is written in reference to slaves—and requesting the attention of the two illustrious subscribers to the Cape Literary Gazette,—the Lords Brougham and Goderich, to its contents.

"Every one must be considered the best protector or guardian of his own *goods* and property; and no one but himself knows properly to set a value upon and *appraise* his *goods*. The fact itself indeed, to see another appointed over *my goods* in order to protect them, supposes an incapability in myself, whether on account of convicted guilt, or ill or bad use of my right or property. But all these incapabilities may never be presumed, but must be proved."

TABLE BAY FREE.

A Free Port has at length been granted to the colony. This is a distinguished boon, and was anticipated by the Advertiser, August 8th, 1826, in the following language. "A Free Port will follow in the train of the general measures of ministers on the subject of Trade and Commerce." On this subject says the learned *Bystander*, in his "Cursory Remarks" published in 1827.—"It is on the resort of the vessels of all nations to her harbours, for the supplies required in lengthened voyages, that the Cape must depend: to that she must be indebted for her wealth and consideration; by that she will be enabled to find means for her actual wants; and by that she will be provided with the power of acquiring a share in the indulgences of polished life."

MR. W. H———'S LAST.

A gentleman remarking in reference to a late trial at the Supreme Court, that the *subordinates* in office were any thing but *civil* to the public,—Mr. H. observed, "how could it be otherwise, there was a *criminal* case before their masters."

A STRANGE IDEA RESPECTING THE PROTECTOR.

Jacob in his late examination before the Supreme Court, was asked if he had made any complaint to the Protecter of Slaves in Cape Town, of ill-treatment, and whether he had obtained redress:—he replied, "Yes, *he gave me satisfaction, because he did not beat me, but let me go home.*"

PROGRESS OF CONNUBIAL BLESSEDNESS AT THE PAARL.

Extract of a letter. "Cupid is very busy here with the young folks. A great many instances of marriages between the ages of 60 and 62 might be enumerated, but I shall just mention two or three which discover the peculiar march of the tender passion. Mr. J. H. Retief aged 70, has been united in wedlock to Miss Villiers, aged 24. —Mr. J. Fischer, aged 75, to a young lady under 30.—and Mr. Wolfaard, aged 83, to a blooming young widow. The lads of the village are in great despair, whilst the fair sex are all on the *qui vive.*"

PROSPERITY OF THE FRONTIER.

Extract of a Letter dated Graham's Town, 16th May.—This part of the colony is fast improving, (no thanks, however, to our ridiculous Newspaper,) and every one appears well satisfied with the prospect before him. Trade is daily increasing; houses building; and money not so scarce as formerly. The country is looking beautiful—grass a foot high, the cattle fat, the "vallies shouting for joy," and every thing else as joyous. Good fat mutton and beef three farthings per pound at the butchers. The grazier obtains it for *nothing*, as the hide and fat realize more than the live animals. There is also good beef to be bought at a half-penny per pound. A Commercial Hall is building, the Government has granted the ground in the principal street, and the cash supplies are all ready. Our neighbours, the Caffers, are sometimes a little troublesome. This we must expect, just as much as such things occurred once in England and Scotland's border countries. But civilization in Cafferland is making great progress, and the Missionaries, "through evil and good report," are clearing the way for the reign of peace in these glorious lands. You may laugh at the idea, but I have no doubt of an ultimate chain of safe communication from Graham's Town to Mozambique, Sofala, and *Ophir!*"

NOTIONS OF A FREE PORT.

An old lady in Cape Town, on hearing the news of a Free Port, exclaimed, with all the economical notions of a Joseph Hume,—"I rejoice at this; no more taxes; we can now all do as we like, and shan't require Governors and Judges any longer!"

SUSPENSE.

During the administration of the late Lieut.-Governor, and when the old System was falling to pieces in all directions, and new creations taking place, a great deal of anxiety prevailed, owing to the *closeness* of those measures, and delay respecting them, in which was involved the question of the *daily-bread* of many an individual. The writer, during these times of change, often met Mr. ———, and as often observed the changes of decay in his countenance and gait. He was the victim of that suspense which generally gnaws and cankers into the frame. We are told in a work lately published by an eye-witness (Mr. Wakefield,) that "*Suspense* is sufficient to plough fixed lines and furrows in the face of a man of five-and twenty—sufficient to bleach the grey to a perfect white. Of all the conditions to which the heart is subject, Suspense is the one that is most terrible."

ORNITHOLOGICAL SENSIBILITIES.

When the columns of black smoke first issued from the Steam Engine on the shores of Rogge Bay, the marine birds screamed a deafening scream, and fled in the wildest consternation. Nor did they return to their haunts, till more than a week had elapsed. We learn this anecdote from an old fisherman near the spot.

THE PUBLIC LIBRARY.

The following gentlemen have been elected to serve in Committee for the ensuing year:

W. WILBERFORCE BIRD,
Dr. MURRAY,
J. MARSHALL,
G. SANFORD,
J. D. WATT,
R. COOPER,
W. HAWKINS, H. E. I. C.
H. CLOETE,
F. COLLISON,
W. LAWSON, Auditor.
G. SANFORD, Treasurer.

Extract from the recently published Report of the late Committee:

"In drawing this Report to a close, your Committee hopes it may not appear presumptuous slightly to hint, that the Public Library, by the circulation of the most practical, popular, and scientific publications, in every art and in every science, *may have* most materially aided and assisted in the improvments of a Colony now progressing with a giant's stride.—That the breweries, the distilleries, the powers of the steam engine,—all tending to diminish labour where it is so valuable, and to increase demand and supply *may* owe much of their advancement to the knowledge and scientific intelligence conveyed through the pages of this intellectual institution.

"Political Economy—the fashionable study of the day, *may have* discovered in the Library, additional matter for the exercise of its important influence. Nor ought the opportunities for study, which are here afforded to the schools and the college, to be held of little estimation.

"The Committee concludes, by repeating the observation of an eminent Roman Orator and Philosopher,—

"That those, who by their instrumentality cause two blades of corn to grow, where one grew before, are amongst the greatest benefactors to mankind."

TO CORRESPONDENTS.

WE have received a long letter from *Crito*, which is inadmissible from its vulgar style, and the presumptuous insinuations which it contains. He considers the greater part of the South African Press to be under the influence of a party, and has had the audacity to charge US with being *retained* by "The Missionary Society." He alludes to what he is pleased to term our "frequent reference to morbid subjects, in order to create morbid sensibilities." He then proceeds to offer a few words of compliment! Very sincere, no doubt. He concludes, as we guessed he would, with the use of those ready-made bottled-up terms—cant, ravings, fanaticism, enthusiasm, and a few other *isms*. The *moral* of his letter is, the mild system of slavery here, compared with the misery of the English peasantry. We thank him most heartily for one reference. He asks—"Who are such slaves as the English field-labourers, especially during the harvest season, when they are worked like horses?" Now, how mistaken are some men! What is there, in all ancient pastoral life, more joyous and enlivening than a modern British harvest-home? Even an ordinary reaping day, full as it may seem of images of *labour*, would furnish matter for an eclogue. Suppose the poet to take a sketch of the field about breakfast-time: the reapers stretched along upon the thick grass by the side of a shady hedge; boys gathering nuts in the bushes; fine brunettes pouring out the foaming ale, or handing round the milk-white curds in wooden bowls; and all present full of mirth, entertaining each other with lays of rustic minstrelsy. Rising well refreshed, and bending their merry brown faces in rows over their bright sickles, a troop of British reapers appear altogether as poetical as the most idle knot of shepherds ever beheld in Arcadia.

M. M. is under consideration.

We trust our Poetical Correspondent will continue to favour us, *according to promise.*

Owing to some mystery which is to us, at present, a *profound secret*, the second part of "Anti-Masonic Conventions," has been abstracted from our *locked-up box*. To what elf, sprite, or kelpie, this affair is imputable, we know not. Our old friends, the *brownies*, are free from suspicion. These *genii* are never given to "picking and stealing." On the contrary, they often perform useful services.

LITERATURE, CRITICISM, SCIENCE,

AND THE ADVANCEMENT OF USEFUL KNOWLEDGE.

No. 7. Vol. II.] CAPE TOWN: MONDAY, JULY 2, 1832. PRICE, { 20 *Shillings* / *per Annum.*

A PUBLIC TRIBUTE OF RESPECT TO THE MEMORY OF AN INDIAN SCHOLAR.

When the illustrious dead are gathered into one common tomb, all national distinctions fade away, and they seem to be connected to us by a closer union than laws or governments, or even *Church Ordinances* can produce. But before we come to the immediate particulars under present review, we intend propounding a few questions. Comparisons are said to be odious; we shall, nevertheless, run the risk of giving offence somewhere, by asking how it comes to pass that there is so little of original *genius* at the Cape of Good Hope;—that, in fact, there is no *talent;*—that every thing around us wears the face of mediocrity; that surrounded as we are with *personable* appearances, our youth exhibit no precosity of intellect, but, on the contrary, are just content to pass through life in the same way as the mere plodders before them?

Observe the Cape youthful reader—you seldom discover the boy take up a book of real profit when opportunity calls him to its perusal. The volumes to amend the heart, refine the manners, and exalt the taste, are discarded. In his selection of books, and examination of them, he is a mere butterfly, roving from volume to volume in idle playfulness. In one sense, the *bee* and the *bear* teach him a lesson; the former takes care to *collect* the honey, the other to *ransack*, overturn, and partake of the combs. We apprehend this waste of time of which we complain, this desultory method of becoming acquainted with books, and men, and things, arises in a great measure from the fear *of differing from the mode.* The claims made upon the conformity of each individual by the generality, are very extensive. There is scarcely an office, or an act of life, however retired, for which there is not prescribed *Cape mode.* In an enlarged sense, the Cape mankind perform the great functions of their being simultaneously, as an army goes through its evolutions; and herd their opinions as they do their processions,—whenever a man dressed in black, with streamers of crape at his tail, politely invites you to march two by two to the church-yard.

The old proverb—"birds of a feather flock together," is a philosophical axiom. Men love every thing that is like themselves, and in general hate what is different. Among cannibals it must be a heinous sin against the mode, to abstain from dining off a man's leg or arm, and to prefer a slice of bread-fruit, or the chine of a wild boar. Anthropophagites hate singularity like other people. But the truth is, it is not until society has reached a certain point, that it is *ripe* for free institutions. It is not until men are resolved to hear both sides of a question, and *read* both sides of a question, that they are fitted for the *Jury System,* or to sit in the country's *Legislation.* It is not until they are determined to judge and think for themselves,—independently of *Jacobus* this, or *Daantje* that, that they become fitted to exercise their rights as free citizens. But the want of *talent* in our Cape youth—

"Aye! there's the rub."

We find no fault with our schools, for nobody can be taught faster than he can learn; the speed of the best horseman must be limited to the power of his horse. It is true, that we have no right, as yet, to expect abundance of *fruit* from the pupils in our seminaries of instruction; still we ought to look for the dawnings of intellect, the buds and blossoms of talent or genius. The absence of these must be accounted for on some principle or other; the why and the wherefore is, perhaps, the temptations of surrounding circumstances—the facilities afforded of entering society in an unfledged state—before the *mind* is matured so as to know any thing of *itself.*—The foolish whims and caprices of over-indulgent parents, and the little self-denial, patience, and perseverance, the boy is called to practice: Hence, there is no *disciplined* course of study, no quiet retired contemplation of intellectual subjects—no "pale cast of thought," intimating a connection between the scholar and the "midnight lamp." The news of the day, the wretched stuff of the *Zuid-Afrikaan,* the marchings on the parade, the mock-heroic and jaw-work of the theatre, the *fragrance* of segars, the *music* of billiard-balls, the small-talk of the tea-table, the dash of a *ride-out,* the enchantments of the *rix-dollar* scenes at the public sales, the *playing* clubs, the *singing* clubs, the *lottery* clubs, the *shews* of every kind, whether at the quarterly cattle fair, or at the Philanthropic, or the Lutheran Church—all, all,—and very many others, rule, captivate, and gain the ascendancy over, and distract the mind.

These are plain, uncourtly sayings, but they are offered in the spirit of one of old, who made a necessary distinction between duplicity and faithfulness.

"Faithful are the wounds of a friend,
But the kisses of an enemy are deceitful."

We now direct our attention to the primary object of this article—to notice the public tribute of respect recently paid to the memory of a much-valued and deeply lamented genius—a native of India.

In the first volume of the *Cape Literary Gazette,* (page 118,) there are some beautiful lines on the Abolition of Suttee, by HENRY DEROZIO.

There are, we feel assured, many of our readers who share our feelings of sincere concern at the premature death of the amiable author, an accomplished Indian scholar. When we look but a few brief years (says the Indian back

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Gazette,) and remember the intelligent and animated East Indian boy that gave such undubitable promise of something more than common-place talent;—when we reflect on the formidable disadvantages he had to contend with, and the elasticity and success with which he bore up against them, even so as to "make for himself a name," our regret for departed genius, is mingled with admiration at its buoyant energy. Destined to terminate his short, but bright career, when others are but commencing theirs; he, nevertheless, lived long enough to acquire a reputation that is not likely to perish, and that is honourably associated with the literature, and the moral, social, and political improvement of his countrymen."

Mr. Derozio began to write poetical effusions at the age of fourteen or fifteen, and most of these, as they were written, were originally published in the India Gazette. They evinced a vigour of thought, an originality of conception, a play of fancy, and a delicacy of tone which occasioned the more surprize when the reader came to know that the author was an East Indian boy, whose peregrinations had never extended beyond the limits of Bengal; and whose Alma Mater had been a Calcutta school. At length, in 1827, he published a volume of poems, which attracted even the notice, and excited the applause of even a portion of the London press. Ever since, his name has been before the public, either as a contributor to various literary works, or the able and independent editor of a newspaper. Of a diligent and active turn, he was not a youth that could sit down content to eat the bread of idleness; nor had he any false fastidiousness as to the sphere in which he could usefully exert his talents, provided the opportunity for their beneficial exercise offered itself. Accordingly, our youthful poet became a teacher at the Hindoo college. It certainly, one would imagine, was not the situation a young and ardent mind like his would choose, had he a variety of choice. This, however, he had not—and he accordingly entered with alacrity and zeal upon his new duties.

Mr. Derozio's next publication was "The Fakeer of Jungheera"—a work that gave still further proofs of genius, and evinced an extraordinary command of language, and an acute perception of the beauties of nature, and the idealities which form for the poet a world of his own. Of felicity in the thought, no less than in the expression of that sympathy which the poetical mind holds with the world, visible and invisible, some verses entitled "a Walk by Moonlight," published two or three weeks before his death, furnish an example—for instance:

* * *

The moon stood silent in the sky,
And look'd upon our earth;
The clouds divided, passed by,
In homage to her worth.

There was a dance among the leaves
Hymning her influence—
That low breathed minstrelsy which binds
The soul to thought intense.

* * *

How vague are all the mysteries
Which binds us to our earth;
How far they send into the heart
Their tones of early mirth!

How lovely are the phantoms dim
Which bless that better sight,
That man enjoys when proud he stands
In his own spirit's light;

When, like a thing that is not our's,
This earthliness goes by,
And we *behold* the spiritualness
Of all that cannot die.

'Tis then we understand the voice
Which in the night wind sings;
And feel the mystic melody
Played on the forests strings, &c.

* * *

That the interest which he took in the progress of his pupils, was as deep as it was generous and independent of all selfish motives, is sufficiently evident, were there no other proof of it than the beautiful sonnet addressed to the students of the Hindoo College, which he published in the Bengal Annual for 1831.

Expanding, like the petals of young flowers;
I watch the gentle opening of your minds.
And the sweet loosening of the spell that binds
Your intellectual energies and powers.
That stretch (like young birds in soft summer hours)
Their wings to try their strengh, O how the winds
Of circumstance, and freshening April showers
Of early knowledge, and unnumbered kinds
Of new perceptions shed their influence;
And how you worship Truth omnipotence!
What joyance rains upon me, when I see
Fame, in the mirror of futurity,
Weaving the chaplets you are yet to gain,
And then I feel I have not lived in vain.

The high estimation in which Mr. Derozio was held, will be best discovered when we mention to our readers that a public meeting was held at Calcutta in Dec. last, for the purpose of taking steps for the erection, by subscription, of a monument to his memory. The meeting was most numerously and respectably attended; Mr. J. W. Ricketts in the Chair. Among those present, several Hindoo gentlemen are said to have taken an active part in the proceedings.

We cannot perhaps conclude this article better than by bringing before the reader the lines which Mr. Derozio wrote in imitation of Byron's celebrated opening ones to the "Bride of Abydos"—and which now are fraught with solemn reflections.

Know ye the land where the fountain is springing,
Whose waters give life, and whose flow never ends;
Where Cherub and Seraph, in concert, are singing
The hymn that in odour and incense ascends?
Know ye the land where the sun cannot shine?
Where his light would be darkened by glory divine;
Where the fields are all fair, and the flow'ret's young blossom
Never fades while sweetness each breath they perfume;
Where sighs are ne'er heard, and where tears are ne'er shed
From hearts that might elsewhere have broken and bled;
Where grief is unfelt, where its name is unknown,
Where the music of gladness is heard in each tone;
Where melody vibrates from harps of pure gold,
Far brighter than mortal's weak eye can behold;
Where the harpers are robed in a mantle of light,
More dazzling than diamonds, than silver more white;
Where rays from a rainbow of emerald beam,
Where truth is no name, and where bliss is no dream?
'Tis the seat of our GOD! 'tis the land of the blest—
The kingdom of glory—the region of rest—
The boon that to man shall hereafter be given—
'Tis Love's hallowed empire—'tis Heaven! 'tis Heaven!

THE LATE COLONEL GORDON.

We have been solicited by a respectable publishing House in London, to request of our correspondents any information relative to Col. Gordon, an officer formerly holding office at the Cape of Good Hope. Madame Gordon, *née Nicollet*, as she signs herself in reference to a publication *intended* for the press some years since, says,—"My husband, Col. Gordon, was a man who was generally known, and had an extensive correspondence with literary men in all countries. His numerous maps, journals, and drawings on the Cape, would fill half-a-dozen folio volumes, but I regret to say his journal of 1774 is missing."

This journal is the object of present inquiry, and we shall feel obliged by any communication on the subject, from our readers in town or country.

We may remark, as a clue to future investigation, that Col. Gordon accompanied Lieut. Paterson in his travels into the interior of this Colony; and Lieut. Paterson, in his narrative of those travels, (page 3,) says,—"I was particularly fortunate in meeting with a gentleman, Col. Gordon, who had travelled in that country some years before (about 1774), and was lately returned from Holland, as second in command, and appointed to succeed Col. du Phren, who was then commander in Chief. Col. Gordon is a gentleman of extensive information in most branches of natural history; and, I believe, is the only person who has any considerable knowledge of that country, being acquainted with the interior parts for near 1,500 miles from the Cape. He had acquired the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

language of the Hottentots; which, together with his perfect acquaintance with Dutch, gave him an advantage over most other travellers."

At the close of 1804, the Colonel's manuscripts were offered to the French government, with whom his widow endeavoured to stipulate that one of her sons, then an ensign in the army, should be made a Lieut.-Colonel; and the other, who serving in the navy as a Lieutenant, should be promoted to the rank of Post Captain. But Bonaparte's officers were not so formed. Denon took a kind interest in the affair. Col. Gordon is said to have discovered the great Orange River. It was, at least undescribed in the maps previously to his visit. The drawings among the manuscripts already in possession of his family, amount to 400.

LITERATURE.

Eugene Aram. 3 vols. By the Author of *Pelham, Devereux,* &c. 1832.

We may apply to many of the novel writers, the fabricators of adventures, what Lord Bacon says when he regrets that philosophers, ignorant of real business, chose to write about legislation, instead of statesmen, whose proper office it was.—"They make," says he, "imaginary laws for imaginary commonwealths." But we are free to confess there is an exception in the present case. Mr. Bulwer has hit upon a striking historical fact to work upon, and well has it aroused the most quiescent feelings, and excited a very general interest. Eugene Aram appears to us to be the very best of Mr. Bulwer's productions. It has not a particle of his characteristic affectation, hence his style is clear, expressive, and frequently beautiful—more beautiful for being perfectly natural. But we have our regrets. We are sorry at the occasional use of low, vulgar slang expressions. The introduction of Dame Darkmans, as one of the characters in the piece, has induced the author to bring forth his political views. The old crone is a sort of second Meg Merilies. The corporal and his cat deserve to be turned out of the history, and the psalm-quoting Publican is, we think, extremely unnatural. Then, again, in the religious views of the author we take no part. The following observations upon the wonderful facility with which the human mind acquiesces in the decrees of Providence, however afflicting, breathe a fine, as well as a true tone of christian philosophy. But Mr. Bulwer has contrived, nevertheless, in the construction of the passage, to keep out of view all reference to the consolations of christian *hope*, in bearing the mind up in this state of trial.

"In our estimate of the ills of life, we never sufficiently take into our consideration the wonderful elasticity of our moral frame, the unlooked for, the startling facility with which the human mind accommodates itself to all change of circumstance, making an object, and even a joy, from the hardest and seemingly the least redeemed conditions of fate. The man who watched the spider in his cell, may have taken, at least, as much interest in the watch, as when engaged in the most ardent and ambitious objects of his former life; and he was but a type of his brethren; all in similar circumstances would have found some similar occupation. Let any man look over his past life, let him recall not *moments*, not *hours* of agony, for to them custom lends not her blessed magic; but let him single out some *lengthened* period of physical or moral endurance; in hastily reverting to it, it may seem at first, I grant, altogether wretched; a series of days marked with the black stone,—the clouds without a star;—but let him look more closely, it was not so during the time of suffering; a thousand little things in the bustle of life dormant and unheeded, *then* started forth into notice, and became to him objects of interest or diversion; the dreary present, once made familiar, glided away from him, not less than if it had been all happiness; his mind dwelt not on the dull intervals, but the stepping-stone it had created and placed at each; and by that moral dreaming, which for ever goes on within man's secret heart, he lived as little in the immediate world before him, as in the most sanguine period of his youth, or the most scheming of his maturity."

Of *Eugene Aram* we have gleaned the following particulars of a man whose name is unhappily associated with a deed of blood as extraordinary in its details as any recorded in our calendar of crime. In the year 1745, being then an Usher, and deeply engaged in the study of Chaldee, Hebrew, Arabic, and the Celtic dialects, for the formation of a Lexicon, he abruptly turned over a still darker page in human knowledge, and the brow that learning might have made illustrious, was stamped ignominious for ever with the brand of Cain. To obtain a trifling property, he concerted with an accomplice, and with his own hand effected, the violent death of one Daniel Clarke, a shoemaker of Knaresborough, in Yorkshire. For fourteen years nearly the secret slept with the victim in the earth of St. Robert's Cave, and the manner of its discovery would appear a striking example of the Divine Justice, even amongst those marvels narrated in that curious old volume, alluded to in The Fortunes of Nigel, under its quaint title of "God's Revenge Against Murther."

The accidental digging up of a skeleton, and the unwary and emphatic declaration of Aram's accomplice, that it could not be that of Clarke, betraying a guilty knowledge of the true bones, he was wrought to a confession of their deposit. The learned homicide was seized and arraigned; and a trial of uncommon interest was wound up by a defence as memorable as the tragedy itself for eloquence and ingenuity;—too ingenious for innocence, and eloquent enough to do credit even to that long premeditation which the interval between the deed and its discovery had afforded.

The following is the remarkable defence of Aram on his trial.

"My Lord,

"I know not whether it is of right, or through some indulgence of your lordship, that I am allowed the liberty at this bar, and and at this time, to attempt a defence, incapable and uninstructed as I am to speak: since, while I see so many eyes upon me, so numerous and awful a concourse, fixed with attention, and filled with I know not what expectancy, I labour not with guilt, my lord, but with perplexity; for, having never seen a Court but this, being wholly unacquainted with law, the customs of the bar, and all judiciary proceedings, I fear I shall be so little capable of speaking with propriety in this place, that it exceeds my hope if I shall be able to speak at all.

"I have heard, my lord, the indictment read, wherein I find myself charged with the highest crime, with an enormity I am altogether incapable of; a fact, to the commission of which there goes far more insensibility of heart, more profligacy of morals, than ever fell to my lot; and nothing possibly could have admitted a presumption of this nature but a depravity not inferior to that imputed to me. However, as I stand indicted at your lordship's bar, and have heard what is called evidence adduced in support of such a charge, I very humbly solicit your lordship's patience, and beg the hearing of this respectable audience, while I, single and unskilful, destitute of friends, and unassisted by counsel, say something, perhaps like argument, in my defence. I shall consume but little of your lordship's time: what I have to say will be short; and this brevity, probably, will be the best part of it: however, it is offered with all possible regard and the greatest submission to your lordship's consideration, and that of this honourable Court.

"First, my lord, the whole tenor of my conduct in life contradicts every particular of the indictment: yet had I never said this, did not my present circumstances extort it from me, and seem to make it necessary. Permit me here, my lord, to call upon malignity itself, so long and cruelly busied in this prosecution, to charge upon me any immorality of which prejudice was not the author. No, my lord, I concerted no schemes of fraud, projected no violence, injured no man's person or property; my days were honestly laborious, my nights intensely studious; and I humbly conceive my notice of this, especially at this time, will not be thought impertinent or unseasonable, but at least, deserving some attention; because, my lord, that any person, after a temperate use of life, a series of thinking and acting regularly, and without one single diviation from sobriety, should plunge into the very depth of profligacy precipitately and at once, is altogether improbable and unprecedented, and absolutely inconsistent with the course of things. Mankind is never corrupted at once; villainy is always progressive, and declines from right, step after step, till every regard of probity

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

is lost, and every sense of all moral obligation totally perishes.

"Again, my lord, a suspicion of this kind, which nothing but malevolence could entertain, and ignorance propagate, is violently opposed by my very situation at that time, with respect to health; for, but a little space before, I had been confined to my bed, and suffered under a very long and severe disorder, and was not able, for half a year together, so much as to walk. The distemper left me, indeed—yet slowly, and in part; but so macerated, so enfeebled, that I was reduced to crutches; and, so far from being well about the time I am charged with this fact, that I never, to this day, perfectly recovered. Could, then, a person in this condition take any thing into his head so unlikely, so extravagant? I, past the vigour of my age, feeble and valetudinary, with no inducement to engage, no ability to accomplish, no weapon wherewith to perpetrate such a fact; without interest, without power, without motive, without means.

"Besides, it must needs occur to every one that an action of this atrocious nature is never heard of but when its springs are laid open; it appears that it was to support some indolence, or supply some luxury; to satisfy some avarice, or oblige some malice; to prevent some real or some imaginary want: yet I lay not under the influence of any of these. Surely, my lord, I may, consistently with both truth and modesty, affirm thus much; and none who have any veracity, and knew me, will ever question this.

"In the second place, the disappearance of Clarke is suggested as an argument of his being dead; but the uncertainty of such an inference from that, and the fallibility of all conclusions of such a sort from such a circumstance, are too obvious and too notorious to require instances; yet, superseding many, permit to produce a very recent one, and that afforded by this castle.

"In June, 1757, William Thompson, for all the vigilance of this place, in open day light, and double ironed, made his escape; and, notwithstanding an immediate inquiry set on foot, the strictest search, and all advertisement, was never seen or heard of since. If then Thompson got off unseen, through all these difficulties, how very easy was it for Clarke, when none of them opposed him? But what would be thought of a prosecution commenced against any one seen last with Thompson?

"Permit me next, my lord, to observe a little upon the bones which have been discovered. It is said, (which, perhaps, is saying very far,) that these are the skeleton of a man. It is possible, indeed, it may; but is there any certain known criterion which incontestably distinguishes the sex in human bones. Let it be considered, my lord, whether the ascertaining of this point ought not to precede any attempt to identify them.

"The place of their depositum, too, claims much more attention than is commonly bestowed upon it; for, of all places in the world, none could have mentioned any one wherein there was greater certainty of finding human bones than a hermitage, except he should point out a church yard; hermitages, in time past, being not only places of religious retirement, but of burial too: and it has scarce, or never, been heard of, but that every cell now known contains, or contained, these relics of humanity; some mutilated, and some entire. I do not inform, but give me leave to remind your lordship, that here sat solitary Sanctity, and here the hermit or the anchoress hoped that repose for their bones, when dead, they here enjoyed when living.

"All the time, my lord, I am sensible this is known to your lordship, and many in the Court, better than to me; but it seems necessary to my case that others, who have not at all, perhaps, adverted to things of this nature, and may have concern in my trial, should be made acquainted with it. Suffer me then, my lord, to produce a few of many evidences that these cells were used as repositories of the dead, and to enumerate a few in which human bones have been found, as it happened in this question; lest, to some, that accident might seem extraordinary, and, consequently, occasion prejudice.

"1. The bones, as was supposed, of the Saxon Saint, Dubritius, were discovered buried in his cell at Guy's Cliff, near Warwick, as appears from the authority of Sir William Dugdale.

"2. The bones, thought to be those of the anchoress Rosia, were but lately discovered in a cell at Royston, entire, fair, and undecayed, though they must have lain interred for several centuries, as is proved by Dr. Stukely.

"3. But my own country, nay almost this neighbourhood, supplies another instance; for in January, 1747, were found, by Mr. Stovin, accompanied by a reverend gentlemen, the bones, in part, of some recluse, in the cell at Lindholm, near Hatfield. They were believed to be those of William of Lindholm, a hermit, who had long made this cave his habitation.

"4. In February, 1744, part of Woburn Abbey being pulled down, a large portion of a corpse appeared, even with the flesh on, and which bore cutting with a knife; though it is certain this had lain above two hundred years, and how much longer is doubtful; for this abbey was founded in 1145, and dissolved in 1538 or 1539. What would have been said, what believed, if this had been an accident to the bones in question?

"Farther, my lord:—it is not yet out of living memory that at a little distance from Knaresborough, in a field, part of the manor of the worthy and patriot baronet who does that borough the honour to represent it in parliament, were found, in digging for gravel, not one human skeleton only, but five or six, deposited side by side, with each an urn placed at his head, as your lordship knows was usual in ancient interments.

"About the same time, and in another field, almost close to this borough, was discovered also, in searching for gravel, another human skeleton; but the piety of the same worthy gentleman ordered both pits to be filled up again, commendably unwilling to disturb the dead.

"Is the invention of these bones forgotten, then, or industriously concealed, that the discovery of these in question may appear more singular and extraordinary? whereas, in fact, there is nothing extraordinary in it. My lord, almost every place conceals such remains. In fields, in hills, in highway sides, in commons, lie frequent and unsuspected bones; and our present allotments for rest for the departed are but of some centuries.

"Another particular seems not to claim a little of your lordship's notice, and that of the gentlemen of the jury; which is, that perhaps no example occurs of more than one skeleton being found in one cell: and in the cell in question was found but one; agreeable, in this, to the peculiarity of every other known cell in Britain. Not the invention of one skeleton, but of two, would have appeared suspicious and uncommon. But it seems another skeleton has been discovered by some labourer, which was full as confidently averred to be Clarke's as this My lord, must some of the living, if it promotes some interest, be made answerable for all the bones that earth hath concealed, and chance exposed? And might not a place where bones lay be mentioned by person by chance as well as found by a labourer by chance? Or is it more criminal accidentally to name where bones lie, than accidentally to find where they lie?

"Here too is a human skull produced, which is fractured; but was this the cause, or was it the consequence of death? was it owing to violence, or was it the effect of natural decay? If it was violence, was that violence before or after death? My lord, in May, 1732, the remains of William, lord archbishop of this province, were taken up, by permission, in this cathedral, and the bones of the skull were found broken; yet certainly he died by no violence offered to him alive that could occasion the fracture there.

"Let it be considered, my lord, that upon the dissolution of religious houses, and the commencement of the Reformation, the ravages of those times affected both the living and the dead. In search after imaginary treasures, coffins were broken up, graves and vaults dug open, monuments ransacked, and shrines demolished; and it ceased about the reign of Queen Elizabeth. I entreat your lordship, suffer not the violence, the depredations, and the iniquities of those times, to be imputed to this.

"Moreover, what gentlemen here is ignorant that Knaresborough had a castle, which, though now a ruin, was once considerable both for its strength and garrison? All know it was vigorously besieged by the arms of the parliament; at which siege, in sallies, conflicts, flights, pursuits, many fell in all the places round it, and where they fell, were buried; for every place, my lord, is burial earth in war; and many, questionless, of these rest yet unknown, whose bones futurity shall discover.

"I hope, with all imaginable submission, that what has been said will not be thought impertinent to this indictment; and that it will be far from the wisdom, the learning, and the integrity of this place, to impute to the living what zeal in its fury may have done—what nature may have taken off, and piety interred—or what war alone may have destroyed, alone deposited.

"As to the circumstances that have been raked together, I have nothing to observe but that all circumstances whatever are precarious, and have been but too frequently found lamentably fallible; even the strongest have failed. They may rise to the utmost degree of probability, yet they are but probability still. Why need I name to your lordship the two Harrisons recorded by Dr. Howel, who both suffered upon circumstances because of the sudden disappearance of their lodger, who was in credit, had contracted debts, borrowed money, and went off unseen, and returned a great many years after their execution? Why name the intricate affair of Jacques de Moulin, under King Charles II. related by a gentleman who was counsel for the crown? and why the unhappy Coleman, who suffered innocently, though convicted upon positive evidence; and whose children perished for want, because the world uncharitably believed the father guilty? Why mention the perjury of Smith incautiously admitted king's evidence; who, to screen himself, equally accused Faircloth and Loveday of the murder of Dun; the first of whom, in 1749, was executed at Winchester; and Loveday was about to suffer at Reading, had not Smith been proved perjured, to the satisfaction of the court, by the surgeon of Gosport hospital?

"Now, my lord, having endeavoured to show that the whole of this process is altogether repugnant to every part of my life; that it is inconsistent with my condition of health about that time; that no rational inference can be drawn that a person is dead who suddenly disappears; that hermitages were the constant repositories of the bones of a recluse; that the proofs of this are well authenticated; that the revolutions in religion, or the fortune of war, have mangled or buried the dead; the conclusion remains, perhaps, no less reasonably than impatiently wished for. I, at last, after a year's confinement, equal to either fortune, put myself upon the candour, the justice, and the humanity of your lordship; and upon yours, my countrymen, gentlemen of the jury."*

THE VILLAGE BLACKSMITH.

THERE is a very interesting book lately published, entitled the "Village

* Aram was hung in chains in Knaresborough Forest, 1759.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Blacksmith," in "a Memoir of the Life of Samuel Hick." The Book Societies and Lending Libraries should not fail to procure the Work.

The author thus commences with the history of his hero,—no fictitious character, by the bye, not the imaginary hero of the novelist, or the *beau ideal* of the *romancer*, but a well known village blacksmith, of Micklefield, in Yorkshire.

"Samuel Hick, the subject of the present memoir, was in the moral world, what some of the precious stones are in the mineral kingdom, a portion of which lie scattered along the eastern coast of the island, and particularly of Yorkshire, his own county;—a man that might have escaped the notice of a multitude of watering-place visitors, like the pebbles immediately under their eye; one who, to pursue the simile, was likely to be picked up by the curious, in actual pursuit of such specimens, and thus,—though slighted and trodden under foot, like the encrusted gem, by persons of opposite taste, to be preserved from being for ever buried in the dust, as a thing of nought in the sand, after the opportunities of knowing his real value—when above the surface, had been permitted to pass unobserved and unimproved;—one of those characters, in short, that could only be discovered when sought after, or forced upon the senses by his own personal appearance, in the peculiarities by which he was distinguished—who was ever secure of his price when found—but who would, nevertheless, be placed by a virtuoso, rather among the more curious and singularly formed, than among the richest and rarer specimens in his collection."—pp. 1, 2.

The following instance of benevolence, (among many others,) would do credit to the wealthy squire of a country village.

"Hick was an utter stranger to the feeling of giving 'grudgingly.' His was, in poetic language, a 'burning charity;' like concealed fire, constantly enlarging, till it actually tears away the surface of the earth, to let loose the imprisoned flame It only wanted an object on which to expend itself; and, as he rarely gave with discretion, the first applicant generally faired most bountifully. He was returning from the pit one day with a load of coals: a little girl seeing him pass the door, ran towards him, and asked him for a piece of coal, stating that her mother was confined, and the family without fire. He stopped the horse, went into the house, made inquiry into their circumstances, found the tale of the child correct, brought the cart to the door, and poured down the whole of the load, free of cost. Having no money upon him to pay for an additional load, and being apprehensive of a lecture at home for the *abundance* of his charity, he returned to the coal-pit where he knew he had credit for twenty times the quantity, re-filled his cart, and returned home with his soul humming its way up to heaven, like the lark breasting the morning breeze, and gladdening the inhabitants below with its first song.

"To him it was of no importance what was the nature of the want; if it *were* a *want*, it was sure to be met by him with the first object calculated to supply it, to which he had any legal claim; and met too with the freedom and sudden gush of a fountain breaking from the side of a hill, giving forth its streams till its sources are exhausted by its impetuosity. Of this, his conduct to some soldiers on a march, during the late war, affords, perhaps, as fine a specimen as can be selected. It was what is termed a 'forced march,' and in the height of summer. The regiment being on its way to the south, a party halted at Micklefield early in the morning; the village inn could but accommodate a small portion of them, and the remainder took their seats on the heaps of stones by the side of the road. Samuel, as usual, was up early; and, sallying out of the house, he had presented to his view these veterans in arms. A thrill of loyalty was felt in his bosom, as every thing connected with his king, to whom he was passionately attached, was calculated to produce. He instantly returned to the house, placed before the men the whole contents of the buttery, pantry, and cellar—bread, cheese, milk, butter, meat, and beer went, and he himself in the midst of the men, as happy as a king living in the hearts of his subjects. Though in the very hey-day of enjoyment, he looked with tenderness upon the men, who were about to take the field, and dismissed them with his blessing. But he had part of the reckoning still to pay with his partner. Martha came down stairs, and, after engaging in other domestic concerns, proceeded to the buttery, to skim the milk for breakfast. All had disappeared. Inquiry was made: and when she found how the things had been disposed of, she chided him, saying, 'You might have taken the cream off before you gave it to them.' Samuel replied, 'Bless thee, *bairn*, (child) it would do them more good with the cream on.'"—pp. 105, 107.

PRESENT STATE OF JAVA.

Skizzen von der Insel Java, &c.—Sketches of the Island of Java and its various Inhabitants. By J. J. X. Pfyffer, of Neucck. Parts I. and II., with coloured plates. Schaffhausen, 1829. Hurter: London, Ackermann.

THE fall of the United States of Holland brought about the transfer of Java and its dependencies to Great Britain; and, as a celebrated writer has admirably observed,* "the old monopoly vanished: ancient secrets were divulged; day succeeded to night; Sir Thomas Stamford Raffles was placed at the head of the Batavian Society; naturalists, such as Horsfield, laboured in its service; a fresh spirit was infused into its proceedings; * * * English research prevailed, and with this loftier views, a more intimate acquaintance with the state of science in Europe, and a tenor of conduct far more befitting the character of a learned institution. Raffles and Horsfield have alone done as much as one half the members of that Society before them." It is impossible for us to quote this passage without expressing our fervent desire that the learned and scientific of all countries would imitate the example of this eminent reviewer, and award to the labours of their contemporaries that measure of justice which is their honest desert, but which, on too many an occasion, a sinister reference to complexion of country, to party, or station in life, unjustly denies or withholds.

Since Holland has recovered her eastern possessions, her government has evinced a laudable anxiety to encourage the pursuits of science throughout the colonies, but particularly in those east of the Cape. Indeed, we cannot advert to this subject without a feeling of respect and admiration for what has been already undertaken and achieved. Temminck, Blume, and others, have thrown an interesting light on the state and splendid operations of nature within those regions; and the gentleman whose pages we are about to open has afforded us an attractive foretaste of what we may expect from the remaining portions of a work which is chiefly devoted to the physiognomy of our own kind, and the state of society under the same sky. From his earliest years he entertained an earnest longing to visit the ever-verdant archipelago of the Indies; and accident accomplished the fruition of his wishes.

* M. Depping.

We can only infer, from one or two very sensible observations, that this accident partook of the nature of some personal calamity: the detail he has left unexplained. A run of six months and five days from the Texel, was attended by no incidents more memorable than the capture of an albatross above sixteen feet in breadth, and of several sharks—a female specimen of which measured eleven feet and a quarter in length, and contained more than forty living young, each of them being one foot and a half long. Among them was a live fish, which from its shape appeared to belong to some other species, and on this account naturally excited the traveller's curiosity. Though pieces of clothing, ropes, lumps of flesh, and other nauseous substances—but, worst of all, though the body of an old woman had been thrown overboard the preceding day—the sailors fell to work on the shark with voracious avidity, and committed huge fragments of it to the boiler, in their anxiety, as they alleged, to secure a meal of fresh meat. Col. Pfyffer reached the Straits of Sundah in October 1819, and anchored in the roadstead of Batavia two days afterwards. His service under the colonial government of the island lasted until the month of September 1827, when, in spite of the brilliant prospects which the future held out to him, his feverish longing to revisit his paternal soil extinguished all personal considerations, and he embarked for Europe. We hope that it may not have fallen to the lot of any of our readers to have experienced the wretched state of mind which the colonel describes to be consequent upon dreams of home under a stranger sky; and at all events, we trust that the melancholy picture he has sketched is of exaggerated dimensions.

It is time, however, that we turned to his sketches of the island of Java. These begin with some topographical notices.

The island is fertile and beautiful; and its soil yields almost every thing which the cultivator can desire. By the side of tropical plants are found most European vegetables, and various fruits of more temperate zones; these are sure to succeed where proper attention is paid to the relative qualities of soil and climate. Mountains and valleys, hills and dales, coast exposure, and inland shades, offer inexhaustible variety. From recent computation, the population would appear to exceed five millions, whereas in 1774, Thunberg states it at 2,029,915 souls. Immense lines of forest, districts where the supply of water is scanty, extensive tracts which are uncultured or insalubrious (such as the Djampan on the Wynkoopers Baai), and a variety of diseases engendered by miasma, are, to my mind, very satisfactory reasons why the population is not greater. Alluding to the difficulties which the Dutch East-Indian government have had to encounter in obtaining the annual census, Col. Pfyffer remarks, that "the princes or other great lords strive as much as possible to increase the number of their households, and endeavour to avoid making any return of births; for they are apprehensive of the interference of the government, who allow them no greater number of servants than their rank or necessities require, because such followers are not liable to military service excepting in cases of great emergency, and are exempted from removal and public labour. The limit which this regulation prescribes to the aggrandisement of the Javanese nobility, produces a salutary effect both in an economical and a moral point of view. The careless, indolent life which was led by an over numerous retinue of dependents; the favouritism exercised by their masters; the career of violence and mischief in which they were consequently enabled to indulge with impunity, and the overbearing pride and recklessness of their deportment, rendered this class of individuals the scourge and refuse of their fellow-countrymen. Another motive for concealment, or sending in a false return, may, I think, be

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

traced to the priesthood, who had in view either to increase the numbers of their vassals, or were impelled by religious prejudices; for they were accustomed to urge in justification that passage in the Koran, which calls down the punishment inflicted on *Radja Dawûd* (King David) on the heads of such as number their people. * * * /

"The eastern portion of Java is the seat of two native governments; that of the Susuhunan, or emperor of Surakarta, and that of the sultan of Djocjokarta. Though the power of both has been considerably curtailed, and they are mainly dependent upon the Dutch authorities, their influence is still of so formidable a nature, that the intervention of a single warlike and able individual would speedily enable them to re-assert their independence; and, from their superior numbers, combined with the pernicious character of their climate, to extirpate their European masters. So long as these two kingdoms are permitted to exist, the possession of Java by the Dutch must be fraught with insecurity. Fanaticism, jealously, and inextinguishable hatred, lurk in the dismal recesses of the island, and the native omits no opportunity which offers of sowing distrust and contempt of Europeans, who are called *Orang Capir*, pagans or infidels. It is not the love of liberty,—that lofty feeling which the Divinity has imprinted in generous souls!—which calls them to arms, and has been the mainspring of the existing war, but ambition and religious enthusiasm."

The machinery of government appears to be conducted much after the fashion of that of our own possessions, by division into provinces and districts (*dessa* or *tjutak*); the one being administered by residents, and the other by responsible *employés*, to whom secretaries, superintendents of plantations, collectors of customs, warehouse-keepers, &c. are subordinate.

The three principal towns of Java are Batavia, Samarang, and Surabaya; and in describing the first of these spots, the traveller quotes an instance, which the reader may add to a million of others, that the march (we had almost said the ravages) of intellect in these our days, is not yet forced enough to teach governments or individuals, that where they may take care of the pence, the pounds will not always take care of themselves. "Though Batavia," he remarks, "is said by persons acquainted with the subject, to have become much healthier of late years, a fatal scourge appeared in the year 1827, which arose from a penny-wise and pound-foolish desire of economy. On a spot where frequently not a single drop of rain will fall for months together, nor the hurly-burly of horses and carriages finds a moment's interregnum in the day-time, the watering of the streets twice during the four-and-twenty hours was a perfect blessing, and of singular advantage to the health of the inhabitants. This useful custom was abandoned; and, as a natural consequence, the state is the gainer of a few score pounds a year, while Batavia is losing its tenants, and is shorn of one of its chief recommendations. At present, the salubrity of the site has enticed all respectable persons to take up their residence at Weltevreden, Koningsplein, or Meester Cornelis, about 6 miles beyond the city, where you may ride for several miles amidst elegant country-seats, built in the English or Italian style. * * Few Europeans reside in Batavia, excepting those who are directly concerned in shipping."

Having disposed of his topographical notanda, Colonel Pfyffer affords us an instructive sketch of the natural productions of Java. Amongst the rest, he reports, "that many districts are untenantable, owing to the numbers of tigers by which they are infested, and this in spite of a reward of sixteen gulden (twenty-seven shillings) for the capture of a royal, and seven (twelve shillings) for that of a spotted tiger. "The rhinoceros," he says, "is, when wounded, an extremely dangerous enemy; and the power and courage he displays are not to be described. In spite of his seemingly unwieldy bulk, he is quick and perilous in his motions; tearing up trees by their roots, and destroying every thing that falls in his way, in order to get at the sportsman who has assailed or wounded him. Even the Javanese, though in general a good marksman, and familiar with his habits, is afraid of hunting this animal. The *kalong*, or gigantic bat, which is also called the flying fox, on account of its breast and tail, is preferred for its flesh to most other winged creatures. It has hooks on its wings, by means of which it suspends itself to the branches of fruit-trees in the night-time; but when day-light appears, it flies back to its sequestered haunts. In the environs of Ankol, about three or four miles from Batavia, lies an immense and impervious forest, which is the customary resort of this predatory animal, When they roam about at dusk, in quest of prey, they associate by thousands, and obscure the sky for several minutes. Peacocks abound in the island; but are generally found in solitary mountainous districts, where their neighbour, the tiger, amuses himself with hunting them."

Among the author's notices of the vegetable kingdom, we have been unable to discover any novelty; and from those of the mineral riches of Java, we have only to note, that "there is an abundance of iron mines, which, from the plentiful supply of wood, and its consequent cheapness, afford powerful inducements to the establishing of smelting works." After rendering a short account of the measures, weights, and coins of the island, he commences with the more immediate object of his sketches, its inhabitants; and as it will be for the interest of the reader, that we should profit by the remaining portions of his instructive and entertaining book, we feel justified in foregoing any comment of our own on the brief extracts we proceed to lay before him.

"The children of Java are well grown, strong, and nimble; qualities which I conceive to arise from their being brought up in the open air. They are washed in cold water on the very day of their birth, and the practice is continued until they are able to run alone and follow their own inclination for bathing. From thenceforward they lead a sort of amphibious life, and take far greater pleasure in water than on dry land; indeed, whenever the heat is most overpowering, both children and grown-up persons jump into the water, or else lustrate one another from head to foot out of a hollowed cocoa nut. * * * The child is suffered to amuse itself without restraint, even in the most dangerous sports. I have been often frightened at the sight of three or four boys, (mere urchins, scarcely able to set one foot before the other,) mount the back of a horse or buffalo, and gallop about, as if both they and their bearer were 'daft.' The latter of these animals greets their familiarity with so much temper, and becomes so fondly attached to them, that he is their surest defence against the attacks of the tiger, and has on several occasions saved many an infant life. In the year 1825, a little boy, belonging to the district of Kuningen, in the province of Cheribon, was assailed by a tiger, and had received several severe wounds, when a resolute buffalo rushed forward to protect his favourite against the savage animal Though the tiger usually overpowers him in open ground, by adroitly leaping behind his enemy's neck and applying to it his powerful claws and jaws without let or hindrance, on the present occasion the cause of innocence triumphed, and the blood-thirsty creature was so effectually maimed by the sharp horns of the faithful buffalo, that he fell down dead while attempting to make his escape." Of the Javenese peasant, he observes: "The condition of the lower classes cannot fail, at first sight, to appear in the highest degree hard and insupportable to a stranger; the slavish submission of the inferior to his superior makes a melancholy impression upon the mind of a European. The Javenese does not receive the commands of his *radehn* (or noble master,) or *orang besar* (superior,) in an erect posture, but in the lowliest attitude he can devise; stooping down, sitting with his legs crossed and his body bent forwards. Whilst the order is giving, he frequently repeats the expressions, *N'ja nun!* or *nun!* (yes, my lord and master,) though he uses *tuan* (master) when addressed by a European. Without rising from the ground, or even casting his eyes upwards, he now and then brings his hands together by the tip of the fingers, and raises them to his head, in token of his entire submissiveness. * * *

The next subject is the *rongin*, *bedoio*, or dancing girl. "Her songs are impromtu, and suited to her auditory. In the twinkling of an eye she selects the preferable points of her admirer's exterior; an arch smile lights up her features; she extols his handsome figure, his noble bearing, his eyes, feet, and dress, and sums up her eulogy with a seductive and apparently artless portraiture of his liberality and munificence. These girls also recite national ballads, of which the substance is derived from the legendary recollection of their ancient rulers. Many of these ballads are perfect facsimiles of Ovid's Metamorphoses, and constitute a portion of Javenese mythography. * * * Amongst others, the summit of a mountain, being shaped like a boat, it is termed *Gunong prâhve*, or the mountain of the ship; and tradition records it as having been the resting-place of Noah, the *nely's* (or prophets's) ark after the deluge had subsided."

The plates accompanying these sketches are admirably characteristic, and both designed and executed with considerable talent.

NATURAL HISTORY.

SURROUNDED as we are in this interesting part of the world, with the immense displays of Creative goodness, it is to be lamented that our researches or inquiries are not oftener in exercise respecting these things; that there is an apparent want of inclination to render such pursuits subservient, not only to the interests of Science, but to the purposes of commercial profit. In the list of the *Class Mammalia*,—the *Order Rodentia*, of this Colony the *Mole*, occupies immense tracts of land, and might, we think, be turned to good account in the *profit* alluded to. In every part of the Sand Flats, says Mr. Burchell, I observed innumerable mole-hills, and my foot very often sunk into their burrows. For this reason, it is very unpleasant, if not dangerous, to ride on horseback in such places as persons are liable to be thrown, by the feet of their horses unexpectedly sinking into these holes. The animal which make these hillocks, is a very large kind of Mole Rat, nearly as big as a rabbit, with a very soft, downy, ash-coloured fur, having, in appearance at least, neither eyes, ears, nor tail. It is peculiar to this colony, and is called *Zand Mol*, (Sand Mole.)

From the great softness of the fur,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and the abundance of skins that might be obtained, it might possibly constitute an article of value for colonial trade, or for exportation, and it is surprising that no speculative person has hitherto attempted to convert these skins to some useful purpose.

Respecting the peculiar habits of the *Mole*, we subjoin an extract from an excellent little work which has just appeared, entitled—Gleanings in Natural History, with Local Recollections, by Ed. Jesse, Esq. Deputy Surveyor of His Majesty's Parks, 8vo. pp. 331. Murray, 1832. It is well when His Majesty's Government, or a Colonial Government, bestow appointments on *useful* civil servants, such as Mr. Jesse. He seems to us to be one who feels disposed, and labours to leave the world better than he found it, and belongs in no sense to that (unfortunately numerous) class of men who are merely satisfied with the performance of legal honesty, or bare-weight public duty—who seldom give a particle that is not in the bond.

Moreover, as to his Book the author writes as a mere amateur, and we like his work the better, for the absence of that *systematic method*, which many of the Naturalists adopt, for the *negligé* dress in which it appears. His book will be read with delight by every person who knows how to value true simplicity of mind, exalted by an earnest devotional temperament, which always directs its inquiries from nature to nature's God. Again, he confines his remarks, in a great measure, to matters which fell within his own observation; although he does not hesitate occasionally to borrow a confirmatory fact or illustration from other authorities.

THE MOLE.

——'Tread softly, that the blind mole may not
'Hear a foot fall; *we now are near his cell.*'
Shakspeare.

The mole-hills which we see in fields and meadows, are thrown up by the mole probably during its search for food. Little was known of the natural history of this animal, till a French naturalist, M. St. Hilaire, published lately some interesting particulars respecting it. The mole forms several under-ground passages; and the way she proceeds in doing this is as follows:—she first makes a *run* in various directions, by undermining the ground, and unites this and several others at one point, making, however, some of them larger than the others. M. St. Hilaire says she finishes by arranging them with the most perfect symmetry, plastering the sides with great care; and when completed, it may be called her *encampment*. In the centre of these works she establishes herself, and appropriates a separate place to the reception of her young, which is in some respects differently constructed from her own. In order to render the respective habitations which she and her young occupy not liable to be injured by the rain, she makes them almost even with the ground, and higher up than the runs, which serve as drains, or channels, to carry off the water. She makes choice of the place of her abode with the greatest care, sometimes constructing it at the foot of a wall, or near a hedge or a tree, where it has the less chance of being broken in. This abode is sometimes protected by having a quantity of earth thrown over it, especially in light soils, where I have seen a mound almost large enough to fill a wheelbarrow. Sometimes, however, no earth is thrown up over the habitation. This precaution of the mole is very necessary, to prevent the places she has chosen for retreats for herself and her young, from being trampled in. When a mole has occasion to make her run through a gateway, I have observed that she generally carries it as near as possible to the gate-post, where it is less likely to be injured. Some runs are so near the surface, that I have seen the ground crack during the animal's progress in working them. The bed for the young is composed of the blades of wheat, with which the mole forms a sort of mattress. Four hundred and two of them were counted in one nest, and all so fresh in appearance, that they had been probably collected by this little animal in the course of two or three days. This shows not only her extraordinary industry, but the great depredation she must commit.

The mole is never known to work for food near the place which she has fixed upon for her abode. She labours to procure it about two hours in the morning, and as many in the evening, and then returns to her home or resting-place, which is so constructed, that she is instantly made aware of any danger. This effect is produced by forming the upper runs in a sort of circle, so as to communicate a vibration when anything passes over them. The mole then takes alarm, and escapes by one of her *safety* runs.

The mole is not often seen on the surface of the earth. I once, however, caught one, and turned it loose upon a lawn, the turf of which was on a bed of strong gravel, and particularly hard and dry. Notwithstanding these disadvantages, the mole contrived to bury itself almost in an instant, working into the earth by means of her snout and fins (for they can hardly be called feet) so fast, that the ground seemed to yield to her mere pressure.

The power of smelling in the mole is very acute; and it is supposed that this sense serves to direct her in the search of her food. She hunts after beetles and worms, which last she pursues eagerly, but not always successfully; for the earth-worm is aware of its danger, and quick in escaping from it. Her search for prey taking place in the morning and evening, when birds are more generally on their feed, must be the means of contributing greatly to their subsistence by driving worms to the surface of the earth, and furnishes another striking proof that the 'fowls of the air' have their food provided by an almighty and superintending Providence in a variety of ways.

Le Court, who assisted M. St. Hilaire in his observations, and who appears to have been a sort of philosophical mole-catcher, was surprised when the naturalist expressed a doubt as to the mole seeing. He informed him that, in swimming rivers, they habitually guide themselves by their sight; but, in order to satisfy M. St. Hilaire on this point, he contrived the following experiment with him:—They made two openings in a dry tiled drain, at one of which several moles were successively introduced. Le Court took his stand at the other. If he stood quite still, the mole soon came out and escaped; but if, at the moment in which she showed herself at the hole, he moved only his thumb, she stopped and turned back. By repeating this as often as she re-appeared, the mole was kept imprisoned in the drain.

There has been a very general idea amongst our mole-catchers, that if the smallest drop of blood is taken from a mole, it occasions instant death. Le Court seems to account for this opinion in speaking of the fights which take place between the male moles, by saying, that if one is ever so slightly wounded in a vein near the ear, the wound is mortal.

In order to ascertain the rate at which a mole moved, he put in practice the following curious experiment:—He placed some slight sticks, with a little flag at the top of them, in the run of a mole, which he had previously ascertained by tracing it to be of considerable length, and along which the mole passed and re-passed four times a day in search of food. These sticks were placed at certain intervals in the run, so that if the mole touched them, the flag would instantly show it. He then introduced a horn at one extremity of the run, and blowing it loudly frightened the animal; and she then went along the run at such a rate, moving the flags in her passage, that Le Court and his friends, who were stationed at intervals along the run to assist in the observation, considered that she went as fast as a horse could trot at its greatest speed.

Hunger in the mole is thought to be a more violent feeling than fear; and its appetite is singularly voracious. If it sees a bird near, it quits its hole—approaches as if to attack it; and if the bird pecks it, the mole retires towards its hole, and tempts the bird to follow. She then watches her opportunity—darts upon it—seizes it by the belly, which she tears open, assisting herself for this purpose with her *flaps*, and, thrusting her head into it, devours it. She drinks as greedily as she eats. The mole does not, like the mouse, lay up a store of food, as she preys on worms and various kinds of insects; she will also eat frogs, but will not touch a toad, if ever so hungry. A mole was tried with eggs and oysters, but refused to eat either. They will, however, eat fruit, and, Buffon says, acorns. If two moles are shut up together without food, the strongest will devour the weakest, even to the bones, nothing but the skin is left, which they never eat, and which, when one has killed the other, is always seen to be ripped up along the belly. It was found that ten or twelve hours was the longest time they could live without food. This fact seems to prove that the mole is not torpid in frosty weather, which Linnæus asserted she was. It is known that, in such seasons, worms, ants, and the larvæ of cock-chaffers and beetles penetrate deep into the ground. It is probable, therefore, that the runs of the mole made in search of food are regulated, as to their depth, by the habits of the grubs on which she feeds. One would suppose, from the texture of its fur, which is particularly short and thick, that the mole is not very susceptible of cold. Indeed, its whole formation is admirably adapted to its mode of life.

It has been said that the mole, when the ground which it frequents is flooded, will climb up trees. This, however, seems to be unnecessary, as I have seen it swim with perfect ease, which indeed Le Court had also observed.

A HISTORY OF THE "HUMBUG" FAMILY.

Discovered among the Papers of a deceased Antiquary.

[Communicated by a Correspondent.]

IT is extraordinary that, although both the continental and English press groan with the immense number of "Memoirs" they have put forth, mostly relating to some individual member of my family, none of them have thought proper to give the public an authentic account of its progress. Perhaps the gigantic nature of the subject prevented them. Perhaps they had not materials. It is left to me, then, to perform this arduous task, and I take it upon me with the full consciousness of that great responsibility which rests with so important an undertaking.

The antiquity of my family may be ascertained at the Herald's College; not a name there, which boasts of its purity and high descent, but springs from that illustrious race, from which I have the honour to be descended. We have become a mighty people, and increase far beyond the bounds of Mr. Malthus's powers of calculation, while a bond of social brotherhood binds us, like the Freemasons, into one society.

Our first chroniclers were the Egyptian priests,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the worshippers of Isis and Osiris, and the other branches of that respectable family. To them we are indebted for the pyramids, formed with incredible labour by many millions of people, for the laudable purpose of keeping our name in remembrance by posterity. In them are preserved the mummies of those immortal kings, who conferred so much honour on our race. To them also are we indebted for the language of hieroglyphics, which long remained one of the unknown tongues, and for the science of astrology,—that noble study which told, by the unerring record in the heavens, the destiny of man.

The next who immortalized our name were the Greek "Rhapsodists." Jupiter was the supreme "Humbug" of his day, and through him we claim relationship with the whole of the dramatis personæ of the Grecian mythology, the Dryads and the Oceanides, the Cyclops and the Giants, the Satyrs, *et hoc genus omne*. That was a glorious time for our reign. We had temples erected to our honour; we had oracles, whose responses were considered sacred; we had offerings, and sacrifice and oblations: we thrived well. But the historians have recorded the greatness of our house. "The great kings" were decidedly great Humbugs from Nimrod to Xerxes, and those of Assyria and Persia are scarcely less so than those of Greece. Philip of Macedon did honour to the name (Demosthenes himself is our authority for the relationship), and his celebrated son, Alexander the Great, we have reason to boast of for the beneficial effects which followed from the millions he sacrificod. Those splendid orators, archons, and philosophers, whose "talents" proceeded from a foreign treasury, swell the list of great names to whom we bear kindred.

With the Romans we also flourished; from Romulus and Remus to the twelve Cæsars; and from them to the Palæologi of the Lower Empire; the Augurs, the Haruspices, and the Vestal Virgins, were our relations. We lay claim to Titus Livius, of Padua, for chronicling prodigies, and to Ovid for writing metamorphoses.

With the barbarians we have always been highly esteemed. Our ancestors, Alaric, Nadir Shah, Zenghis Khan, and Attila, are of honourable and respected memory, and yet nothing to compare with that exalted Humbug Mahomet.

With the introduction of Christianity our name fell into some disrepute, but it soon afterwards acquired favour again. The fathers of the church have mentioned some of our race with great respect, indeed they have always been eminent for their piety. An immortal inhabitant of the Thebaid, whose name unfortunately has escaped me, acquired fame in this world, and beatitude in the next, by living all his life upon the perpendicular—standing upright upon a column; and another sainted individual walked, after decapitation, with his head under his arm.

In all religions the name of my family has been conspicuous; whether of Juggernaut or of Woden, of Vishnu or of Belus, or of either of the thousand and one different forms of worship which are, or have been in practice; Druids, Brahmins, Dervishes, Popes, and the rest. Those who were most honoured for their voluntary sufferings, whether the devotee, who measured with the length of his body the way to his idol; or the worshipper of the Koran, who walked barefooted to the sacred minarets of Mecca; or the Catholic monk, who disciplines himself with a rope's end, have ever been my nearest and dearest relatives.

I claim the highest alliances. Almost every king, from Nebuchadnezzar, who was the first royal botanist that found out the qualities of *grass*, to Louis Philippe, who has been equally succesful in discovering the properties of *birch*; has the French throne has been the most constantly honoured by my kinsmen. The whole race of Bourbons are my cousins, consequently our beloved Ferdinand of Spain is especially dear to us. Miguel of Portugal, the Autrocrat of all the Russias, the King of Holland, and the Pope of Rome, have frequently acknowledged the relationship. But the most celebrated of the name remains unmentioned. Napoleon was the greatest "Humbug" that ever existed. Instance his projected invasion of England, his attempt to destroy our commerce, his bulletins; the glorious emanations of his extraordinary genius. I am justly proud of my connection *by blood* with so distinguished an individual.

Although, in empires and in kingdoms, my family has obtained the greatest honour and reputation, in free states it has been frequently in as high estimation. Those great men who governed the free cities of Italy during the middle ages, by their mild paternal sway, and the gentle spirit of their government, made the citizens boast of their freedom. It is impossible to give the names of all that great family who existed in those times of liberty and equality; we will only mention the Doges of Venice and the Popes of Rome. The Venetian government inculcated that spirit of patriotism for which the members of my family have always been distinguished. The public operations of the Council of Three; the liberality of opinion allowed by the officers of St. Mark: the political importance possessed by the people, even by the poorest fisherman of the Lagunes; and the uncontrolled authority of the chief of the state, even in his marriage with the Adriatic, prove incontestably the power which my relations had in the government. The sway of the Roman pontiffs was at one time more partaking of the nature of the family name, than it does at present. It was they who instituted the Crusades, the most important warfare that was ever undertaken, and attended, of course, with all the beneficial results that were expected It was they who found out the value of relics—the true cross has through them been miraculously divided into as many chips as would set the Tiber on fire. It was to them we are indebted for plenary indulgences;—fortunate discovery, that for the sacrifice of a little loose coin we might sin *ad libitum*, with pardon on earth, and paradise in heaven! Those were comfortable times to live in. It is much to be regretted that we cannot get rid of an unfortunate creditor, or a troublesome acquaintance, with those methods of dispatch which were then in practice. We have changed the name of defendant for that of prisoner, and the office of the confessor for Jack Ketch. "What a falling off is here, my countrymen." Liberty and the march of intellect were better understood in the times of my ancestors; a man might then not only do what he liked with his own, which is not allowed to my cousin of Newcastle, but might also do what he pleased with what did *not* belong to him.

The mode in which my family have been treated in this country, I find to be exceedingly flattering. We have given many kings to the British throne. I need but mention a few, John—(though he has done our name some injury, by signing Magna Charta,) Richard the Second and Third, Henry the Eighth, Charles the Second, and—but I shall say nothing of the George's. It is to be remarked that crowned heads distinguished by epithets, are almost always of our family. Frederic of Prussia, and Peter of Russia we have much reason to boast of. Louis *le Grand*, and Louis *le Desiré*;—their most sacred and most catholic majesties;—he of the *celestial* empire, and he of the *sublime* porte, the king of the seven white elephants, and the pacha of three tails; with numerous other potentates, whose titles are equally distinguished, and equally deserved; I am proud to say are all of the blood of the "Humbugs."

But it is to our character for literature and science that our fame will endure for ever. Who were the professors of the Eleusinian mysteries, and those of Bacchus, and the Aphroditè? Who were the philosophers? The Epicureans, the Stoics, the Cynics, and the other sects which sprung up at Athens? Who was Diogenes? and who was Epicurus? Gentle reader, with due deference to classical authority, with few exceptions, they are all of the glorious race of "Humbugs." Who discovered the atomic theory, the philosopher's stone, the universal panacea, and the transmigration of souls? Who were the alchymists, the astrologers, and the magicians? To whom are we indebted for the metallic tractors, the vital air, and the universal rubber? Who were Van Helmont, Friar Bacon, the prophet Nixon, and Johanna Southcote, and last, not least, who is the illustrious St. John Long? The same, the same! Has not my family discovered a remedy for every disease under the sun? Have they not formed joint stock companies which would enrich all who joined them? Did they not fish up chests of plate at Vigo Bay, and sacks of pearls at the Ladrones? and did they not send home cargoes of the precious metals from the watery mines of South America? Did they not lend loans at an excellent interest to every independent state as large as a potatoe-garden? Who can forget the immense profits which were realized by the Tlalpuaxhua, the Real del Monte, and the Rio de la Plata shares? by the loans to Guatamala, Buenos Ayres, Peru, Chili, Columbia, and Mexico? Who formed the washing-company, the milk-company? Who made the Thames tunnel? The same, the same! Have I not reason to be proud of my family?

Literary eminence has been in their hands for many generations, from the author of the "Koran," to that of "Satan, a poem." Indeed, my talented relations seem very frequently to monopolize the favour of the public. They have even gone so far as to create royal societies, and to institute clubs. Biographers are of my kith and kin. Boswell and Croker are my cousins german. Political economists are generally bound to me by nearer ties: Macculoch and Malthus are almost brothers. The managers of theatres, if you will ask the actors; the editors, if you will ask their contributors; and the critics, if you will ask the authors, are, nearly or distantly, related to me. You may judge of the first by the bill of performance; if it speaks of "overflows," a sure sign; the next, by the frequent mention of their "principles;" the third, by an appearance of honest indignation for the degraded state of literature; if they have these signs, they have a right to quarter the family arms. The poets of the day to whom I claim kindred, are numerous and select, but it is impossible to name them all; and the rest would quarrel with me if I were only to mention a few. On the church my family has conferred many shining ornaments.

* * * * *

As statesman they have been equally illustrious. There is scarcely one who has had the direction of affairs, or who has been in the enjoyment of office, with whom I cannot claim relationship. To my ancestors are we indebted for the blessings of the national debt, tithes, sinecures, pensions, rotten boroughs, and taxes, and for the glory we achieved in the war with America. Their descendants opposed the repeal of the Test and Corporation Acts—they opposed Catholic Emancipation, and they are now laudably engaged in opposing Reform. I have lost many great men, but there are many remaining to keep up the honour of the family name. While we can boast of such statesmen as Londonderry and Wharncliffe, such legislators as Hardinge and Peel, and such orators as Hunt and Wetherell, let us not despair. The members of my family may always be known in parliament by a superior patriotism, and a more frequent announcement of disinterestedness. They are above petty motives, they are superior to low desires. They undertake office for the good of their country, and dislike leaving their places, for fear the country might be a loser by the change. Indeed they are always

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

patriots, always virtuous, and always disinterested.

But there are others of my relations whom it would seem invidious to pass over. These begin life as the oracles of Select Vestries, are particularly partial to parish money, and patronize periodical feasting, as long as it continues at the expense of other people. They become members of corporations, and, as they have lately done at Bristol, shew themselves in a time of danger, with the same alacrity as at the time of dinner. To Sir Claudius Hunter and Sir Peter Laurie I am proud to claim relationship.

Few are aware how many of our public architects are of that distinguished race from which I am descended. Our ancestors lived in their dwellings of wood till they caught fire; but we, in this age of improvement, are enabled to live in our neat fabrics of lath and plaster till they fall down. Look at the villas of the Regent's Park!—are the mansions of Inigo Jones to be compared to them? View the modern churches—are not these pretty buildings far superior to the heathenish structures of Sir Christopher Wren? And why are these so—but because Mr. Nash and Sir Geoffrey Wyatville are my first cousins.

The medical practitioners have acknowledged the relationship by the extreme avidity with which they have undertaken to relieve the public from all fear of the Cholera. They have instituted Boards of Health, and introduced many other plans which sufficiently shew their anxiety to do honour to the race from which they sprung. Another very imaginative race of men, more familiarly known as auctioneers, I feel flattered in being related to. Many members of this respectable community have the happy art of transforming things apparently worthless to articles of extraordinary value. They seem to possess the philosopher's stone, and turn all that's brass, except their own countenances, into gold. Give them a ruinous building, of which the rats and the winds are the only inmates, and it will rise in a night, like the palace of Aladdin, into a splendid family mansion, replete with every convenience. But we have understood that the new properties vanish immediately they come into the possession of the purchaser, and are no more heard of. The art of painting things in their brightest colours was first discovered by one of my ancestors. The lawyers, again, from time immemorial, have been known as an illustrious branch of the "Humbugs." They are the same now as they ever were. They shew the same happy facility of defending either side of a cause, the same dexterity in leading their clients through the mazes of the law, till they have completely incapacitated them for any further arbitration. They possess the same love of justice, and the same ideas of its value.

I am happy to say that my family is now in a very flourishing state. I never read an advertisement, or a speech in parliament, but I am confident as to the source in which it originated. Every declaration of a member at the hustings is full of the family sentiments. All prospectuses, designs, proposals, manifestoes, proceed from the same source. Those interesting pieces of information in our public prints, commonly called "Puffs," are manufactured on the same principles; and Rowland's Macassar claims its full share of public notice, as well as the last fashionable novel. When the Russian talks of freedom, the Italian of patriotism, the Frenchman of sentiment, the Portuguese of glory, the Dutchman of taste, the German of religion, the Scotsman of modesty, and the Irishman of metaphysics; and when an Englishman prefers French *politesse*, and a *coutelette á la Maintenon*, to British hospitality and roast beef, there cannot be a doubt in the world that they belong to my ancient and respectable family—they are all "Humbugs."

W*.

LITERARY EXTRACTS.

VARIETIES IN HUMAN FOOD.

[*From a Treatise on Pulmonary Consumption, &c. By John Murray, F. S. A., &c.*]

Our real wants are few, but luxury has made them innumerable, and almost every thing that moves on earth, in the sea, or air, has been put in requisition, and devoured by that omnivorous animal, MAN; and though animal and vegetable life chiefly contributes to his support, we are informed by Humboldt that he discovered a tribe in South America, the Ottomaques, who subsisted partially on a species of magnesian and aluminous earth; and we find, according to Spix and Martius, that the natives of the river St. Francisco also eat earth: the soil there contains nitre; and boys and girls may be seen to eat the whitewash of the walls, and sometimes wood, cloth, and charcoal.

In South America, indeed, according to the same authorities, nothing in the shape of life comes wrong to them, for they eat serpents, lizards, and ounces; and Humboldt has seen children drag enormous centipedes out of their holes, and cranch them up. The negro children are as fond of a bit of rock-salt as those of England are of sugar-candy. The mere *catalogue raisonne* of substances used as articles of food or luxuries would occupy a volume.

Cannibals, or anthropophagi, devour human flesh. At Esmeraldi their delicate morceau is a roasted monkey. Puppies, on the Missouri and Mississipi, are choice food. Horse flesh in Arabia; elephant's flesh in India; camel's flesh in Egypt. The pariahs of Hindostan, attracted by the smell of putrid carrion, rush in crowds to dispute the mass of corruption with the dogs, vultures, and kites. The wild Bushmen generally devour their food raw. The natives of the Kurulean islands are very partial to bear's liver. The Chinese are not scrupulous in their choice; cats, dogs, rats, serpents, all are pressed into their *cuisine*.

Mr. Dobell, in his Travels in Siberia and China, says, "the Chinese eat frogs, cats, dogs, and rats: they are washed and prepared, as if they were the most delicate food; and their rice is always washed a dozen times, before it is boiled." The Kamtschadales use the fat of seals for oil and butter, and are often compelled to live on fish-oil, but they form it into a paste with saw-dust, or rasped fibres of indigenous plants. When the Indians of Asia or America take long journeys, and are likely to be destitute of provisions, they mix the juice of tobacco with powdered shells in the form of small balls; and this dissolving in the mouth allays the sensation of hunger. The negroes in the interior of Africa often subsist entirely on gum arabic; and we are informed by Hasselquist, that a caravan of Abyssinians, on their journey to Cairo, subsisted for two months on gum arabic. The crew of a vessel, also, destitute of provisions, were supported on gum senegal, of which article the cargo consisted.

The Calmucks subsist on *raw* flesh, and they are *ugly*: this is rather alarming to those who follow their example, and eat their meat *rare*, as it is termed, or half cooked, a few degrees removed from *brind*. An Esquimeaux dines on a whale or a walrus: and occasionally their dinner consists of an *old sack*, made of fish skins. We were told that, some years ago, when gas was unknown as a source of illumination, Russian sailors, at Leith, made no scruple to dip their sop, or morsal, into the train oil of the lamps. The Solan goose or gannet is sometimes cooked in Scotland, notwithstanding its effluvium is so overpowering that the process cannot be risked in an ordinary kitchen, but must be conducted either in an outhouse, or in the open air. Veal must be *blanched*.

The following is rather an odd bill of fare: one of the outposts of the French army, engaged in the taking of Algiers, killed two snakes and a lion, which were duly sent to the floating *Restaurant*, on the following day. The *Carte du Jour* presents the following items, in consequence of this supply: "filet de lion, sauté dans sa glace, matelotte de serpens, boa a la tartare, fraise de lion a la poulette, pieds de lion farcis, lion fraisé aux petits pois, &c." "We defy any one," says the author of Transalpine Memoirs, "to ascertain the real state of the Italian or French composées of the cuisine. At an inn, on the route from Sienna to Acquapendente, a *turkey*, whose neck was wrung towards evening, was served up, disguised as *bouille*, boiled beef, as a stew of turkey, and as a quarter of roast lamb." Very, of the Palais Royal, a celebrated Restaurateur, sports, if we remember right, upwards of 300 dishes on his *Carte du Jour;* a carte of this kind, containing 150 dishes, being put into the hands of a Londoner, he immediately returned it, saying, it must be a mistake, it was a *bill of lading*.

The natives of Tonquin, according to Dampier, give their friends arrack, in which snakes and scorpions have been infused. The Lotophagi lived on the lotus, while the Ophisophagie, and the Troglodites lived on serpents. The Kalmuc Tartars also feed on snakes, &c.; and the Syrians eat crocodiles. In the annals of Tacitus, we read of a man at Colonia Agrippina, whose favourite dish, like that of De la Lande, was spiders. Bear's paws, birds' nests, and sea-slug, are dainty bits; raw is esteemed superior to roast mutton, by the natives of Thibet. The inhabitants of Cochin-China prefer rotten eggs to fresh, so much so, that putrid eggs are rated thirty per cent. higher than fresh ones. Dampier tells us, that "the Indians of the Bashee Islands eat the bodies of locusts," and he, too, relished this species of food. The Tonquineze also feed on locusts, which are either fresh or pickled, sometimes broiled on coals. The inhabitants of Madagascar not only eat them, but prefer them to the finest fish. Rein-deer, and a kind of meal formed of pounded fish, are used in Lapland and Iceland; brind, still quivering with life, in Abyssinia; in Australia a good fat grub would be preferred to every thing

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

else; and in the West Indies a large caterpillar, found on the palm, is esteemed a luxury; while the edible nest of the Java swallow (hirundo edulis) is so rich a dainty, that the auxiliary ingredients of the dish will cost about 15*l*. In the Levant, the locust (gryllus cristata) is sold in the market as a chief article of diet.

In all these things the continent of Europe is not a whit behind the rest of the world, and displays feats which may well excite our "special wonder." Passing over such dainties as *sawer craut, olla podrida, caviar,* &c., France dresses up frogs and snails, con amore. *Frogeries,* and even *Viperies,* are necessary adjuncts to the mansions of the noblesse. The quantities of frogs we have seen in some of the markets on the continent, have excited in us the utmost surprise: in the market of Auxerre we had the curiosity to inquire the price of snails (helix promatia,) and found them rated at three francs (2s. 6d.) per 100; not long ago, indeed, seven snails were charged a franc at an inn in Germany. In Italy we have been served up the *pholas, echinus, sepia,* &., while "mine host" at Terracina asks his guest whether he prefers the eel of the hedge or that of the river. The astronomer de la Lande was remarkably fond of spiders, and would chuckle them up *sans ceremonie* whenever they came in his way; and a young lady, too, had a particular predilection in that way.

We conceive, however, that Great Britain in these excellencies far transcends her continental neighbours: not to mention the "braxy" of Scotland, which is putrid mutton, the sheep having died of the rot, it is notorious that game and venison are seldom relished till it is "high," or, in honest and faithful language, till it is a mass of putrefaction, and disengaging in abundance one of the most septic poisons the chemist knows of; in numerous cases it is a mass of life and motion, the offspring of putridity. Mr. Hunter, however, says that "boiled and roasted, and even *putrid* meat, is easier of digestion than raw;" so that these would-be epicures, who take their food after the manner of Abyssinians, do violence to this precept, while they who take *putrid* (in common parlance *high)* game, as *intenerated* (as it is called) meat, *i. e.* on the verge of putrefaction, are but a step removed. It is truly astonishing what the respiratory organs of some individuals can withstand. We remember having been once at an inn in Derbyshire, in what is commonly termed the "commercial room," when a dinner was brought in for a "traveller" about four hours later than we should select for that meal; *game* was one of the dishes, and so horrid was it putrescence, that, had we not thrown up the window and made our escape, we should certainly have fallen a victim—at least temporarily; but the experiments of Dupuytren, Chausier, and Thenard, are quite conclusive.

Though we know not that the monstroussized liver of the goose. an effect of disease, has yet found its way into the English *cuisine;* all the rack and the ingenuity of cruelty and torture have been exhausted, to supply the cravings of a depraved and degraded appetite, and one which human nature might well be ashamed of: the bull may be no longer "baited" for this purpose, but pigs are still whipped to death; lobsters are boiled alive; cod are crimped; and eels are skinned, writhing in agony; not to mention geese, which are duly nailed to the floor by their webbed feet, that they may repose and fatten; turkeys are crammed, and finally bled to death under the tongue; hares are hunted, and die in fevered inflammation, or, it may be, duly inoculated with the poison of hydrophobia, from dogs excited to madness by the chase. Now all these practised cruelties, though they may blanch the cod-fish, or tinge the lobster with ruby, excite inflammatory action in the animal suffering them, and inflamed surfaces evolve morbid or poisonous matter.

JOHN PHILPOT CURRAN.

WHEN Judge Robinson was on the bench, a dispute took place between him and Mr. Curran, on some point connected with a case then before the court. During the altercation, his lordship indulged in some sarcastic remark on the embarrassed circumstances of the young lawyer. The latter feeling indignant at the personality of the allusion, addressed him in the following words.

"My lord, when the person who is invested with the dignity of the judgment-seat, lays it aside for a moment to enter into a disgraceful personal contest, it is in vain, when he has been worsted in the conflict, that he seeks to resume it; it is in vain that he seeks to shelter himself behind an authority which he has abandoned."

Judge R.—"If you say another word, Sir, I'll commit you."

Mr. C.—"If your lordship should do so, we shall both of us have the consolation of reflecting, that I am not the worst thing your lordship has committed." Here this caustic dialogue ended.

Mr. Curran, it appears, being personally unknown to Mr. Abernethy, had visited him several times, without having had an opportunity of fully explaining the nature of his disorder. At length, he went with a full determination to obtain a hearing, and began his tale accordingly Scarcely had he commenced, before he was interrupted as usual; but instead of being intimidated, he fixed his dark piercing eye on the doctor, and thus addressed him:

"Mr. Abernethy, I have been here on eight different days, and I have paid you eight different guineas; but you have never yet listened to the symptoms of my complaint. I am resolved, sir, not to leave this room until you satisfy me by doing so."

Struck by his manner and intepidity, Mr. Abernethy threw himself back in his chair, and, assuming the posture of a most indefatigable listener, exclaimed in a tone of half surprise and half humour,—"Oh, very well, sir, I am ready to hear you out. Go on, give me the whole, your birth, parentage, and education. I wait your pleasure; go on." On hearing this, Mr. Curran, not in the least disconcerted, assumed a grave countenance, and proceeded as follows:

"My name is John Philpot Curran. My parents were poor, but I believe honest people, of the province of Munster, where also I was born, being a native of Newmarket, County of Cork, in the year 1750. My father being employed to collect the rents of a Protestant gentleman of small fortune, in that neighbourhood, obtained my entrance into one of the Protestant Free Schools, where I obtained the first rudiments of my education. I was next enabled to enter Trinity College, Dublin, in the humble sphere of a sizer."

In this manner, Mr. Curran continued for several minutes, giving to his astonished hearer a true, but irresistibly laughable account of his "birth, parentage, and education," as desired, until he came to his illness and sufferings, the detail of which was not again interrupted. It is scarcely necessary to add, that Mr. Abernethy's attention to his gifted patient, was, from that hour to the close of his life, assiduous, unremitting, and devoted.

SHAMPOOING IN INDIA.

THE comfort derived from the pressure of the hands on the limbs, by a clever shampooer, is alone to be estimated by those who have experienced the benefits derived from this luxurious habit, in a climate where such indulgences are needed to assist in creating a free circulation of the blood, which is very seldom induced by exercise, as in more northern latitudes. Persons of rank are shampooed by their servants, during the *hours of sleep,* whether it be by day or night; and if through any accidental circumstance the pressure is discontinued, even for a few seconds only, the sleep is immediately broken: such is the power of habit.

MONKEYS.

THE husbandman, whose land is in the vicinity of a forest, and the abode of monkeys, (in India,) secures safety to his crops, by planting a patch of ground with that species of grain which these animals are known to prefer. Here they assemble as appetite calls, and feast themselves upon their own allotment; and as if they appreciated the hospitality of the landlord, not a blade is broken, or a seed destroyed in the fields of corn to the right and left of their plantation. But woe to the farmer who neglects this provision: his fields will not only be visited by the marauders, but their vengeance will be displayed in the wasteful destruction of his cultivation.—*(Mrs. Hassan Ali.)*

THE MONKEYS AND THE ALLIGATOR.

IN the neighbourhood of Muttra is an immense jungle or forest, where monkeys abound in great numbers and variety. Near a village bordering this forest, is a large natural lake which is said to abound with every sort of fish and alligators. On the banks of this lake are many trees, some of which branch out a great distance over the water. On these trees monkeys of a large description, called Lungoor

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

gambol from spray to spray in happy amusement: sometimes they crowd in numbers on one branch, by which means their weight nearly brings the end of the bough to the surface of the water; on which occasion it is by no means unusual for one or more of their numbers to be lessened.

Whether the monkeys told their thoughts or not, my informant did not say, but the retailers of the story assert, that the oldest monkey was aware that his missing brethren had been seized by an alligator from the branch of the tree, whilst they were enjoying their amusement. This old monkey, it would seem, resolved on revenging the injury done to his tribe, and formed a plan of retaliating on the common enemy of his race.

The monkeys were observed by the villagers, for many successive days, actively occupied in collecting the fibrous bark of certain trees, which they were converting into a thick rope. The novelty of this employment surprised the peasants and induced them to watch daily for the result. When the rope was completed, from sixty to seventy of the strongest monkeys conveyed it to the tree: having formed a noose at one end with the nicest care, the other end was secured by them to the overhanging arm of the tree. This ready, they commenced their former gambols, jumping about and crowding on the same branch which had been so fatal to many of their brethren.

The alligator, unconscious of the stratagem thus prepared to secure him, sprang from the water as the branch descended, but instead of catching the monkey he expected, he was himself caught in the noose; and the monkeys moving away rather precipitately, the alligator was drawn considerably above the surface of the water. The more he struggled the firmer he was held by the noose; and here was his skeleton to be seem many years after, suspended from the tree over the water, until time and the changes of season released the blanched bones from their exalted situation, to consign them to their more natural element in the lake below.

(Ib.)

THE COLONIES.

The improvements in our Colonies constitute a topic, which, as it regards the literature of the mother country, may strictly be said to be new. While we have, from time to time, been admiring and wondering over the grand schemes of other nations for their internal improvement, we have been entirely unaware that undertakings of far greater magnitude have been going on in our own colonies, than the most splendid in Europe, since the abdication of Buonaparte;—undertakings which are not to be surpassed even by those of the United States.

A college, not inferior to any seminary in the United States in point of edificial grandeur, has been recently erected in the small island of Guernsey. The whole continent, within the same period, cannot present the establishment of any institution for the benefit of the people equally superb. This was effected on the means of an ancient endowment by Sir John Colborne, the late governor.

In Nova Scotia, under the patronage of Lord Dalhousie, another college, upon a large scale, has also been established. By a bequest of a Mr. M'Gill, the means for establishing a third college of princely magnifience, in Montreal, have been provided. And for Upper Canada a truly royal endowment has been procured from the crown by Archdeacon Strachan of York, in that province, for a university, upon a scale worthy of the ancient founders of the colleges of Oxford and Cambridge. The expense for the building of this college is not estimated at much less than that of King's College, London.

Since September, 1824, a Roman Catholic church has been erected in Montreal, which, for magnitude, has not a parallel in all the ecclesiastical structures raised in Christendom since the denunciation of the Jesuits. It is calculated to contain ten thousands persons; is adorned with six lofty towers, three on each side, and the two on the west front will, when finished, be nearly as high as those of Westminster Abbey. The eastern window at the high altar is sixty-four feet in height: that of York Minster is, we believe, not more than seventy-two. In point of ornament and curious carving, such as adorn the cathedrals of the old countries, it is certainly interior; but in distant effect, from its situation and its towers, it is equal to any of them.

VAN DIEMEN'S LAND.

CONSUMPTION OF SPIRITS.

The population is a fraction more than 20,000 souls, and the annual consumption of ardent spirits is from 80 to 90 thousand gallons, which gives the proportion of Four Gallons to each individual being, whether free or bond, man, woman, or infant at the breast! Shall we wonder, says the Hobart Town Courier, that distress should prevail in our colony after this, compared to which a good or a bad crop in the ensuing harvest is but as straw scattered before the wind! Shall we wonder at the Sheriff's and Court of Requests' executions for debt, or at the 200 cases of unparalleled distress with which the present three-fold accumulated term of the Supreme Court, covers the walls of the Registrar's office?

AGRICULTURAL SUFFERING.

It is with much regret we announce the direful effects of the last week's morning frosts on almost all the farms in the central and loftier parts of the interior. Whole fields of many acres of wheat, just opening into bloom, have been completely destroyed, and the unfortunate owners are now mowing them down for hay. Indeed, it is only in the more sterile and unproductive parts that the crop has at all, and that partially, escaped. In our little annual for the present year, we have devoted some pains to the consideration of this drawback on the prosperity of the agricultural settler in this Island. and of the best means of obviating and preventing it. In all low and fertile situations where the incumbent frosty vapour is apt to settle and where the stalks and blades are most juicy and luxuriant, the destruction is certain; while the stronger fibres and hardier culm of the poorer soils, in some measure withstand it.—*(Hobart Town Courier, 1st Jan. 1832.)*

CHRISTIANITY NOT A RELIGION OF WORDS AND CEREMONIES.

(An Extract from the Christian Observer, March, 1832.)

It is recorded of the Honourable Robert Royle, that he never mentioned the Divine name without taking off his hat. This was very well in *him*, because this act of external or manual reverence was not belied, but supported, by his general habits. But many a copyist might uncover his head—and do nothing better. It is indeed told of Dr. John Campbell (the statistical writer) that he never passed by a church without removing also *his* hat, but he never went into one, and he was a regular devotee to wine.

Christianity cannot be a religion of words and ceremonies. But Romanism *can* be; and I have often wondered that Protestants of serious and sagacious minds, should not be aware how nearly they symbolize with their opponents in verbal devotion. Among the Papists every thing is rubbed over with the varnish of their religion. Among the ships captured, I think, at Trafalgar, were the Santissima Trinidada, and the Salvador del mundo. If these nominalists discern a cluster of islets, they are called the virgin islands; if a single island, it becomes Trinidad. In coasting along a new continent, they double a cape, and name it Spirito Santo. They build a town and term it valparaiso. The neighbouring bay is distinguished by the appellation of conception. Some of the rivers are canonized under the patronage and names of favourite saints; and vera cruz is seen to designate some promising colony

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

The Latin chivalry is consecrated after a like fashion. There are the orders of St. BENTO D' AVIS, St JOACHIM, our own St. GEORGE.—I wish we were *well rid of him*, and of a thousand other demi-gods and deified heroes, successors of the *dii minores* of the heathen world;—and lastly, the Gallican order of St. ESPRIT, which is, indeed, the climax of this polluted and profane system. As to the emblem of the cross, and the I. H. S. usually attached to it, they are crowded thickly over the whole machinery of mystic Babylon. They are embroidered on the Pope's slipper, to apologize for the kissing of his toe; and they blaze in vast proportions in his basilicas and monastic establishments I doubt not that they are stamped upon every rack, thumbscrew, manacle, and stiletto in the inquisition; and shew themselves, in short, in every nook and corner where the evil genius of antichrist rears its dark and sanguinary shrines. The names of several of our own colleges are relics of the self-same system. In both Universities we have TRINITY, JESUS, MAGDALEN, and CORPUS CHRISTI; at Oxford, ALL-SOULS and CHRIST-CHURCH; and at Cambridge, CHRIST'S and EMMANUEL * These appellations have been supposed by surface theorists, to indicate "the piety of our ancestors." It would be nearer the truth to call it fraud and ungodliness. The feudal mottoes of several ancient families originated in the same periods, and from similar causes. ESPERANCE EN DIEU is combined with the heraldic splendour of the Percies. Lord Waterford displays NIL NISI CRUCE; Lord Lucan, SPES MEA CHRISTUS; the Wellesleys, PORRO, UNUM EST NECESSARIUM; and Lord Glengall, the plain English of GOD BE MY GUIDE. With these devotional mottoes, and of which there are numerous other examples, their present possessors have no concern further than as having found them on their family escutcheons.† They appear on the superb equipages which crowd nightly to the doors of the Opera house and of St. James's-street, as well as at some fashionable chapel on Sundays.

SAYINGS IN CONVERSATION.

"Did you see the abuse of you in a scurrilous Sunday paper lastweek?" said A. "No, and I never care for such things," replied L.; "for though a calf's tongue may be rough, it is but a calf's tongue after all."

"X. is so very close," it was observed, "he will squabble about a single farthing." "Well," remarked W., "I have always thought that the less one squabbles about the better."

"That fellow ****," said W., "with his princely fortune, is so over-burdened with wealth that he does not know how to spend it." "Yes," remarked J., "he is evidently living in a state of great pecuniary embarrassment."—"Waiter, snuff the candles," exclaimed the same witty person; "these wicks are fort nights."

"How do you think Lacy has done the Devil, at Covent Garden?" asked one of a coterie assembled as usual at the Garrick after the play. "Why," replied the punster, "he has done like a very Greek—by shewing himself to be quite a Lacy-demonian."

* Emmanuel College was, however, founded in 1584, by Sir Walter Mildmay; who, I believe, placed the Chapel north and south, from disrelish of the customs of the papal founders. The buildings are erected upon the site of a Dominican convent. Queen Elizabeth said to Sir Walter, "I hear you have erected a Puritan foundation." "No, madam; far be it from me to countenance any thing contrary to your established laws; but I have set an acorn which, when it becomes an oak, God alone knows what will be the fruit thereof." (Fuller's History of Cambridge, 1655, p. 147.) The acorn vegetated luxuriantly, and produced from the young stem of its oak Bishops Hall and Bedel; Chaderton, one of king James's translators; Preston, Cudworth, Culverwell, Marshall, and Wallace the geometrician; all these in its first seventy years.

† It is observable that the Duke of Wellington's motto is changed into *Virtutis fortuna comes*. The text, *But one thing is needful.* is retained by Marquis Wellesley, Lords Cowley and Maryborough; and I believe, by Mr. P. T. L. Pole. Their family name, in my remembrance, was *Wesley*. Charles Wesley, brother of the founder of Methodism, declining to become the heir of a name sake in Ireland—Mr. Garret Wesley—the property once intended for him, was inherited by the first Earl of Mornington, grandfather of the Duke of Wellington. The original name, coupled with the original motto, may create a smile, and call forth some unavailing wishes.

To the Editor, &c.

Dear Mr. Editor,—I was tormented to death last night with the tooth-ache; the only momentary cessation of pain I experienced was while I composed the following conundrums, and laughed thereat.

What street in London puts you in mind of a tooth which has pained you for any length of time? *Long Acre!*

When should you apply a *sovereign* remedy to your tooth? When it is *a-king!*

By what ejaculatory exclamation would you declare that your tooth pained you? It aches *by gum!*

Why does an aching tooth impose silence on the sufferer? Because it makes him *hold his jaw!*

To what town in Poland should you go to have it extracted? *Pultusk!*

Which of your teeth are like a mantua-maker's fingers and thumb when she is cutting out a dress? *In-cisors!*

When do your teeth usurp the functions of the tongue? When they are *chattering!*

Why is it, then, not to be wondered at that your teeth cause frequent disturbances in your mouth? Because they often make there *more than one row!*

But the con. which gave me the greatest delight, and after the making whereof I was so satisfied with myself, as to have well-nigh fallen asleep and forgotten my pain, was the following highly-classical conception:

When does an aching tooth put you in mind of Paris, with his bow and arrow, giving Achilles his mortal wound? *When it shoots in the Temple!* Ha! ha! ha!

20th March, 1832. G. N. BROWNE.

ORIGINAL SPECIMEN OF A VALENTINE.

Dear Mr. Editor,—I was yesterday very much surprised, on putting on a a pair of lambswool stockings, to find a small hole in the heel of one of them darned with brown silk; I, of course, wondered much at this phenomenon; and for the whole day, and the greater part of last night, I was racking my brains to discover what my laundress could mean by such a freak. The enclosed Valentine, which I received this morning, explained the mystery; and as it may perhaps amuse some of your readers, I take the liberty of sending you the original, as received.

I am, &c.

G. N. BOURNE.

Feberrey 14.

my dare friend, i hav ben a long tim a tacked too u but nevver dust diskover the tender pinching, as the french call it, in my brest for u—however this is *lip* yare and laddies may say what they lick, I am detarmined no longar to keep the sickrat in my buzzum, for when I am allone I mourn my fat as the tender turkeydove duz her lost Mat and whips micelf at such a rat that I fair my grif will bring me to my graf before my Tim—My murther his Now out! and farther is not near so I seize the hopportunitea to teacup my Pin to scratch these fue lines to you, and O! my Deer my Hart Doe jump as i duz so—i Get on slowly as I hav only a Still pin which sleeps threw the paper every minuet—i Hav no other pin but a quill and no pinnife sept farther's racer which is locked up in the Tickhaddy

U may wunder hoo your Crossponder is like, I ham a tal gal my fetters are good tho pitied with the small poghckes, I ham allso considered a sharp gal for my Edge witch is nintin i Ham allso A very good skoldhard at buck noleg and i Ham very fond of Reading Bucks sept that i cant get not none to read sept the Tims noozs pepper witch Bob the pot boy brings actionally with the Bear sept when we get Hale at the Hintermidyat shopes

i duz love to see men lick u with grate wisecurs Hit givs them the grand marital luck of han Off fie Sir Hand ho! if u wood cut mee hof a bite of your ear!! i Wood put hit in a Lowc at and keep hit for your sack

Hi Ho i size wen i Thinks you nose not hoo I Ham and Hit duz not biccum a moddast Gal to speck out too plainlie But praps u Will find Mee howt wen I tell u *that yore Lam's ool stockings No 3 ad a littel ole in the ele last Wick witch is now mendead with brown silk!!* Now gess me howt if you can

hopping fat will Won day bring huz tugeither I must konklude this Hepistol but before it goes Hoff I will finish with a spech witch I urd at the Theehater last nit made by the Hairyone of the Play to her Bo

When wee shall be untied at the oly Halter in the
Bonds of Highmen New Flowers of weeded Loov
Will Shout up bellow hour feet evry day
Hall the Hills of life will be made smooth
And We shall see nothing but, a pye nest,
before us.

JULIA ——

if you wish to send a handsaw to this letter if you *put it in the toe off one off your stockings goin to the wash, your julia* will get it

THE FIRE-WORSHIPPERS.

AT a distance of ten miles from Baku, on the Caspian, is a place called Ateschjah, or the abode of fire. As we approached it, we distinctly traced a sulphurous smell, which became perfectly unbearable when we were close upon it. The smell spreads over a circuit of six or seven hundred yards, and in the centre of the Ateschjah, when the weather is dry, a long flame, of a bluish white colour, the intensity of which increases during the night, is seen to rise.

At some distance from the fire, but on the same sulphurous soil, Indians of the Gheber religion, or fire-worshippers, have erected little dwellings of stone. The earth enclosed between the walls is covered over with a bed of white clay, a foot thick; but openings, closed with a plug, are left here and there. When an inhabitant wants a fire for his kitchen, or a light during the evening, he raises up one of these plugs, holds a lighted brand before the opening, and the flame immediately shews itself. Whatever may be the dimension of the aperture, the flame possesses the same diameter, but its height and heat increase in proportion as it has greater room to play. If we hold our hand before the current of air which exhales from it, after the flame has been put out, without shutting the hole, a great heat is felt; the skin reddens and puffs up; and the same effects are produced as in sulphurous vapour-baths.

During the night, and in order to obtain a light which may reach to the height of the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

objects at which the people are working, they make small holes in the ground, and insert reeds, the interior of which has been previously steeped in lime water: in this way, whenever they wish, they produce a current of inflammable air, which affords a flame six inches high, with a bright and equable light. The poor Indian weavers, who inhabit the place, light both sides of their looms by this means, nor have they any further trouble in procuring and renewing their light. Every other fire is useless to them, for the heat of this one is so great that it forces them to keep the door and windows open. It is extremely dangerous to light a wood fire in any other spot; indeed, lamentable accidents have already occurred from the sudden inflammation of the aërial fluid. This gas is also portable; the Ghebers send bottles of it into distant provinces of Persia, and the contents retain their inflammability for whole months afterwards; of which advantage is taken by the priests to work upon the superstition of their followers. The inhabitants of Ateschjah keep lime ovens to consume the bodies of their relations after death. This sulphuretted hydrogen vapour, or inflammable gas, the artificial production and use of which is spreading all over Europe, has been for centuries furnished by nature to the natives of these countries. Travellers have for ages gazed at this phenomenon, without thinking it possible for man to imitate it; or bethinking them of taking a leaf out of Nature's lexicon!

Besides this, there is another in the environs of Baku which seems to be purely meteoric. After the warm showers of October and November, and when the evening is hot, all the country appears to be in flames. The fire frequently rolls along the mountains in enormous masses, and with incredible swiftness. Sometimes it remains motionless. In the autumn also, when the moon shines bright, a light of brilliant blue colour illumines all the western horizon: the mountains of Soghtoku is often resplendent with similar fires; but they do not extend into the plain. If, on the contrary, the night is dark, innumerable jets of flame, sometimes insulated, sometimes in large masses, cover the low parts of the country, and in this case the mountains are involved in darkness. This fire is not incandescent; and if you should find yourself in the midst of what has the appearance of devouring flames, you will not experience the slightest sensation of warmth: even hay and reeds remain uninjured. One traveller observed, that during these fantastical conflagrations, the empty tube of his barometer appeared on fire; and he consequently inferred that this phenomenon is probably of an electrical nature.

This small district seems every way calculated as an asylum for the remnant of the unfortunate disciples of Zoroaster. Indeed, were we ourselves as well supplied with natural fire, and surrounded by the magnificent spectacle of these igneous wonders, we might be in some danger of becoming Ghebers in our own persons, and boast ourselves of that

"Impious race,
Those slaves of fire, who, morn and even,
Hail there Creator's dwelling place
Among the living lights of heaven!"

(*Harkness.*)

PRAYER.

Go, when the morning shineth,
Go, when the moon is bright,
Go, when the eve declineth,
Go, in the hush of night;
Go, with pure mind and feeling,
Fling earthly thoughts away,
And, in thy chamber kneeling,
Do thou in secret pray.

Remember all who *love thee*,
All who are loved by thee,
Pray, too, for those *who hate thee*,
If any such there be,
Then for thyself in meekness,
A blessing humbly claim,
And link with each petition,
Thy great Redeemer's name.

Or if 't is denied thee
In solitude to pray,
Should holy thoughts come o'er thee
When friends are round thy way:
Even then the silent breathing
Of thy spirit raised above,
Will reach his throne of glory,
Who is Mercy, Truth, and Love.

Oh! not a joy or blessing
With this can we compare,
The power that he hath given us
To pour our souls in prayer!
Whene'er thou pinest in sadness,
Before his footstool fall,
And remember in thy gladness,
His grace who gave thee all.

(*Edinburgh Literary Journal.*)

A College for Working Men established.—It is understood, that part of Mr. Owen's Plan for Removing the Causes of Ignorance and Poverty, is the providing of working men with habitations in a building, where a great number may reside together. The experiment, we believe, will shortly commence in the Bazaar in Gray's-inn-lane, which is to be bought by the association set on foot by Mr. Owen. Not only are the immates, however, to live under one roof, but to work together, and for their own benefit alone, without the intervention of a master, while a farm is to be taken in the country, which the children of the cooperators are to cultivate, as a pleasant relaxation from the fatigues of study! The whole might be set down for a benevolent day dream, but that the subscriptions of the public are requested.

SELECT NOTICES.

In Tait's Edinburgh Magazine for March, (a new periodical of great ability,) there is a sentence which explains the planter's hostility to the Missionaries, and indeed the actual anomalous condition of slavery in the West Indies; the rebellion, observes the writer, was not the work of any one class of Missionaries, further than this, that they have contributed to enlighten the minds of the Blacks, and that EVERY STEP IN KNOWLEDGE UNFITS MAN FOR SLAVERY.——*The Lady Chapel, St. Saviour's, Southwark.*—This elegant design of early pointed architecture, as a precious relic of antiquity, has been preserved from the demolition of the purse-proud shopkeeping mob of St. Saviour's parish, Southwark. Happy are we to find, that their barbarous proposal to raze it to the ground, has been counteracted by the manly, laudable spirit of the intelligent portion of the parish, who by their successful resistence to an odious spoilation, have rescued the character of the country from eternal shame.——*Dutch Costume.*—The females residing in the dominions of the *wisest King of the Continent*, have adopted a national costume. The idea was first suggested in the "Euphrosine," a periodical journal, which is conducted by a coterie of women at Amsterdam. The dresses are wholly Dutch; and are of course, extremely tasteful. The dress consists of a tunic of silk, or any other material, striped red and blue, and corsage velvet.——*Electricity.*—An Italian savant has obtained from the common magnet a spark similar to that of electricity. This discovery may possibly lead to some important results with reference to the needle and the Aurora Borealis.——*Fiddling to purpose.*—Paganinni acknowledges to have cleared £22,000 by his visit to England, "*notwithstanding our state of suffering.*"——*The English Language.*—Clubs have been recently formed in all parts of Germany, for the purpose of promoting the diffusion of English literature. Most of the British popular works are already printed there in a very cheap form.——*St. Simonians.*—This sect is making rapid progress in France, and is indeed but another name for the worshippers of the Goddess of Reason, set up during the period of the former Revolution, is about it is said to dispense with the necessity of the marriage ceremony altogether. [*This is nothing new. In ten thousand instances this sacred institution has been dispensed with during the last fourteen years at the Cape of Good Hope,—the Presbyterian Colony of the Cape of Good Hope!*]——*The Landers.*—The audience given by the King, at Windsor, is said to have been most kind, intellectual, and interesting. His Majesty (whom God preserve!) continued his enquiries relating to the river Niger, for a length of time, and took notes of the conversation. Many branches of the Royal family were, on this occasion, present. The Landers are extremely popular in England, and their amiable *Methodism* is more than tolerated.——*Lady Hester.*—Lady Hester Stanhope still resides at the monastry of Abra, in Syria. She may be regarded as the virtual Queen of Palmyra. Her usual dress is that of a Prince of the Bedouin Arabs, of the most splendid description. She receives no English travellers, but to foreigners she is exceedingly hospitable. Her religion is said to be Mahomedan! She lives wholly in the oriental manner, surrounded by a vast number of slaves. She is the niece of William Pitt, and grand-daughter of the great Lord Chatham.——*The Fathers of the Church.*—The most eloquent of such was St. John, surnamed by his eloquence "Chrysostom," who was archbishop of Constantinople about the latter end of the fourth century, (398.) By his wisdom and prodigious eloquence, he converted a dissipated and luxurious capital, into a general temple of religious devotion. When he preached, the theatres and circus was abandoned. His works are numerous; his treatise on the priesthood is a noble and eloquent production.——*Burnet's History of his own times.*—In the Lansdown Library there is a copy of his work, with remarks on the margin in the hand-writing of Swift. We select one or two specimens, p. 163, Burnet, (speaking of the *Paradise Lost*) "It was indeed the *beautifullest and perfectest* poem that ever was writ, at least in *our* language." *Swift.* "A mistake! for it was *in English.*"—p. 227. "It seems, that the French made no great account of their prisoners, for they released 25,000 Dutch for 50,000 crowns" *Swift.* "What!" ten shillings a piece! by much too dear for a Dutchman!"——*The Philanthropic Cotton Manufacturer.*—When Watson, the Bishop of Landaff, published his immortal work the "Apology for the Bible in 1796, the deservedly celebrated David Dale, of New Lanark, asked and obtained permission to print 3000 copies at his own expence to distribute among his own workmen, which were distributed accordingly.——*The late Archdeacon Daubeny.*—This celebrated controversialist, although a bigoted ultra in church affairs, was nevertheless sound at heart. He was an early riser, and usually passed the "hour of prime" in his garden, where he was wont to sing the morning hymn. His maxim through life was, that "he could not be idle," and would "not be useless," that he must work as long as he could, and wished "to die in his harness." In this respect his wishes was gratified; he continued busy till the last, and died after a few hours illness at the age of four score.——*Military Flogging.*—This subject has been recently brought before the House of Commons. Sir John Hobhouse declared that his feelings were as yet unchanged by office, and that this foul and revolting stain upon the armies of England, would be of no lengthened existence.——*Leigh Hunt.*—With no regard for his principles either political or religious, we lament his misfortunes as a man of talent. Many of his poems are extremely beautiful, and his "*Lord Byron and some of his Contemporaries*," is a work of great merit and amusement, in spite of all the opposition of the Byron devotees towards its disparagement. To relieve Hunt from his difficulties, it is intended to publish in a handsome volume, price one guinea, a collection of his poems, revised by himself, with notes and additions. The plan has been sanctioned by the following

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

list of celebrated names, Lords Dover, Gower, Holland, Mulgrave, and Russell. Messrs. Swinburne, Bulwer, Hawkins, Macauly, Sheil, Barnes, Bowrig, Thos. Campbell, Thos. Pringle, Coleridge, Coulson, Cunningham, Godwin, Hogg, Hood, D'Israeli, Jerdan, Knowles, Lamb, Landor, Luttrell, Ritchie, Southey, Turner, Rogers, Roscoe, and Wordsworth ——From the last census it appears that the population of England, Scotland, and Wales, is 16,537,398. Now the average of deaths in proportion to the population, as ascertained by the returns for England, is as one in fifty-four annually; or, in other words, the total of the burials is about 306,433 in a year, or about 840 in a day. The number of those who have been said to have died of the cholera in the last four months, and we may now add of cases "anywise resembling," is only 1,927, or a little more than the total amount of two days deaths througout the country. And it must be recollected that the large proportion of those who have died of cholera were persons who from their state of body and habits of life would have fallen victims to other diseases. In some few instances, where the returns from that and other causes, during the same months have been procured, and compared with the returns of mortality of previous years, it turns out that there is no additional mortality in consequence of the cholera. Why is not the precise increase or diminution, as it may be, of of the mortality speciged or regular set forth in the tabular returns of the board of health.—— *Fortune's Favourites.*—There some men who are fortune's favourites, and who, like cats, light for ever on their legs. Wilkes was one of these didappers, whom, if you had striped naked, and thrown over Weaminster Bridge, you might have met on the next day, with a bag-wig on his head, a sword by his side, a laced coat upon his back, and money in his pocket.——*How to turn the Brain.*—Nothing is so likely to turn the brain as intense application directed to one of six things: the quadrature of the circle; the multiplication of the cube; the perpetual motion; the philosophers stone; the judicial astrology; and magic. ——*Remedy for the S ing of a Wasp.*— Press the pipe of a key upon the part stung, for a minute or two, when the pain will cease, and the swelling disappear.——*Tailing a Lawyer.*—Oglander, in his Memoirs of the Isle of Wight, wri-ten in 1700, gives the following record:—I have heard, and partly know it to be true, that not only heretofore was there no lawyer nor attorney in the Wight, but in Sir George Cary's time. 1588, an attorney coming to settle there was, by his command, and with a pound of candles hanging at his breech, lighted, with bells about his legs, hunted out of the island.——*Transport of Edifices.*—In May last, M. Gregori alluded to a circumstance mentioned in a late number of the "Journal des Artistes," of a rock of granite, forty-two feet long and twenty-seven high, having been transported from the Bay of Finland to St. Petersburgh, to serve as a pedestal to a statue of Peter the Great. He stated that a much more remarkable fact had occurred at Crescentino in 1776, when a common mason, named Serra, succeeded in transporting a brick belfry, which he had contrived to cut from its base without injuring the walls, from one church to another, at a considerable distance. Wile it was being moved a man inside rang the bells. A model of the machine employed in the transport was deposited in the library of the Institute.——*A Counsel's opinion of the folly of going to Law.*—Mr.——— being in company one day, after he had retired from practice, the glorious uncertainty of the law became the subject of conversation. He was appealed to for his opinion; when he laconically observed, "If any man was to claim the *coat* upon my back, and threaten me with a law suit in case of a refusal to give it him, he certainly should have it, lest in *defending* my coat, I should find out, too late, that I was deprived of my waistcoat also!"——*An Agreeable Antagonist.*—We are never so well pleased with an antagonist, as when he makes an objection to which we are provided with a good answer.

CAPE OF GOOD HOPE.

NOTES OF THE MONTH.

(By Vivian.)

AN HISTORICAL FRAGMENT of the COLONY.

("Evil-disposed or ignorant Persons")

(Vide Ordinance No. 90.)

MUCH of our duty as public journalists consists, in gathering up the Fragments of history, and despositing them in our archives. On the 8th ultimo (thanks to His Excellency the Governor in Council,) the old *Cape Gazette*, became the most spirited Journal in the colony, and in answer to the prayers of a church-going people, delivered His Majesty's loyal and dutiful subjects, from the

"Conspiracy and rebellion"

of the "evil disposed or ignorant" of the community, and happily restored that public confidence in the Goverment, which in some small degree had been probably shaken.*

The moral of the story is as follows. His Majesty the King in Council having determined to dispense a larger measure of justice to his greatly-injured subjects in this colony, who are at present held in Slavery, many holders of such Slaves (considering them in no other light that of "goods and chattels,"—bought and sold at public sale, along with tables and chairs, horses, oxen, and pigs, at the pleasure of the slave-master,) became highly incensed at this humane interference of the Sovereign, and led on by certain persons in Cape Town, positively defied the King's Prerogative, They subscribed to and published a manifesto, in which they declared, that should the contemplated Ordinance of the Governor appear, they would resist "the due execution of the laws." Hence the timely appearance of Ordinance No. 90. The names of the "evil-disposed or ignorant persons" who followed "a line of conduct so injurous and dangerous to themselves and the community" are thus alphabetically arranged.

* Thankful as we are for the interference of good government, (in *mercy* to the disaffected,) yet we do really think, too much has been made of this ridiculous affair. Gascons are Gascons all the world over, and the African is well known to be well versed in the school of boasting. It is true, that in the list of names we discover certain Field-Cornets (unworthy their post,) sundry Heemraden or recently such, (more shame to the Kirk,) and a few persons cornected with official station or the *Pension List*, (which latter requires weeding,) yet the majority are an extremely unlettered herd, some of whom being scarcely able to make an intelligent use of pen and ink. Many are also very young,—the farmers boys, who were induced to a treasonable act, by their advisers. It is extremely hard that the Cape should suffer, from the threatenings of individuals so ignorant and obscure; that our liberties should seem affected by the conduct of such persons—but we check ourselves—

"Laws are made for the *bad* not for the *good*."

The truth is, Ordinance No. 90 was called for—the conduct of the *malecontents* had closed up the avenues (or attempted to do so,) of our public improvement. Such intemperate people are like those Africans, who, as Mungo Park tells us, let down a crate or wicker trap, upon themselves and the lions they were attempting to ensnare, when every soul was doomed to death by his own folly. To none other than the "evil disposed" is the new law applicable. The persons are happily a very small minority, for we must not forget that among the subscribers to "dangerous opinions" in the list above, there are none from the village of Stellenbosch, none from Klapmuts, Moddergat, Hottentots Holland, Earste River, or Malmsbury. Then again, look at the loyal inhabitants of Tulbagh, Worcester, Caledon, Swellendam, George, Uitenhage, &c.

THE CAPE ASPERSED.

THE false representations of the *South African* as it respects the state of this improving British Colony, have travelled abroad, and the Editor of the *Hobart's Town* paper has very sillily given a place in his columns to the following paragraph.

Dec. 1831. The prospects of the Settlers at the Cape of Good Hope were of the most gloomy description. An *intelligent writer* [oh! oh!] in the "South African" says:—"The colony is now like a bankrupt, at the mercy of his creditors; our certificate of Rehabilitation would be a House of Assembly [nimmer! nimmer!] until that or something like it, is granted, it would be folly to recommence the world. Long and dear bought experience must now convince us, that to be wisely governed by gentlemen at seven thousand miles distant, is impossible."—*Pshaw!*

LECTURES ON SCIENCE.

A series of lectures on Science is announced for delivery at an early period, to take place in the Meeting Room of the South African Institution. Tickets of admission for individuals Rds. 15. For families Rds. 20, The lecturer is not named, but we presume the gentleman who is to explain "the causes of observable movements" is Dr. McCartney. The subscription list will no doubt be filled up for the sake of the Institution, but we think the situation highly objectionable, and will prevent *the people* from any participation in the benefit of the lectures. The Commercial Room with its comfortable fires, lighted lamps, and other accommodations, are perhaps better adapted to the convenience of the inhabitants. To be sure Looyer's-plein may suit a select number of persons who have carriages. Who else would adventure to the far distant situation of the intended place of lecture through the cold, rainy, dark winter nights of the present season?

"WE POOR FARMERS."

Extract from a traveller's Note Book of 1832, *(April and May.)*

"I have just returned from my pleasant trip to Graham's Town and the frontier My residence at the Cape has been during a course of very many years, and often has it been my lot to witness in past times fluctuations in business and colonial distress. I record it in my journal of this year, that I have never beheld things in general wear a more promising aspect. It was not my *good fortune* to be born in Great Britain, but I am thankful for the privileges of a British subject. I mention this, in case it should be asserted that I am *partial* in my regards, when I state from conviction, that our present prosperity is to be attributed to the presence of the British Merchants and British Settlers (whether lay or otherwise) in the Cape Colony. * * * During one of my sojourns in the course of my late tour, I was amazingly surprised one evening at a farm house in the *Long Kloef*, (George,) on witnessing the evening return-home of immense flocks of Turkeys, Geese, Ducks, and poultry of every description. The whole of these as they passed in regimental order before me, so excited my wonder as to lead me to exclaim to the worthy farmer, "My good friend! for what market are all these creatures intended?" "Market!" replied the farmer, "no market at all. Now, Mynheer, you see for yourself what we poor farmers in the country are obliged to put up with,—we have nothing else to eat!!"

THE SOUTH AFRICAN INSTITUTION,

18th June.—The Anniversary Meeting,

Mr. VON LUDWIG, in the Chair.

THE Report detailed the proceedings of the past year, which was ordered to be printed A reference having been made in the Report to the publication of the *Quarterly Journal of the Society*, for the support of which an ample subscription patronage was provided by the public, we may remark the singularity of the circumstance, that although six numbers have been published only No. 3, of 1830, had reached London in April, 1832. After distinct notices of the various articles in No. 3, *The Philosophical Magazine* of London says "On the whole we cannot but deem the South African Journal a very useful work, and it has our warmest wishes for its success. We would suggest, *however*, that the occasional introduction of *condensed* views, (such as Dr. Smith must be fully competent to furnish,) of some of the important researches and *reforms* of science proceeding in Europe, and detailed in our Scientific Journals and Transactions of Societies, would considerably augment its utility to the investigators of nature at the Cape, by tending to preserve them from the *errors* and inconveniences which to some extent are inseparable from the centres of scientific knowledge in Europe."

SOCIETY FOR PROMOTING CHRISTIAN KNOWLEDGE.

Patron, His Excellency the Governor; *President*, Rev. Geo. Hough, A.M.; *Treasurer*, Hamilton Ross, Esq.; *Secretary*, Rev. E. Judge, A.M.

The Annual Report has been just published. The number of Books sold and distributed since the last Report, appear to be as follows:

Bibles, ...	72
Testaments, ...	40
Common Prayer, . .	96
Books and Tracts, . .	617
Total . .	825

Number of *Children* in connection with the Society, 242. *Subscribers* in Cape Town, 20—Port Elizabeth, 7. Annual *Receipts*, 1831 2, Rds. 1247 : 6 : 5; *Payments*, Rds. 1117 : 2 : 5. Balance in hand, Rds. 130 : 4.

"The Committee trust through the persevering endeavours of the Society, "the children of our poorer countrymen in Town, and such of the Free Black and Slave population" as regularly attend the Society's schools, "may be *retained*, and attached to the solemn Ritual of our National Zion, and her sacrifices of Adoration and Prayer."

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

"WHAT'S IN A NAME?"

An Australian paper, by the late arrivals, says, "among the natives there are the usual multitude of Jacky's, Bobby's, Tommy's, and Jemmy's:—

"All men exceedingly remarkable at times,"

as well as the more grotesque appellations of Needle, Potatoe, Spider, Harlequin, Cobbler, Dandy, with Monday's, Friday's, and Saturday's, whose *fair* spouses have adopted the gentler names of

Jenny, Nanny, Peggy, Molly,
Sophy, Susy, Kate, and Polly."

We beat the Australians hollow in our selection of names. Whatever be the condition of the slaves at the Cape, it must be acknowledged in justice to their *owners*, that dignified names are invariably awarded to their "goods and chattels." For example we have among the males

Adam, Abel, Andrew, and Amos,
David, Solomon, Peter and Paul,
Isaac, Jacob, Moses, and Thomas,
Abraham, Benjamin, Gideon, and Saul.
Aaron, Absalom, Felix, and Matthew,
Ephraim, Esau, Mark, Luke and John,
Philip—Simon, Job, and Bartholomew,
Simeon, Enoch, Zaccheus,—Sampson.
Apollos, Cornelius, Joshua, and Gabriel,
Gideon, Jephthah, *Joab*, and *Joel*,
John, Joseph, Josias, and Ishmael,
Michael—Jonas, and famed Daniel.*
Achilles, Cupid-O, and Alexander,
Telemachus, Adonis, and Hector;
Jupiter, Mars, and Lysander,
Cæsar, Hercules, and Mentor.

(THE FAIR SEX.)

[Orient Pearls at random strung,]
Eve, Esther, Rachel, Deborah,
Hagar, Dorcas, Martha, and Mary;
Leah, Elizabeth, Anna, Rebekha,
Susannah, and Lydia, and Sarah.
Charlotte and *Rosa*, *Diana*—Sabina,
Thedosia, Gertrude, Margaritta and *Flora*;
Juliana and Lucy, *Lucretia*—Paulina,
Rosamond, Agatha, and Clara.

* At Mauritius it appears that they are very unbiblical in their appellations. The slaves are named from their personal defects. Hence a squint eye, a lame leg, a humped-back, a low-stature, a fat or a meagre appearance, decides the question of a name!

DR. ANDREW SMITH, AND THE PROGRESS OF DISCOVERY.

A very general pleasure is abroad, on the safe return of Dr. Smith and his party from *Port Natal*. The journey to Natal occupied, it appears, ten weeks after leaving Graham's Town. This lengthened period is accounted for on the score of the numerous rivers in a swollen state. The Doctor is, we believe, the first scientific traveller who has encountered this journey, and we rejoice that such enterprise and decision of character, is amply repaid in the great accession to Natural History—Zoology—Ornithology—Geology—Botany—Geography, and a physiological acquaintance with numerous wandering tribes. From all the accounts which we have seen, we find Dr. Smith giving the clearest testimony of the beauty, salubrity, and immense resources of the countries through which he passed, as suited to civilized man. There is also the advantage of an unfailing supply of labour from the fragments of the broken tribes who every where flock to the white man for food and protection.

THE CLUBS OF CAPE TOWN.

The Chasse Ennui Club celebrated its first anniversary dinner at Mallison's Hotel, on the 4th of June; Henry Saundby and Alex. Chiappini, Esqrs. Chair and Croupier The meeting is understood to have been one of the most interesting and intellectual description. Dr. Henry Macartney enraptured the audience by his various unpremeditated bursts of eloquence; and upon this occasion the native genuine humour of England flowed in upon the meeting, as a living brook unstained and pure. This is just as it should be; it is heartless work when it is reluctantly forced to play through artificial *pipes* and conductors.

THE SOUTH AFRICAN CLUB.

This Club is said to be composed of a large number of subscribers, many of whom are very respectable; we allude to several Merchants, gentlemen connected with India, and the Commissariat, Barrack, and Engineer departments. The others, are various grades of clerks in the civil service, and several dealers in wines, &c. &c. The accommodations afforded by Mr. Solomon to this Society, are of the most liberal kind.

THE BEEF-STEAK CLUB.

(March of the Gridiron.)

The first meeting, composed of two-and-thirty members, sat down at George's on the 9th ultimo; and, with the powerful aid of the worthy landlord, and Dr. H. Macartney, proved

'The *feast* of reason, and the *flow* of soul.'

The Chairs were well filled by Hamilton Ross and W. Hawkins, Esqrs. This Club is composed principally of Merchants of the most respectable description. We trust none of our readers will profane this Institution, by imagining a collection of greasy citizens devouring beef-steaks, whom common voracity draws together, and common satiety will disperse. On that despicable tenure, the flies of our (unfortunately) contiguous shambles, would be a Beef-Steak Club. Beef is, indeed, the grosser ligament of the union, its outward and tangible sign. But an ethereal spirit, an intellectual sympathy from the happy and flourishing state of the Cape is there, to draw and cement kindred hearts to each other. It is the carnival of the soul; is *free trade*, i. e. unfettered commerce, not in verbose tortuous mazes of disquisition, but in all sorts of gladnesses, extracted from all sorts of things; a voyage of the spirits, with Dr. M'C. at the helm, bound no where, with liberty to touch every where, and bringing home from every point of the compass a large cargo of heart-stirring hilarity—undisturbed by one moment's spleen, or acerbity, or wounded self-love.

OUR VISITORS FROM INDIA.

It is not perhaps generally understood, how large a tide of wealth flows in upon the Cape, by the arrival of British visitors from India. At all times constituting a most influential class of inhabitants, the present highly respectable influx of guests from India, must prove of great importance to our trading and commercial interests. Nor must we forget to appreciate the support and countenance which these distinguished residents afford to our Public Library, our Commercial Exchange, the Press, our Literary and other British establishments. The following is a list of the gentlemen and families from India at present at the Cape, producing by such presence in favour of the colony, (say in twelve months,) upwards of Twenty Thousand Pounds Sterling.

Allen, Mr. B. C. S.
Burroughs, Capt., B. A.

The necessity of representing in a reformed Parliament the *intelligence* as well as the property of the country, has been admitted in the most express terms by Earl Grey and the rest of the Cabinet; and the safety of such a measure is not likely to be denied by those who have expressed so much anxiety respecting the character of the constituency of the House of Commons.

In former times the intelligence of the age was concentrated in our universities; but during the rapid progress of knowledge new institutions have sprung up, and by their vast and increasing influence the intellectual strength of the nation has been developed and organized. The parent institutions are no longer the sole depositaries of science; and much of the genius of the age now adorns those gifted associations which owe their existence and their permanence to individual liberality. The modern establishments for the promotion of literature, science, and the fine arts, bear the same relation to the venerable institutions of our colleges, as the great manufacturing towns bear to some of our ancient though still flourishing burghs; and the same arguments which are employed for giving representatives to the seats of our national industry may be used, for giving them to the chartered associations of our literature and science.

A proposal was made in the House of Lords by an influential Scottish nobleman (the Earl of Haddington) to give one representative to the University of Edinburgh. The difficulty of finding a sufficiently extended constituency was urged as an objection to this very reasonable suggestion; but the difficulty might be completely removed by uniting to the University the Royal Society of Edinburgh and that of the Scottish Antiquaries In like manner the Royal Irish Academy might be united to the constituency of the University of Dublin — (*Journal of Science.*)

A PEEP AT ST. HELENA.

Extracted from the Two Days' Tour of an Officer.

About four hours before daylight we were quite close to the south-east point of St. Helena, where stand the two high mountains called Diana's and Cuckoo Peak. It was not light enough to perceive more than their dark towering heads frowning grandly above us; the sides appeared rugged and precipitous to a degree. Just off the Point, and a little way from the land, are two small rocks, the one called the Pillar, or Isle of Hercules, and the other the Island of St. George. We had soon passed these, and at daylight were under Sugarloaf Hill; after a communication with a detached battery planted just beneath it, we continued towards the harbour. It would be impossible to convey by description an idea of the rugged exterior of this island—a cluster of spiral mountains, some running to considerable heights, and all presenting towards the sea a rugged inaccessible front, rising nearly perpendicularly from it, with not the least appearance of verdure, tree, or habitation. As Napoleon must be foremost in the thoughts of all who now visit St. Helena, it would be no great effort of the imagination to fancy it the mighty mausoleum of a mighty hero, erected purposely in the waste of waters—another pyramid in another desert. As the day broke cloudily over it, and its peaks reared their dark heads like gigantic columns, the surf murmuring hoarsely at their bases, I could not view it with any other feelings. As the sun rose, we perceived Ladder Hill, and passing Munden's Point, a projecting part of the rock, having a battery upon it commanding the landing-place, came suddenly in view of James Town, a lively-looking city, situated in a valley, between Mount Rupert and Ladder Hill. The houses are light-coloured and neatly built, ascending from the sea towards the head of a valley, and have the appearance from the roadstead of the fanciful arrangement of a Chinese picture. On the west, about 600 feet above it, stands Ladder Hill; its summit is covered with houses, and its bosom with lines of extensive fortification, commanding most effectually all the approaches from seaward; a very excellent winding road from the city leads up to it. On the east side of the town is Rupert's Hill, unadorned and barren. I landed about ten o'clock, and after a walk of ten minutes, through a line of pupul trees, the outward side of the road being planted with cannon, I passed a drawbridge, and entered a gate which opened into a neat square, the church standing nearly opposite, and forming the end of the principal street, which leads directly from the centre of the square. Opposite the church is a very pretty garden, railed in, having for one side the back part of the castle—it runs to the base of Rupert's Hill; there are many rare and familiar plants in it. On the left hand of the gate, on entering, is the castle, and on the right stands an hotel, the board of which intimates that it was the only one at St. Helena. I took up my abode in it. I set out immediately and visited, in the first place, all the shops in the colony; I was surprised at their numbers, and confounded at their dearness. Every shopkeeper keeps a miscellaneous depôt, in which may be found the goods of every country, particularly of China. They are so greatly beyond the proportion of buyers in the colony, both in numbers and prices, that were it not for the continual visits of ships homeward bound from India, they could not exist; and even as it is, they are obliged to add other occupations to their legitimate one of storekeeper. They are usually employed by ships to lay in their provisions and stock, which they purchase from the farmers, and calling themselves ship agents, charge a most exorbitant price for every thing. A sheep of the Cape of Good Hope cost 3*l.* 10*s.*; a fowl 5*s.*; a duck 7*s.*; 5*l.* was the price asked for a milch goat; a bag of potatoes, containing one cwt. a guinea. The last article is the growth of the island; it is a thin-skinned, pale, and waxy vegetable, although of very good flavour. When a number of passengers arrive at the same period, these agents entertain them at their houses as boarders, at a charge, I believe, of thirty shillings a-day. Their houses are very good and comfortable—their servants are generally slaves; for though considerably ameliorated of late years, the custom is still in force here. I was struck with some advertisements upon that subject. I observed through the city, for example,—"Wanted, for sale, a girl or woman."—"Strayed away, Mr. Scott's Margaret." I was doubtful whether this last alluded to an animal of the brute or human race; I was assured, however, it was one of the latter that had strayed from her fold.

If appearance may be considered a criterion of health, St. Helena must be one of the most healthy spots in the world. The male part of the population look hale and florid as English residents, and the soldiers, in looks, dress, and smartness, might vie with any corps in the United Kingdom; they receive a ration of salt meat, rice, vegetables, and Cape wine; spirits have long been discontinued, and, indeed, the duty is so high upon the better quality of spirits that it is never sold on the island, and the inferior description is totally prohibited. This conduces amazingly to health. The children of the Europeans are the most rosy and pretty little creatures I have seen for years, and the females appeared to me all beautiful. I know not whether being so long unaccustomed to rosy cheeks, with nearly four months of no fair cheeks at all, may have contributed to throw additional charms over these St. Helena Helens, but I am not willing to deduct one single beauty from them on that account, and must still think them really what they seemed to be. So notoriously healthy, however, is this island, that out of 5000, the present population, the average deaths in the year may be safely rated under fifty, and most of them old people and infants, who die everywhere.

The town is the quietest I have ever seen in my life; no carriages or bustle of any description; nothing broke its quiet during my stay but the church bells, and nothing varied its uniformity but the procession of a funeral, an old man who had died in his 75th year, a respectable inhabitant: he was attended by almost everybody in the place, arranged two by two, decently dressed in mourning, the clergyman leading the party all through the town, from the church to the burial-ground, its extreme length. This is the common custom, and befitting the isolated inhabitants of so remote a spot; every one must be deeply interested in the lot of his neighbour; they should feel but as one family. There was something beyond the common feeling for a departed brother in the mourning followers of the old man; three days before, he had a son, a farmer, who had not been long in the island, and who had succeeded to his father in the charge of the plantation. He went out in the morning to collect the eggs of the sea fowl, who lay them in the most precipitous parts of the rocks; they are esteemed as food resembling very much in flavour the eggs of the plover He ventured to a spot where he could proceed no farther, it was too narrow to turn—the footing was slight—he made an effort, and was dashed to pieces; he fell 600 feet without interruption. The accident was told to his old father, who just heard it and died. The son left a widow and three children, for whom a subscription-list was filling up very quickly and liberally.

Towards the upper part the valley becomes much compressed. The houses, although occupied by the lower order, are very neat, and there appears not the least filth about them. Here are the barracks, the hospital, and a new public garden; a brewery is also established, in which beer is made from imported malt and hops; it is pretty good, and sold in the canteens. The dark people in the place are Africans, and their offspring by Europeans. A number of Chinese were engaged some years ago as labourers and mechanics, for a certain time; their mode of employment and price of labour was fixed by the government; their engagements expired some time ago, and they are now free; many have returned to their own country—the number now scarcely exceeds 120, it was formerly nearly 600. The garrison consists of about 800 men, artillery and infantry; the officers of the first service are of late years educated at the Company's academy at Addiscombe, and scientific pursuits have been very much encouraged in the island, by the establishment of an observatory, and the introduction to it of many philosophical and scientific works and instruments.—*United Service Journal.*

AN APOLOGUE.

There was once, a certain planet revolving between the orbits of Venus and Mars; a goodly planet, and originally fair to look upon; but the inhabitants of which had been struck with a deadly pestilence, for which they could devise no remedy. The disease was a sort of moral cholera; it paralysed the whole spiritual frame; none of the stimuli which once affected it were now of any avail: it had eyes, and saw not; ears, and heard not; its appetite for what was once its proper nourishment was gone; and though the effects of the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

malady were sometimes slow and chronic, they were sure in the end, unless impeded by an invisible energy, to be fatal.

But this invisible energy at length interposed, and a specific was provided. The earliest intimation of this wonder-working catholicon was given soon after the disease first broke out; but further particulars were from time to time added, till, somewhere towards two thousand years ago the whole was complete, and the principle Donor of the prescription, having pity on a race of beings perishing under so awful a visitation, directed that it should be every where made known; and those who had themselves freely received and been healed were enjoined, by their love and gratitude for so great a blessing, to endeavour to convey it to others.

For a time they did so: but those who came after them began to grow indifferent; so that, had not the same unseen energy still prevailed, this invaluable remedy, or rather the prescription for it, had been well nigh lost. Nor was this all; for, instead of being liberally supplied without restriction as the Donor intended, it began to be doled out drop by drop, and by a most unaccountable fancy a law passed, that in future the prescription and the directions for using the medicine should be written in a learned language—that is to say, Latin,—so that, as to any practical benefit, the great majority of persons might almost as well have never heard of the remedy; and in point of fact they at length began to think that it was no concern of theirs to have the receipt in their possession, or the remedy in their own hands; so that gradually the whole management came under the control of a race of shaven-headed physicians, who took their fees and doled out a few drops of the elixir mixed up with sundry deleterious drugs. but took care not to let the genuine receipt, which would have detected their artifice, go out of their own hands If indeed there had been any exclusive skill required in dispensing the remedy, this might have been necessary; but the directions were so plain, and the medicine so safe, that such a usurpation was altogether unjustifiable, and it ended in the most shameful adulteration, peculation, and parsimony of supply; while the generation after generation was perishing for want of this great catholicon. A cart load of hay was known to have been given for a few drops, and a full supply was no where to be procured.

Some fifty years ago a notion had gone abroad, that partly by art and partly by chance all the copies of the receipt had become grievously falsified, so much so that it was doubtful if a genuine bottle of the remedy was to be found in the whole planet; but various skilful persons, particularly one Kennicott, put this question at rest by examining great numbers of samples collected from various quarters, all of which were found to contain the essential ingredients, so that even the worst specimen in the collection exhibited the salutary virtues of the medicine. They found indeed some bottles discoloured; some were not so transparent as others; a little sediment of dust and refuse was found in many, but the catholicon was still in the main unadulterated and useful.

At length a happy thought occurred to a few benevolent persons,—we doubt not through the unseen energy of the original Donor,—that as the pestilence was universal, and the medicine every where applicable, it would be a great benefit to the whole planet, and in true accordance with the will of the Prince, and the directions of the prescription, if they were to unite their efforts to promote the diffusion and application of this wonder-working remedy. It appeared, however, when they came to commence the proceedings, that they entertained considerable differences of opinion respecting the character and mode of its operation; but the chief promoters of the scheme, having themselves experienced its efficacy, determined to apply their minds to the universal distribution of the remedy, even though they could not freely concur in all their opinions respecting its virtues. The only preliminary which they considered necessary for the formation of their benevolent plan was, that they should agree that a formidable disease was every where prevalent, and that this medicine was a specific for it; and they refused not the aid of any persons who would use their efforts and bestow their liberality for promoting so good a design.

They indeed soon found objections made to this scheme. Some thought the medicine would be so cheap that it would be despised; and that the poor, instead of keeping it at home for constant use, would pawn it for gin and whiskey. Others thought they would make an ill use of it, and that they ought only to take it under the superintendence of a regular physician, notwithstanding they might die before a physician arrived, or live in constant danger because this golden medicine was kept out of their reach. Others were afraid the preparation was too strong according to the original receipt, and wish to dilute it, or to leave out a portion of the more active ingredients. Others thought it would be better always to accompany it by a corrective, to prevent any possible mischief which might arise from its solitary use; but they could not agree on any common formula for this supposed corrective, for each had a favourite pill, or powder, or nostrum of his own, and the Latin people aforesaid, with few exceptions, resisted the popular use of it altogether.

At length, however, notwithstanding all these obstacles, the good men whom we have mentioned persisted in their plan, and with so great and good effect that there was scarcely a speck of the planet to which some portion of this elixir of life had not found its way; and the boon was attended with benefits unprecedented, but which we need not here pause to describe. There might be occasional mistakes, and we believe there were, in the management of so vast an enterprise; but as a whole it was worked with great care, and with unspeakable advantage; and what was of the utmost importance, the plan propagated itself, so that the people in distant parts of the planet, where only a few bottles had penetrated, began to form a similar scheme for multiplying the medicine and issuing it from their own doors, till by means of these innumerable laboratories scattered throughout the planet, this universal specific would in the course of a few years have been every where accessible.

Sorry are we however, to say that a few persons who had joined in the original design, began to feel scruples respecting it, and even went so far as to open a new laboratory. They thought, and we fear too truly, that some who distributed the medicine to others had not tried its powers themselves, and could not speak by experience as to its efficacy; but still, as was justly observed, this would not prevent others being benefited, though the donors might perish by their own blindness and obstinacy. Again, they thought that the Latin people ought to have no share in the distribution; though if any of these persons gave up their learned scruple, and others watched them so well that they could not, if they wished, adulterate the medicine or mystify the prescription, we cannot see what evil there could be in using their aid. Again, it was objected that some helped to distribute the medicine who entertained inadequate notions of its value, and of the character and intentions of the Royal Donor. Now it was extremely distressing to every man who duly reverenced the source from which this invaluable treasure was derived, and acknowledged the Donor, as their rightful Prince, that any person should entertain such evil opinions; but as they made no attempt to adulterate his medicine, and would not be allowed by their coadjutors to do so; nay, as they freely permitted a most accurate receipt to be used, to the exclusion of a favorite, falsified, and as they called it "improved" one of their own; it does not seem very clear why a reverence of the Prince should cause their aid, such as it was, and it was little enough, to be accepted, since it was bestowed contrary to their own wrong notions, and redounded to the benefit of all his subjects Indeed, all that they expended to carry on the great laboratory was so much taken from their own little quack shop of adulterated medicines, and thus was to be doubly hailed rather than rejected. Another objection was, that the whole scheme was evil, inasmuch as in applauding the medicine, the unseen Energy of the Donor was forgotten; but this objection was not valid, since those who took the management of the scheme from first to last expressed their strong feeling that it was only this unseen and patent energy, which daily and hourly they implored, that could render the specific of any avail; and they thought it very unfair, that, while in obedience to the orders of their prince, and dependence upon his wonder-working influence, they were distributing his sovereign remedy, they should be told that they were only a label-and bottle manufactory, and were idolizing the mere drugs instead of depending upon the secret influence which gave them their virtue—— *The Interpretation—the Old and New Bible Society.*

THE ROCK OF THE GUAHIBA WOMAN.

Missionaries of the Church of Rome.

The following interesting particulars are extracted from the 5th vol. of Humboldt's Personal Narrative of Travels to the Equinoctial Regions.

Before we reached the confluence, Atabo River, a granitic hummock, that rises on the western bank, near the mouth of the Guasacavi, fixed our attention; it is called the *Rock of the Guahiba woman**, or the Rock of the Mother, *Piedra de la Madre.* We inquired the cause of so singular a denomination. Father Zea could not satisfy our curiosity; but some weeks after, another missionary, one of the predecessors of this ecclessiastic, whom we found settled at San Fernando as president of the missions, related to us an event, which I recorded in my journal, and which excited in our minds the most painful feelings. If, in these solitary scenes, man scarcely leaves behind him any trace of his existence, it is doubly humiliating for a European to see perpetuated by the name of a rock, by one of those imperishable monuments of nature, the remembrance of the moral degradation of our species, and the contrast between the virtue of a savage, and the barbarism of civilized man!

* *Piedra de la Guahiba.*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

In 1797 the missionary of San Fernando had led his Indians to the banks of the Rio Guaviare, on one of those hostile incursions, which are prohibited alike by religion and the Spanish laws. They found in an Indian hut a Guahiba mother with three children, two of whom were still infants. They were occupied in preparing the flour of cassava. Resistance was impossible; the father was gone to fish, and the mother tried in vain to flee with her children. Scarcely had she reached the savannah, when she was seized by the Indians of the mission, who go to *hunt men*, like the Whites and the Negroes in Africa. The mother and her children were bound, and dragged to the bank of the river. The monk, seated in his boat, waited the issue of an expedition, of which he partook not the danger. Had the mother made too violent a resistance, the Indians would have killed her, for every thing is permitted when they go to the conquest of souls *(à la conquista espiritual)*, and it is children in particular they seek to capture, in order to treat them in the mission as *poitos* or slaves of the Christians. The prisoners were carried to San Fernando in the hope, that the mother would be unable to find her way back to her home by land. Far from those children who had accompanied their father on the day in which she had been carried off, this unhappy woman showed signs of the deepest despair. She attempted to take back to her family the children, who had been snatched away by the priestly missionary; and fled with them repeatedly from the village of San Fernando, but the Indians never failed to seize her anew; and the missionary, after having caused her to be mercilessly beaten, took the cruel resolution of separating the mother from the two children, who had been carried off with her. She was conveyed alone toward the missions of the Rio Negro, going up Atabapo. Slightly bound, she was seated at the bow of the boat, ignorant of the fate that awaited her; but she judged by the direction of the Sun, that she was removing farther and farther from her hut and her native country. She succeeded in breaking her bonds, threw herself into the water, and swam to the left hand of the Atapabo. The current carried her to a shelf of rock, which bears her name to this day. She landed, and took shelter in the woods, but the president of the missions ordered the Indians to row to the shore, and follow the traces of the Guahiba. In the evening she was brought back. Stretched upon the rock *(la Piedra de la Madre)* a cruel punishment was inflicted on her with those straps of manatee leather, which serve for whips in the country, and with which the alcades are always furnished. This unhappy woman, her hand tied behind her back with strong stalks of *macacare*, was then dragged to the mission of Javita.

She was there thrown into one of the caravanseras that are called *Casa del Rey*. It was the rainy season, and the night was profoundly dark. Forests till then believed to be impenetrable separated the mission of Javita from that of San Fernando, which was twenty-five leagues distant in a straight line. No other path is known than that of the rivers; no man ever attempted to go by land from one village to another, were they only a few leagues apart. But such difficulties do not stop a mother, who is separated from her children. Her children are at San Fernando de Atabapo; she must find them again, she must execute her project of delivering them from the hands of Christians, of bringing them back to their father on the banks of the Guaviare. The Guahiba was carelessly guarded in the caravansera. Her arms being wounded, the Indians of Javita had loosened her bonds, unknown to the missionary and the alcades. She succeeded by the help of her teeth in breaking them entirely; disappeared during the night; and at the fourth rising Sun was seen at the mission of San Fernando, hovering around the hut where her children were confined. "What that woman performed," added the missionary, who give us this sad narrative, "the most robust Indian would not have ventured to undertake. She traversed the woods at a season, when the sky is constantly covered with clouds, and the Sun during whole days appears but for a few minutes. Did the course of the waters direct her away? The inundations of the rivers forced her to go far from the banks of the main stream, through the midst of woods where the movement of the waters is almost imperceptible. How often must she have been stopped by the thorny lianas, that form a network around the trunks they entwine! How often must she have swam across the rivulets, that run into the Atabapo! This unfortunate woman was asked how she had sustained herself during four days? She said, that exhausted with fatigue, she could find no other nourishment than those great black ants called *vachacos*, which climbs the trees in long bands, to suspend on them their resinous nests." We pressed the missionary to tell us, whether the Guahiba had peacefully enjoyed the happiness of remaining with her children; and if any repentance had followed this excess of cruelty. He would not satisfy our curiosity; but at our return from the Rio Negro we learnt, that the Indian mother was not allowed time to cure her wounds, but was again separated from her children, and sent to one of the missions of the Upper Orooноko. There she died, refusing all kind of nourishment, as the savages do in great calamities.

Such is the remembrance annexed to this fatal rock, to the *Piedra de la Madre*. In the relation of my travels I feel no propensity to pause at a picture of individual calamity, of evils which are every where frequent, where there are masters and slaves, civilized Europeans living with people in a state of barbarism, and priests executing the plenitude of arbitrary power on men ignorant and without defence. Historian of the countries through which I passed, I generally confine myself to pointing out what is imperfect, or fatal to humanity, in their civil or religious institutions. If I have dwelt longer on the *Rock of the Guahiba*, it was to display an affecting instance of maternal tenderness in a trace of people so long calumniated; and because I thought some benefit might accrue from publishing a fact, which I had from the monks of St. Francis, and which proves how much the system of the missions calls for the care of the legislator.

TREASURES OF THE DEEP.

WHEN we reflect on the number of curious monuments consigned to the bed of the ocean, in the course of every naval war, from the earliest times, our conception is greatly raised respecting the multiplicity of lasting memorials which man is leaving of his labours. During our last great struggle with France, thirty two of our ships of the line went to the bottom in the course of twenty two years, besides seven fifty-gun ships, eighty six frigates, and a multitude of smaller vessels. The navies of the other European powers, France, Holland, Spain, and Denmark, were almost annihilated during the same period; so that the aggregate of their losses must have many times exceeded that of Great Britain. But the reader must not imagine that the fury of war is more conducive than the peaceful spirit of commercial enterprise to the accumulation of wrecked vessels in the bed of the sea. From an examination of Lloyd's list, from the year 1793 to the commencement of 1829, it appeared, that the number of British vessels alone lost during that period, amounted on an average, to no less than one and a half daily, a greater number than we should have anticipated, although we learn from Moreau's tables, that the number of merchant vessels employed at one time in the navigation of England and Scotland, amounted to about twenty thousand, having one with another, a mean burden of 120 tons. Out of five hundred and fifty ships of the royal navy, lost to the country during the period above mentioned, only one hundred and sixty were taken or destroyed by the enemy, the rest having either stranded or foundered, or have been burnt by accident: a striking proof, that the dangers of our naval warfare, however great, may be far exceeded by the storm, the hurricane, the shoal, and the other perils of the deep. Millions of dollars and other coins have been sometimes submerged in a single ship. It was a splendid boast that the deeds of the English chivalry, at Agincourt, made Henry's chronicle

> "As rich with praise
> As is the ooze and bottom of the deep
> With sunken wreck and sunless treasuries."
> *(Lyell's Principles of Geology.)*

THINGS WORTH KNOWING.

Honey.—In a Treatise on Bees, recently published by a Scotch gentleman, it is calculated, that the pasture of Scotland would maintain as many bees as would produce on the average 4,000,000 pints of honey, and 1,000,000 lbs. of wax. Three times the amount of each, he considers to be no unreasonable estimate of what the three United Kingdoms would yield. Taking the price of honey at 5s. the pint, and the wax at 1s. 6d., the income arising from the industry of bees alone in England would amount to more than three millions and a half sterling per annum.

Ship's Bottoms.—The great problem which puzzled the mind of the first chemical philosopher of modern times, namely, a suitable covering of metal for ship's bottoms, has at length been solved. Zinc is the metal employed. Sheets of it are steeped in tallow, in which a small portion of verdigris is mixed. It has been found, by practical experiment, that no adhesions of sea-weed, shells &c. take place on the outside of the sheeting.

New Hot Bed.—At a late meeting of the Edinburgh Horticultural Society, a communication was read from Mr. David Dow, stating, that he has found the shellings of corn, the refuse of the manufacture of oatmeal, to answer all the purposes of supplying gradual and permanent heat, in growing exotic plants, for which oak leaves, tan, &c. were heretofore employed.

The Sun Flower.—This plant is now cultivated in the United States of America, on a considerable scale, on account of the very superior oil which it produces. One bushel of the Sun flower, which can be raised at the expence of about one shilling, will yield a gallon of oil, which when made into cake, forms excellent food for cattle.

Flax.—It has been discovered that the hollyhock *(Althæ rosea)* is an excellent substitute for flax. Several individuals have embarked in the manufacture of it.

LACONICS.

[The following brevities are from the forthcoming Number of the "Comic Magazine"; a sort of monthly Figaro, only in a smarter coat, and something dearer. The cuts—eighteen in number—are by far the best part of the bargain. Some of them are excellent, and all are amusing.]—*(Lit. Gaz.)*

— Soldiers are generally considered inconstant Is it from their being accustomed to *cut-lasses?*

— Red-haired men make the best troops, for they always carry their *fire-locks* upon their shoulders.

— It is said, the older we grow, the wiser we get: but is it not more natural to suppose, that the *greater* a person's *ears*, the more *ass* he?

— No man should appear unhappy, on the principle that no good *wight* ever looks *blue*.

— Marriage is designated the *bridle* state: and, indeed, it puts a *curb* upon most persons.

— Clocks that have stopped, by misrepresent-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ing the time, become paradoxes; they *stand* and *lie* simultaneously.

— Schools for young persons are called pre-*parrot*-ory, because at them every thing is learnt by rote.

— Intercourse is generally a sign of friendship: and, indeed, it is but natural, if you *correspond* with a person, for most persons to think you *like* him.

— A sword is one of the emblems of justice: and it is but *uniform* that, with such a weapon, we should meet *red-dress*.

— The week preceding Easter is most appropriately termed *Passion* Week, insomuch as then even the buns are *cross*.

— Jews generally wear beards, to shew that they are of the tribe of *Hair-on* (Aaron).

MR. JEREMIE'S PAMPHLET.

And now one word to Mr. Jeremie on the question of compensation. 'In every civilized state,' says Mr. Jeremie, 'property actually converted to the purposes of the state, has been actually paid for, at its fair value.' [Page 120.] Man a property! Never will those who were present forget the indignant burst of displeasure when Mr. Burge, a Colonial Barrister, ventured in the House of Commons last winter, to call a slave his master's freehold! The very walls echoed back the angry disclaimer with an emphasis that seemed to share it.—*Westminster Review.*

Opening of King George the Third's Library.—It is pretty generally known that his late Majesty, who, although since his death so universally vilified, yet in his lifetime did *some* things worthy of praise, gave his father's very extensive library to the nation, and that new buildings were preparing for its reception at the British Museum. These buildings are now completed, and the library has been thrown open to the public since the commencement of the present year. It is a most magnificent apartment, three hundred feet long, and thirty-five wide, and fitted up in the highest style of splendour—the ceiling being superbly ornamented, and the floor composed of the most elaborate inlaid work. Four marble pillars, which are employed more for ornament than use, are said alone to have cost an immense sum, and there are several other fittings of the most expensive scagliola. These decorations are all that the public are permitted to see, except the massively-gilt backs of the books. They are indeed—and this is a wonderful stretch of liberality—admitted into the library, and may walk all about it—examine the floor, the ceiling, and the pillars—but the only literary privilege they enjoy, is that of reading the titles of the works, printed in gold upon their backs, through the *wire-guards* by which they are protected from unlicensed hands. A gallery runs round the building, in which this insidious precaution is not taken; but this is carefully closed, like the old library of the Museum, to all but those provided with a trustee's ticket. There needs some more liberal regulation in this department—at any rate, the privilege should be more extended and easier attainable. The new buildings are from designs by Mr. Smirke; and the part already opened, comprises only one half—perhaps not so much of the contemplated additions; but the corresponding wing to George the Third's library (over which, there is a new geological collection, in an apartment of equal extent) appears to be approaching completion.—*Mechanics' Magazine.*

Commerce and Manufactures at the Antipodes. In a few years it is very likely that New Zealand will become an English colony. Settlers are already established there, who are actively engaged in cultivating hemp and flax, and two detachments of military have been sent from New South Wales for their protection from the natives. Our Australian brethren are progressing very rapidly; they have even begun to cure beef for the English market (some small distance off!) and are setting on foot new manufacturing establishments with astonishing activity, and on a very extensive scale. A new Marine Insurance Company has started at Sydney, with a capital of 150,000*l.*; and the letter writers of that polished Metropolis have been furnished with a great convenience in the shape of a "two-penny post."

COBBETT AND THE SCOTCH.

Antipathies, like comparisons, are "odious," but they are wearing themselves out very fast; and we may yet live to see the day when prejudices of all kinds shall be unfashionable. Fifteen years of peace works wonders. A quarter of a century ago the French were, in the eyes of every enlightened man in England, a "beggarly race of frog-eaters;" now they are our "lively and illustrious neighbours." Having captured their metropolis, and fixed the god of their idolatry upon a pedestal at St. Helena, we exalt the whole nation to the skies; just as the victor at a game of chess vows that his antagonist, though beaten, is one of the best players in the world. We affect liberality till we actually feel it. If we were to pretend to love even the Dutch, no doubt we should succeed in becoming excessively attached after a time. If it be advisable to begin, like Mrs. Malaprop, "with a little aversion," surely a good deal must be infinitely better. Meanwhile personal antipathies flourish here and there very perseveringly in spite of useful-knowledge societies and the march of reason. We heard somebody the other night, discussing the conduct of one of our popular writers, exclaim, with true British feeling—"But what can you expect from a *foreigner?*" "Foreigner!" shouted fifty voices. "Well, a *Scotchman*, it's all the same."

Cobbett, however, is decidedly the best "hater" of his day. He is the great high-priest of them all. His prejudices amount to prodigies; his antipathies take place of all his other attractions. They are generally harmless, and always amusing. To say that Cobbett has no honesty, is nonsense; no man living is so honest in his hatred, while it lasts. The great Dr. Gulliver Johnson shrinks upon this ground into a Lilliputian Boswell beside him. We wish somebody would make a collection of his bitterest and most brilliant essays in this way. Think of that simple, straightforward, and truly descriptive epithet of his, applied to the Quakers—when he called them, "unbaptized, *buttonless* blackguards." It is perfect alike in antipathy and alliteration. It may be a question which Cobbett detests most thoroughly—potatoes or political economists. Some people content themselves with a dash of dislike, or at most a spice or so of scorn and contempt upon such matters; but Cobbett's is direct, downright, undeniable, and unmitigated hatred; and whether it be the practice of ruining kingdoms on the part of a minister, or of drinking tea on the part of the people, it is the same to him; his hatred never wants words to work with—his thunder always roars as astoundingly as if we had never heard it before—and he seems to be in no more danger of exhausting his stores of abuse than Sir William Jones, who could have given the lie in fifty languages, at least. But perhaps the Scotch may claim the honor of having monopolized the larger portion of his detestation—as the story we have to tell will shew.

Cobbett, it seems, the other day was called upon to attend some meeting in the city; and the time not admitting of a journey to Kensington to prepare, he went to a shop in one of the courts in the neighbourhood of Fleet-street to be shaved. Not perceiving the name of Mac-something over the door, he only discovered by the northern accent in which he was requested to be seated, that he was patronizing a Scotchman. It was too late however, to retract, and he sat down, not over disposed to listen to the chit chat of the operator, who, ignorant of the person of his customer, entered at once into some moral reflections upon the Bristol burnings. In the heat of his enthusiasm, he happened to stumble upon the terms, "low rabble." At this the politician started up, of course at the risk of his life, and for a moment looked as if he meant to apply the razor that had just been at his own throat, to that of the operator. "How dare you," he exclaimed, in a tone admirably proportioned to the fury of his look, "how dare you—a selfish soap-suddy Scotchman—a fellow that lives here by sufferance, and takes the bread out of the mouth of the honest British artisan—how dare you in my presence apply such a term as 'rabble' to the people of England?" The operator, all alarm and apology, hinted nevertheless, upon the strength of the weapon with which he was so formidably armed, that he had as good a right to the bread he ate as an English barber; and that among other things, he had suffered for his country. "*Your* country! What country? you don't call *that* a country! But pray let us hear how you have suffered for your country." "Why, I happened to be aboard a Berwick smack when she was taken prisoner by a French privateer, and I remained in a French prison for seven years."—"So much the better," said Cobbett, as he resumed his seat and rubbed his hands, apparently quite appeased. "So much the better; *we saved seven years of your keep.*"

ON THE WANT OF ENCOURAGEMENT IN SCIENCE AND LITERATURE.

A good deal of interest is at present excited at home on this subject, and a great portion of the influential press is taken up with discussions on the want of encouragement to men of learning. And if we direct our attention to the question, it is remarkable, that although the bar, the army, the navy, diplomacy, and wealth have proved passports to honour—for instance to the peerage, there is not a single example on record of that dignity being conferred as the reward of scientific or literary talents It may be said, that, though in theory the House of Lords requires the profoundest knowledge of *every description* for the public welfare, yet that experience has shewn the fallacy of such an idea; and upon this ground only can the extraordinary fact be explained, that not one of the men of whose fame that of our mother country is identified, has one been raised to the peerage. Were the legal and constitutional practice of occasionally creating peers *for life* again adopted, the House of Lords would probably be distinguished by having some of the great names of the age among its members. Let the reader judge for himself of the shackles placed on science by the following document. It is the cost of a *charter* granted to the Astronomical Society of London.

SCOTTISH MANNERS.

MANY young ladies of quality were sent to reside with, and be finished off by, the hon. Mrs. Ogilvie, lady of the hon. Patrick Ogilvie of Longmay and Inchmartin. She was supposed to be the best bred women of her time in Scotland, and died in 1753. Her system was rigorous, according to the spirit of the times. The young ladies were taught to sit upright; and the mother of our informant, (one of the said young ladies,) even when advanced to nearly her eightieth year, never permitted her back to touch the chair in sitting.

There is a characteristic anecdote of the husband of this rigorous preceptress. He was a younger brother of the earl of Findlater, who greatly exerted himself in behalf of the union, and who observed upon the rising of the last Scottish parliament "Now, there is an end of an auld sang!"—The younger brother had condescended to trade a little in cattle, which was not then considered derogatory to the dignity of a Scottish gentleman. However, the earl was offended at the measure, and upbraided his brother for it. "Haud your tongue, man!" said the cattle dealer, "Better sell nowte than sell *nations*," pronouncing the last word with peculiar and emphatic breadth.*

THE FOURTH SEASON OF A FASHIONABLE FLIRT.

Time passed on;—and that portion of the year which in the country we call Spring and in London the Season, shone once more upon the earth. Adela Richmond re-commenced her course of gaieties, less pretty but more beautiful than ever, —less admired, but a thousand times more talked of. Lady Germaine now began to think it necessary to plant herself on higher and more ostensible ground. She took care that her daughter's portrait should adorn the walls of Somerset House, and her name be included among those of the beauties noticed by the Court Circular at the Drawing Room. Banishing all remembrance of Sir Burford and her past mortification, she resolved the Adela's fourth season should crown her career with bridal orange-blossom.

And in what, may we venture to inquire, consisted the "course of gaiety" apparently so warmly appreciated by both mother and daughter;—what were their habits, their occupations, their means and measures of enjoyment? To rail for the first four months of the season at the dulness and emptiness of the town;—to fume, fret, and scold for the four ensuing, at balls, or rumours of balls, from which they fancied themselves designedly omitted;—to grumble during the bright days of June at the multiplicity and incompatibility of their engagements;—and amid the fading pleasures of July, to grasp at every dying flower till its leaves were crushed,—to redouble every effort, every matrimonial manœuvre, till disappointment became disgrace.

Nor were the minor cares and occupations of Adela more edifying or more satisfactory. Up till daylight, morning after morning, yet ever hurried away from the ball-room in "the sweet o' the night," lest the grey twilight should prove a dangerous visitation, a revealer of defeatures, a beacon-light to the unwary;—chained to a mid-day couch, day after day, by headache and the apprehension not of personal fatigue, but of a careworn countenance;—all the labours of beauty,—all the cares of designing, ordering, inspecting and altering, ball dress after dress;—all the dread of being surpassed by the addition of a flounce, feather, or spangle, by some mischievous rival;—all the apprehension of appearing either before or behind the fashion,—of offending Lady This by copying some irresistible peculiarity of her costume, of Lady That by flying into a contrary extreme;—all the peevish, trivial, selfish, contemptible vexations and toils of a mere woman of the world, were already gathering round her young head! To attract, to enslave, to form a good connexion, occupied every thought of this immortal and responsible being.

At all events her exertions were crowned with success. Adela,—"the lovely Adela Richmond," —"the fascinating Adela Richmond,"—afforded a theme for universal panegyric. *Whose* eyes were half so blue,—*whose* teeth half so pearly,—*whose* tresses half so redundant? Fair, gracious, piquante, many a prudent father trembled when he saw the fashionable flirt resting upon the arm of his son; many a gentle mother grew uneasy on beholding the worldly-wise beauty engaged in conversation with her daughter. Still, there were enough of the inexperienced, the vain, the hollow, and the frivolous, to applaud—worship—sigh—tremble,—do everything but seek to make the varnished toy their own.—*The Fair of May Fair.*

* Chambers's Traditions of Edinburgh.

TRADE OF BALILING.

The trade at the port of Baliling is carried on principally in foreign prows, which visit the island from various places, the Balinese themselves having few prows, and seldom venturing far from their own shores. From the great island of Ceram, at the back of Amboyna, about ten prows came every year. The time of their arrival is in October, and they return in January. They bring nutmegs, tortoise-shell, a kind of medicinal bark, called *masoodji*, very much prized by the natives of Java, and other articles common to the eastern islands. These prows are manned by able-bodied Caffres, brought from the coast of New Guinea, who speak the Malay language in a distinct and clear way, and in a determined kind of tone, as though they had been accustomed to command rather than to obey. Their prows are all tied and pinned together with wooden pins, without an iron nail about them; and when they arrive at Ceram, they pull the whole to pieces, and each man carrying a plank or a beam, they store the prows up in the village till it is time to go to sea again. Between Bali and Java the trade is carried on in Chinese prows, about ten of which are employed, making half-a-dozen voyages a-year. They carry coarse cloths, chintzes, and battic handkerchiefs to Bali, and receive in return dried beef, hides, and tallow, together with a portion of the masoodji bark and nutmegs from Ceram. Their lading generally amounts to 20,000 or 30,000 rupees value; the profit on the cargo from Java yields about ten per cent.; but on the return voyage much more. Besides the Ceram and Chinese prows, Bali is also visited by Bugguese prows, a dozen of which come from Sambawa, twenty from a part of the Celebes, and twenty more from Singapore; the latter are most richly laden, and bring annually about twenty chests of opium to Baliling alone.—*Asiatic Journal.*

THE CAPE COLONY.

THE next subject in order (State of the Nation,) is the Cape of Good Hope—a vineyard, and assuredly, at no distant period, a granary under the most favourable climate in the world. It would be as absurd to judge of the importance of the Cape from what it actually is, as it would be to estimate the value of Virginia and Maryland by what they appear to have been in the time of Charles the Second. The Cape of Good Hope is one of the most important appendages to the British Empire, and we have reason to know that Government is looking towards it with kindlier feelings than heretofore. The Cape is in every respect an infant colony, and may be said to have but recently escaped from the leading-strings or the go-cart.

* * * * The inferior quality of her vineyards is such as it now exists from the absence only of a *due capital* and competition. At present, the wine farmers are unable to manufacture a good article—they are hampered with the mortgage system, and possess no real capital. It is impossible to foresee, how far into the interior of Africa the spirit, activity, and intelligence of British colonists may push the boundary of this promising settlement. But every new colony, and every augmentation of population and culture in those already possessed, necessarily enlarge the market for the reception of British commerce and manufactures. It is in the very nature of the produce of manufactures to increase from year to year, and to become so depreciated in current price by their excess, as to occasion great distress amongst large bodies of men. It is an object of sound policy to encounter this mischief by precautionary measures. But the only measure of this kind is to provide for a proportionate augmentation of consumption. It is under this principle, that no efforts have been spared by our colonial administration to assist the culture and population of our new colonies. The emigrants to the Cape were sent with this view; they were *selected* with this view. Happily the present condition of this colony affords no subject of further remark beyond that of enforcing the necessity of emigration to the Cape. Under the general administration of the colonial department, and the exemplary execution of their duties by the local authorities, no settlement of this great empire affords a more cheerful aspect.—*Edinburgh Magazine.*

SELECT NOTICES.

Disinfecting Powers of high temperatures.—Dr. Henry has ascertained, by direct experiment, that articles of clothing having been worn by individuals suffering under scarlatina, which is well known to be highly infectious, may be rendered disinfecting by exposure during at least one hour to a temperature of not less than 260 degrees of Fahrenheit.——*Materials of Poetry.* —Good sense is the *body* of poetic genius; fancy its *drapery*; motion its *life*; and imagination the *soul* that is every where and in all, and forms all into one graceful and intelligent whole. —*Coleridge.*——*Hint for Lovers.*—If a youth is wooingly disposed towards a damsel, as he values his happiness, let him follow my advice: Call on the lady when she least expects him, and take note of the appearance of all that is under her control. Observe if the shoe fits neatly—if the gloves are clean, and the hair well polished. And I would forgive a man for breaking off an engagement, if he discovered a greasy novel hid

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

away under the cushion of a sofa, or a hole in the garniture of the prettiest foot in the world. Slovenliness will ever be avoided by a well-regulated mind, as would be a pestilence. A woman cannot always be what is called dressed, particularly one in middling or humble life, where her duty, and it is consequently to be hoped, her pleasure lies, in superintending and assisting in all domestic matters; but she may be always neat—well appointed. And as certainly as a virtuous woman is a crown of glory to her husband, so surely is a slovenly one a crown of thorns.—*Mrs. C Hall.*——*Substitute for Tea.*—A patent has been granted to Mr. Richard Abbey, of Walthamstow, Essex, formerly a tea-dealer, "for a new mode of preparing the leaf of a British plant for producing a healthy beverage by infusion." According to the specification, the British plant in question is the hawthorn, from which the leaves may be taken from the month of April to September, inclusive: they are first to be carefully picked and cleansed, then to be well rinsed and drained; and, whilst in the damp state, they are to be put into a common culinary steamer, where they are to be subjected to the action of the vapour until they change from a green to an olive colour; the leaves are then to be taken out, and dried upon a "hot plate well heated," and to be continually stirred up, and turned over, until they are thoroughly dry, in which state they may be prepared for use. When required for that purpose, an infusion is to be made in the same manner as tea, and sugar and cream are to be added, to suit the taste of the drinker.——*A Shaving Clause.*—Brand, in his History of Newcastle, says, that at a meeting of the fraternity of barber-surgeons there, in 1742, (of course long before combination laws were thought of,) one of the resolutions entered upon the minutes was—"That no brother do shave John Robinson till he pays what he owes to Robert Shafto." We can fancy no anathema more terrible, short of papal excommunication.——*A Working Parson.*—The Rev Mr Mattison, formerly Curate of Pattersdale, buried his mother, married and buried his father, christened his wife, and published his own banns of marriage in the church, and he christened and married all his four children, a son and three daughters! He died January 31, 1766, at the age of ninety-six, sixty years of which he had been curate of Pattersdale. Till the last years of his life, his stipend did not exceed twelve pounds, and never reached twenty pounds per annum.—*Guide to the Lakes.*——*Rise and Fall of Water in Wells.*—William Bland, jun. esq., has discovered, by an interesting series of observations, that the water in wells rises and falls periodically. He has observed, that the water in the well of New Place, in the parish of Hartlip, near Sittingbone, Kent, and in thirty-one other places, has almost invariably been of the greatest depth at or about the longest day, and of the least depth at or about the shortest day. He has also noticed, that the regular rising and falling of the springs does not depend on the rains, although they have some influence in producing a greater rise. Another interesting portion of this gentleman's observations, consists of the height of the spring-heads above the level of the sea, which accompanies the rise and fall of the great hills.——*Curious Turkish Custom.*—We next landed at Toosla, (says Dr Walsh, in his account of a visit to Nicœa, published in the "Amulet,") remarkable for the size and excellence of its cherries. Cherries were originally brought by Lucullus, I think, to Rome from this coast, where, after an interval of more than two thousand years, so unchanged is nature, they still retain their primitive excellence. It is one of the odd customs of the Turks, which their contact with Europeans has not yet changed, that any stranger may enter a man's garden, and eat as much as he pleases, provided he takes none away with him. So, availing ourselves of this right, we walked into the first romantic garden we met, to eat such cherries as really surprised me: they were as large as walnuts, and of the most delicious flavour; when coming away, we bought some for sea-store—two oaks for ten paras, that is, five pounds for about three halfpence.——*Ancient Prices.*—In Wilkin's "Leges Saxonæ," as quoted by Dr. Henry, we have prices of various articles in England in the reign of Ethereld, about the year 997, which the learned doctor has calculated with great correctness, in money of the present time:—Price of a man or slave, 2*l.* 16*s.* 2*d.*; a horse, 1*l.* 15*s.* 2*d.*; a mare or colt, 1*l.* 3*s.* 5*d.*; an ass or mule, 14*s.* 1*d.*; an ox, 7*s.* 0½*d.*; a cow, 6*s.* 2*d.*; a swine, 1*s.* 10½*d.*; a sheep, 1*s.* 2*d.*; a goat, 4½*d.*——*Contagion.*—Whilst the cholera is said to rage in Sunderland, Wales is the seat of typhus fever, and Sussex of the small pox.——*Cholera.*—The Cholera at Sunderland and Newcastle is but a joke to the malady at Smyrna, where it has attacked as many as five hundred in one night. The greater number of the shops are shut, and the city is almost deserted.——*German Titles.*—An office for the sale of German titles of honour is now open in Paris; a knighthship may be had for 5,000 francs; a countship for 20,000, and a marquisate for 40,000.——*Perpetual Motion.*—One of the Secretaries of the Treasury was lately applied to, to patronise a new discovery of the perpetual motion! The following is his reply:—

London, Oct. 25.

Sir,—I am much obliged to you for communicating your ingenious design, which I fear you will, however, find that the friction on the pivot, as well as the re-action of the air, would, with other difficulties, interfere with your discovery, of the merits of which I do not, however, pretend to be a competent judge.—I am, Sir, your obedient servant, T. SPRING RICE.

——*Steam Boat.*—The largest steam boat in the world is one now plying on the river St. Lawrence. It is 189 feet long, and 70 feet broad in the widest part, 12 feet deep in the hold, and draws 7 feet 9 inches of water.——*Old and New Style.*—There is a very general error abroad on this subject, which it may be of consequence to correct. Since the commencement of the present century another day in addition to the prior eleven has been thrown out, so that the difference for all years since 1800 is twelve days.——*Wall Paper.*—A sort of cloth made of cotton wool, pressed by means of calendars into a flat sheet, resembling in colour and appearance a sheet of demy paper, and printed into a variety of suitable patterns, is now getting into use as a substitute for paper, for covering the walls of dwelling-houses.——*A New Light.*—A new inflammable liquid is said to have been just discovered, which establishes that light is not the result of any principle resident in combustible bodies.——*The Moravians.*—The entire number of Moravians in civilised countries, is estimated at 16,000. They support 127 missionaries in foreign lands, at an expense of 40,000 dollars annually. The fruits of their missions have been 33,000 converts!——*New Ordeal.*—Two students at Berlin lately introduced a new method of duelling. To render the chance equal, they went to a patient attacked with the cholera and kissed him. Neither of them having been taken ill after twenty-four hours, the witnesses stated that the matter was ended.——*Eclipses.*—In the next year there will be but two eclipses—both of the sun. The first will take place on February 1st, and will be invisible at Greenwich; the second takes place on July 17th, visible at Greenwich, begins two hours three and a quarter minutes p. m., ends two hours twenty-eight and a half minutes, digits eclipsed one-fifth. On the 5th of May the planet Mercury will appear, like a black spot, to move over the sun's disc.——*Influence of Climate.*—The opinion is as old as Plato, (vide Repub. lib. iv.) that climate exercises an influence over the human dispositions. He gives as examples the inhabitants of Thrace, Scythia, and similar elevated regions, who are extremely irascible and quarrelsome. The climate of Phœnicia and Egypt, he judged, on the same principles, to produce a love of riches; and that of Attica a love of wisdom. How much these must have changed in character, supposing Plato's opinion to have been correct!——*Price of making a Park a Garden.*—Queen Caroline spoke of shutting up St. James's Park, and converting it into a noble garden for the palace of that name. She asked my father what it might probably cost; who replied, "*only three* CROWNS."—*Walpole.*——*Fortunate Impossibility.*—An Italian, who was very poor, and very much addicted to play, used to apostrophise Fortune thus: "Treacherous goddess! Thou canst make me lose, but thou canst not make me pay."——*Infidel Enthusiasm.*—The propagators of infidelity in France previous to the revolution, were so assiduous in spreading it far and wide, that they annually expended £900,000 sterling in purchasing, printing, and distributing deistical and other books, in order to corrupt the minds of the people, and prepare them for desperate measures.——*Agesilaus.*—I was once required to write to the President in favour of one of my friends, who was involved in a troublesome affair. After puzzling for a long time how to make the application, I could remember nothing better than the letter of Agesilaus on a similar occasion. "If Cinias is not guilty, set him at liberty for your own sake; if he is, for mine; but be it as it may, set him at liberty."—*Menage.*——*Literary Entertainments.*——I knew a person who occasionally gave entertainments to authors. His fancy was to place them at table, each according to the size and thickness of the volumes they had published, commencing with the folio authors, and proceeding through the quarto and octavo, down to the duodecimo, each according to his rank—*Ibid.*——*Proof of Nobility.*—A Gascon, in proof of his nobility, asserted that in his father's castle, they used no other fire-wood but the batons of the different Marechals of France of his family.——*Brain of the Elephant.*—His head I had an opportunity of seeing the next day, when I had it opened, and the smallness of the brain is a direct contradiction to the hypothesis that the size of this organ is in proportion to the sagaciousness of the animal.—*Discoveries in Africa.*

CAPE OF GOOD HOPE.

NOTES OF THE MONTH.

(By VIVIAN.)

MR. LE BRETON'S PAMPHLET.

PAMPHLETS have been, as they often are, dangerous affairs. There was a time when England had not a *Times*, a *Courier*, a *Globe*, a *Chronicle*, or even a *Spectator*, and yet the restless and indomitable intellect of the British people found momentary organs for the expression of its opinions. The Press swarmed with pamphlets. The history of pamphlets would form a curious history. The collection of the French revolutionary pamphlets now stands by the English tracts* of the age of the haughty Charles the First, as abundant in number, and fierce in passion; rival monuments which exist together, for the astonishment and the instruction of posterity, for whom they reveal so many suppressed secrets in the history of man. But what of all this?—we are to look to

* Most of the thirty thousand English Tracts were collected by the order of Charles the First, and became the gift of George the Third to the National Library. The French collection has been a recent acquisition.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

our own affairs,—and, therefore, here goes to welcome Mr. Le Breton's pamphlet as a proof that the good old doctrine —*As it was in the beginning, now and ever shall be,* is by no means a *dead letter.* It is true, we have been resting on our oars in the Cape Pamphlet world for long while of time. The last of the periodicals worth noticing in our colony of growing intellect, were those by a *By-Stander,* a *Miller,* and a *Fairbairn.* Subsequent to these publications, we have naught before us but the "oblivious pool,"—the *dead sea* of apathy; all hail! therefore, Thomas Le Breton, Esq. author of "*A Letter addressed to the Shareholders of the South African Assurance Company, &c.*"

We are not quite sure that Mr. Le Breton's Letter was called for in the pamphlet shape — the worthy author holds, as we understand, a vast extent of *common* right in the pages of a certain newspaper, and we suspect it would have been a vast saving of the Rix had he occupied his *joint-stock* rights, and left the printing costs of the pamphlet for the benefit of his heirs, administrators, or assigns. But the paper perishes while the pamphlet lives, and moreover as it is the duty of every man to think for himself, it is also one of the privileges of Englishmen freely to address men in office how they like, and when they like, and where they like, when they have grievances to state, or when they conceive errors to exist, which affect the interests of their country, or the particular society to which they may be attached. So much, then, on the side of printing the pamphlet. Now as to its contents—we can afford but little space for observation, beyond recommending its whole 30 pages to the reader. It is written according to our judgment, in a fair, down-right English style; and this is saying much in these days of affected mawkishness. We are by no means anxious to know the *cast of character* referred to in the pamphlet before us. Who "my Afrikander friend" is, pape 4, or "my Dutch friends" are, page 7, or "the hole and corner men" are, page 11, or "the man with a little box and a little book" is, page 15, are matters of secondary consideration.

We learn from the publication, and this we are bound to consider as the *moral* of the whole, that Mr. Le Breton is the successful founder of the Fire and Life Assurance Company at the Cape of Good Hope. Such Companies may be placed among the most useful institutions of modern times, and their increase shews that their value is becoming daily appreciated. But let us come to the summing up of the pamphlet in a business-like way.

1st. We have the probabilities of human life discussed, (page 6) and the gratifying intelligence communicated to life-lovers, that *if a man has rounded 42 in this colony, he may live for ever!*

2d. We have a very satisfactory abstract of the Cash Account, (page 12) from which we find it clearly demonstrated that the Company is not founded on bubble principles. *(Esto perpetua!)*

3d. We have the particulars (page 23.) of Mr. Le Breton resigning the seals of office as Secretary, subsequently to the *Hooge Hof* of Directors refusing him the Insurance of his life. And we have recorded, (page 25,) the liberal conduct of Messrs. Nisbet and Dickson, of the Alliance Company, in effecting this *desideratum* to the satisfaction of the founder of the South African Company.

4th. We have (page 26,) some very pertinent hints on the election of Committees, Directors, &c A reform has been long required on this head at the Cape.

5th. *Grand total*—The Institution

"Has afforded security to the Creditor from the poor but honest Debtor,—it has provided for the Orphan, the Widow, and the Friendless,—it has been the means of securing to the lender monies upon bond,—*it has broken down the accursed walls of personal securities,*—it enables those who are insured to rest comfortably in their beds, knowing that a conflagration will not bring them to ruin,—it has reduced colonial premiums; yet has produced a large profit with magnificent prospects,—and it has kept not only a vast sum of money in this Colony; but, in conjunction with the admirable *Savings' Bank,* it has assisted to revive drooping trade, by causing additional circulation amongst us."—(Pp. 29-30.)

One or two parting words to Mr. Le Breton and Philanthropists, and all founders of useful Societies. One or two words to every man who has the wisdom to plan, the courage to execute, and the resolution to persevere, and who, moreover, possesses an intellect above the *common mode.* It is a surprising passage which a late French author has given us. "That a man of great merit is a kind of public enemy." But be not surprised at this, you have read who suffered the Ostracism at Athens, and what a pretty reason the country fellow offered, why he gave his voice for the banishment of Aristides:—"Because he was every where called The Just." And for what reason the *Ephori* laid a fine on *Agesilaus*:—"Because he possessed, above all other men, the hearts of the *Lacedemonians.*" You have read why the *Ephesians* expelled the best of their citizens:—"If any are determined to *excel their neighbours,* let them find another place to do it." You have read that he who conquered *Hannibal,* saw it necessary to *retire* from Rome, that the merits of others might be more noticed. Yes, Yes, Sirs, such is the cruelly disfigured state of our fallen nature, that men will often acknowledge *small* obligations, but return wonderful malice for such as are extraordinary. Excess of desert is often turned into a kind of demerit. Men will sooner forgive great injuries, than great *services.* (In making this observation, we naturally think of Mr. Fairbairn and certain colonial *ingrates.*) He that built a matchless castle for the Poles, had his eyes put out that he might not build such another!

A LATE CHURCH ORDINANCE.

A writer in the Advertiser *(Complainant.)* appears to have fallen out with the Episcopal regulations of a late Ordinance, which provides that none other than Episcopal bones shall lie in the Church yard of Bathurst: a regulation which seems to say to *Dissenting* bones—

"More manners learn, and at a distance rot."

Now, how differently constituted are some minds. We, for instance, supposing our choice consulted and we were making our Will,—our directions would be according to the following:

Lay me not in the charnel ground,
Where flesh and bones are mangled;
Nor let the sullen death-bell sound,
Nor any chime be jangled.

But lay me 'neath the shady trees,
Where the waving boughs are wreathed;
And let no sound but the sighing breeze
Be o'er my burial breathed.

And let the winter birdie sing
His hymn of Resignation;
Or the full-throated choir of spring
Shout peals of Jubilation.

Let no friend's hand be flimsy-gloved,
No crape-bands *look* repining,
But wear the sunny flowers I loved,
Or ivy, green and shining.

Let not my name on staring stone,
With loud bare lies be worded:
What little good or ill I've done,
Elsewhere is safe recorded.

CAPE BOTANY.

Those interested in transmitting seeds to Europe, will do well to read an interesting communication by Mr. Bowie, our intelligent Cape botanist, in a late number (36,) of the Gardener's Magazine. It is entitled—*Hints on raising the Leguminous Plants of Australia and the Cape of Good Hope from seeds, on acclimmatising them in Europe, and on their native habits.* Much impatience, and even despair, is often manifested by the amateur naturalist, on finding no *immediate* reward crowning his labours with success. But Mr. Bowie tells us, that he found during his residence in England, "many of the Cape seeds only vegetating after being *three years* in the ground." The truth is, few things appear more curious than the fact, that the seeds of various plants and flowers, which have lain dormant in the ground through a succession of *ages,* have been enabled to vegetate, or have been brought into action by the application of some compost or manure, *agreeable to their nature.* In some plants, however,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

germination seems to have a specific and regular term. The following particulars are submitted to the reader—subject, however, to his correction:

A Table of the period in which the following Seeds germinate after being sown:

Wheat,	1 day.
Spinach, Beans, and Mustard,	3 —
Lettuce,	4 —
Melon, Cucumber, and Cress,	5 —
Radish and Beetroot,	6 —
Barley,	7 —
Cabbage,	10 —
Hyssop,	30 —
Parsley,	40 or 50 —
Almond, Chesnut, and Peach,	1 year.
Rose, Hawthorn, and Filbert,	2 —

To encourage the planting system, so greatly needed at the Cape of Good Hope, we may remark in conclusion, that when plants are buried in the ground to a greater depth than is natural to them for their proper growth, they do not vegetate; but they do not therefore die; they retain their power of vegetation to an unlimited period; and when, by any accident, brought so near the surface as to suit their evolution, they begin immediately to grow. This principle—

"Goodness immense" in the Creator,

has been ascertained to be capable of existing in this latent state for above two thousand years unextinguished, and springing again into active vegetation as soon as planted in a *congenial* soil (1). It even remains unimpaired in blighted corn, and will grow from that, as vigorously as from the perfect seed (2). But yet, although thus abiding in vitality in its dormant state for an indefinite length of time, such is its delicacy of existence when once roused into its living action, that it perishes for ever if it be prevented from continuing or nourishing its growth (3). This living principle can subsist in all its reproductive powers in fruit-trees, from one to two centuries (4), and in others from many more (5). Some of the poisons affect the activity of this principle, though they do not destroy it (6).

NOTES.

(1.) At the Royal Institution in 1830, Mr. Houlton produced a bulbous root, which had been discovered in the hand of an Egyptian Mummy, where it had remained above 2,000 years. On exposure to the atmosphere it germinated, and when planted in earth, it grew with great rapidity.—*Journ. Royal Inst. No.* 1.

(2.) Sir Joseph Banks, in 1805, sowed 80 grains of the most *blighted wheat* in pots in a hot-house, and had 72 healthful plants.

(3.) Those who convey seeds from distant countries, should be instructed to keep them dry: for if they receive any damp, sufficient to cause an attempt at vegetation, they then necessarily die, because the process, as they are situated, cannot go on.—*Smith's Introd.* 29.

(4.) An apricot tree, 120 years old, was bearing fruit sufficient for my family, (Life of Kames, vol. 2, p. 73.) Pear-trees, planted in the time of King William the 3d, were, by gradually paring away the old wood and bark, covering the garden walls with new branches and fine fruit in 1807. —*Smith's Introd. p* 29.

(5.) A yew-tree was in existence at Peronne, in 1790, which was mentioned in the original charter for building the church in 634. (*Journ. of Science, No.* 40, *p.* 112.)—The most vital parts of the stem of a tree, are thought to be the innermost layers of the bark, and the outermost layers of the wood.—(*Quarterly Journal of Agriculture.*)

(6.) Thus sensitive plants lose their power of contracting, if laurel-water, opium, or nux vomica be applied. So they contract from camphor, and do not dilate again.—(*Journal of Science.*)

"WHY NOT"—

(Gentle Shepherd tell me.)

"Why not have a Bishop for the Cape of Good Hope? Why not another for Malta, who might occasionally visit those places in the surrounding countries, where considerable numbers of English Episcopalians reside, without the means of obtaining for their children the primitive *right* of Confirmation. The benefit of such appointments would be incalculable, particularly in regard to ordinary and superintending *native* missionaries; and the *expense* to the mother-country needs not be great, as the senior chaplain might be appointed to the office, which would not require the same *temporal rank and expenditure* which attach to it *at home and in India.* We would respectfully submit the suggestion to our Church Societies, and *especially* to the Most Reverend and Right Reverend Prelates who preside over the province of Canterbury and the see of London.—(From the *Christian Observer*, Appendix to volume 31st, copied *verbatim et literatim.*)

SOUTH AFRICAN LITERARY AND SCIENTIFIC INSTITUTION.

The Literary Society and South African Institution having formed a *junction*, have taken the above title. The following Gentlemen were elected Office-bearers on the 14th ult.

President,
Hon. Col. BELL, C.B.

Vice Presidents,
Hon. Capt. Stockenstrom.
Hon. Mr. Justice Burton,
Dr. Murray,
Dr. Neethling.

Council,

Mr. von Ludwig,	Dr. Liesching,
Mr. Hertzog,	Dr. Fairbridge,
Major Cloete,	Rev. Mr. Faure,
Mr. W. Liesching,	Hon. J. W. Stoll,
Mr. Borcherds,	Major Michell,
Lieut.-Col. Wade,	Mr. Mackrill.

Secretaries,
Drs. Adamson and Dyce.

Treasurer,
Mr. F. S. Watermeyer.

IMPROMPTU.

By Moses, itinerant Poet and Money Scrivener.

What makes loyalty appear?
The receipt of £500 a-year.
What drives loyalty away?
Just the loss of so much pay.

THE 75th REGIMENT.

The departure of this fine Regiment for the Frontier, is near at hand, and forms a subject of general regret in Cape Town. The officers, in a body, have been great patrons to the most useful of our Literary Institutions; and in a pecuniary point of view, their absence will be a great loss. On the other hand, Graham's Town, and its rising interests, will derive encouraging assistance by the presence of this spirited, handsome, and well-conducted Regiment,

LITERARY NOTICES.

CAPT. J. Lisle Fenwick, H. M. 58th Regt. has in the press, a Work entitled, "Notes of a Voyage from Ceylon to England, with some Remarks on the present state of the Mauritius, the Cape of Good Hope, the condition of Slaves in those Colonies,—Present State of St. Helena, &c.

DR. Howison's Work on the Cape of Good Hope and its Frontier, is nearly ready for the Press.

PREPARING FOR PUBLICATION.

JOURNEYS from Cape Town, to the Great Orange River, the Missionary Stations on the Frontier, with an account of the present state of the Amakosæ Caffers, &c. by A. Steedman, Esq.

M. Douville's Travels in Congo and Southern Africa in the years 1828, 1829, and 1830, are about to appear.

Mr. Greig is preparing the Cape Directory for 1833. It is intended as usual to embrace every object of colonial interest—Statistical, Agricultural, Commercial, and Scientific.

MATHEMATICAL PROBLEM.

(An answer required,)

Required a number which, when divided by 4, 5, 4, 5, 4, the remainder shall be 4, 5, 4, 5; and when divided by 4, 5, 4, 5, the remainder shall be 4, 5, 4; and when divided by 4, 5, 4, the remainder shall be 4, 5; and when divided by 4, 5, the remainder shall be 4.

Required also, a certain number which, when added to the lowest quantity required, shall continually produce similar results.

LODGE OFFICERS OF THE LODGE THE HOPE.

(*Commercial Exchange*, 1832.)

C. Burton, Esq. *Master.*
J. Henoch Neethling, Esq. *Past Master.*
Rev. George Hough, M. A. *Chaplain.*
J. B. Ebden, Esq. } *Wardens.*
Jas. Bance, Esq. }
Major Molesworth, } *Deacons.*
W. M. Edye, Esq. }
W. Dickson, Esq. *Treasurer.*
Rob. Cooper, Esq. *Secretary.*
Alex. Thomson, Esq. } *Stewards.*
W. Gadney, Esq. }
George Cadogan, Esq. *Inner Guard.*

Mr. Walker, *Tyler.*

The following are the Fees of the Lodge:

On Initiation, . . .	Rds. 65.
Passing to the second Degree,	— 30.
Raising to the Sublime, .	— 50.

"Every Person initiated into Masonry, must defray the expence thereof, provided it *do* not exceed a guinea and a half."

Every Brother on his Affiliation shall pay 20 Rds.

CORRESPONDENCE.

A Correspondent has addressed us in reference to the wordy-war of the Cape Newspapers. He suggests "a cessation of hostilities," and recommends PEACE to the belligerents; adopting as his motto the lines from Bloomfield:

"Halt! ye legions, sheath your Steel!
Blood grows precious, shed no more."

A Calculator charges us with being "wholly unfit to become Auditor General, or Chancellor of the Exchequer." We plead our deficiency at once, and pray to be excused from serving such Office. The amount which will accrue to the Cape by the present residence of "Our Indian Visitors," was estimated in our last at too low a rate. Instead of Twenty Thousand Pounds sterling in twelve months, the probability is that the amount will not fall much short of *Thirty Thousand Pounds!*

DEPARTED this life, Thursday, 26th July, JOHN FREDERICK BECK, Esq. late of Long-street, Cape Town. His memory will be choice in the recollections of the writer of this notice, for the many acts of pure and disinterested friendship on the part of the deceased, and for the other inestimable qualities which he possessed.

Printed and published by W. BRIDEKIRK, Heeregracht, Cape Town.

LECTURES
ON NATURAL PHILOSOPHY.

LECTURE II.—BY ORLANDO.*

(ON THE FORMATION OF OUR PLANETARY SYSTEM—THE STARS AND THE COMETS.)

GENTLEMEN!—The fourth rotation of our Globe was accompanied by the formation and arrangement of our Planetary System. At this period of our Creation, Moses places the formation of the Sun and Moon, and their association with our Earth; and expresses the Divine order, that they should regulate the illumination of our world, and divide our day into the two natural distinctions of visible light and succeeding darkness, and become the cause of our seasons, and suggest and govern our computations of time.

'And Elohim said, Let there be lights in the firmament of the Heaven to divide the day from the night; and let them be for signs and for seasons, and for days, and years; and let them be for lights in the firmament of the Heaven to give light upon the Earth: and it was so.'
Gen. I. ver. XIV. XV.

It has not satisfied some, that the Sun should be supposed not to have existed before our Earth; but why should an anterior subsistence be claimed for it more than ourselves? There is no reason which makes it necessary that the Sun or Moon should have been framed at any other era, rather than at this period. We do not know, and we have no means of knowing, at what point of the ever-flowing eternity of that which is alone eternal,—the Divine subsistence — the creation of our Earth, or any part of the Universe began, nor in what section of it we are living now. All that we can learn explicitly from Revelation is, that nearly 6,000 years have passed since our first ancestor began to be. We are approaching the six thousandth annual revolution of our Globe round the Sun. This is all we possibly know.

But what ever may be the comparative antiquity between our Globe and myriads of radiant Bodies which nightly gem the immense expansion of celestial space between us, in their unaltering stations, the most natural idea, as to those which are linked with us in their concurring revolutions round our grand central luminary—and as to the Sun himself which attracts both them and ourselves—and as to that pleasing Satellite which makes our night so poetical and so beautiful,—is, that they and we had all one coinciding period of existence, and differ little in the chronology of our origin. This fact, at least, which seems to be philosophically certain, that all the bodies which compose our Planetary System must have been placed at one and the same time in that arrangement, and in those positions, in which we now behold them; because all maintain their present stations, and motions, and distances, by their mutual action on each other; neither could be where they are, nor move as they do, nor subsist as we see them, unless they were all co-existing: the presence of each is essential to the system which they constitute—the Sun to them, they to the Sun, and all to each other; and this circumstance is a strong indication that the Sun did not precede the Earth in his formation, but was made just as that was framing, as Moses has narrated. Each of the Planets and the Sun, have, no doubt, their several peculiar uses; but they have also been fabricated with mutual relations, and for common purposes. Our system of animated and vegetable nature could not subsist without the Sun. We could not have our seasons, our daylight, or our years, without him. He, therefore, has been made expressly for us, as well as for the substances and beings that he may contain within himself. He has been equally made for our sister Stars, to whom he is apparently as indispensable as to us. The true chronology of these noble structures seems therefore to be, that the Sun and the Planets were formed while our earth was creating. The Sun and Moon, for their uses to us, as well as for those to themselves and to the bodies that, with us, circle round them: and this the Hebrew author intimates, when he adds—

'And Elohim made two great lights; the greater light to rule the day, and the lesser light to rule the night: the stars also.'—Gen. i. ver, 16.

That the Stars here mentioned were the planets of our system, and not the Fixed Stars, seems a just inference, from the fact that, after mentioning them, Moses immediately subjoins

'And Elohim set them in the firmament of the heaven, to give light upon the earth, and to rule over the day, and over the night.'

Now, the Stars which were more particularly set in the firmament with direct relation to our Earth were the Planets, two of whom are connected with our day and night, for Venus and Jupiter alternately become our morning and evening stars, and give a light to our Earth in their transcendant brilliancy, which no fixed star affords.

But for the stars with which we are now connected, are the six Planets distinguished by the names of

Mercury,	Venus,	Mars,
Jupiter,	Saturn,	Uranus.

And those smaller ones, discovered within the present century, and called the Telescopic Planets, because they are not discernible without the aid of a very powerful astronomical instrument; though, perhaps, instead of them, the more ancient one of which they are conjectured to be the wandering fragments, was the primeval one of the

* Delivered before the Members of the Poker Club.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

other six. The immense distance which separates the Stars which belong to our System, from the other unmoving ones, that shine in the infinity of space beyond, increases the probability that Moses alluded only to those with which our earth was concerned. Of the creation of the rest, as they form no part of our Cosmogony, but belong to other orders and systems of existence, with which at present no relations, no account is transmitted to us. They are, indeed, the most splendid mysteries of nature. They are known to us only as radiant points; for the most powerful telescopes cannot farther enlarge them; and yet our scientific contemporaries are ascertaining that their number amounts to a multitude, which their predecessors never imagined, and which seems to exceed all our powers of fully exploring. Of these it is remarkable, that they are undergoing changes for which we have no means of accounting, but which display mighty causes to be there in operation. It is one of the wonders of Creation, that any phenomena of bodies at such an immense distance from us, should be perceptible by human sight, that a manifest INFINITY should be made visible to our intellect by immense distances which our eye can survey, and which from what is seen, compel the judgment to perceive and infer an unbounded universality beyond them: for there is nothing in them which denotes that what reaches our sight in them is at the last limits of existing nature. These lofty mansions of being indicate to us that they have the same Creator as ourselves, and are but so many other magnificent scenes of His sovereignty and care. For they display an abiding relation of position, and a similarity of motion and of nature, and there are strong indications of unity of design and creation. The identity of the light, which alike emanates from all, precludes all rational doubt on this interesting question. That our light was His creation, we learn from the Scriptures. This fact justifies us in referring it, in other orbs, to the same origin: and nothing in the Universe shews any marks of any other creative power.

The creation of the Fourth Day, being considered as confined to our own System, embraced the Sun, Moon, and connected Planets, and may be considered as extending to their composition and allocation. Let us briefly recollect the leading circumstances of this important formation.

Of the actual substance of the SUN, so little, satisfactory yet to our judgment, has been discovered, that all which is mentioned concerning it, can rank no higher than conjectures of scientific imagination more or less plausible. The comparative masses of its spacious substance, and of the other Planets have been calculated. Dr. Herschel thought its body to be opaque, with an upper stratum of self-luminous clouds. Black spots, of varying magnitude and form, are continually appearing upon it, and receding; and have led astronomers to discover that the Sun has a rotation round its own axis, which it performs in about 25 days and a half.* These spots are almost always comprised in a particular zone of its surface. His diameter has been estimated to be 886,149 miles. From the faint zodical light, which at times accompanies it, an atmosphere has been ascribed to it. The variety of seasons which it was appointed to produce, is caused by the inclination of the Ecliptic to the equator.

The substance of the MOON is more known to us than that af the brighter Luminary. Its volume is 49 times less than the volume of the Earth There is ground for supposing that all is solid at its surface, for it appears in powerful telescopes, as an arid mass on which some have thought they could perceive the effects, and even the explosions of volcanoes. There are mountains on the surface of the Moon, which rise to the height of nearly two miles; and it has been inferred that it has deep cavities, like the basins of our seas. Caspian lakes have been supposed in it. But it has either no atmosphere, or it is of such extreme rarity as to exceed the nearest vacuum we can produce by our best constructed air pumps; so that no terrestrial animal could breathe alive upon its surface. If, then, it be inhabited, it is not by beings who have bodies like other men, or any of our animated races. The lunar population must be of a far more aërial nature than our present selves, or our most delicate fellow creatures. Only sylphs, spirits, or angels, suit such ethereal medium. It has a great number of invariable spots, which prove that the Moon always presents to us the same hemisphere, and revolves on its axis in a period equal to that of its revolution. Its dark and bright parts have given rise to the idea, that it has seas, islands, and continents; but it is now doubted whether it has any water at all; and it has been supposed that if it had any oceans, the superior attraction of the Earth, especially when in conjunction with the Sun, would draw the aqueous fluid into a deluge over a large part of its surface. The light of the full Moon is at least 300,000 times more feeble than that of the Sun. From this inferiority, the lunar rays, when collected in the most powerful mirrors, produce no sensible effect on the thermometer. Indeed they seem to have a cold-producing agency, according to the experience of practical men, the philosophers have not yet ascertained the fact by their direct experiments. (1.) That they have a peculiar and unsalutary influence on the animal frame, appears to have been actually experienced by some of our countrymen. (2) Other nations declare the same. (3) It has been so often observed in mental derangement, that this malady has been named Lunacy, from the assumed effect; and medical men, experienced in such cases, are perfectly aware that in many there is a visible excitement at the changes of this luminary. Its atmospheric effects have been also asserted. We learn from Plutarch, that the ancients believed the Moon to produce many singular results, which he enumerates. Hence, however beautiful and interesting the moonlight scene of both heaven and earth is felt to be by all, it will be always wise to recollect, that night is our natural season of retirement and repose.

But our System could not be completed to be what it is, without the other PLANETS. These are the six larger ones, and the four Asteroids, which move in circuit round the Sun like ourselves; and the satellites which are found to revolve round the three most distant Planets. The 10 Planets and Asteroids, are always visible, except when immersed in the solar rays. The first five have been known from the remotest antiquity, because they can be observed by the natural eye; but Uranus and the Asteroids remained unknown till the Telescope descried them since the 18th century. Mercury and Venus never recede from the Sun beyond certain limits. The others are elongated from it to all possible angular distances. But the motions of all

* La Place, vol. 1, page 19.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

these bodies are comprehended in a zone of the celestial sphere called the Zodiac; and the breadth of this is divided into two equal parts by the Ecliptic.

MERCURY, so near the Sun, and thence so heated, that Dr. Walsh has not unaptly said, the inhabitants, if any, must be so many animated basaltic Memnons, revolves round its axis as we do, and in the same time. VENUS revolves like our Earth, in somewhat less than a day. Schroeter has inferred from his observations, that it has mountains of a considerable height, and is surrounded by an extensive atmosphere. It may, therefore, have inhabitants more like ourselves than those of the other Planets, but it is much hotter than our globe even in our torrid zone. It surpasses all the celestial orbs in brilliancy. It appears sometimes with horns, like the Moon. MARS, distinguished by the redness of its colour, does not move exactly in the plane of the Ecliptic. It sometimes deviates several degrees from it. It changes its apparent form, and becomes sensibly oval, according to its position with respect to the Sun; which shews that it receives light from this luminary. The splendid orb of JUPITER, though above 20 times larger in diameter than our Globe, yet has received such a far greater acceleration of agency than was appointed to our Planet, that he revolves round himself in less than half our day. His diurnal circuit gives him five hours daylight and five hours night; but his circuit round the Sun is so ample, and his ratio of motion so different from ours, that he takes nearly 12 of our years to complete it. JUPITER was made to be the most brilliant of the planets after Venus, which he sometimes surpasses in brightness, though he is at least five times more remote from us than the Sun. Like Mars and our Globe, his orb is flattened at the Poles. Four small stars or Satellites constantly accompany him, always changing their relative positions. The magnitude of these Moons cannot yet be exactly measured; nor have the several Belts which are observable upon his surface, been as yet accounted for. To his inhabitants the Sun is supposed to appear but as a bright star, giving little or no sensible heat. SATURN, was placed about nine and a half times further from us than the Sun; and made to revolve round its own axis, like Jupiter, in less than half of our day; though his mass is so much greater than ours. His celebrated Ring was found by Herschel to have a similar rotation in nearly the same time. Although so remote from the Sun, both his body and his ring are deemed opaque bodies, illuminated by it. The Ring disappears when the Earth is in its plane, as its thickness is imperceptible, and it becomes also invisible when the Sun is in its plane, and continues so as long as that plane is between the Sun and the Earth. Its several Satellites revolve around it from east to west, in orbits nearly circular. With the orbit of Saturn, our Solar System had been always thought to terminate, till Dr. Herschel, on the 18th March, 1781, discovered a new Planet to be revolving at twice the distance of Jupiter from the Sun. This grand addition to our System was at first named Georgius Sidus, then Herschel, and now more commonly URANUS. Its present diameter is very small. Herschel discovered six Satellites to revolve about it, in orbits nearly circular. Two only have been recognised and fully admitted by other astronomers. The Asteroids, or Telescopic Planets that revolve between Mars and Jupiter, need not be further noticed than to mention their apparent confirmation of the new law which the scientific Bode had suggested. His idea was, that the several planetary orbits have a progression in their magnitude. But this law seemed to be interrupted between Mars and Jupiter. Hence he inferred, that there was a planet wanting in that interval; a bold yet profound conjecture; but this predicted deficiency is now found to be supplied by the four new Asteroids, which occur in the very space where the unexplained vacancy presented a strong objection to the theory. All their orbits conform in dimension to the law in question. Thus the deduction of Bode was ascertained to be one of those predictive anticipations of true science, which if just, are like Newton's inference of the combustibility of the diamond, sure to be verified by the subsequent accessions of our philosophical knowledge. Now, as to COMETS. It may be asked whether they were among the heavenly Bodies that were of a contemporary formation with our Earth. It is a natural inquiry; but we have no materials on which we can satisfactorily reason to any useful conclusion on this point. Although we have now become acquainted with so many, we know but little about them. They participate, like the other Stars, in the movememt of the Heavens; and this combined with the smallness of their parallax, proves that they are not meteors generated in our atmosphere. Their proper motions are extremely complicated. They have a place in every direction; and are not restricted, like other Planets, to move from west to east. Their recurring presence proves that their first existence ascends into unexplored and unrecorded antiquity. Yet from whence they come to us, we as little know as for what purpose. Tycho Brake proved that they were farther from the Earth than the Moon, and were nearly as distant as the Planets. The Comet of 1682 re-appeared in 1759, having in the interval described an orbit like an ellipsis, answering to a revolution of 27,937 days. It will, therefore, re-appear in November, 1835. On the subject of Comets in general, I feel great pleasure in recommending to this meeting an "Essay on Comets," which gained the first of Dr. Fellowes's Prizes in the University of Edinburgh. The work is written by my attached friend David Milne.

The *primitive fluidity* of the Planets is clearly indicated by the compression of their figure, conformably to the laws of the mutual attraction of their molecules. It is also demonstrated by the regular diminution of gravity as we proceed from the Equator to the Poles. This state of primitive fluidity to which we are conducted by astronomical phenomena, is also apparent from those which natural history points out. Such is the deliberate judgment of La Place. Sir Isaac Newton had also, a century before, asserted the primeval fluidity of our Globe. It is thus that Moses first displays it to our view, a moving, liquid, unformed mass. In this state, under the additional action of light, it began its wonderful rotation, and became the regular composition of which it now consists. * * * * * Our Earth is above 90 millions of miles from the Sun; Saturn is above 800 more miles farther off; and the next and most remote that we know, which is connected with us, the Uranus, is twice that mighty distance. The fact is sublime, and vast beyond the power of our words to express, or of our ideas to conceive. Our System occupies an area of 5000 millions of miles, and yet this amazing portion of space is but one small portion of the indescribable Universe. Above 100,000 stars, apparently Suns like ours, shine above us; and to each of these, analogy would lead us to assign a similar appropriation of space. This is indeed a marvellous mystery. It compels us to call Creation an infinite immensity. It aggrandizes the Creator into a sublimity,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

that would render it the most presumptuous folly for us to imagine that He could think of, or care for us, if He had not expressly revealed to us his condescending regard, and His invitation and command that we should attach ourselves to Him. But this awful greatness makes that Revelation the more inestimable to us; for without such a Charter, without such personal authorization for our affectionate adoration and grateful duty, what could our reason suggest to us, while it contemplated a majesty so tremendous, but a tremulous dread and silent despair!

In conclusion, Gentlemen, we are philosophically entitled to say, that this World must have been framed by a transcendant Supernatural Agency; and could not otherwise have become what it is;—neither could it, without the continued aid and co-operation of the same Superhuman Power, remain what it is;—so firm, so unbroken, so undecaying, and so beautiful as we every where discern it to be. For it is a vast complication of multifarious parts—a very artificial arrangement of heterogeneous things, none of whose particles are in their original or natural state; and the whole and every portion—all that is in it or upon it—are in continual motion, action, re-action, and counteraction. Our common reason suggests that what is complicated cannot have been eternal, nor what is full of the most abstruse science in its construction, have been put together but by an highly scientific Mind. So all discordant and artificial combinations, that are always in counteraction with each other, with a constant nisus to separate, could never be kept permanently together but by the unceasing application of the complicating Power, and the continued superintendance of the forming Intelligence. Any other supposition only leaves an effect without a cause.

The difficulty is not lessened by the theory, of a Creation so perfectly formed at first, as to require no after Providence or attention; for this idea, if correctly examined, will be found to be but the assumption of an impossibility, when applied to any complicated structure. A simple atom, which, when once made to exist, cannot cease to be, and cannot alter, except by His Fiat who called it into being. But no complication of particles out of their natural state into an artificial one, can continue in their forced condition without a continued action of the complicating power—and this is the Creating one. The combining energy must continue to combine, or the combination in time will sever. The Creating Power must continue to act as the Conserving Power; and therefore, as a superintending Providence, preserving what it has made, supplying what wears off, supporting what declines, restoring what decays, and adding new means and impulses when new results are to be produced and new purposes accomplished. No words alone create; no words alone can be supposed to preserve. In both cases a power operates. The just inference from these remarks seems to be, that supernatural agency is as necessary to the present subsistence of things, as it was to produce their original formation. Let me caution the younger part of my audience to avoid all absurd prejudices theoretically against this view of things—against miracles, *i.e.* the doctrine of superhuman interference. Creation was a miracle. Its subsistence is not less so. The true idea of a miracle is, that it is an act of Divine Power—an event which the material laws of nature, without the greater law of the Divine Agency could not effect. To describe a miracle as a violation of the laws of nature, is an incorrect and inapplicable definition; for *all the laws of nature are in continual violation and counteraction with each other.* Fire burns, but water extinguishes it. Water is fluid, but cold converts it into a solid, and heat into air. It is the established course of nature, that all its laws should be thus violating each other. It is by such a violation that we roll yearly round the Sun. This is the result of the attractive law continually violating the law of that propulsive force which every Planet has received. These two laws are in constant struggle, each violating the other; neither prevailing. We now go round the Sun with no willing movement; and instead of flying from it as one law urges us to do, and instead of falling into it, to which the other is always drawing us—this mutual violation of each other's law compels our Planet into the elliptical circuit, which is the artificial product of this appointed contest.

I throw out these hints for your consideration, because Sacred History, being the history of the Divine agency in human affairs, cannot but comprise the appearance, and be expected to exhibit the occurrence of such miracles as were necessary to effectuate its objects.

The subjects of the next Lecture are

Creation of Vegetation—Necessity of Light and Air to it—On the Divine Agency in Nature—On the distinction between Light and the Solar Ray.

NOTES.

(1) Dr. Howard has affirmed, that on placing the blackened upper ball of his differential thermometer in the focus of a 13-inch reflecting mirror, opposed to the light of a full moon, the liquor sank in half a minute eight degrees!

(2) Men on board a ship, while lying in the moonlight, with their faces exposed to the beams, often have their muscles distorted, and their mouths drawn awry. Fish hung up all night in the light of the moon, when eaten next day, has occasioned violent sickness. See most of the Voyages round the World.

(3) Mr. Madden mentions, that the Arabs attribute a morbific influence to the moon, and think it causes ophthalmia and catarrh.

POLITICAL PROPHECIES NOT GENERALLY VERIFIED.

"I quit the Camp."—*Burke.*

"I have now done with this House—ruin stares the country in the face, and Revolution is at the door. I have read the history of 40 years which have passed before me, and every page of that history confirms me in the determination I have now taken. I shall no longer hold my place in this House. Let the noble Lords do their dirty work alone."

[The noble Earl Carnarvon having said these words sat down: upon which the Duke of Wellington and his party rose and left the House in a body.]

The above is an extract from the debates in the House of Lords, 17th of May, 1832, and is taken from a London paper. It is no part of our duty in this Journal, to advocate any set of political principles; we may, however, watch the progress of our National History, and contemplate the "signs of the times." We may also draw a few historic parallels, simply with the view of suggesting *reasons for repose* to those whose minds are in a state of distressing anxiety, to such as have not studied *Hayley's* "Triumphs of Temper," and lastly, to justify the heading of the present article.

The year 1707 is conspicuous in the history of our country, for the Union of the two Kingdoms—England and Scotland. The Scots from that æra have unquestionably enjoyed more happiness as a people, and risen to more wealth and consequence as individuals, than they would have attained in their disunited state. Nor has England reason to complain of the Union. Instead of turbulent neighbours, she has gained hardy soldiers, a world of intellect, and a loyal people. Scotland has, since the Union, never been as she was always before, the instrument, often reluctant, but too frequently impelled—the victim of French politics. No—the Union has blended the population of each, into one general country of fraternal emulation, respect, kindness, progression, and prosperity. Scotsmen and Englishmen are now real brothers, and assist-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ing friends in art, in arms, in science, in commerce, in philanthropy, and in every thing which adorns our common nature, and which distinguishes its political society. Yes, the Union began a new history for both countries, of a grander character than either had known before: and we are now partners in all the honor, fame, and power, which wise government, high moral character, and peaceful consistent conduct, can obtain or impart to either. In one point of view, the great good sense of Scotland is of the highest order. As an *ancient kingdom*, it is readily to be supposed, that it required a strong mastery over the passions to yield with a quiet surrender, her dear-bought privileges, and especially her far-famed *language*. Let us recollect it was the language of a whole country long an independent kingdom, separate in laws, character, and manners. It was not, be it considered, the language of a polyglot family,

"Black, White, and Grey,"——

but the language of a people unmixed with all the ends of the earth, and who really had an indisputable claim to its perpetuity. The language is now no more, but it is connected in the imagination not only with olden time, which is uniformly conceived as more pure, lofty, and simple, than the present, but also with all the soft and bright colors of remembered childhood and domestic affection. And what introduced this portion of change in Scotland? The general introduction of the English language throughout the country—by means of Schools, the *Pulpit*, and the Courts of Justice, and without the aid of those stumbling-blocks—*Translators*. But then all men were *sincere* in their *public capacities;* they were united in carrying into effect the Ordinances of Government. There was but *one opinion* as to the necessity of establishing *one community* of language. They knew its influential importance in cementing the affections of all ranks to Britain and her laws; they put down those rebellious people who stupidly attempted a resistance, (for there were a few such,) and they lived to behold their loyal and praise-worthy efforts crowned for—

"The good, the common good of all the land."

But we have somewhat wandered from our subject. Our business is to advert to those melancholy pictures which are often presented to the public in the shape of political prophecies. The noble Earl of Carnarvon (an extremely worthy man) having presented us with a text, the patriotic Lord Belhaven of 1706, has furnished us with a comment. His lordship, in pleading against the Union of the two kingdoms, in a kind of prophetic, or rather poetic vision, fancied many evils, the very reverse of which have come to pass. The following is a copy of the famous speech of Lord Belhaven in the Scottish Parliament, and which depictures, with most impressing imagery, the evils which he thought would arise from the measure in question being carried.

"Methinks I see a free and independent kingdom, delivering up the great object of dispute among nations, for which the world has ever been fighting, and all Europe is at present engaged in war; the power to manage their own affairs without assistance or controul. I see the present peers of Scotland, whose ancestors have exacted tribute through England, walking like English attorneys in the court of requests; while at home a petty English exciseman shall receive more homage and respect than were ever paid to the greatest of their progenitors. I see the estate of barons, the bold assertors of our liberties in the worst of times, setting a watch upon their lips, and a guard upon their tongues, to avoid the penalties of unknown laws; and the burrows, walking through their desolate streets, drooping under disappointments, and wormed out of the branches of their former trade. I see the honest and industrious tradesman, loaded with new taxes and impositions, disappointed of the equivalent, eating his saltless porridge, and drinking water instead of ale. I see the incurable difficulties of the landed gentry, fettered with the golden chain of equivalents; their daughters petitioning for want of husbands, and their sons for want of employment. But above all, I see our ancient mother Caledonia, like Cæsar, sitting in the midst of our senate, looking mournfully around, covering herself with her royal garment, and breathing out her last words, *And thou too, my son!* while she attends the fatal blow from our hands. Patricide is worse than parricide; to offer violence to our country is worse than to our parents. But shall we whose predecessors have founded our monarchy and transmitted its constitution and its laws entire, to us a free and independent kingdom, shall we be silent when our country is in danger, or betray what our progenitors have so dearly purchased? The English are a great and a glorious nation. Their armies are every where victorious; their navy is the terror of Europe; their commerce encircles the globe, and their capital has become the emporium of the whole earth. But we are obscure, poor, and despised, though once a nation of better account; situated in a remote corner of the world, without alliances, and without a name. What then can prevent us from burying our animosities, and uniting cordially together, since our very existence as a nation is at stake? The enemy is already at our gates! Hannibal is within our gates! Hannibal is at the foot of the throne, which he will soon demolish, seize upon these regalia, and dismiss us never to return to this house again! Where are the Douglases, the Grahams, the Campbells, our peers and chieftains, who vindicated by their swords, from the usurpation of the English Edwards, the independence of their country, which their sons are about to forfeit by a single vote? I see the English constitution remaining firm: the same houses of parliament; the same taxes, customs, and exercise; the same trading companies, laws, and judicatures; whilst ours are either subjected to new regulations, or are annihilated for ever. And for what? that we may be admitted to the honour of paying their old arrears, and presenting a few witnesses to attest the new debts which they may be pleased to contract! Good God! is this an entire surrender? My heart bursts with indignation and grief, at the triumph which the English will obtain to-day, over a fierce and warlike nation, that has struggled to maintain its independence so long! But if England should offer us our own conditions never will I consent to the surrender of our sovereignty; without which, unless the contracting parties remain independent, there is no security different from his who stipulates for the preservation of his property when he becomes a slave."

MISCHIEVOUS PEOPLE.

One characteristic of the English populace—perhaps we ought to say people, for it extends to the middle classes—is their propensity to mischief. The people of most other countries may safely be admitted into parks, gardens, public buildings, and galleries of pictures, and of statues; but in England it is necessary to exclude them, as much as possible, from all such places, because there is no security against the wanton mischief and gross offences which are committed in mere sport. This disgraceful part of the English character (for such it is, and as such all foreigners regard it,) can neither be soon nor easily corrected; but any thing tends to correct it that contributes to give the people a taste for intellectual pleasures—any thing that contributes to their innocent enjoyment—any thing that excites them to wholesome and pleasurable activity of body and mind; and the faster the march of intellect can be made to proceed in this direction, and the farther it goes, the better.

The above is an extract from the last Number (93) of the Quarterly Review, and as far as it regards the existence of mischievous people, we perfectly agree with our cotemporary; well knowing that they are by far a too numerous sect, but we are not persuaded that the remedy suggested will cure the evil; for how does it happen, that with the craving of books,—the march of intellectual pleasures, there is on the part of the public a determined anxiety to destroy, disfigure, or otherwise injure the property of our private as well as our public libraries? There is not, perhaps, a more pestilent class of nuisances to a gentleman's library on the wide surface of the globe, than Book Borrowers:—Look into every private library and behold the delapidated state of such—and this arising from the men and women who *borrow*, but who never *return*. We have known such people justify their conduct on the plea, that the return of their borrowed books has not been solicited; they thus enjoy

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

a property not their own, founded on the unsuspecting confidence or treacherous memories of their friends and neighbours. But our present business is not so much with book-borrowers. We have to do with a very numerous class of personages—the subscribers to, and readers of circulating libraries. Than the readers of such (taking proper exceptions,) we know not a more ungrateful race of beings. Just take up the books of a library about six weeks old, and what do you observe?—The books torn and creased in all directions,—broken-backed, lob-sided, or altogether divested of title page, table of contents, frontispiece, and the first and last chapters of the volume. And then who has done all this mischief. *Nobody!* It was so at first. Sometimes, it is true, an honourable reader comes forward and apologises for the loss of, or damage done to a book by his dog, or cat, or servant, or child, and immediately draws his purse-strings to supply the deficiency. But there is another class of book-destroyers,—the marginal note scribblers who have the vanity to record their puerile opinions in books not their own property. The copious digitorial memoranda, which are visible in the books of most of our public libraries, are utterly disgraceful to the writers, and at once a proof of extreme bad taste. Again, we know there are such people in the world as book-*stealers*. A man who would steal a book would make no bones of stealing a sheep provided he were hungry. The worst of it is, some people seem to glory in their book-thefts, as much as the monks of the darker ages used to exult in stealing the relics of a Saint! One more class of incorrigibles and we have done. *Mrs. Negotie Winkel* and her son would ruin you a noble library in a twelve-month or less; not by malice prepense, and aforethought, but just by *dis honestly* lending your books to some score of idlers like themselves, each of whom generously contributes his or her quota towards their disfigurement and eventual destruction. One lady reads your elegantly bound L. E. L. in bed, and of course, leaves a tumulus of tallow in greasy remembrance of her reading habits. A second puts the bride of Ivanhoe and the whole of her attendants into deep mourning, at the very moment she is plighting him her troth, by overturning an ink-stand upon the description.

A third, a toilette reader, abstracts all the advertising sheets of *La Belle Assemblee* and *World of Fashion* for curl paper.—A fourth casts up her accounts in the pages of *Pin Money*, and leaves a scrawl record of the profits arising from the incomings of the coolie earnings. A fifth gives Evelina the benefit of a shower bath before breakfast, by leaving her out for 12 hours upon a garden seat to endure the pitless pelting of the spring showers; until her eyes are so bleared, and her skin so swollen and soddened by the ablution, that she is no more fit to enter genteel company. Not a few of these second-hand book borrowers, do not scruple to feed the hungry heroes and heroines of our works of fiction, by administering to their necessities half the greasy crumbs of their breakfast, tea, and still *richer* supper tables; now and then superadding to their benefactions a cup of tea or coffee.

In conclusion, let it be observed, that second-hand borrowers are the most careless recipients of your favours of any genus of the species, because they know, that the person to whom they are required to return the book, will not read it after them; and they are equally satisfied that whatever mischief they do it, no blame whatever can be attached to them by the owner.

ORIGINAL CORRESPONDENCE.

To the Editor of the Cape of Good Hope Literary Gazette.

Sir,—Impressed with a desire to communicate what may be useful in this age of inquiry, when the *faculty* of acquiring knowledge, whereby we may attain to the possession of wisdom, is being so generally cultivated; and as in the present state of society, the press is the grand medium of communication,—I take the liberty to forward for insertion, the following translation in part, of a Latin Work entitled "Principia Rerum Naturalium;" which I think may be acceptable and interesting to many of your readers. If consistent with the plan of your literary work, I will from time to time, as leisure permits, present you with a continuation. I am led to believe, no complete English translation of this work, is at present extant.

Philoctirestos.

PRINCIPIA RERUM NATURALIUM.

(Translated from the Latin,)

CHAPTER THE FIRST.

Treats of the Means which lead to true Philosophy, and of the Man who may justly be styled a Philosopher

If the mind be well connected with the organs of the senses, or in other words, if man be truly rational, he is perpetually aspiring after wisdom. The soul is in the desire of being instructed by the senses, and of continually exercising its perception from them, as if separate from itself; and the senses in turn from the mind, to which they present their several objects for contemplation. Thus each performs and contributes to a like common operation, and tends to one ultimate object, the wisdom of the man. For this purpose there exists a continual connexion between the soul and body, and reason being added to the senses, the desire after wisdom becomes the peculiar mark, and characteristic of man; but unless he feels delight in the Knowledge, and embraces whatever lies beyond, or soars above his senses, he is far from being truly rational, nor is there a due connexion between the senses and the soul. The senses, and their various organs, can receive but grossly, and in an imperfect measure, the phenomena of the world. Now, there is no other animal but man who possesses any knowledge beyond that of the mere senses and of their organs disposed in the pia meninx of the brain. They have no power of penetrating further, neither can refer by a defect in the more subtle active power, the objects presented to a higher, or more accurate principle. But truly the wisdom of man cannot be said to differ from theirs, if we choose to refer the objects, or operations of the world upon our senses, to no other principle than what they do, and not to the soul, and to its reason. The desire to know the causes of things, and also to investigate the secret and unknown operations of Nature, is a certain prognostic that we are willing to be wise. For this purpose each one uniformly consults the oracle of the mind, and thence requires his answer; that is, we are eager to acquire deeper wisdom than that proffered us in a superficial manner through the medium of the senses.

But he who wishes to attain the end, must wish likewise to acquire the means. Now, these are the means which more especially lead to knowledge truly philosophical; *Experience, Geometry*, and the *Faculty of Reasoning*. First then let us try whether, and in what manner we have the power, by these three means to arrive at knowledge *a priori*, or to reach, in natural, and physical enquiries, the extremest boundaries of human wisdom.

By philosophy is here understood the knowledge of the mechanism of our world, and of whatever in the world falls under Geometrical government, and laws; and which it is possible to detect by experience, assisted by geometry and reason. Under the goverment of geometry are its three kingdoms, the *Mineral*, the *Vegetable*, and the *Animal*, and, if it be as yet permitted to call it a fourth, the *Elemental*. The mineral kingdom includes every thing in the earth of a hard material, and terrestrial nature, whether it be metallic, stony, or sulphuous; together with every substance, either fixed, or fluid, which cannot be classed as vegetable, or elemental. The Vegetable Kingdom includes every thing which owes its origin to the Mineral, and which serves to adorn the surface of the earth, by increase of growth and vegetation. The Animal Kingdom embraces whatever encreases by growth, but which lives by the possession each one of an individual soul. In the Elemental we comprehend all those bodies, which are of themselves, and by their own nature fluid; in which each particle exults, and flourishes by its own peculiar powers of motion and elasticity. A collected volume of these constitutes an Element, as Air, Æther, and that still more subtle one, which we shall hereafter investigate in the course of our Principia.

Under the government of geometry, and under the mechanical laws of motion, we may be allowed to rank the whole mineral as well as vegetable kingdoms, and indeed the animal too in respect to mechanical organs, muscles, fibres, and membranes; so that anatomically considered, it is both vegetable and organical. But in respect to the soul, and its various faculties, I do not conceive it possible that they can be explained, or comprehended by any of the known laws of motion; such indeed is our present state of ignorance, we know not whether the motions by which the soul operates on the organs of the body, be such as to be reduced to any rule, or law, either singular, or dissimilar with those of mechanism. The elements by which the earth is surrounded, and in which it floats, acknowledge mechanism and its laws to be as it were peculiarly their own; so intimately is mechanism united with the element, as to owe its very existence to them; and indeed the method by which they are moved, and actuated, is mechanism itself, which is thus both conceived and born of the elemental kingdom. Since then the elements of Air, Æther, and whatever is of a still more subtle nature, are naturally, and peculiarly influenced by geometry and mechanism, we have it in our power to elucidate them by the assistance of experience, the known laws of motion, and geometry united. In this first part of our Principia we speak, in part generally, and in part specifically, of the elements, of their progress from the first and most subtle, to the last which is circumfused around the earth; also of the motion of the elemental particles, of their figure, and whatever else may relate to them either as an attribute, or as essential to their nature.

Arduous is the attempt to explain philosophically the hitherto secret operations of elemental nature, far removed, and almost hidden from our view. I must endeavour to place, as it were, before the eyes, those phenomena, which she herself is careful to conceal, and of which she seems most adverse to the investigation. In such an ocean I should not venture to spread my sail, without having experience, and geometry continually present to direct the hand, and watch the helm. With these to assist and direct me, I may hope for a prosperous passage over the trackless deep. These shall be my two stars to guide me in my course, and light me on my way; for of these do we stand most in need in the thick darkness which involves both elemental nature and the human mind.

(To be continued.)

ON THE CAPE INTELLECT.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—I am not offended at the stirring-up system (as you call it) by which you very often provoke some of your readers, because I apprehend that you mean good rather than harm. But when in your last you say our Cape Youth have neither genius nor talent, I think you labour under a mistake; and also in the causes of such deficiency which you enumerate, I think you have overlooked the circumstances, viz:—that many of the evils of which you complain, and *some* of which I admit are but too true, arises from the fact, that it is our misfortune to possess Slave and Hottentot servants. Where Slaves prevail, can we expect much improvement of the mind? Who ever heard of talent in a West Indian, or from a person born in one of the southern states of North America?

A COLONIST.

WITNESSES AND THEIR INTERROGATORS.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—It often falls to my lot to witness the distressing outward situation of witnesses who are brought before the Police Court and the Supreme Court, and I have often wished for a situation which should enable me, in my official capacity, to put things on a more equitable footing. I allude to the *naked* appearances which one so often observes, and the meagre gaunt and hungry looks of the poor creatures. In many cases, I am clearly of opinion that a witness is frequently unable to give clear evidence from physical inability.—What I mean, may be illustrated by the following case mentioned by M. Berranger in his Criminal Law of France, and although in his work, *Prisoners* are mentioned, yet it must not be forgotten that many of the *witnesses* in this Colony are comparatively such.

I am, Sir,
A BYE-STANDER.

"You contradict yourself," said the president, addressing one of the prisoners, "in many of your answers." "Sir," answered the unhappy being, "I have undergone so many interrogatories, that I hardly know what I am saying. I have been *au secret!!* This torture I suffered 100 days. For fifty hours I received no food, and thrice in that time I was interrogated. The last time was at mid-night, and I could scarcely stand for hunger. When I was carried back, I asked for bread. It was refused as being beyond the usual hour of distribution. I remained six weeks without change of linen or water to wash in. My wife tried frequently to bring me a few necessary articles:—in vain. My three first interrogatories were succeeded by twenty others. If the scaffold had then been offered me, I should have thought it a mercy. My reason was shattered. When the judge interrogated me, I had lost my recollection. 'You hesitate, said he; 'you contradict yourself; you are agitated—then you are guilty' Now, Mr. President, can you be surprized, if you find some contradictions in my answers." The appearance of the man bore full testimony to the sufferings he described. The crowd shuddered with horror. A loud murmur burst forth, and it was with some difficulty that order could be restored."

PSALMODY — INSTRUMENTS — TUNES — THE ENGLISH EPISCOPAL — THE SCOTTISH — THE LUTHERAN—THE METHODIST—AND INDEPENDENT CONGREGATIONS.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—I am a lover of music, but it must be in its proper place. I am sorry it should have left the drawing-room and the *hall,* and that it should have *secularized* itself in the church. I think it reflects great discredit on us at the Cape, that for some years past we have failed to countenance the winter concerts; that we have not employed that musical talent around us which is well known to exist in very many quarters. But my present question is—*Church Music.* It was in the course of the 16th century, I think, that the Psalmody of England and the other protestant countries, was brought to the state in which it now remains, and in which it is desirable that it should continue to remain. For this psalmody we are indebted to the reformers of Germany, especially Luther, who was himself an enthusiastic lover of music, and is believed to have composed some of the finest tunes, particularly the 100th psalm, and the hymn of the last Judgment. Our psalm tunes, consisting of prolonged and simple sounds, are admirably adapted for being sung by congregations; and as the effect of this kind of music is much increased by its venerable antiquity, it would be very unfortunate should it yield to the influence of modern innovation: for this reason it is desirable that organists and directors of choirs (presuming such to be necessary,) should confine themselves to the established old tunes, instead of displacing them by the *jigs* of modern composition. Of course, (to be honest,) I allude to the musical ceremonials of the English Episcopal Congregation. Turn we, *secondly,* to the Reformed or Colonial Church. In Cape Town, the singing is conducted with becoming solemnity, (understanding, at the same time, that it is *loud enough* in all conscience.) In the country churches the manner of conducting the psalmody is distressing; and to make matters worse, a foolish fashion has been introduced of annoying the services by the shout of wind-instruments—the sound of *horns.* Such as I recollect hearing at Tulbagh and other places, is a hurly-burly rioting blustering, without meaning or melody, which puts you in fear of the tympanum in your ears, without possessing the power of giving you satisfaction for the affront. I declare, I would just as soon hear the grunting harmony of a thousand hogs, and coupled with the recollection of other instruments which I have heard in some of the churches, I am sure I would give the preference to the squeaking hurdy-gurdy, the scream of a macaw, or even the music of the knife-grinder. This department of the colonial state should be looked after, and the Presbyteries warned on the subject. Thirdly, as it regards St. Andrew's Kirk, I do not contemplate much improvement. At present, the unfortunate leader has it all to himself. Until the *heart* and the *mouth are opened,* there need not be expected much *shewing forth of Praise.* But as this is the work of Omnipotence, (so declared by the Psalmist David,) no worldly reasoning on my part would suffice to break that sullen silence which the folk of Saint Andrew's think it fashionable to preserve. Fourthly, the *Lutherans.*—This congregation, so highly respectable, is famed for the consistency of its solemn and christian manner of praise. One exception must, however, be made—I mean its Annual Festival Day—which brings a crowd of people together—not, I suspect, to * * * * * * * * * * * * * * * but to have their ears tickled with the tumult of mechanical sounds—and to enjoy the delicious gratification of exclaiming when the sounds are over

"Hoe fraai!"

Fifthly, the *Methodists:*—Dear to the writer is the memory of the inestimable John Wesley! Would that the moderns who profess to adopt his principles, possessed his incorruptible simplicity—his heavenly-devotedness—his unequalled zeal. In the humble and densely populated purlieus of Barrack-street, I have heard the simple song of praise conducted with modesty, and certainly well calculated to soothe the "savage breast" Alas! and alack-a-day, fashion (it may be) has taken the congregation by the hand, and led it to a more worldly site. It is enough for me to observe, in reference to the subject under review, that very frequently the *shouting singing* adopted by *certain* members of this congregation is well calculated to

"Split the ears of the groundlings."

Once more, and lastly:—*The Inde-*

pendents — those who worship in the Chapel, Church-square. What must an infidel or gainsayer think, on hearing, as I have heard at this place, very solemn hymns joyfully performed to some brisk melody. There is a tune called *Job*, which would perhaps be a great favourite, did it not require the first half of the line to be repeated, which is often inconvenient, and generally unmeaning. I have heard this tune sung to Hymn 100, Book ii. of Dr. Watts, in the last verse of which the *repeat* has a most dreadful effect; not worse, however, than in the 1st verse of Hymn 128 of Book i. Yet are such words coolly and complacently sung to the regret, I should think, of the minister, and probably, some of his people. The 92d Psalm of Dr. Watts is not unfrequently sung to *Derby* tune, in which there is an awkward fugue which divides the last lines at the 5th syllable. How distressing to hear the clerk or leader bawl out and reiterate

'Blast them in ever— —'

Instances of this description might easily be multiplied; some of an inexpressibly ludicrous kind. Bath Chapel tune, for instance, sung to Hymn 20, Book i. gives, in the 2d verse, the following repeat:

'Upon a poor *pel*——'

The absurd introduction of fugues has in like manner converted many of our hymns into catches, and it is difficult to acquit the composer in all cases of a facetious design. Catches and glees are, indeed, apparently the model for modern psalmody, and many tunes are literally taken from them. I like a good glee, I confess, and admire Callcott, and Webbe, and Lord Mornington; but I have no wish to hear "The Red-Cross Knights," or "Here in a Cool Grot," performed to sacred words. Viewing the *fugue* with the eye of a *musician*, (I beg pardon, as a *lover of music*,) it is a source of great delight to me; but when I consider its object in Church Music, I cannot but look upon it as entirely out of place. Let music elsewhere be as unlimited as its scope may be, in the church it should absolutely tend to one grand object; it is there essentially a portion of *divine worship*. Its aim is not to create that feeling of delight and admiration, which, viewed as a work of *art*, it might give rise to; it should excite the assembled congregation to devotion, and direct their thoughts from man and all his trickeries, *outward adornings* and *singing powers*, to sincere and humble adoration of our Great God and Saviour Jesus Christ.

DUNDEE.

LITERARY EXTRACTS.

MARCUS TULLIUS CICERO IN THE DUNGEONS OF THE INQUISITION OF ROME, IN 1818.

(Extracted from the English MS. of an Italian Exile.)

* * * As the Italians have a naturally lively disposition, and think but little about past and future sorrows, one may not be surprised to see in all places of amusement the appearance at least of true enjoyment. It is for this reason that the Carnival of Rome presents, within the short space of twenty-four hours,* the length of its real duration, more interesting scenes, and greater variety of masks, than the long and wearisome Carnivals of Naples, Milan, and Venice. It may be said, that at that epoch the poorest of the inhabitants will sacrifice any thing to display themselves and their finery in the renowned Strada del Corso. It has been proved that, during that period, the pawnbrokers of Rome lend more money than for the rest of the year. It was at this season of merriment and rejoicing that the anecdote I am about to relate happened to me.

Being solicited by a lady to perform in mask, and assume the character of Cicero, with the promise that she would accompany me in the character and dress of Tulliola, I consented; and having had a mask taken from the bust of the Roman orator, which is preserved in the capitol, and dressed in the style of a Roman consul, I entered into the Corso, accompanied by my supposed daughter. At first, I placed myself under the gate of the Palace Bolognetti, where a great crowd soon collected around me. Clever men were not backward in questioning me about many ancient historical and political events, and I answered in Latin to all their questions. The facility with which I conversed in the language of the great Roman—a facility, indeed, which it had been my early ambition to acquire—excited public attention, and, in a short time, all the Corso spoke of nothing but of the wonderful Cicero of the Palace Bolognetti, and I was almost besieged by the multitude

After having remained more than an hour in that situation, I went to pay a visit to Prince Ghigi, in whose drawing-room a great number of the Roman nobility, and many literary men, had assembled to witness the races of the Barbari. Cicero, of course, was soon attacked on all sides. Prince Ghigi accused me of having flattered Cæsar, and changed my principles on several occasions. These accusations I combated with many historical arguments, and proved that Cicero's integrity and patriotism had remained unstained during that dreadful period of Rome. Every person present tried to guess who was the representative of the Roman orator. Some said, and felt assured, that I was a Professor of the Sapienza; others, that I was one of the *Scriptores* of the Vatican; but the Cavalier Odescalchi said before the company, that he knew but one man who could perform Cicero in a like manner, and that was the Hungarian gentleman who had often delivered extemporaneous Latin poetry before the *Accademia Latina*. Seeing that I was so nearly discovered, I left the Palace Ghigi, but promised that, at night, I would go to the *Festino* of the theatre Alibert.

From thence I walked up and down the Corso, and often spoke in Latin to the numerous English who were seated before the Palace Ruspoli, particularly to a lady who, in my opinion, was one of the finest women I ever beheld She could not understand me; and as I would not speak in any living language, her husband, a captain in the British navy, was my interpreter; I obtained their address, and had afterwards the pleasure of becoming intimately acquainted with them.

* The Carnival of Rome lasts eight days, but the masks are only permitted to circulate during three hours of each day.

According to my promise, I went to the Festino. There all that Rome contained of talent and genius had assembled to attack, embarras, and overcome, if possible, the living Cicero. For four hours all the most difficult parts of the works of the Roman orator were proposed for my explanation; several of his orations, in which either the beginning or the conclusion are wanting, I was required to complete. Having for many years had the works of this great master, I may say, at my fingers' ends, I was enabled to afford so satisfactory an explanation of them, that my auditors were truly astonished.

About one o'clock in the morning, the Prince of Canino (Lucien Bonaparte), who was present, demanded my opinion relative to the present state of Rome, and inquired what I thought of its civil and criminal laws. Unfortunately for me, in the warmth of discussion, I forgot where I was, and having been questioned how I could speak so precisely on things that had occurred two thousand years after my death, I told them that I had often the opportunity of meeting in the lower regions some of the cleverest inhabitants of Rome, and that lately I had had a long conversation with Cardinal Maury, on the very subject. This was a thunderbolt to the ears of several of the auditors. Such a speech was the greatest blasphemy against the holy order of cardinals; and the Arguses of the Roman Inquisition soon denounced me to Monsignor Pacca, governor of Rome. Orders were immediately given for my arrest as soon as I left the house, and, accordingly, about two o'clock, while I was stepping into a carriage, I was seized by four sbirri. They conducted me into a neighbouring house, where my eyes were bound, and, without speaking a syllable, I was hurried into a coach, and driven off. When I alighted, I found myself in the Monastery of Santa Maria in Minerva, where the Inquisitors of the Holy Office hold their infernal sittings, and where the dungeons are situated in which the accused are kept during the progress of their trial, and until their final sentence is pronounced. The little subterraneous cave in which I was imprisoned was scarcely of sufficient height to allow me to stand upright; it was about six feet wide, and nearly as much in length. The only aperture was a small hole, which looked into a dark corridor, and served to admit the air. A wooden chair, and a pitcher of water, were all the furniture.

It would be impossible to describe what were my feelings and my anxiety during that long night. I had twice in my life been confined, and also condemned to death for political offences, but I had never tenanted a dungeon half so appalling as was that subterranean den.

In the morning, about ten o'clock, two robust friars made their appearance, and informed me that I was to be conducted before the inquisitor, but they wished to tie both my hands. I strongly opposed this act of tyranny, and would not submit. They answered it was indispensable; but I continued in my resolution. When the friars saw that I was determined not to submit they retired; and after about a quarter of an hour returned, and ordered me to follow them. We passed through several dark corridors, ascended by a gloomy stair-case, and arrived at the cell of the Rev. Father Olivieri,* one of the four inquisitors of the holy office of Rome. This inquisitorial attorney-general was a man of about fifty years of age, of dark complexion and high stature, and possessed all the exterior striking features of his tyrannical vocation. His black, fierce-looking eyes, his large mouth and thick lips, inspired a sort of awe mingled with disgust. Next to him was seated a younger monk, ready to transcribe his questions and my answers. The reverend father

* Father Olivieri is still living, and has lately been appointed, by Cardinal Barnetti, the present secretary of state of Gregory XIV., the supreme inquisitor of the arrested Carbonari of the Roman States. There is no appeal from the decisions of his tribunal!!!

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

stared at me for a minute or two as if wishing to read into my heart, and then sitting down, began as follows:—

"What is your name, country, profession, and religion?"

"I am Arnuel Tchocha, a native of Buda, in Hungary, by profession a soldier, and a Catholic by birth."

"Why have you been arrested?"

"I do not know."

"Have you not spoken in a public theatre against the holy order of cardinals?"

"I do not remember having committed such an offence."

"Did you not say, last night, while speaking of the present laws of Rome, that you had seen, in hell, Cardinal Maury?"

"Yes, I did, but it was in the warmth of my argumentation; and I never thought that it would be deemed an offence to the holy order of cardinals, especially as I there represented Cicero, who was by no means a good Catholic."

"Can you assign any other motive which might mitigate the rigour of the holy inquisition for your great crime?"

"I do not know of any. Besides," added I, "Cardinal Maury was, during all his life, undoubtedly opposed to the Roman church's infallibility, and to the last moment of his existence he would not abjure this erroneous opinion."

"'Tis true," answered Father Olivieri; "but you know that the holy pontiff, having sent to the dying cardinal his *in articulo mortis* absolution, it is almost an article of faith that Cardinal Maury has been saved from the torments of hell."

"I did not know this," replied I; "and I must confess that, had I been informed of the circumstance, it would not have altered my sentiments."

"Are you the same person who has often delivered extemporaneous Latin poetry in the Latin Academy?"

"Yes, I am."

"Well," the Rev. Father Olivieri then observed, "how can a soldier be so well acquainted with ancient literature and history as to deliver extemporaneous Latin poetry, and to represent, as you have done, the character of Cicero?"

"*Factum infectum fieri nequit*," answered I; "and if I have done it, it is the best proof of what a soldier can do."

"But," replied the inquisitor, taking a paper into his hand, "here is a letter which I have received from the most Rev. Monsignor Pacca, governor of Rome;* he informs me that strong suspicions are entertained that you are not a Hungarian, but that under such a fictitious name is concealed an Italian nobleman, of very dangerous religious and political principles. What can you reply to it?

"My answer will be very short," said I. "You and Monsignor Pacca have been deceived. I have a German passport, and am well known to Prince Kounitz, our ambassador at Rome."

Father Olivieri, on hearing this, seemed much surprised, remained silent for some moments, and then told me, "That I was to return to my dungeon, that he might make his report, and obtain further information."

"To this I replied, by saying, "That if I was to be retained as a prisoner, they should give me better accommodation, and that they should send for my clothes, for I could not remain longer dressed as Cicero." In the meanwhile, I told the inquisitor that I was intimately acquainted with the Cardinals Fontana and Litta,* who were at that epoch the presidents of the tribunal of the holy office of Rome, and that if my just request was not granted, to them I would appeal for redress, and that I was certain to obtain it.

This observation rendered the reverend inquisitor more reasonable; he ordered the two friars to conduct me into the hall, where generally the offenders are kept in custody; he also promised me that I should have my clothes, if I would give a written order to my servant to deliver them to the messenger: this I did directly, and withdrew.

The new prison, in which I was now confined, was a large subterraneous apartment, placed under the court of the Monastery of Santa Maria in Minerva. It was not very dark, for at the top of the ceilings there were several openings, guarded with iron bars; a long wooden bedstead was at one side, upon which ten or twelve persons could have lain; a large black crucifix was suspended at one side of the wall, and several old dirty pious books were fastened with small iron chains to the wooden chairs of the apartment. On the walls were written, or rather engraved with some pointed instrument, some thousand names of the unfortunate victims of inquisitorial despotism, who had been interred alive before me in that dungeon, and, very probably, for no greater offence; among which, I distinguished Guido Reni, Salvator Rosa, the Cavalier d'Arpino, Vincenzo Damiana, Cagliostro, and the celebrated Dominican monk, Fontana Rosa; under this was the following—*Bene est, quia Monachus Monachos odi.* I read also the names of several German, English, and Irish artists, and heretics, and not a few of the French liberals. After having minutely examined my new habitation, I threw myself on the bedstead, and, being extremely fatigued, went to sleep.

About four o'clock I was roused by a friar, who came to bring me some food, and my clothes I thanked him, and requested that he would give me a light, for it was already very dark. This was granted. I ate something, and exchanged the dress of Cicero, which had proved so fatal to me. About twelve o'clock in the night, I heard a very distressing voice, and the cries of a man who certainly was suffering under bodily torture, for now and then I plainly understood that he exclaimed, "Have mercy upon me. I cannot confess what I have not done. Have mercy upon me; I am dying!" This was a very dreadful omen; and I endured the most painful sensation in considering that perhaps a similar treatment was prepared for me.

Next morning the two friars came very early, and conducted me again to the inquisitor Olivieri. As soon as I entered his cell, he told me "that further information had been taken, and that he was fully convinced of my being not a Hungarian. Besides," added he, "Monsignor Pacca has been informed by the Marquis of Fuscaldo, the Neapolitan ambassador at the court of Rome, that you are a very bad subject of his Sicilian Majesty. If it be so, he has demanded you as a prisoner, and in a few days you will be confronted with persons who will identify you."

I was truly alarmed on hearing this, but I did not manifest any exterior apprehension, for I was convinced that before such an epoch my friends would have done all in their power to save me. In this opinion I was not mistaken, for my Tulliola, who had left the theatre a short time before my arrest, not having seen me the next day, began to think that some misfortune had befallen me; and having sent to my lodgings, was informed of my absence, and of the suspicion of my having fallen into the hands of the inquisition. Knowing that I was acquainted with the Austrian ambassador, she therefore immediately called on him, and related her apprehensions concerning me. Prince Kounitz immediately ordered his carriage, and drove to Monsignor Pacca, requesting to know where I was. The governor answered, that he knew nothing at all about my destiny, and that it was possible I had gone out of town. Kounitz was not satisfied with this reply, and remarked, that as I was one of the subjects of the Emperor of Austria, it was his duty to see that I should not be ill-treated and unjustly condemned. Monsignor Pacca repeated that he was quite ignorant of what might have happened to me.

The ambassador called, therefore, on the Cardinal of state, and finding that his eminence had gone to spend the evening at the Palace Ghigi, and there to play at cards with the amiable princess, his favourite lady, the prince soon directed his course to that conversazione, and having met Gonzalvi, called him out, and repeated to him the same questions he had already made to Monsignor Pacca, but received, almost literally, the same answers. To this Kounitz intimated his intention of addressing himself to the pope, if on the next morning I should not be found, or if the cardinal would not let him know where I was detained. Gonzalvi persisted in his being ignorant of my fate, and the Prince withdrew.

Next morning, about eleven o'clock, Prince Kounitz, with all the etiquette of an ambassador, waited on Pius VII., and after having kissed his foot, explained the cause of his extraordinary visit. When the pope heard all that the prince had to say, he suddenly exclaimed—"What? is the Hungarian gentleman arrested? I know him. *Poor Checchino!** and for why?" The prince answered, "That he did not know." "Well," replied the pope, "I will soon know it," and having rang, ordered, to Monsignor Riario, who was his lord in waiting, that Cardinal Gonzalvi should be immediately sent for, and, dispensing with the papal etiquette, desired the prince to take a seat. During the time they were waiting for the secretary of state, Pius VII. spoke very favourably of me; assured Prince Kounitz that he had found in me a true friend while he was confined at Fontainebleau, and that I had often endangered my own welfare to bring him some comfort; the good pope added that he knew me from my infancy, that I was intrinsically good, but that he had always found that I often acted very imprudently.

In a short time Gonzalvi was announced, and when, on entering, the cardinal saw Prince Kounitz sitting by the pope, he soon guessed why he had been called. Pius VII. was a very excellent man, and truly pious, he was also a profound divine, and extremely erudite. Of all the successors of St. Peter, since they have obtained temporal power, he is the only pontiff who has not enriched his family; and although he reigned more than twenty four years, he died very poor, for his charity knew no bounds. The only fault he had, was, that he cared very little about worldly affairs; and it may be said, that though Pius VII. was the nominal pope, it was Cardinal Gonzalvi that reigned uncontrolled.

However, when Pius VII. was determined that any thing should be done, or that any abuse should be abolished, he was the most firm, and the most obstinate man in the world. In the present circumstance he proved his authority,

* This famous personage, after having been for more than five years the greatest hypocrite and tyrant of Rome, was at last denounced as being at the head of a party who wished to overthrow the papal government; and had not Cardinal Pacca, his uncle, obtained his escape from the Roman states, he would have certainly experienced the rigours of the holy office. In his flight, however, he did not forget his own interest, and basely took away with him 100,000 Roman scudi from the coffers of the poor, which were deposited in his hands!

* These two princes of the Roman church, so well known for their wisdom and moderation, had been appointed to this office by Pius VII., when, after his return from exile, he re-established, almost by compulsion of the Dominican monks, the Inquisition of Rome, which the French had abolished. This appointment greatly displeased all the intolerant members of the Sacred College.

* The Abbot Barnabas Chiaromonte, was accustomed to call the writer by this name, which means *little Francis;* and although the one had become a pope, and the other a man of six feet stature, and thirty-five years of age, he still continued the use of this affectionate appellation.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and, without any observation, demanded from his secretary of state—"What has happened to the Hungarian gentleman, who the other day performed the mask of Cicero, and since that period is missing'" Gonzalvi seeing that the pope knew that it was almost certain that Cicero had been arrested, replied—"Your holiness is well aware that those who sacrilegiously blaspheme against our holy religion are immediately given into the hands of the holy inquisition, and that their apprehension must be kept secret until they are examined and tried. It is for this reason that I could not give a satisfactory answer to the Austrian ambassador. But since your holiness commands me to disclose the secrets of the holy office, I will briefly relate what has been done with the Hungarian gentleman, or rather with the Neapolitan nobleman." Here the cardinal reported all that has already been exposed, and particularly insisted on the instances of the Marquis of Fuscaldo. As soon as Gonzalvi ended his information, the pope said—"Cardinal, it is our will that the prisoner should be directly restored to liberty; and as the Austrian ambassador is so generous as to offer to go to deliver his subject, you will accompany his excellency, and see that my commands are fulfilled without further delay."

It was nearly three o'clock when I heard the footsteps of several persons in the corridor of my prison. I felt a strange sensation, but soon was relieved from my anxiety by my door being opened, and by the appearance of my excellent friend, Prince Kounitz, who, with a smile on his face, requested me to go with him.

To pass from the abode of tyranny, torture, and despair, to the magnificent palace of a generous prince—to escape from the furious hands of the inquisitors to be again restored to my best friends, was but an instant. A few days after this, having taken leave of all those who had known and assisted me, I bade adieu to Rome and to Italy—probably for ever!

THE AFRICAN CHIEF.

THERE is great power in the following lines by Bryant, the American Poet. The story of the ballad may be found in the African Repository for April, 1825. The subject of it was a warrior of majestic stature, the brother of Yarradee, King of the Solima nation. He had been taken in battle, and was brought in chains, for sale, to the Rio Pongas, where he was exhibited in the market-place, his ankles still adorned with the massy rings of gold which he wore when he was captured. The refusal of his captor to listen to his offers of ransom, drove him mad, and he died a maniac.

Chained in the market-place he stood,
A man of giant frame,
Amid the gathering multitude
That shrunk to hear his name—
All stern of look and strong of limb,
His dark eye on the ground:—
And silently they gazed on him,
As on a lion bound.

Vainly, but well, that chief had fought,—
He was a captive now,—
Yet pride, that fortune humbles not,
Was written on his brow.
The scars his dark broad bosom wore,
Shewed warrior true and brave;
A prince among his tribe before,
He could not be a slave.

Then to his conqueror he spake—
"My brother is a king;
Undo this necklace from my neck,
And take this bracelet ring;
And send me where my brother reigns,
And I will fill thy hands
With store of ivory from the plains,
And gold-dust from the sands"

"Not for thy ivory nor thy gold
Will I unbind thy chain:
That bloody hand shall never hold
The battle-spear again.
A price thy nation never gave,
Shall yet be paid for thee;
For thou shalt be the Christian's slave,
In lands beyond the sea."

Then wept the warrior chief, and bade
To shred his locks away;
And, one by one, each heavy braid
Before the victor lay.
Thick were the platted locks, and long,
And deftly hidden there,
Shone many a wedge of gold among
The dark and crisped hair.

"Look, feast thy greedy eye with gold
Long kept for sorest need;
Take it—thou askest sums untold,
And say that I am freed.
Take it—my wife the long, long day
Weeps by the cocoa-tree,
And my young children leave their play,
And ask in vain for me."

"I take thy gold—but I have made
Thy fetters fast and strong,
And ween that by the cocoa shade
Thy wife will wait the long."
Strong was the agony that shook
The captive's frame to hear,
And the proud meaning of his look
Was changed to mortal fear.

His heart was broken—crazed his brain—
At once his eye grew wild—
He struggled fiercely with his chain,
Whispered, and wept, and smiled;
Yet wore not long those fatal bands,
And once, at shut of day,
They drew him forth upon the sands,
The foul hyena's prey.

THE LION SERMON.

(From a Periodical Work, published thirty years ago.)

THE discourse to which this singular title is introductory, will be better illustrated by our prefacing it with a short account of the very extraordinary circumstance from which it originated.

We have to record a memorable instance of the interposition of Providence in favour of a man every way worthy of it, and a grateful and pious remembrance of that Divine protection so miraculously afforded.

As long ago as the reigns of king James and Charles the First, lived sir John Gayer, knight, a wealthy citizen of London, and a merchant of the first eminence. To his spirit of commercial adventure he was indebted for his high rank in society, and the opulence which enabled him so honourably to support it.

He was an inhabitant of the ward of Aldgate, and a liberal benefactor to the Church and poor of the parish of St. Catherine Cree, in which he resided.

He had planned a mercantile speculation, the success of which he conceived materially depended upon his personal superintendence. With a view to its execution, he embarked on board a vessel richly laden with his property, and sailed to the coast of Asia.

The different places he visited with his merchandize, and the accidents he encountered in so long and perilous a voyage, have not been transmitted to our times. Probably his papers were destroyed in the great fire of London.

The adventure which forms the present subject is the only one of which we have any distinct account. This gentleman, travelling with a caravan of merchants across the deserts of Arabia, by some unaccountable fatality separated from his companions, and night overtook him before he became sensible of his danger. He in vain endeavoured to gain the caravan; it had advanced too far, and he was enveloped in all the horrors of darkness, in the midst of a dreary and dismal desert. No place of refuge was near, and he seemed the destined prey of the savage animals which he heard roaring for food a short distance from him. In this awful situation, neither his courage, his presence of mind, or his reliance on Heaven forsook him. His own exertions he knew were vain; and he resigned himself, like a true Christian, to the disposal of his God.

He did not make rash vows, which he knew might not be fulfilled without a crime, but actuated by a just sentiment of religion, he fell on his knees, prayed fervently and devoutly, promised that if Heaven would rescue him from impending danger, the whole produce of his merchandize should be given as an offering in benefaction to his native country.

At this moment a lion of tremendous size was approaching him. Death appeared inevitable; but whether it was owing to the prayers of the pious knight, or to the generous nature of the noble animal, the fact was, that the lion, after prowling round him, bristling his shaggy hair, and eyeing him, apparently with fierce intent, suddenly stopped short, turned round and walked quietly away, without offering him the slightest injury.

The knight continued in the same suppliant posture till the morning dawned, when he pursued his journey, and happily came up with his friends, who had considered him for ever lost.

The remainder of his voyage was prosperous; he disposed of his freight to advantage, and reached England with increased wealth.

He was not unmindful of the vow he had made in the desert, but without delay proceeded to carry it into effect. To different charities he distributed considerable alms, but particularly to the poor of his own parish; and among other donations, he bequeathed two hundred pounds to the Church of St. Catherine Cree, to be laid out in the purchase of an Estate, the profits of which were also to be applied to the poor, on condition that a sermon should be occasionally preached in that Church, to commemorate his deliverance from the jaws of the lion.

Wednesday, October 16th, 1805, was the day appointed for the pious celebration of the event thus related. The Church bell of St. Catherine Cree tolled as usual for Divine Service, and when the congregation had assembled, the morning prayers were read.

The lesson for the day was appropriately taken from the sixth chapter of Daniel, where it is recorded, that after the prophet was cast into the lion's den, the Lord shut their mouths, so that they did not hurt him.

The verses of the thirty-fourth psalm, inferring that "those who fear the Lord shall dwell in safety, though hungry lions roar around them," was sung by the charity children. After the service, the rector of the parish pronounced what is aptly called "The Lion Sermon." He took his text from the eighth verse of the Second Epistle of Peter. "Be sober, be vigilant, because your adversary, the devil, as a roaring lion, walketh about, seeking whom he may devour."

Upon this subject the preacher descanted with great eloquence, and concluded his admonitory discourse, by representing the virtue, charity, piety, and unshaken constancy of sir John Gayer, as examples every way worthy of imitation. J. T. H.

ROMAN CUSTOMS AT A MODERN BANQUET.

(From Auston Park.)

At a day not very distant a *cheleris*, or invitation, was sent to Dr. Biventer, Mr. Flitt..... and Mr. Trace, requesting the favour of their company at a *Symposium*, or entertainment in

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

the classic taste of Rome..... The day came round, and the gentlemen arrived, dressed as for a modern dinner party, and much did it astonish them, when instead of being led into the drawing room, they were conducted to the cold bath ..... At length, the sound of flutes was heard upon the stairs, and sundry dishes were placed upon the table, which was not spread with a table cloth, but only wiped down with a moist sponge. Immediately afterwards, Mr. Rust made his appearance, dressed also in the synthesis and slippers: he bowed to each of the guests as he entered, and took his place on the vacant couch, at the top of the table, with Doctor Biventer on his right hand, and the other gentlemen on his left: the bottom was left open for the convenience of bringing and removing the dishes.

He apologized for the unmannerly intrusion of his archimagirus, or chief cook, who, he said, was French, because that nation, like the ancient Sicilians, were most renowned for their cooks; he found him, however, strangely bigotted to his own customs, although he did not require him to compound any dish which was not mentioned and described in the works of Heraclytus, Glaucus, the Locrensian, or others, and which have been prepared by Mithacus, of Sicily, Apuleius, and many celebrated cooks of antiquity. He trusted that they would excuse that he himself was the carptor, or carver, as he dare not trust any of his servants with it, who had not been trained like the ancient "Gesticulatores," to carve to music. He begged they would taste the "prima mensa," or first course, which was only to give a whet to the appetite. This consisted of acid herbs, sorrel, colewort, eggs fried with honey, sweet wine and oil, and other light dishes. "What have we got here?" said Doctor Biventer, not much relishing any of the already recapitulated articles, while he removed a cover, which stood next him, and thrust both his eyes into a dish which he thought did not appear particularly tempting, any more than the rest. "That, Doctor," said Mr Rust, "is the celebrated cochlerea of Apuleius, being made of snails, stewed in mare's milk."—"Good Heavens!" exclaimed the Doctor, turning aside his eyes, with an expression very different from that with which an epicure gloats upon a favourite dish; "Why, then, if I must taste this 'prima mensa,' I'll try the eggs" Of this he managed to get through a small quantity, without much more emotion than might be perceived in an occasional contortion of the muscles of the face. Mr. Flitt took a few leaves of sorrel, and Mr. Trace, by the advice of Mr. Rust, took two or three of the snails, but was, however, obliged to leave them half eaten. Mr. Rust himself could not quite finish some of the same dish which he had put upon his own plate, but set them aside, remarking, that it was not customary to take much of the "prima mensa," but to reserve the appetite for the second course.

* * * * *

Meanwhile, Rust tossed off the five cups, which contained rather more than glasses, which he had rejected, with a view of more nearly imitating the "poculæ" of the ancients. No sooner had they passed his lips than they were seen shining through his small grey eyes: and he became rather "ebrius," very talkative, and very communicative. "Ton agathon basileus oinos," said he; wine is the king of all good things. In the mean time, the flutes were performing, and, dish by dish, the table was covered with the "caput cœnæ," or principal course, which Mr. Rust described as followeth:

"That large dish in the middle, which I have made after the example of Vitellius, I name, as he did his, the 'Shield of Minerva' It contains a roasted swan, stuffed with mint, pepper, carraway, and coriander, heightened with nitrum, or rather hartshorn, as I could not procure any modern chemical nearer, and swimming in a gravey of honey and oil; on each side is a peacock, boiled with vinegar, honey, oil, mint, and flour;—that small dish contains two lizards, fried in oil; that is a small 'porcus trojanus,' or trojan boar, stuffed with mutton, beef, anchovies, garlic, sweet wine, and the liver, lites, blood, and brains, of a calf:—this is a hare, stuffed with fennel, pepper, asafœtida, cloves, garlic, and nitrum;—that is an 'isicium,' or tomaculum, of flour, honey, oil, brains of a sow, and sweet wine.—Now, my friends, and worthy guests, you see all the supper, they are the truliest dainty dishes of old, for the enjoyment of which, even Cæsar frequently took an emetic before supper, and always after it, that he might return to the delights of such a table, which might verily be denominated a Sicilian feast. As for me, my friends, I cannot partake of all of these, for I labour under a malady, the which I have already hinted, being, indeed, 'ludus amoris,' the very sport of love; 'Clara me cepit ocellis,' by her glances Clarat caught me; and I guide myself by the rules of Crato, Fernelius Guianerius Mercurialis, Franciscus Bonsuetus, Freitagius Bobrasius, and other learned physicians, that I may not, by diet, increase my complaint; I shall, therefore, confine myself to the lizards, and to this hare, which they all appove, and which, as Martial says, in his epigrum to Gellia, makes merry, and is a merry meat.—he also adds, it will make one fair; if so, I may, perchance, find favour in her eyes; but for you, my friends, all is free—Doctor, will you take the wing of a peacock?"—"Truly, Mr. Rust, I cannot say;—I have some scruple about eating these heathen dishes; they may, for aught I know, have some evil effect upon a Christian clergyman, and work him harm:—I think—Have you any thing cold in the house? for, candidly, I feel almost fainting, what with the bath, and the 'prima mensa' of sorrel, eggs, and snails."—"This swan, I think you would like a piece of the breast; it is finer than a goose: I would have procured, if due time had been given, an 'Avis Afra, or Guinea hen, a Melian crane, a dish of nightingales, and other dainties, but doubt not that you will find these truly praiseworthy, if you can so far overcome prejudice, as to taste them." Doctor Biventer took a piece of the swan, paring away all the hard parts, and avoiding the intolerable seasoning, and gravy; for it really became a serious thing with him, to be kept so long fasting. Mr. Flitt took the wing of a peacock, (not very very unappropriate;) and Mr Trace, notwithstanding Mr. Rust much wished to help him to a lizard, took a slice of the "porcus trojanus;" Mr. Rust, as he said, confined himself to lizard and hare, which he ate as devoutly as if he had been accustomed to such meat from his infancy: but no sooner had the several knives opened the horrible beds of seasoning, with which every dish was full, than the room became almost too much to bear; Dr. Biventer puffed and fanned himself, Mr. Flitt took out his bottle of aromatic vinegar, and Mr. Trace requested permission to withdraw for a few moments, as he said he felt faint. Thus passed away the "caput cœnæ," and then came the "commissatio," or dessert, which consisted of mushrooms, apples, pears, candied asafœtida, and jellies, of vinegar, honey, and oil. The wine was all perfumed with rose and bergamot, and had been suspended in the smoke of the kitchen fire, to give it the flavour of extreme age, like the old Chian and Ambracian, the whole of which was not quite what could have been wished by the guests. The gentlemen took a few of the apples and pears, which were the only simple products of nature upon the table, and poured out plentifully the general consoler, wine, which warmed them, and raised their spirits, which hitherto appeared to be less influenced by the luxuries of a Roman entertainment, than of a plain English one.

ENGLAND BROUGHT TO JUDGMENT.

It is by the empires which England has created, by the degree of civilisation which she has diffused, and the tracts of earth over which she has spread it, that she must be judged by posterity. The only rule for appreciating nations is to compare original means with the ends attained; and in what nation did the latter ever show such an excess above the former as in Britain? The Greeks had greater natural advantages, but used them not so wisely. The Romans did for themselves as much as a people could do; but the rest of mankind felt rather their ambition than their benevolence. Among modern states, not one could be named that has disseminated so much good, and so little evil, as England. Spain and Portugal discovered new seas and lands—England discovered and enlightened them. Germany has not been in a situation favorable to maritime adventures. France, with extensive coasts, and all the power and knowledge which could make her great by sea, has indeed completed voyages of circumnavigation; but she has planted few colonies, and can appeal to no deserts, once unpeopled, to prove that the men who now inhabit them are her offspring. The public monuments of England can bear no comparison with the stupendous edifices which the Romans erected in their conquests. They are surpassed by those of ancient Greece, of modern Italy, and of nations much inferior in the arts of embellishment. Upon the useful establishments which make her present superiority, and so far surpass the conceptions of all other nations, time can more easily lay its pitiless hand than upon hewn stone and brass. The roads, six times as numerous, and incomparably more practicable than in any other country, must leave less traces behind them than the ancient causeway; and, overgrown with grass, their thin beds of loose pebbles may be turned up by the ploughshare. Their present perfection may make their obliteration more easy. The canals which now are thronged with traffic; which, in their ordinary course, are so modest, though so magnificent when any obstacle is to be overcome, may more easily burst their dikes, or be filled up with mud, than those whose boast was architecture, not trade. The subterraneous works of the greatest city of the world, the dwelling of more than a million and a half of men, may lie underground forgotten, and leave no towering arch to strike the eye, like the Appian or the Claudian aqueducts. Envy, too, may pen the history of England, and rival nations gratify their enmity by detraction. Spain may tell how the Catholics have been persecuted, and the library of the Inquisition record the condemnations of the men who were punished for conspiring against the sister-in-law of King Philip. France may charge her civil wars with perfidy; her revolution with cruelty; her policy with intrigue. All nations may lend her their own vices. The United States, indeed, will call her ancient annals theirs, and glory in having had such princes as Edward and Henry; but will they be thus candid on her future story? They must; their own existence will testify against whatever malice they may yet retain. When they behold themselves, and think how they were founded; when they read their own laws and constitution, and reflect from whom they held them, and the spirit which enacted them; when they see, in other regions, other nations freer and happier than natural circumstances would have made them, and find the languages of all to be derived from one source—from the idiom which Shakspeare, Bacon, and Newton spoke, they will be forced to say, 'Had England not been great and generous, these things could not have been.' When the greatest of republics shall allow that Britain was the freest of kingdoms, all will own that no nation of the world ever was so prolific a parent of mighty empires. —*Chenevix.*

EUGENE ARAM.

Mr. Bulwer's Work, entitled as above, and which we noticed in our

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

7th Number, seems, according to the public papers, to have excited an immense interest in France, Germany, and America. It has been translated in the languages of the two first. We wish the principles of the book had been better—in such a case it might have been as useful as its extensive circulation. We have gleaned the following additional particulars of Aram.

The recollection of this man is still preserved at Lynn, in Norfolk, at which town he was for some time usher at the grammar school. A small room at the back of the house, in which he slept, was, until these last few years, (when it was pulled down and rebuilt,) mysteriously pointed to by the little urchins as they passed up to bed of a cold, ghost-enticing night, as the chamber in which the "usher, who was hanged for murder," was used to sleep.

The tradition which remains of his character is, that he was "a man of loneliness and mystery," sullen and reserved; that on half-holydays, and when his duties would allow, he strayed, solitary and cheerless, as if to avoid the world, amongst the flat uninteresting marshes which are situated on the opposite side of the river Ouse.

At Lynn the character of Aram was, until his apprehension, unexceptionable; but after that event, circumstances were then called to mind which seemed to indicate a naturally dark character; but whether these were all strictly founded in truth, or magnified suspicions arising from appalling circumstances of the crime of which he was convicted, I am unable to determine. The following, derived from unquestionable authority, having been related by Dr. L., who was a master of the grammer-school at the time, may serve as a sample:—there can be no doubt but that the worthy Dr. himself believed his suspicions well founded, as he used to tremble when he related it. It was customary for the parents of the scholars, on an appointed day, to dine with the master, at which time it was expected they would bring with them the amount of their bills.—It was late at night, after one of such meetings, that Dr. L. was awakened by a noise at his bed-room door; he rose up, and going into the passage which led to the staircase, but which was not in the direct way from Aram's bed room to the ground-floor, he discovered the usher dressed. Having questioned him as to the object of his rising at that unseasonable hour, Aram confusedly answered that he had been taken unwell and been obliged to go down stairs. The Dr then retired, unsuspiciously, to bed. From the combined circumstances of the noise at the door, his great agitation and confusion, and from his being found in the passage, the worthy Dr. in latter years, had no doubt, that, from its being known to Aram that a considerable sum of money was in his bed-room, Aram intended nothing less than to rob him; and no doubt, continued the narrator, he would have murdered me too, if it had been rendered necessary, from my discovering or opposing him.

The spot just at the entrance to the playground, at which Aram was taken into custody by two strange men from Yorkshire, is still remarked, and generally by the young scholar in a tremulous whisper.

EPIGRAM.

(From the Dutch.)

Wist een dwaes, dat hy waer zot.

Could fools but feel their want of sense,
And strive to earn intelligence,
They would be wiser for their pains;
But 'tis the bane of folly ever
To think itself supremely clever,—
And thus the fool a fool remains.

A GENTLEMANLY AVOWAL OF A DIFFERENCE OF OPINION.

COLERIDGE *versus* IRVING.

[*From Mr. Coleridge on the Constitution of Church and State.*]

AND now, as the conclusion, let me be permitted to add a word or two of Edward Irving himself. That he possesses my unqualified esteem as a man, is only saying, that I know him, and am neither blinded by envy nor bigotry. But my name has been brought into connexion with his, on points that regard his public ministry; and he himself has publicly distinguished me as his friend on public grounds; and in proof of my confidence in his regard, I have not the least apprehension of forfeiting it by a frank declaration of what I think. Well, then! I have no faith in his prophesyings; small sympathy with his fulminations; and in certain peculiarities of his *theological* system, as distinct from his religious principles, I cannot see my way. But I hold withal, and not the less firmly for these discrepancies in our moods and judgments, that EDWARD IRVING possesses more of the spirit and purposes of the first Reformers, that he has more of the Head and Heart, the Life, the Unction, and the genial power of MARTIN LUTHER, than any man now alive; yea, than any man of this and the last century. I see in EDWARD IRVING a minister of Christ after the order of Paul; and if the points, in which I think him either erroneous, or excessive and *out of bounds*, have been at any time a subject of serious regret with me, this regret has arisen principally or altogether from the apprehension of their narrowing the sphere of his influence, from the too great probability that they may furnish occasion or pretext for withholding or withdrawing many from those momentous truths, which the age especially needs, and for the enforcement of which he hath been so highly and especially gifted! Finally, my friend's intellect is too instinct with life, too *potential* to remain stationary; and assuming, as every satisfied believer must be supposed to do, the truth of my own views, I look forward with confident hope to a time when his soul shall have perfected her victory over the dead letter of the senses and its apparitions in the sensuous understanding; when the Halcyon IDEAS shall have alit on the surging sea of his conceptions,

"Which then shall quite forget to rave,
While birds of Calm sit brooding on the charmed wave."

MILTON.

AN ATTACK UPON THE CLUBS!

PART THE FIRST.

(From the Monthly Magazine.)

THESE fashionable clubs, springing up, like poisonous toadstools, from the rank soil of luxury, idleness, and sensuality, until they darken the whole metropolis with their pestiferous shade, constitute a positive nuisance, that "has increased, is increasing, and ought to be diminished." Not only do I deny their utility, both abstractedly and relatively, but I maintain them to be fraught with all sorts of mischief. In a state of semi-civilization and partial knowledge, where the surface of society is broken up into incongruous masses, men of refined manners and cultivated minds may excusably secure themselves, by the companionship of clubs, against the annoyances of vulgarity and ignorance: but in the present state of the metropolis, when education and polished demeanour are so generally diffused, that no person, moving in decent circles, is likely to sit down at table with idiots and blackguards, there can be no valid reason for pushing the system of luxury and exclusiveness—always the besetting sin of the English—to that degree of proud and sullen absurdity by which it is now characterized. What is the ostensible ground for establishing these lay, and much worse than monkish, convents?—Sociableness. Frivolous and false pretext! Nothing on earth can be so pointedly, so thoroughly, so unequivocally unsocial. An enlightened individual, fond of intelligent society, and anxious that his symposium may combine "the feast of reason and the flow of soul," will invite to it as great a variety of talent as he can command, selecting his company from the different professions, from men of literature, from one or other of the legislative bodies, from the court, the camp, the city; in order that the conversation may be varied, lively, and delightful, and that each individual, acquiring while he contributes knowledge, may at least have a chance of learning from his neighbour something with which he was previously unacquainted. Who that has mingled in the world—who that has tasted the "noctes cænas que divûm"—has not felt the ineffable charm resulting from this collision of differently-stored minds? Who has not found that intellectual honey, like that of the bee's, is always the sweetest when it is gathered from many flowers of varying growth, odour, and character?

In proportion as this principle is good, must that upon which our clubs are formed be bad; for it is diametrically opposite. We have military, naval, literary, law, theatrical, travellers', and half a score more, fundamentally exclusive, and confined to a particular class; the manifest tendency of all which is to divide society as much as possible into *castes*, not by any means dissimilar from those of the Hindoos, and not by any means unlikely to terminate in an analogous, though less marked sluggishness of mind, and inaptitude for social advancement. Corporations and companies, established in the first instance for the protection of particular trades and callings, are intelligible in their origin, although they may have degenerated into styes of swinish gormandizing; but what shall be said to professional clubs, which, never having been able to adduce any basis of utility, begin where the others have ended—with this notable exception—that they do not appropriate one pound, one shilling—nay, not one farthing of their surplus revenues to charitable purposes? When, in our rides and drives around London, we behold the numerous and munificent endowments of the City-companies for the support of the poor and aged, we willingly overlook the waste and wassailing in the hall: but what benevolent foundations—what doles to the poor—what assistance to any one portion of the whole human race, except French cooks and pampered menials, emanate from the palaces of club-gluttony at the west end of the town; or what single good of any sort can be urged, as a set-off against their manifest and manifold evils? I pause for a reply.

Would the individual who refused to associate with any but the partners of his own establishment, or the brethren of his own guild, be deemed a polite companionable person—or a shy, sullen, reserved, unaminable churl? Certainly the latter; and as a modern professional or exclusive club is but a collection of such individuals, it must of course deserve a similar character. Its union of one class is a separation from all others; the junction of its members is a dismemberment from the general body of citizens; it is dissocial in its very association. It is a cabal, a caste, a *clique*, a coterie, a junto, a conspiracy, a knot, a pack, a tiche, a gang; any thing, in short, that is close, sullen, selfish, disjunctive, and inhospitable: but if there be in such narrow fellowship, any single element of sociability, why then the monks who planted their convents in the desert of the Thebaid, were sociable beings, and useful members of society. Goldsmith very properly condems the man of talent,

——————"Who narrowed his mind,
And to party gave up what was meant for mankind.',

But as a profession is still narrower than a party, so is it still more culpable to withdraw from

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

our fellow-creatures, in order to sequestrate with so paltry a band. There may be an *esprit de corps* in such herding; but there is no spirit of philanthropy—no spirit of humanism. He who sympathizes with the community at large, rather than with a particular class, must surely be the most valuable member of society—the most useful subject—the best informed and pleasantest companion—the most in accordance with the general spirit of the age, which points with a steady and resolute hand at the abolition of all invidious distinctions and classifications: whereas these hateful clubs tend to perpetuate separation, and to establish the most odious and contemptible of all aristocracies—that of the purse and of the stomach. Degradation of head and heart must be the inevitable result of this gastronomical mockery. The *esprit de corps* or corporate attachment that it produces, is not so much the love of one body of men, as the hatred of all others. What collision, what comparison, what enlargement of mind can be expected from the intercourse of persons, all of whom have been similarly educated, and from their youth upwards have been devoted to the same pursuit? If the constant inter-communion of those "whose talk is of bullocks" stamps them with a character of indelible rusticity; if the vulgarians, confined to the narrow civic circle, wear a notorious brand of cockneyism, how can we expect that a convent of fellow-professors shall escape without a congenial stigma of shallow pedantry, technicality, and clubism? No—they will only confirm one another in all the little paltry prejudices and peculiarities; there will be no beneficial friction with the world at large to rub off the angles and asperities of character; and as the bachelor becomes odd, old-fashioned, and churlish, for want of the polishing influences of female society, so will the seclusion from general male companionship entail similar vices upon the professional clubbist. So much for his chances of mental improvement!

A Singular Adventure.

Once upon a time a traveller stepped into a stage coach. He was a young man just starting in life. He found six passengers about him, all of them grey headed and extremely aged men. The youngest appeared to have seen at least eighty winters. Our young traveller was struck with the singularly mild and happy aspect which distinguished all his fellow passengers, and determined to ascertain the secret of a long life, and the arts of making old age comfortable; he addressed the one who was apparently the oldest, who told him that he had always led a regular and abstemious life, eating vegetables and drinking water. The young man was rather daunted at this, inasmuch as he liked the good things of life. He addressed the second, who astounded him, by saying he had always eaten roast beef and gone to bed *regularly* fuddled, seventy years, adding, that all depends on *regularity*. The third had prolonged his days by never seeking or accepting office—the fourth by resolutely abstaining from all political or religious controversies; and the fifth by getting to bed at sunset and rising at dawn. The sixth was apparently much younger than the other five—his hair was less grey, and there was more of it—a placid smile, denoting a perfectly easy conscience mantled his face, and his voice was jocund and strong. They were all surprised to learn that he was by ten years the oldest man in the coach. "How," exclaimed our young traveller, "how is it you have thus preserved the freshness of life?"—"It is no great mystery," said the old man, "I have drank water and drank wine—I have eaten meat and vegetables—I have held a public office—I have dabbled in politics and written religious pamphlets—I have sometimes gone to bed at midnight, got up at sunrise and at noon—but I ALWAYS PAID PROMPTLY FOR MY NEWSPAPERS"—[We thought it better to tell this "*singular* adventure" before we interpreted it. It is extracted from an American Paper recently received, and is a hint to such of the subscribers as were tardy in payment. It is quite equal to the best days of our lotteries, when the Carrols and Bishes were in their bloom.]—*Athenæum.*

THE ANNUAL WANTS OF BRITAIN.

Of *wheat*, fifteen million quarters are annually consumed in Great Britain. This is about a quarter of wheat to each individual. Of *malt*, twenty-five million bushels are annually used in breweries and distilleries in the United Kingdom; and there are forty-six thousand acres under cultivation with *hops*. Of the quantity of potatoes and other vegetables consumed we have no accounts. Of meat, about one million two hundred and fifty thousand head of cattle, sheep, and pigs, are sold during the year in Smithfield market alone, which is probably about a tenth of the consumption of the whole kingdom. The quantity of *tea* consumed in the United Kingdom, is about thirty million pounds annually. Of *sugar*, nearly four million hundred weights, or about five hundred million lbs. every year; which is a consumption of twenty pounds for every individual, reckoning the population at twenty-five millions; and of *coffee* about twenty million pounds are annually consumed. Of *soap*, one hundred and fourteen million lbs. are consumed; and of *candles*, about a hundred and seventeen million pounds. Of sea-borne *coals* alone, there are about three million chaldron consumed in England and Wales; and it is estimated that, adding the coals of the midland counties, each person of the population consumes a chaldron throughout the kingdom. Of clothing, we annually manufacture about two hundred million lbs. of cotton wool, which produce twelve hundred million yards of calico and various other cotton fabrics, and of these we export about a third; so that eight hundred million yards remain for home consumption, being about thirty yards annually for each person. The woollen manufacture consumes about thirty million lbs. of wool. Of *hides skins* about fifty million are annually tanned and dressed. Of *paper*, about fifty million lbs. are yearly manufactured, which is about two million reams, of five hundred sheets to the ream.

To carry on the commerce of this country with foreign nations, and between distant parts of the United Kingdom, there are twenty thousand ships in constant employ, belonging to our own merchants. To carry on the commerce with ourselves, the total length of our turnpike-roads is twenty five thousand miles, and three thousand miles of canals. To produce food for the inhabitants of the country, we have forty million acres under cultivation. To clothe them we have millions of spindles worked by steam, instead of a few thousand turned by hand, as they were a century ago. The fixed capital of the country insured in fire-offices, that insurance being far short of its real amount, is above five hundred million pounds sterling. The fixed capital uninsured, or not represented by this species of insurance, is perhaps as much. The capital expended in improvement in land, is, we should conceive, equal to the capital which is represented by houses, and furniture, and shipping, and stocks of goods. The public capital of the country expended in roads, canals, docks, harbours, and buildings, is equal to at least half the private capital. All this capital is the accumulated labour of two thousand years, when the civilization of the country first began. The greater portion of it is the accumulated labour of the last four hundred years, when labour and capital, through the partial abolition of slavery, first began to work together with freedom, and therefore with energy and skill.—*Effects of Machinery.*

ENGLISH MANNERS.

(From the Tour of a German Prince.)

But of all offences against English manners which a man can commit, the three following are the greatest:—to put his knife to his mouth instead of his fork; to take up sugar or asparagus with his fingers; or, above all, to spit any where in a room. These are certainly laudable prohibitions, and well-bred people of all countries avoid such practices,—though even on these points manners alter greatly; for Marshal Richelieu detected an adventurer who passed himself off for a man of rank, by the single circumstance of his taking up olives with his fork and not with his fingers. The ridiculous thing is the amazing importance which is here attached to them. The last-named crime is so pedantically prescribed in England, that you might seek through all London in vain to find such a piece of furniture as a spitting-box. A Dutchman who was very uncomfortable for the want of one, declared with great indignation, that an Englishman's only spitting-box was his stomach. These things are, I repeat, more than trivial, but the most important rules of behaviour in foreign countries almost always regard trivialities. Had I, for example, to give a few universal rules to a young traveller, I should seriously counsel him thus:—In Naples, treat the people brutally; in Rome, be natural; in Austria, don't talk politics; in France, give yourself no airs; in Germany, a great many, and in England, don't spit. With these rules, the young man would get on very well. What one must justly admire in the well-adapted arrangement of every thing belonging to the economy of life and of all public establishments in England, as well as the systematical rigour with which what has once been determined on is unalterably followed up. In Germany, all good institutions soon fall asleep, and new brooms alone sweep clean; here it is quite otherwise. On the other hand, every thing is not required of the same person, but exactly so much and no more as falls within his department. The treatment of servants is as excellent as their performance of their duties. Each has his prescribed field of activity; in which, however, the strictest and most punctual execution of orders is required of him, and in any case of neglect the master knows whom he has to call to account. At the same time, the servants enjoy a reasonable freedom, and have certain portions of time allotted to them, which their master carefully respects. The whole treatment of the serving classes is much more decorous, and combined with more "égards" than with us; but then they are so entirely excluded from all familiarity, and such profound respect is exacted from them, that they appear to be considered rather as machines than as beings of the same order. This, and their high wages, are no doubt the causes that the servants really possess more external dignity than any other class in England, relatively to their station.—*Science.*

WOMEN.

As the part which women are intended to act in life is different from that which is assigned to men, I am inclined to believe that their mental, as well as bodily, powers are different, and that they are not in general more formed for the labours of the politician, the lawyer, or the mathematician, than for those of the soldier or sailor. But if they have not the close application which is requisite for deep study, they have the quickness of apprehension which often supplies the want of it; and if, notwithstanding some brilliant exceptions, they must yield the palm of literary fame to the other sex, there are triumphs of much higher importance to which they may with strict propriety aspire.

To the woman is committed the care of all that is most valuable in domestic society. She is the guardian of religion, of morals, of man-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ners, of taste; of all that charms in private life, and is necessary to the happiness of every day. The modest dignity of a virtuous woman can silence the blasphemer, and make the libertine blush. To her particularly belong,

"The gentle offices of patient love,
Beyond all flattery, and all price above!"
Mrs. H. More.

From her the indigent expect relief—to her the afflicted apply for consolation. If, as I readily allow, the delicacy of their organs makes females generally unfit for the deep study, as well as the active exertion necessary to form the statesman, the philosopher, or the hero, it is because they are not designed to act in these characters. But, on the other hand, if the superior delicacy of those organs gives them quickness of apprehension, refinement of taste, penetration into character, compassion for the unfortunate,—if, when they are what they ought to be, they have more feeling, more tenderness, more patience, and more humanity, than men in general possess,—it is because Providence intended them to soften the harshness and calm the passions which continually disturb the peace of the world, and to heal the wounds which men too often inflict.—*Pen Tamar.*

THE CANADAS.

As the tide of emigration has set in so strongly towards the Canadas, the following observations upon its laws may be acceptable to some of our readers:—

In the Canadas, the civil and criminal laws of England are in force, generally subject to provincial alterations. The old French law which was in existence previously to the year 1663, is still the law of property, with some exceptions, in Lower Canada. None of the laws enacted in France since that period extended to the colony, unless enregistered there This is the reason why the ordinance of 1763, for the better regulation of trade, is not in force. The criminal laws of England were transplanted into the Colonies by 14 Geo. III. c. 83. and of course none since that period, can become law in the Canadas, unless they are particularly specified and included in their provisions. Properly speaking, the Canadas have no commercial code. Great confusion sometimes arises respecting the decisions, according to the English custom of merchants, and those made under the old French code; and actions at law are frequently settled according to what appears to be the principle of natural justice, rather than according to established precedent. This surely conveys a reflection upon the wisdom of the provincial legislature; but the fact is, that the mercantile community is not sufficiently represented in the House of Assembly for Lower Canada.

Lower Canada is divided into three judicial districts: of Quebec, the Three Rivers, and Montreal, the boundary line being drawn nearly at right angles with the St. Lawrence.

There are but the three courts of justice, the Court of Appeal, the King's Bench, and the Summary Court. The Governor sometimes sits as president of the Court of Appeal; but the chair is more often filled by one of the chief justices. The court is formed by all the members of the executive council.

The Court of King's Bench is divided into a superior and inferior court. The latter has jurisdiction only where the matter in dispute is of the value of ten pounds or under There are a chief justice and three puisne judges at Quebec; the same at Montreal, and a district judge at the Three Rivers. When the superior court is held at this latter place, it is held by one of the chief justices, two puisne judges, and the district judge. The summary courts have jurisdiction over property to the value of one hundred francs, and are held once a month, before a commissioner appointed by the provincial government, on petition from the country inhabitants. Quarter sessions are held regularly before three magistrates, with much the same power as in England, for the punishment of offences against the criminal law; and petty civil cases may be disposed of daily by one or more magistrates. A magistrate is required to have property of the real actual value of 300*l.* and the oaths upon taking office are very strict.

A barrister may act as an attorney and solicitor at the same time, which, as in the United States, appears to have originated in the impossibility of making the profession pay without such an arrangement. Pleadings may be written in either language; and English and Canadian, French, are spoken almost indiscriminately in the Courts. I have observed great and unavoidable confusion in the inferior court of King's Bench; the judges, counsel, solicitors, clients, and witnesses, all talking occasionally at the same time in either language, just as it may happen; and in the midst of the uproar, the Sentorian voice of the officer of the court may be heard, as he endeavours to restore tranquillity by calling out silence! (English) silence! (French) in quick succession. But the proceedings in the superior court are conducted with all the decorum of an English court of justice; and the old jealous British lion, *painted* in the king's arms over the heads of the judges, frowns grimly upon the scene, with a pair of eyebrows sufficient to inspire even ermine dignity itself with awe and veneration. Many of the powers belonging to a court of equity are exercised by the Court of King's Bench under the old French law. It grants injunctions by a process termed a sequestre. It takes care of the property of minors, and appoints curators of the persons and property of lunatics. The law of entail, by a limitation called a "substitution fidei commissaire" is well known in Lower Canada, but seldom acted upon. —*Vigne's Six Months in America.*

SIR WALTER SCOTT.

The Return.—Sir Walter Scott has arrived in London, and is now at the house of his son-in-law, Mr. Lockhart. We regret to learn that this eminent writer and admirable man has not returned with any renewed vigour of constitution, or any chance of gratifying the world with further displays of his genius. He is, indeed, much worse in health than when he set out, and serious apprehensions are entertained of his recovery. In passing down the Rhine, he suffered by another stroke of paralysis in the boat, and had it not been for the presence of mind of his servant in bleeding him, he could not have survived the attack. He has now, we are informed, lost the use of one side, and is not likely to recover it. He has been attended by physicians ever since his return. —*May* 17.

Jeremy Bentham's Will.—This document was proved at Doctor's Commons on Monday. After appointing his executors and disposing of his body, he gives his interest in the *Westminster Review* to Dr. Bowring, with a sum of money for the publication of his (Bentham's) works complete. He divides his books among his friends, according to their subject, adding 100*l* to one set, an organ to another, and so forth. Other books are left to the London University. All his servants are provided for. All his freehold and leasehold property goes to the children of his brother, Sir S. Bentham. He gives rings bearing his effigy, and a portion of his hair, to his especial friends—Lafayette; Jose del Vallé, formerly president of the Republic of Guatemala; M. Van de Weyer, Ambassador from his Belgic Majesty; Jean Baptiste Say, the French political economist; Felix Bodin, member of the Chamber of Deputies; Messrs. Bickersteth, Chadwick, Doane, and Tyrrell, barristers-at-law; Dr. Bowring, Dr. Southwood Smith, Dr. Arnot, General Miller, Mrs. Austin, wife of the Professor of Jurisprudence at the London University, Joseph Parkes, of Birmingham, Albany Fonblanque, Francis Place, John Stuart Mill, the son of the historian of British India, Colonel Thomson, William Tait, of Edinburgh, and George Wheatly, of Whitehaven.

FREDERICK THE GREAT.

(From Lord Dover's Life.)

His fondness for his tall regiment of guards is well known; every country bordering upon his own territories was ransacked in search of giants, and upon more than one occasion, he was near going to war, rather than be compelled to give up his acquisitions of this kind. Nor was any class of men, or any profession, sacred from the violence of the Prussian press-gangs. Even priests were actually torn from the altars, as was the case, among others, with the Abbe Bastiani, who was carried off while celebrating mass in a village-church in the north of Italy. He subsequently settled at Berlin, and was admitted into the intimate society of Frederick the Great.* The extraordinary desire of Frederick William to recruit this regiment, seems even to have got the better of the passion of avarice, which, on all other occasions, reigned paramount in his breast; for we find instances recorded, in which he gave great sums for single recruits of a gigantic stature. To one called "*the great Joseph*," who apparently was a monk, he gave 5000 florins for enlisting, and paid 1500 rix dollars to the monastery he belonged to. In the procuring of an Italian, named *Andrea Capra*, the charge was as follows;—1500 rix dollars as bounty money to the recruit himself, and 2000 rix dollars to the persons who discovered and watched him, and to those who carried him off by force from his own country. But the most expensive recruit of all appears to have been an Irishman, named *James Kirkland*, for the procuring of whom the following curious bill was brought in to the King:—

	£.	s.	d.
For the man himself, on condition of his giving up his person, . .	1000	0	0
For the sending of two spies, .	18	18	0
The journey from Ireland to Chester,	30	0	0
From Chester to Ireland . .	25	12	0
The man who accompanied him on the journey, ...	10	10	0
To himself on his arrival, . .	1	18	0
Three years of wages promised him,	60	0	0
To some of his acquaintance in London, *who helped to perswade him,*	18	18	0
A fortnight's allowance, . .	1	8	0
For a *uniform*, shoes, &c. . .	19	6	0
Journey from London to Berlin, .	21	0	0
Post horses from Gravesend to London, and back, ...	6	6	0
To other persons employed in the business,	8	7	0
The 2 soldiers of the guard who assisted,	15	15	0
To some persons for secrecy, .	12	12	0
Expenses at the inn at Gravesend, .	4	13	0
To a justice of peace, . .	6	6	0
To a man who accompanied him, and watched him constantly, . .	3	3	0
For a boat, ...	0	5	0
For letters to Ireland and back, .	2	10	0

Making in all the enormous sum of 1200*l.* 10*s.*! paid for a single recruit.

SELECT NOTICES.

To make Furniture Oil.—Put some alkanet root into a glazed pipkin, with as much linseed oil as will cover it; let it boil moderately, it will become of a strong red colour; let it cool, and it is then fit for use.——*Antipathies.*—Some natural antipathies are extremely singular. Some faint away at the smell of roses. Erasmus, who was born in Rotterdam, had such an aversion to fish, that he could not taste it without a fever. The smell of apples was sufficient with Duchesni, secretary to Francis I, to cause a violent discharge of blood from the nose. And a gentleman, at the Court of Ferdinand, used to bleed copiously at the nose whenever he heard a cat mew.——*Thoughts on*

* Bastiani, after being kidnapped, was placed in a regiment as a private soldier, but as his history excited some curiosity, Prince Frederick took much notice of him, and on his accession to the throne, made Bastiani a canon of the cathedral of Breslau, and a constant companion of his own.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Sleep.—Sleep suspends our misfortunes, and strengthens us, that we may the better support them when awake. It also refreshes the powers of both body and mind. It contributes to health when we are in sickness. When afflictions press upon us, those moments given up to sleep, are the most happy in our existence.——*To clean Marble.*—Mix up a quantity of very strong soap lees with quick lime, to the consistency of milk, and lay it on the marble you wish to clean, where it may remain 24 or 30 hours. It is afterwards to be cleaned with soap and water, and it will appear as if new.——*An invisible Antagonist.*—A Gascon officer, who was present at a skirmish, fired a pistol at one of the enemy, and afterwards boasted that he had killed him. "That can't be," said another, "for not a man was left on the field." "Poh!" said the Gascon, "don't you see—I must have blown him to atoms.——*Fossil Forest.* -A fossil under-ground forest, about forty feet in thickness, and extending for several miles, has been lately discovered by a pedestrian tourist in the immediate vicinity of Rome. The petrific matter is a calc sinster, and the discoverer of this colossal phenomenon in natural history is of opinion that it has been occasioned by an earthquake, the memory of which is lost—probably long prior to the foundation of Rome. Not less singular than the phenomenon itself, is the circumstance of its having escaped the observation of the scientific for so many ages.—— *Appropriate Music.*—There is a set of music bells in the steeple of St. John's church, Perth, which play one of a series of lively Scottish airs every time the clock strikes. It so happened, one Sunday, at twelve o'clock, just as the minister below happened to use, with peculiar emphasis, the striking scripture metaphor, "Plough up the fallow ground of your hearts," that the music bells, much after the manner of an ochestra on the discharge of a toast at a public dinner, struck up the appropriate air "Corn rigs are bonny," to the infinite edification, and no less amusement, of the audience. ——*How to improve Water for drinking.*—The following plan may be adopted for this purpose:—Let the water, when boiled, be put into a common barrel-churn, where it may be agitated to any degree that may be wished for. In the course of its being thus agitated, it will absorb atmospheric air, and other elastic fluids with which it may come in contact. It will thus become a liquor, safe, pallatable, and wholesome; to be obtained with little trouble and expence; and in its utmost perfection, to the poorest individual.——*Unattackable.*—An officer was defending himself before Sir Sidney Smith, for not having attacked a certain post, because he had considered it *unattackable.* "Sir," said the gallant chief, "that word is not English."——*Polish Exiles.*—Paris contains at this moment several thousand Poles, and it is worthy of remark, that not one of them has been attacked with Cholera.——*Cologne, 20th May* – Numerous Cholera fugitives are constantly arriving from France.

NATURAL HISTORY.

ORANGES.

Of this cheap luxury, those chiefly used in England are from Portugal, Malta. the Barbary coast, and Seville; but by far the greatest number are from Seville, the export from which equals that of all those other places. About forty vessels are yearly freighted with oranges from Seville; each cargo consists of 400 chests, and each chest contains 800 oranges; so that the average number exported from Seville is 12,800,000 oranges; of this number about one-tenth part are bitter. The price paid by the London merchant to the Seville exporter is 120 reals a chest, which is fourpence halfpenny per dozen, or a farthing and a half each; so that if the freight and other expenses be added, one can scarcely expect a good orange under a penny. The cargo of each vessel is generally consigned to about ten persons; so that the trade is a secure one, and, to the grower, sufficiently profitable. The best oranges are allowed to remain long on the tree: the tree blossoms in March; and the choicest fruit still hangs on the tree when the blossom of another crop begins to appear. The Spaniards do not esteem them as thoroughly ripe till then: but in this state they are, of course, unable to bear exportation. The chief part of the export takes place in November and December, and a small number are shipped in January: if the fruit shipped so late as this happens to be long detained on the voyage, the greater part of it arrives in England in a state unfit for use; but, if the voyage be short, this is the finest fruit that comes to the English market. —*Inglis's Spain.*

ON THE CULTURE OF POTATOES.

In the cultivation of the potatoe, it does not seem to be yet settled whether it is necessary that the set should be taken from a large potatoe, or whether that from a small one will answer the same purpose. And yet this seems an easy question to be settled by *experience*, although it is true that the nature of the ground must make a greater difference than the size of the potatoe which is planted. Two rows, one of small and the other of large sets, planted on the same ground, would settle the question. As far as our own experience has gone, we have generally found large sets to answer best, and that one eye, (or two, for fear of accident,) has succeeded quite as well as a whole potatoe. If the small, and almost useless potatoe would answer as well, the saving would be of great importance. The following extract from the Horticultural Register has been sent to us by a correspondent.—Ed.

"Mr. Knight's general rules, as I find them in a letter now before me, are these:—'I obtained from the ash-leaved kidneys last season (a bad one, 1830,) a produce equal to 670 bushels, of 80 lb. each, per statute acre. To obtain these vast crops of the ash-leaved kidney, I always plant whole potatoes, selecting the largest I can raise; and for a very early crop, those ripened early in the preceding summer, and kept dry. I usually plant them on their ends, to stand with the crown-end upward, and place them at four inches' distance, from centre to centre, in the rows; the rows two feet apart, and always pointing north and south. I plant my large potatoes much in the same way, but with wider intervals, according to the height which the stems attain; thus, one which grows a yard high, at six inches' distance from centre to centre, and three feet six inches, or four feet, between the rows, never cutting any potatoe, nor plantings of less weight than a quarter, but generally half a pound. By using such large sets, I get very strong and large plants with widely-extended roots, very early in the summer. The blossoms take away a good deal of sap, which may be better employed in forming potatoes; and whenever a potatoe affords seeds freely, I think it an insuperable objection to it. As a general rule, I think potatoes ought to be planted in rows, distant from each other in proportion to the height of the stem. The height of the stem being full three feet, the rows ought to be about four feet apart and the sets of the very largest varieties planted whole, never to be more distant from centre to centre than six inches. By such mode of planting, the greatest possible quantities of leaf (the organ by which alone blood is made) are exposed to the light." (See Art. VI. signed G. J. T.)—*Horticultural Register*, No. X. p. 441.)

SCIENCE.

TANNING OF LEATHER BY GRAPE MARC.

A MEDICAL man of the neighbourhood of Narbonne has announced that the marc of grapes, after being distilled for the purpose of separating the alcohol, is an important assistant to oak bark, in the tanning process. After preparing skins in the usual manner, he placed them in the pits with the marc, in the place of bark. In thirty-five or forty days the tanning was finished.

The expected advantages are:—1. Shorter time;—2. Reduction of the price of oak bark;—3. A more agreeable odour of the leather than that given by oak bark;—4. Greater strength in the leather.

ZINC SHEATHING.

His majesty's ship Gannet, lately commissioned at Chatham, has been sheathed with sheets of zinc instead of copper, an experiment proposed by Captain Sweney, R. N., who superintended the performance of it. The sheets are of the same size as the copper, but from its brittle nature it was necessary to soften it for the purpose of perforating the holes, the nails also being principally of zinc. The expense is calculated to be about half that of copper.

QUICK COMMUNICATION.

It is the practice with the Admiralty to hold certain communications with the outports daily at one o'clock, by telegraphic despatch. The following is an instance of the wonderful celerity with which these communications are made. Certain instructions relative to the regulation of the time-keepers were lately communicated from the admiralty Office, London, to the telegraph, Portsmouth—and an answer received to them in *one minute.* It is, in fact, scarcely possible to imagine a system more perfect than this system of communication must be.

MACHINERY FOR SCOURING FLOORS.

David Dickinson, Chatham, Connecticut.

A scrubbing-brush is to be worked backwards and forwards by a lever, operating in the manner of a pump-handle. A flat board is to stand upon the floor, and from this is to rise two uprights, to sustain the pin which is the fulcrum of the lever To the lower end of this lever the scrubbing-brush is to be attached by a joint. The board with its appendages, is to be moved about the floor, that the brush may be applied to every part of it, &c. &c. We have seen many machines, some of them white, some yellow, and others black, which worked scrubbing-brushes to admiration: some of them were clever-looking articles, and although unpatented, we should decidedly give them the preference, either for washing, scrubbing, or other useful operations in domestic economy. They may either be hired or purchased, as may be thought most convenient.—*Date of Pat. 10th July*, 1831

CAPE OF GOOD HOPE.

NOTES OF THE MONTH.

(By Vivian.)

THE BOOTCHUANA BOY.

The Scotsman Newspaper of July 6th, 1831, mentions the Ordination of the Rev. W. Robertson, by the Presbytery of Aberdeen, presented to one of the Government Churches in this Colony. There is also the following notice in the same article, which possesses considerable interest.

"During his former residence at the Cape, Mr. Robertson adopted an orphan Negro Boy, belonging to the Mantatee tribe of the Bootchuana country, and retained him as a servant. The boy accompanied his master to Scotland, and during his residence in Edinburgh, he attended the Sessional, and latterly the Circus Place School, where he acquitted himself very much to the satisfaction of his teachers, displaying an acuteness and intelligence not a little remarkable. Before setting off with Mr. Robertson for the Cape, he expressed a wish to be baptized; and his knowledge and general conduct being such as fully to warrant a compliance with his request, the solemn and interesting ordinance was dispensed on Friday last by the

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Rev. Dr. Gordon, and thus the Bootchuana Boy returns to his savage countrymen, probably the first of the Mantatee tribe that has ever been admitted to the possession of christian privileges."

The Rev. Mr. Robertson arrived in the Colony towards the end of 1831, and was appointed Minister of Clanwilliam.

A Correspondent thus reports concerning the parties in question, under date Clanwilliam, 14th August, 1832.

"The Bootchuana lad William Lockey, who received a most respectable education, through the means of the Rev. W. Robertson, our District Minister, is about to leave his benefactor for *Kamiesberg*, in the capacity of *Assistant Teacher* to Mr. Edwards, at the Wesleyan Mission Institution. From what I know of him, I entertain the most pleasing anticipations of his well-doing. It is very encouraging to those who take an interest in the education of the coloured tribes, to find so much capability in an African of supposed inferior intellect, and to discover suitable qualifications in this orphan boy to become a teacher in a Public Institution.

It is also extremely disinterested on the part of our Minister to make such a sacrifice as he really does—in parting with this amiable youth."

THE SOUTH AFRICAN PULPIT.

——— The Pulpit, in the sober use
Of its legitimate peculiar powers,
Must stand acknowledged, while the world shall stand,
The most important and effectual guard,
Support, and ornament of virtue's cause.
(Cowper.)

Some of these days we intend to pay some very direct attention to the South African Pulpit. At present, we shall just glance at the objects which have engaged the attention of three or four Clergymen during the last month, and all, we believe, on one particular day.

ST. ANDREW'S.

The Rev. Dr. Adamson preached a collection sermon on behalf of the Sunday-school attached to this Kirk. The Preacher dwelt much on the advantages of *Religious Knowledge*, over those attainments which merely exercise the reason, but do not controul or discipline the passions; which sharpen the microscopic faculties of the mind,—leads with a mighty enchantment through the realms of time, but cherishes not the "thoughts that wander through eternity." We thought the following idea of the Reverend Preacher very good—'In truth, the fruits of the *Tree of Knowledge* will only send leanness into the Soul which hath no hungering after the fruits of the *Tree of Life*.'

THE MINISTER OF ST. GEORGE'S.

The inordinate propensity for finery and dress, has been long a growing evil at the Cape. A Christian preacher may, therefore, be well forgiven if he lift up the voice of urgent testimony and warning against this temptation of the Enemy. To see an *immortal* being loading itself with *outside shew*, is a spectacle almost as melancholy as that of a shivering and tattered maniac, picking up gew-gaws and feathers and glittering braveries, and fixing them in his wild locks, and spangling with them his flaunting rags! The Rev. Mr. Hough, the Senior Colonial Chaplain, has, therefore, we think, performed a very essential duty in bringing the subject forward for pulpit remonstrance. As long ago as 1657, when plain preaching was in vogue, Dean Reeve thus addresses a London congregation on the subject of outward adornments.

"The Kings of Egypt were wont to give unto their Queens the tribute of the city *Antilla*, to buy themselves girdles; and how much girdles, gorgets, wimples, cawles, crisping-pins, veils, rails, frontlets, bonnets, bracelets, necklaces, slops, flippers, round-tires, sweet-balls, rings, ear-rings, mufflers, glasses, hoods, lawn, musks, civets, rose-powders, gessamy-butter, complexion-waters, do cost in our day, many a sighing husband doth know by the year's account. What ado there is to spruse up many a woman for streets or markets, banquets or temples! She is not fit to be seen, unless she doth appear half naked; nor to be marked, unless she hath her distinguished patches upon her; she goeth not abroad till she be feathered like a Popin-jay, and doth shine like alabaster: it is the great work of the family to dress her; much chafing and fuming there is before she can be thoroughly tired; her spongings and perfumings, lacings and lickings, clippings and strippings, dentrificings and daubings, — the setting of every hair methodically, and the placing of every beauty spot topically, are so tedious, that it is a wonder that my lady can sit, or the maid stand, till all the scenes of this fantastic comedy be acted through. O these birds of Paradise are bought at a dear rate! The keeping of these Lannerets is very chargeable!"

THE REFORMED CHURCH.

A powerful appeal has been made from this Pulpit by the Rev. Mr. Faure, on behalf of a new Building for a Church, to be placed somewhere near the public school in Long-street. This address seems to have had a beneficial tendency—a handsome subscription being afloat. In various parts of the Colony there is a Church-building spirit, which argues well. In some instances, we know of *family* determinations on this head. In colonizing, upon however small a scale, the vow should be remembered which David vowed unto the Almighty God of Jacob: "I will not suffer mine eyes to sleep, nor mine eye-lids to slumber, neither the temples of my head to take any rest, until I have found out a place for the Temple of the Lord." The chief reason why men in latter times have been worsened by colonization, is, that they have not borne this in mind. It was a tradition among the pions Jews, that wherever ten men of Israel were settled together, a synagogue ought to be built there!

Extract From a Traveller's Letter.

(Addressed to VIVIAN.)

I hope you will continue to give us your monthly notes of Criticism; never mind that your remarks must be occasionally displeasing to some—depend on it, we want more of the stirring-up system. I have ever felt the advantage of it from being early initiated in the rules of a Literary Society, and we used to practise every means in our power, (such were our laws,) except personal insult, to try the temper and understanding of each candidate for admission. Every prejudice, which his profession or situation in life might have led him to cherish, was attacked, and exposed by argument and ridicule. The argument was always ingenuous, and the ridicule sometimes a little severe. This ordeal, however, prevented the aspiration of too numerous candidates. Our Society was always kept weeded, for we kicked out every timid cowardly spirit who could not *stand fire*—nor would come up to *the scratch* when necessity called for it. But to business—

I have been visiting Graham's Town, and am now on my way to the Caffer stations. In Graham's Town are very numerous signs of growing improvement. The Hall for Commerce, Public Meetings, and Assemblies, will be very pretty when finished: the plan combines neatness with elegance, and is of course less ambitious than yours in Cape Town, which lays its foot of occupancy on so much ground. The Methodists are finishing a splendid Chapel—nothing like it on the frontier, and would shame many buildings at the Cape. The zeal of this people is most commendable. Here we find a sect doing what the whole of the District of Uitenhage cannot, or rather will not do. Even the minister's house I observed, as I passed it in Uitenhage, is in a most forlorn condition, and a disgrace to the church authorities. Is this the way they treat their pastor?—

"A man who is to all the country dear."

Graham's Town is a thorough English Community, and has not half the draw-backs which you have in the Cape Colony, of a mixture of Dutch and English; two-thirds of the former, and the proportion of the latter not genuine. I hope we shall some one of these days cut the connection, for what with your parties, prejudices, and opposition, it is no credit to be on any very extraordinary terms of intimacy.

The Slave Guardian at Graham's Town is ordered to Graaff-Reinet—a wise remove, because his residence in Albany has been long an anomaly. It is curious enough, I heard of a silly memorial in the course of my travels from certain *boers*, craving permission to hold slaves, and threatening, if refused, to remove to Port Natal! Their departure (such slavers!) would be a happy 'riddance; it would, at the same time, be unfortunate for Natal, as it would perpetuate the system in that part of Africa.

I discover by your newspapers that Political Philosophy has been superseded at the Cape by Moral Philosophy; and that *Jesuistical* principles on the *expediency of a Lie*, find an advocate in a writer who has had the hardihood to style himself *A Candid Englishman*. I think Mr. Fairbairn should return to his former practice of never mentioning the contemporary Thing in his paper.

How are the rising youths coming on at the Cape? What progress make they in Hebrew, Greek, and *Dutch* Latin?!!! The Cape boys are certainly precocious, a peculiarity of the climate to produce such effect on all living substances. I wish they were of slower growth, when one might expect, at years of maturity, something of sterling oak. The lads of America and New South Wales are famed for the spirit of enterprise:—they subdue the soil, and are not ashamed of the sound of their axe in the forest; or else they adventure on the world of waters. Now, what is the Cape peculiarity? To dance, to *trouw*, and be writing-machines in a government office. I have seen Dr. Smith about his eastern tour. If the concurrent testimony of men of all characters and degrees of information is to be relied on, it must be a fine country. But it appears to be without animal-*man*. He has been cut off, and not there to be seen. The Emperor Nicholas should have made *Chaka* and *Dingaan* Field-Marshals when he subdued the Poles—they would have done the business of depopulation to the *Last Man*."

A CARD.

We beg our respectful compliments to the Editor of the *Advertiser*, and assure him that we have read his thoughts on Slavery of the 1st instant, and differ with him *in toto*. The words of the late Mr. Canning supply a forcible admonition at the present juncture.

"Trust not the masters of slaves in what concerns legislation for slaves. However specious their laws may appear, depend upon it, they must be ineffectual in their operation. It is in the nature of things that they should be so. *Let then the British House of Commons do their part themselves. Let them not delegate the trust of doing it to those who cannot execute that trust fairly.* Let the evil be remedied by an Assembly of freemen, by the Goverment of a free people, and not by the masters of slaves. There is something in the nature of absolute authority, in the relation between master and slaves, which makes despotism in *all* cases, and under *all* circumstances, an incompetent and unsure executor even of its own provisions in favour of the objects of its power."

LECTURES
ON NATURAL PHILOSOPHY.

LECTURE III—BY ORLANDO.*

CREATION OF VEGETABLES—NECESSITY OF LIGHT AND AIR TO IT—ON THE DIVINE AGENCY IN NATURE—ON THE DISTINCTION BETWEEN LIGHT AND THE SOLAR RAY.

GENTLEMEN!

I closed my last Lecture with observations on that Divine superintendence and agency which accompany the continued subsistence of our natural world,—because, no other supposition will explain those grand phenomena, which no discernable laws of nature can account for: and because, wherever these act, they only operate as they do, by the energies and qualities derived from the Creating Sovereign, and by the arrangement and co-operating and counteracting positions in which He has placed—and having placed, continues to maintain them. The permanent existence of things as they are, is as great a miracle as their original formation. And I would here observe, that there is so much that is incomprehensible to our finite minds in Creation, as well as in Providence, that it is our duty to obey rather than to cavil—to bend our reason to the Divine Will, and even believe the revealed Testimony with submission and thankfulness, rather than reject its mysterious import. For let us recollect, however much of falsification and of error there may be in the world, there is yet so great a preponderance of truth, that *he who believes indiscriminately will be in the right a thousand times to one oftener than he who doubts indiscriminately. Habitual scepticism implies almost perpetual error. Indeed, either to believe by habit, or to doubt by habit, is the symptom of a feeble or diseased mind. But the former is vastly more congrous to the actual condition of mankind, and to the ordinary course of human affairs,—is more safe, is more reasonable, than the latter.*

But, Gentlemen! to our subject. In no part of our terrestrial abode is a creating mind more visible, than in its VEGETABLE Kingdom; for here we see every where specific combinations producing specific effects, and no other; and with undeviating constancy, and with exactest certainty, each phenomena arising from a peculiar and adapted organization distinct from every other, which invariably produces its suited result, and only that; yet each but the union, different arrangements and quantities of the same common particles. No fancied *tendency* will explain this. The same particles could not tend to be a thousand dissimilar things. No assumed tendency can explain diversity; a tendency to diversity is an impossibility, because, that would be a tendency to be and yet not to be, which may be justly deemed an absurdity. If the particles of Vegetable nature tended to form a rose, the same particles could have no tendency in themselves to compose a lily. All tendency, if such a thing existed, must be uniform; it could not be variable. No presumed tendency can therefore explain the numerous diversities of vegetable organization. All plants are formed of similar component particles, varying only in arrangement and amount; and no particles that tended to form one composition, could tend to form any other. But instead of vegetable nature being only one composition, the Botanist is conversant with from 80,000 to 100,000 species of plants.*

The *Creation of Vegetables* is placed by Moses subsequent to the production of Light and of the Atmosphere; immediately after the waters had receded from the land, and just before the creation and arrangement of the Solar system. The position of Vegetables in the series of creation exactly answers the demands of our present knowledge. Instead of requiring the Sun's light to germinate, seeds and plants, in order to do so, must be sowed and placed in darkness before they begin to vegetate. Solar light is unfriendly to first germination. *Louden* mentions as one of the necessary conditions of germination, that the seed sown *must be defended* from the action of the rays of light. A small heat and moisture first cause the living principle of seeds to begin its operations, but they cannot flower and fruit until they receive the solar beams; nor could they grow without light, air, and moisture. (1)

A portion of oxygen air is essential to vegetation. Hence the previous atmosphere, which contains in it more than that portion, was indispensable, as was also some water on the soil where they were to grow. This exact placing of vegetable formation and first germination, is another test of the authenticity of the Hebrew cosmogony, which random fiction could not have stood.

Gentlemen! According to my mind, no truth in philosophy seems to be now more clearly ascertained, than that light has a distinct existence separate and independent of the Sun. This is a striking confirmation of the Mosaic record; for that expressly distinguishes the existence and operation of light from the solar action upon *it*, and from

* Delivered before the Members of the Poker Club.

* *Hersch.* Disc. 136. This is a much larger number than former estimations. *Louden* mentions only 44,000, of which 38,000 had been described. Encyc. Gard. 250.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

that radiation of it which is connected with his beams and presence. By the first sacred Historian, an interval of three days is placed between the luminous creation, and the appearance and position of the Sun and Moon. Light was therefore, operating by its own laws and agencies, *without the Sun*, and independently of his peculiar agency, from the first day to the fourth of our terrestial fabrication. But from the time that the Sun was placed in his central position, and his rays were appointed to act on our Earth, they have been always performing most beneficial operations, essential to the general course of things. (2) They have also been ascertained by Dr. Herschel, to have a power of heating, distinct from their production of light and colour,—an interesting discovery, connected with more consequences and inferences than have yet been noticed. (3)

The glory of Sir Isaac Newton began by his discovering that light was not simple and homogeneous; but that it consisted of seven rays of different colours, and of different and invariable degrees of refrangibility. The same degree of this belonged always to the same colour, and the same colour to the same degree of refrangibility. Red, yellow, and blue, are the primary colours; white light, their compound. An opposing theory to this, has been gradually growing up from the time of Des Cartes, and is now maintained by several men of no small name and powers in science, (4) which considers light to be an undulating vibration of an ethereal medium universally diffused, and not as Newton thought an emanation of *particles* direct from the Sun. (5) La Place perferred the opinion that Light is an emanation from a luminous body! But the newer system comes nearer the Mosaic fact, that light was a distinct production anterior to the Sun; and appears to be gaining ground in philosophical minds. (6) It seems to me most probable, that Light is an ethereal fluid now generally diffused, and pervading all things, and not an emanation from the Sun; but that this luminary has a direct and additional agency upon it, whose effects we daily see.

It may not be impertinent to suggest, that light seems, like heat, to have two states,—active and latent. The active state causes its visible phenomena, and our sensation of day-light. When this subsides, by the Sun's departure, into its latent state, our sense of darkness, or night, is produced. The solar rays again emerging on it, have the power of changing its latent state into its active visibility. Light has also the property of being absorbed by, and I would add, of combining with all substances; (7) with some wholly, which are then black; with others, the most numerous cases, only in part; and then, that portion of them which is not so absorbed, emanates from the substance in the colour which comes from them to our eye. (8) There is another grand operation in the formation of material and inorganic nature, which has only become a subject of peculiar study within the last half century, and with which I think, the yet *unknown* agencies of LIGHT are principally concerned. This is CRYSTALLIZATION. It is that force or agency by which the constituent particles of bodies are united together into certain primitive forms, which all minerals on being properly broken, are found to exhibit, and which become the rule and basis for the formation of the mass. Similar figures are made on the primitive one; and all of these accumulated crystals the substance is composed, and into these it can always, by careful labour, be divided. (9) They have been traced to four fundamental forms; and these have been thought reducible to one constant and primitive original. Like the rest of nature, the crystalline form is perfectly scientific, (10) and Light seems to have been one of the great secondary agents that is used by the great Mechanist of the Universe to produce it.

Let us now direct our attention more exclusively to the principles and nature and chief phenomena of the Vegetable Creation.

Of all vegetables, and especially in the flowers, light seems to be a component part, and the causes of all their lovely colours, and to be essential to their health and vigour. But mere light of one simple and similar kind would not have had this effect. Its beauties arise from its consisting of seven distinct separable, varying, and differently reflecting rays. (11)

Hitherto, only inorganic, brute, and unliving matter, and aërial and ethereal fluids of the same character, had been made: their elementary particles had been combined together by the subordinate operation of those means or laws to which we give the names of cohesion, attraction, gravitation, crystallization, and such like; but all these made only lifeless substances and compelled movement, without any spontaneous power or self-acting principle within them. Every thing was inert, until impelled; and all motion was the effect of external force, ceasing when that ceased, and never proceeding beyond its compulsory impulse, either in direction or degree.

The Deity now proceeded to a new order and principle of Creation—that which is associated more immediately to Himself. This was, to arrange some of the material elements of nature into definite and interesting forms, with a curious internal mechanism, within which a living principle was to abide, spontaneously acting and producing those peculiar and impressive phenomena, which only life can perform. It is this living principle which brings all that possesses it, into a far nearer relation to their Maker, than inert and inorganic matter—for in its lowest form and activity, it is still totally unlike all that is without it, and has a certain degree of assimilation to its Creator, whose essential quality is eternal, unoriginating, and everduring life. All vitality appears to be some communication of the grandest characteristic in Himself, to those things which possess it, and by which they become living beings. Their forms are His special invention and construction—and their principle of life is also His especial and communicated gift.

The CREATION OF VEGETABLES was the formation of living organized beings, with spontaneous internal powers, but without those of locomotivity; without thinking minds, and without any sensitivity discernible by us, and yet endowed with a principle of life that has many striking analogies with that which all animals possess, and which we ourselves enjoy. PLANTS are distinguished for their multiplicity and variety; for that exuberance of imagination and taste which they display, and for that sense of elegance and beauty which their Maker must have had, to have so formed and diversified them. They are entirely the creation of His choice—the inventions of His rich and beautiful fancy. They have been all individually designed; and special thought must have been employed in each. The Vegetable Kingdom expands every where before us an immense portrai-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

ture of the Divine Mind, in its contriving skill profuse imagination, conceiving genius, and exquisite taste; as well as its interesting qualities of the most gracious benignity and the most benevolent munificence. The various flowers we behold awaken these sentiments within us, and compel our reason to make these perceptions and this inference. They are the annual heralds and ever returning pledges to us of His continuing beneficence, of His desire to please and to benefit us; and therefore, of His parental and intellectual amiabilities. The Thunder, the Pestilence, and the Tempest, awe and humble us into dismaying recollections of His tremendous omnipotence and possible visitations, and of our total inability to resist or avert them; but the beauty and benefactions of His Vegetable Creations—remind and assure us of His unforgetting care, of His condescending sympathy, of His paternal attentions. * * * *

[The next Lecture will detail some of the chief principles and properties of the organization and system of the Vegetable Creation.]

NOTES.

(1) M. Leuchs has tried many experiments on the effects of light on plants. His conclusions are—'Solar light favours in them the assimilation of carbonic acid gas—facilitates their verdure, and the formation of their volatile and aromatic principles.—It is essential to florification and fructification. We cannot obtain ripe seeds from plants reared in darkness. They become more lax and watery as the light is lessened.

(2) The rays of solar light, according to Sir David Brewster, possess several remarkable physical properties; they heat, they illuminate; they promote chemical combination; they effect chemical decompositions; they impart magnetism to steel; they alter the colour of bodies; they communicate to plants and flowers their peculiar flowers; and are, in many cases, necessary to the developement of their characteristic qualities.

(3) From his experiments, Dr. Herschel drew the important conclusion, that there were *invisible* rays in the light of the Sun, which had the power of *producing heat*. These results were confirmed by Sir Henry Englefield. (See Brewster's Optics, p. 89.)

(4) Drs. Hooke and Huygens in Newton's life-time, urged the theory which Des Cartes had first suggested. Newton answered them. But Euler and others revived it. Since he wrote, Dufresnal, A. S. Couchy, and Pouillet, have enforced it. Dr. Ure explains its modern shape at some length in his Geology.

(5) In the Newtonian theory, light is supposed to consist of material particles emitted by luminous bodies; and moving through space with a velocity of 192,000 miles in a second. In the undulating theory, an exceedingly thin and elastic medium, called Ether, is supposed to fill all space, and to occupy the intervals between the particles of all material bodies.

(6) Brewster's Optics, p. 135.

(7) One of the most curious properties of bodies is their power of absorbing light. Charcoal is the most absorptive of all. Even the most transparent bodies in nature, air and water, when in sufficient thickness, are capable of absorbing a great quantity of light. (*Ib.* p 127.)

(8) Bodies absorb light in different degrees, in this order:

Charcoal	Black hornblende	Mica
Coal of all kinds	Obsidian	Water
Metals in general	Rock crystal	Air and
Silver	Selenite	Gases
Gold	Glass	

(*Ib. p.* 137.)

(9) Mr. Daniel in his Lectures, proves that these bodies cannot be broken in any way *we please*, but only in certain particular directions.

(10) The crystalline form is in the highest degree geometrical. (Hersch. p. 291.)

(11) Sir D. Brewster has very happily expressed this fact. If the objects of the material world had been illuminated with white light, all the particles of which possessed the same degree of refrangibility, and were equally acted upon by the bodies on which they fall, *all nature would have shone with a leaden hue!* and all the combinations of external objects, and all the features of the human countenance would have exhibited no other variety than that which they possess in a pencil sketch, or a china-ink drawing. (Life of Newton.)

A LATE "BULL" FROM THE POPE *versus* MASKS.

In our last, we gave an extract from the MS. Journal of an Italian Exile. The late papers have announced, that *Masks* are prohibited by a recent "Bull" from the Roman Pontiff.

It is clear that Politics and Pleasure are the true antagonist powers of the social system, as Attraction and Repulsion are of the physical.

The Pope, in consideration of the suspicious political state of the capital of the world, has just let loose the most amusing "Bull" that was ever started, out of Ireland—amusing, however, to those only whom it does not concern—for to those whom it does concern it is—(like the stoning of the frogs)—death. The mad "Bull" in question—for it is nothing less, and the Pope will find it so—relates to the Carnival, and decrees that it shall take place as usual, but *forbids the use of* MASKS. A Carnival without masks! The play of Hamlet without the Prince, was nothing to this. The revellers may disguise themselves in what costumes they please (always except those of the Monastic Orders), but they must, on no account, cover their faces! Why, the Roman Carnival will, for once, be as "weary, stale, flat, and unprofitable" an affair as a late Slavery Meeting in Cape Town was.

And the order extends to all places, public and private, and to all hours. The poor Romans are interdicted from making themselves happy and ridiculous, even in their own houses: for a mask may cover a conspirator.

The same mandate includes above a score of other directions, almost equally preventive and yet provocative of merriment. Among other refined cruelties, the revellers are forbidden even to fling their accustomed sugar plums at one another—for who knows but each might be some "infernal machine" in masquerade, or convey some incendiary writing—some Swing letter? The penalty for this latter atrocity (of flinging a forbidden sugar plum), is fifteen days imprisonment, and a fine.

As a stretch of papal indulgence, however, the people may scatter very diminutive comfits—of coriander seeds, for example,—*always provided they be purchased by the licensed vender.* But almonds and Pistachio nuts are specially interdicted—they are the "forbidden fruit" of the papal paradise.

Here follow a few more items of this doubly-*marplot* mandate:—"The use of lighted tapers (*moccoletti*) is absolutely interdicted for the present year." (They must amuse themselves in the dark, then. Many of them may not object to this.)

"No one shall dare to frighten, stop, or turn, any of the horses during the race." (By this we may gather, that, under ordinary circumstaces, the above are admitted pleasantries.)

That portion of the decree which affixes the *penalties* in the above cases, is one of the most naive and characteristic bits of composition that we remember to have met with. Thus it expresses itself:—"Those who shall act contrary to the above prescriptions will be subjected to *public flaggellation, fine, imprisonment*, and "EVEN HARD LABOUR." Pray, reader, take the order of these penalties. Whipping at the cart's tail is a trifle—"fine" is decidedly bad—"imprisonment" is the devil—but "hard labour!" How can it have entered into the human conception to have devised such a refined piece of cruelty! An Italian—Roman—condemned to work! "Oh!" (as they say to Mr. Hunt's plebeianisms in the House of Commons,) "Oh!"—must have been the one universal exclamation of Rome, on reading this fatal decree,—which, if it do not cause an immediate revolution in the Papal States, nothing can. Condemn a worshipper of the *dolce far niente* to "hard labour!" The world's at an end!

SUPPLY AND DEMAND.

If human ingenuity has been hitherto dormant on the vital point of food for human consumption, it is now presenting us with indications that it will be indolent and inattentive no longer. Experiments are beginning on the long-neglected art of multiplying human food—and even of obtaining it from other vegetable matter, besides the farinaceous grains and roots of nature. A German is stated in a recent publication, to have found out the means of converting *saw-dust into an eatable food.** A medical gentleman near Manchester is making bread from turnips, carrots, parsnips, and beet; and a French miller has ground and worked straw and hay into nutritive bread, not inferior to that which the largest part of Europe's continental multitude subsist on. As it respects saw-dust as an article of food, we have a reminiscence to the point. Some twenty years since, there lived in our native village, one Elliot, a carpenter, and Thorburn, a tailor. They were both men of eccentric habits, and each prided himself on riding a good horse. On one occasion the parties met, and the tailor complimented the other on the good looks of his riding animal; asking him, at the same time, how he managed to keep up such a fine appearance. "O, said the carpenter, 'tis nothing more than mixing *saw-dust* with his oats." The tailor was highly indignant at the supposed sportiveness of his friend, and turned away in anger. But the fact

* *Dry* bones may be converted to nutriment by steam, or by a cheap acid.—Dorcet, Ann. d'Industrie, Feb. 1829.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

was, that Mr. Elliot did for many years unite saw-dust with oats; and, therefore, the German's discovery is not altogether original.* But, trusting as we do in the undiminishable and undecaying property of *plants*—we seem to require little of human ingenuity to find out other resources for the cravings of our nature. Hence we are relieved from the chimerical dread of a super-abundant population of the Earth, respecting which so much has been said and written for the last thirty years. In nature, the law of population has never exceeded that of the productive power of vegetable life, and never will. All that concerns human beings, has been made upon a principle of benevolence. The same principle continues the system, and superintends the working, and will always adapt the provision to the necessity, and supply further assistance, if new exigencies should require it. Cultivated produce has hitherto outran population in every country, and there is every appearance that it will do so. Two laws are visibly in operation in nature; one, that it shall not produce spontaneously—the other, that it shall be always increasable by human labour and skill. Ordinary, but diligent exertions of these, have hitherto abundantly sufficed for all that has been needed. Local distress may arise from temporary reasons and want of intercourse, but never from a failure in the powers of vegetable nature. The great mischief is, that *Man* frequently mars the benevolent intentions of the Divine economy. Restrictions and Corn Laws are sad drawbacks to the happiness of a people, and never will the prosperity of a country become secured, until wise laws and individual equity, cause the Great Supply to be sufficiently shared by all its inhabitants.

The most essential condition in a daily enlarging population, is a sufficiency of that which will support bodily strength, and nourish the vital principle. The simplest food will always do this, in spite of a contrary belief on the part of some of the gross sheep's-tail-fat eaters of this colony. Who is there rightly minded, that does not discover a food, and a course of prudent diet, which is more favourable to the intellectual energies, and the moral sensibilities, than any other? This seems to be the golden mean between deprivation and exuberance.

'Spare fast that with the Gods doth diet,'

was the experience and the encomium of our Milton; and a moderate use of selected and improved articles of sustenance may give the strongest wing to genius, and the sweetest temper to the animal spirits. But let us look a little further into the supplies of Nature, and we shall find the resources adequate to the demand.

Wheaten bread is a desirable enjoyment, but other vegetable food cannot be unpleasant, since our ancestors lived on *barley-cakes;* the Russian still loves his hard *black rye bread;* the Caledonian his gratifying *oatmeal;* and the Hibernian his *potatoes.* Even *acorn*-food is yet palateable to some people, who might have corn if they would cultivate it. Thus Capt. Beechy mentions of the Indians he saw in California, that they cultivate no land; but acorns, which abound, constitute their principal food.* So Desfontaine remarks on the people of the Atlas Mountains between Algiers and Morocco. In New Zealand, the *Fernroot* furnishes a principal part of the food of the common people at some seasons of the year. (Ellis, Polyn. Res.) At various times in Europe, when scanty harvests pressed, the poor have made their bread of fern-roots. Eveleyn notices, that *Burrs and Thistles* have been used for human food. Bruised thistles have been often given to horses in France, who have fattened on them. The Laplanders make bread from one of their *mosses.* In France, in 1817, the continued rains of the preceding summer having prevented the corn from ripening in one of the departments, the people, for several weeks before the next harvest, were reduced to live solely on herbaceous vegetables, as Goat's-beard, Wild Sorrel, Nettles, Thistles, Bean-tops, and leaves of trees; these were chopped up, boiled, and mashed. (Journ. Experim. 1822.) In the scarcity in Ireland in 1818, Nettles and all other herbaceous herbs, with coarsest bran, were resorted to for food. The natives of New Holland are estimated at 3 millions, yet agriculture is unknown among them. The fondness for bulbous-roots by many of our Bushmen and wild tribes on the boundaries of this colony, is well known.

But the number of new things made from vegetables only, in the year 1831, not only amuse as we read of them, but contribute to illustrate the utilities, both for food and convenience, that are yet additionally derivable from them. Thus M. du Chatellier announces that he has discovered the means of so preparing all the leaves of trees and plants, as to make them excellent *Tobacco;* especially the *Nut* and *Vine.* The powder is as sternutatory as the Nicotian, but does not produce the vertigo which tobacco-snuff occasions. (Bull. Un. 1831, p. 342.) So another, with the aid of a little malt, makes what he terms good *Beer* from *Potatoes.* (Ib. 348.) A gentleman of Vienna has found that *Elderberries,* in equal quantities, yield more *Brandy* than the best of Wheat. (Ib. p. 121.) Another disserts on the advantage of feeding *Cattle* of the *Elm, Acacia* without thorns, *Ash,* and *Poplar.* (Ib. p. 224.) Another, by hand-nets with bags, caught from his corn five bushels of *Grasshoppers,* which he boiled. They turned red, and made a delightful repast to his *Pigs.* Another experimenter found that *Sweet Potatoes* would form wort, ferment and make like *Malt,* good wholesome *Beer,* in flavour precisely like ale made from malt. Another raised on light lands, that grew only 327 bushels of potatoes on the acre, 640 bushels on the same space, of *Jerusalem Artichokes,* which the young calves eat with rapidity, and improved upon; so did *Horses,* and *Sheep,* and *Pigs* too, but not till boiled or steamed. (Farm. Jour.) The seeds of *Grapes,* pressed and boiled, furnish a liquid very like that of *Coffee,* and much used for it in Germany. The seeds of the *Yellow Iris,* roasted, are also declared to make excellent COFFEE. The seeds of the *Forest Broom* have the same quality. Lastly, we have heard that the vapour from all baked bread has been collected into an ardent spirit, somewhat resembling gin. Thus there seems to be no end to the valuable matter which vegetables may, by art and labour, be made to yield for human use.

THE ENGLISH LANGUAGE.

WE learn from the daily and other Periodical Journals of Europe and America, the great progress of the English Language. In the French and German Courts, English Tutors and Governesses are especially employed, whilst the perusal of English publications is sought after with avidity. In Germany, Clubs have been formed for the express purpose of promoting English conversation and the diffusion of English Literature. The truth is, much of this progress may be attributed to Sir Walter Scott. He has rendered ours, an almost uni-

* We recollect that the country-people, on hearing of Elliot's method of feeding his horse, greatly persecuted him—on the plea of *cruelty to animals!*

* They bake them, and bruise them between two stones into a paste, which will keep dried until the following season.—(Voyage to Pacific.)

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

versal language. Indeed, there is no work of high rank in the modern literature of England, which is not reprinted or reprinting For a report of the progress of the English Language in this Colony, we look to the *School Commissions* of Cape Town and those in the villages of the interior. The *laws of the Colony* provide for the publication of such; and periodical reports of every system of proceedings which have matters of public concernment for their object, are of the highest importance. They are a call upon the attention of mankind—to inspect, inquire, and control on the one hand,—to support, aid, and encourage on the other. And we may rest assured, that there is something rotten in every institution or society, which does not welcome inquiry,—that rejects alike, rewards and punishments—that is, public approbation or disapprobation, for which publicity provides. In no department, perhaps, of the colonial administration, does inquiry seem to be more awanting than in that which governs or directs what are called *The Government Schools*. We earnestly recommend that portion of the *respectable* Press which we are yet privileged to enjoy, to call for information on this subject from every quarter.

A KNOWLEDGE OF NATURAL HISTORY IMPORTANT, AS A BRANCH OF EDUCATION.

The plan adopted by several continental nations, particularly the French and the Swedish, of making natural history a branch of education in the public schools, possesses many advantages over the old Gothic system, to which we still cling so pertinaceously on this side of the atlantic. To those young men who are destined to pass a great portion of their lives in regions far removed from their native land, the study of natural history affords intervals of pleasing recreation from the fatigues of professional duty. This study, aided by a knowledge of a few of the modern languages, is the surest passport to the best society. It occupies those idle hours which would otherwise lie heavy on the hands of the young, or incite, perhaps, to dangerous irregularities. It affords exercise to the mind, and frequently adds to the sum of human knowledge. It has also over every other study, this peculiar advantage, that whithersoever fortune may direct our footsteps, materials for it present themselves to our view. The pathless forest, the arid plain, the alpine rock, the desert island, tender by turns their varied and inexhaustible stores, and demand of us only exercise of body as the price at which they will furnish us with food for the mind. Even the boundless waste of ocean, which the common traveller views with an eye of apathy or apprehension, yields to the naturalist a rich harvest of amusement and instruction. A man possessed of a taste for natural history, has it in his power to amass a store of subjects, wherewith he can associate a train of agreeable recollections sufficient to afford him amusement during the remainder of his life; not to mention the pleasure he must feel in sharing his discoveries with those who have the same taste with himself, but who want the opportunity of indulging it.

PRINCIPIA RERUM NATURALIUM.

(Translated from the Latin.)

(BY PHILOCHRESTOS FOR THE LITERARY GAZETTE)

Continued from page 358, *Vol.* 2.

EXPERIENCE may be defined to be the knowledge of every thing in the world of Nature, which is capable of being received by the medium of the senses This definition is calculated to embrace every subject - whether elemental, metallic, or chymical, vegetative, or anatomical, where the mode of their sensible influence or action, *à posteriori*, can be determined by any of the faculties adapted to the perception of external objects. They may, indeed, be termed objects of the senses, and phenomena drawn from the great store-house of natural things.

Let it not, however, be imagined that this experience, or knowledge of effects, confined to one man, or even to one age, is sufficient for exploring the hidden paths of nature. No; the experience of many ages is required for success to crown the investigation. Industry must collect their gradual improvement, and thus progressively increase the store; while the vast treasury of nature lies before us, for the observation of phenomena, and elucidation by experiments, of that part of her operations which engages our research.

The sciences have now for some thousand years past been adding to our experience, and they may be said to have reached that point of excellence, when the enquiry into nature's secret and invisible operations, need no longer be deferred. For an infinity of phenomena already known, and the extant documents of so many ages will prove abundantly sufficient for an *à priori* investigation and deduction from the principles of things. We possess a considerable body of experiments, illustrative of the elements of æther, air, fire, and water, and also of the magnet; and if we reckon those which have been made in metallurgy and chemistry, where nearly all the elements are called forth, and employed for the solution, and condensation of bodies, we cannot for a moment doubt that the world at this day is sufficiently enlightened.

It does not appear that there is any occasion for that infinite variety of experiments which some deem necessary to acquire a knowledge of natural things; let them be but important, and bear directly and approximately to the point, and not diverge too obliquely and remotely from our mechanical world, and its powers. For it is to them we must owe our guidance to the first—composed, and to us general principles; thence, by means of geometry, aided by the leading phenomena, which lie in a middle path between the two, we proceed to particulars; then, by a certain concatenation, to the more simple; and thus at last the most simple, to the fountain from which, more and more modified, they have progressively diverged. The remaining mass, which are either further removed from their source, and at the same time from the simple mechanism of the world, or which are merely collateral, and not in the direction of our view, may be safely laid aside as not essential: indeed, they would tend rather to divert the mind into a contrary course, than to lead us in the grand path of our investigation. For a countless variety of phenomena could be mentioned, which are very distant from their origin, and from which no approach to their source can be elicited but through multiplied errors, and intricate wanderings. Nature, branching forth into such a variety of modifications, may be compared with the arteries and veins of the animal body; these, when nearest the common fountain, the heart, possess considerable breadth and magnitude; but are divided, in their course, into lesser and lesser ramifications, and at last into the finer capillary tubes, whose filaments can scarcely be discerned by the minutest observation. Let us then suppose a person ignorant of, and yet desirous to explore, by experiments, the fount and origin of the blood, which flows through these arteries and veins. Surely in such a case he would hardly commence in the smaller vesicles, and there institute a tedious course of dissections, to trace them in their devious progress; in so laborious a pursuit, he would most probably diverge from his track into other arteries and veins, and thus be long perplexed and misled by their numberless intricacies, before the great and regal aorta terminate the search. Nay, by such a plan, a still further source of error, and consequent removal from the heart, might arise in the section through veins into arteries, while pursuing the contrary direction. Nature may be also styled a labyrinth, whose intricacies you are anxious to explore. Fruitless would be the attempt to wander through its meandering turns, and note the dimensions of all its ways; the difficulty would but grow the more inextricable, you would pursue your footsteps in a circle; and recognize the self-same spot, when most elated by the prospect of success. But would you gain with ease, and possibly by the shortest road, the exit of the labyrinth, reject, then, the senseless wish of exploring all its turns; rather plant yourself at any intersection of its paths, strive to ascertain somewhat of its general form from the ways which you have trodden, and thus, in some degree, retrace your steps. When once you have gained the exit, a mere thread can serve to guide you through all the circuitous tracks, and to retrace your errors; but even this, after a time, you may cast aside, and wander fearlessly without it. Then, as if seated on an eminence, and at a glance surveying the scene which lies before you, how would you smile in tracing out its various breaks and contortions, which have baffled the judgment by multiplied and illusive intersections. But let us now return to the phenomena, and leave similitudes for the subject itself. By too great an accumulation of phenomena, and especially of those which are at a distance from their cause, you not only defeat the desire of scrutinizing the occult operations of nature, but plunge yourself more and more as into a labyrinth, where you are perpetually drawn aside from the end in view, and misled into a distant and contrary region. For it is possible that many things of opposite natures may exist from the same first cause; as fire and water, and air which absorbs them both. Thus a confusion arises as well from their contrary and heterogeneous natures, as from their endless variety, and a notion far too diffused and indistinct is presented to the mind. But let not that man wonder, who cannot arrive at the knowledge of mundane things, so as to reason from principles and causes, if he should be importunate, and still desirous after more, and notwithstanding the experience of so many ages, discover that he is nudy aud ignorant, when, probably, by directing his step into a different path, he had become enriched and most enlightened.

(To be continued.)

MUSIC A SUBSTITUTE FOR MEDICINE.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—I am very much obliged to your Correspondent *Dundee*, on the subject of Church Music and its abuses. I hope all parties will take the hint, and exhibit that reform which is so much required. On the small encouragement given to the musical talent of the Cape, I am also sufficiently aware. Music is of much more importance than some people imagine. Some thirty years ago, a learned German, named *Lichtenthal*, published a work, entitled "The Musical Doctor, or Maladies cured by melody." Of the practicability of the design I have not the least doubt. Apollo was the God of music and medicine, consequently there must be a natural connection between the two. Esculapius, the deity of doctors, was his son, — of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

course, his knowledge of the healing art was based on harmonious principles,—it was the science of *sharps, flats, and naturals* The mysterious alliance which connects them together is still perceptible in their nomenclature. Fevers are generally accompanied by "shakes," almost as prolonged as those of ——; and gout plays upon us "ad libitum," more impressively than Paganini. Our *organs* are as subject to injury, from damp as the best instrument of Hitchcock's manufacture; and the medical practitioner generally *beats time* in his avocations, with as much devotion as the most orthodox professor of harmony. The principal difference is, that we have the "as before" of the former, rather more frequently than the "da capo" of the latter.

Supposing the method of *Lichtenthal* were introduced into this country, I am quite certain it would be attended with the most beneficial effects. Instead of every one running to Doctor this, and Doctor that, they would hasten to Mr C——, who would be held in higher estimation than the whole school of medicine. A fracture might be set to the overture of Der Freischütz, in which the bars would perform the same office as splints; and a wound might be healed by the agency of "Le Philtre," where the chords could very effectually be applied as ligatures. Should the patient be attacked by fever, the paroxysm should be calmed by the gentle application of Mozart; if in a consumption, the frame should be invigorated by the exciting compositions of Spohr. A course of Auber and Rossini might be very advantageously administered in cases of hypochondria; and small quantities of Haydn, the Backs, &c. would cure all minor complaints to which humanity is subject. If there should be any occasion for sleeping draughts, I would recommend "The Dead March in Saul," or "The Battle of Prague," to be taken at bed-time; if a saline mixture should be required, the patient ought, by all means, to take "The Deep, Deep, Sea." Inflammatory attacks might be gradually brought down by an harmonious *diminuendo*, or general debility raised by a skilful *crescendo*. The action of the pulse should be increased by *prestissimo* passages, or lessened under the influence of the *pianissimo adagio*.

We might set at defiance all infectious disorders arising from atmospheric communication, if we could always command an "air" of our own; and the approach of cholera might be prevented by a better method than a *cordon sanitaire*.

If I had to establish a Board of Health, I would divide into districts all large towns, in which one or more of the larger-sized buildings might be set apart for the accommodation of the infected. The apartments should be well ventilated by *wind* instruments. Mr R——, in a "trumpet obligato," might superintend the operations. The patient, at his admittance, should be allowed several bar's rest; if he cannot sleep naturally, a few "minums" from some of our modern *composers* will be found very efficacious. Where any excitement prevails, I particularly recommend the patient to be kept low with solos on the double bass;—"if music is the food of love," no one will deny it to be a very light diet; and, as the order of the day is that *drams* are to be avoided—especially those of the apothecary. The orchestra must always be "instrumental" to a perfect recovery Some of our professors are partial to the use of tonics and diatonics—the former, I am aware, are in general estimation by the faculty; yet I have no doubt, that, if Byrne were to administer them in a bass-viol, the contents of all other phials would be considered "flat, stale, and unprofitable."

That music may be made to produce still more wonderful effects, no one who has read of Orpheus and Arion can for a moment doubt; I trust, therefore, that your fair readers will lay aside all fear of this bugbear of the medical world, while they are possessed of a remedy so easy of application, and "throw physic to the dogs" as only necessary to vulgar people, to whom *Beau monde* is a world unknown.

ANTI-BOLUS.

To the Editor of the Cape of Good Hope Literary Gazette.

CROSSMAN'S INTRODUCTION TO THE KNOWLEDGE OF THE CHRISTIAN RELIGION *versus* AN EPISCOPALIAN.

[TRULY attached as we are to *England's* Episcopal Church, we are sorry to find the least countenance given to any publication at variance with her doctrinal articles or the scriptural teachings of her Ushers, Taylors, Leightons, Beveridges, Cecils, Newtons, Sumners, Wilsons, and a thousand other names of "high renown and holy fame." For this reason, and with no view to engender strife or moot religious controversy; we give publicity to the following communication—which having reference to a book—must be considered as a critical notice on its contents.]

SIR,—The followiug Questions and Answers are extracted from "Crossman's Introduction to the Knowledge of the Christian Religion," a book published by the Society for promoting Christian Knowledge, and to be found in most of the National Schools. (if not all.) When such doctrines are promulgated so openly, what can we expect but that Popery or Infidelity will prevail. Your readers will perceive that they are directly opposed to the articles of the Church of England, where it is declared "That we are accounted righteous before God only for the merit of our Lord and Saviour Jesus Christ, by faith and not for our own works or deservings," *and* "that man cannot turn and prepare himself by his own natural strength and good works to faith and calling upon God. Wherefore we have no power to do good works acceptable and pleasant to God without the Grace of God preventing us," and they are no less contradictory to the whole tenor of Scripture doctrine.

"Q. Did Christ, by dying for us, obtain only the pardon of Adam's sin?

A. Yes, he obtained pardon for all the sins of mankind, *upon condition that they performed their parts of the new Covenant.*

Q. What is man's part to perform in this new Covenant, or Covenant of Grace?

A. To believe in our Lord Jesus Christ, to hope for Salvation by means of his sacrifice on the cross, to avoid sin, and to live according to his Gospel.

Q. Wherein does this second Covenant differ from the first, as to the mildness and mercy of it?

A. Whereas a perfect and unsinning obedience was expected of our first Parents upon pain of death, *we are only required to use our honest and hearty endeavours to serve God and keep his Commandments.*

Q. What if we fail in our obedience?

A. We have an Advocate with the Father, Jesus Christ the righteous, who is the propitiation for our sins; and for his sake God will accept of *our sincere repentance and constant care to do better for the time to come.*

Q. How does Baptism reconcile you to God's love and favour?

A. *By washing away the guilt of that sin wherewith we are born.*"

Your insertion of the above will very much oblige a constant reader and sincere friend.

AN EPISCOPALIAN.

LITERARY EXTRACTS.

"FANTASIA" *a-la*-HOOD.

THE project of a protegée of Mr. Hood's, put in the new "Comic Annual"—that of turning "Blank Verse into Rhyme"—has excited a considerable quantity of morning, evening, and weekly-Journal celebrity. Every shelf of every publisher in the three kingdoms will bear groaning witness to the amount of rhyme in "blank verse" that has been produced in this most poetical of all ages; but to reverse the picture, and to throw a perfume upon Paradise Lost by adding a very novel set of rhymes to it, is certainly ingenious, and worthy of the most Johnsonian days of England Here is a specimen of this new species of poetry, selected from the "Nocturnal Sketch:"—

"Now puss, while folks are in their beds, treads
leads;
And sleepers waking, grumble—'Drat that cat!'
Who in the gutter caterwauls, squalls, mauls
Some feline foe, and screams in shrill ill-will."

Another part of the sketch introduces us to some paralytic watchmen that prowl

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

"About the street, and take up Pall-Mall Sal,
Who, in her nightly jobs, robs fobs.

Whether this whimsical scheme could be brought to bear with advantage upon any of our great rhymeless poems, we leave it to a committee of taste, of which Mr. Robert Montgomery should be chairman, to decide. How would it apply to the "Seasons?"—

"Come gentle Spring! etheral hum-drum, come!"

But we shall not speculate upon the point, particularly as, although it seems difficult, it is easy as lying. We are fearful of diminishing the degree of admiration which it has excited among the critics and coteries, were we to publish the whole thirty thousand lines sent to us by a youthful correspondent; who vows that, though he is only nine years old now, he could go on inditing them till he is ninety-nine, without stopping.

Posterity, however, will no doubt excuse us for transcribing some five-and-twenty of these triple-toned lines. Our Juvenile genius is one of Mr Murray's errand-boys; we shall not give his name at present, because, if he were known to be clever, it would be fatal to his character. Aristocratic authors do not like errand-boys to be greater geniuses than themselves; and we scorn to expose him to the jealousy of Lord Leveson Gower. It will be seen that he fancies himself a sort of poetical Jack-the-giant-killer; but if, instead of slaying all the living authors, as he proposes, he should slaughter one half of them only, we shall hold it to be some atonement for his presumption.—"What stuff!" he begins,

"What stuff! at such the divine Nine pine;
And so, I'm sure it's understood, Hood should.
Why, *I* would rhyme so, till John Jones moans, groans,
Frightening to fits Haynes Bayly, gaily daily.
Nothing so easy: though the book Hook shook,
I'd beat it—nor could Mrs. Bray say nay.
I'd crop at once, like flowers, Power's hours,
And cloud with deadly stupors, Cooper's troopers.
And Scott—yes, while a rod of flames lames James,
You'd see before my altar, Walter falter;
Strangling with arms like Biffen's, Wiffen's griffins
Flat at a single stroke I'd floor poor Moore,
And maul, with puns like pokers, Croker's jokers;
Then make, with showers of attic salt, Galt halt;
And while I stop with brambles Campbell's rambles,
Lo! death, with one or two small shots, pots Watts.
I'd burn (in time all dross goes) Roscoe's Moscows,
And shoot, with well-aimed arrows, Barrow's sparrows.
Then, quick despatching Lelta, helter-skelter,
'Midst shouts of "shame," make Mrs. Gore roar more.
Driving to deep dishonoured holes Knowles, Bowles,
I'd give, like other codgers, Rogers podgers,
And put down James and Horace Smith with pith,
Scattering, like deer before the dogs, Hogg's fogs.
No more you'd hear, when 'neath a slab, Crabbe blab;
Nor heed, amidst my guerdons, Jerdan's burdens.
Mistake not, for Trueba's Shebas, Heber's;
I'd make them both, as well as Crowe, go slow;
And knock down topsy-turvey (scurvy!) Hervey.
Poems and prose by L. E. L. sell well.
But mine should of his kindest milk bilk Dilke,
And melt with music's organs Morgan's gorgons,
Then would the author of "Tremaine" gain pain,
While he, the sire of "The Disowned" (stoned) groaned.
Thus leaving to dramatic fools Poole's rules,
And making, seven nights a week, Peake squeak;
I'd crush, great trio! Moreton, Norton, Gorton,
And down fame's hill send Croly roley-poley!"

(Monthly Magazine.)

BISHOPS IN INDIA.

The Memorial of the Committee of the Church Missionary Society for Africa and the East to the Right Honorable Earl Grey, First Lord Commissioner of His Majesty's Treasury,

Humbly sheweth—that your memorialists have now, for nearly twenty-five years, been engaged in promoting the knowledge of the Christian religion in India, by means of missionaries, catechists, and schoolmasters.

That they have ever been anxious to conduct their proceedings in conformity with the doctrines and discipline of the united Church of England and Ireland.

That before the last renewal of the charter of the East-India Company, they requested the late Rev. Dr. Claudius Buchanan to urge on the public and the legislature the expediency and necessity of a general colonial establishment; in consequence of which he published his work entitled "Colonial Ecclesiastical Establishment," the first edition of which was printed and distributed, by means of your memorialists, among the members of both houses of parliament.

That your memorialists regarded with gratitude and joy the provision made in the new charter granted to the East-India Company, for enabling the crown to constitute a bishopric in India.

That they have now established missionary stations in the presidency of Bengal; in Calcutta, Culna, Burdwan, Buxar, Corruckpore, Benares, Chunar, Allahabad, Agra, Meerut, Kurnaul, and Delhi;—in the presidency of Madras; in Madras, Poonamallee, Pulicat, Mayaveram, Tinnevelly, Cotym, Allipie, Cochin, and Tellicherry;—in the presidency of Bombay; in Bandora near Bombay, and Basseen in the North Concan; in the island of Ceylon: in Cotta, Kandy, Baddagame, and Nellore

That in these stations there are now twenty-eight missionaries, who have received episcopal orders in the united church, and who are labouring to bring the heathen to embrace the Christian faith.

That there are under the charge of the Society's missionaries and catechists, within the diocese of Calcutta, upward of three hundred schools, and nearly twelve thousand scholars.

That the powers of the Bishop of Calcutta having been enlarged on the appointment of Dr. Heber to the see, the missionaries of the society in English orders were licensed by him, received under his episcopal jurisdiction, and summoned to the visitation of his clergy; which course was also pursued by Bishop James and Bishop Turner.

That in consequence of the establishment of episcopacy in India the converts connected with the society have enjoyed the advantage of the rite of confirmation, and its churches have been consecrated, while very great and valuable benefits have resulted from the visits made by the bishops to the stations of the society; their paternal counsels and exhortations, and their judicious instruction, eminently tending to promote the objects of your memorialists, and to strenghthen and confirm the missionaries in their arduous labours.

That there is reason to believe that Bishops Middleton, Heber, and Turner, oppressed by the overwhelming duties of their responsible situation, successively sacrificed their lives in the performance of duties which they were anxious conscientiously to discharge; and not only have the lives of valuable individuals been thus sacrificed, but many and serious inconveniences have arisen from the successive and protracted vacancies in the see, which have been the unavoidable consequence.

That your memorialists, persuaded that it is impracticable for any one bishop duly to superintend so vast a charge, and deeply sensible of the great advantages which their own missionaries bear testimony to having received from the personal visits of the lamented Bishops Heber and Turner, humbly and earnestly beg to represent the urgent importance of appointing more than one bishop to so immense a diocese.

By order of the Committee.

Church Missionary House,
Salisbury Square, March, 1, 1832.

AN ATTACK UPON THE CLUBS!

PART II.

(From the Monthly Magazine.)

It is flagrant that a corporation, or company of any sort, is always ten times more narrow-minded and illiberal than an individual. That which a member, in his personal capacity, would blush to propose, he scruples not to advocate on behalf of his guild. In this respect, corporate morality is about as pure as state policy; names and numbers are presumed to sanction every thing; but can any one become an agent in such dirty work without eventual contamination? Can the individual lend himself to the little cabals, intrigues, and sordid interests of the club, without distorting his own views of right and wrong, and becoming personally, as well as corporately, selfish. A regular clubbist, if he have a friend low down upon the list for admission, will not hesitate, as I am credibly informed, to black-ball all those above him, however unobjectionable, or even unknown, in order to give precedence and immediate election to the favoured party. Is it honourable, is it honest, thus to fix an unmerited stigma upon strangers, from a motive which, however it may be disguised under the veil of friendship, cannot be termed other than corrupt? It may be club-law, and common-law—but it ought not to be the law of gentlemen. These, and the thousand other tortuous finesses and manœuvrings, which the member is accustomed to practise, either for the interest of himself or his brotherhood—together with the gossiping, whispering, and backbiting to which such a system must inevitably give rise—can hardly exercise any very beneficial influence upon the heart of the participants.

But what say you, methinks I hear the reader exclaim, "to the great social advantage to be derived from these assemblages?" I say there is no such advantage—none whatever. If a man can enrol himself in a club for the sake of society, he may, with as good a chance of succeeding in that object, enlist in the army. No individual pretends to an acquaintance with the whole mob of his ballotted brethren, nor with a half, nor even with a tithe. He knows, or desires to see, but a few; and these few, dining at various hours or different tables, and frequenting the club on certain days, he can only hope to meet by some rare and for-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

tunate coincidence. But even if he knew them all, so far as the professional and exclusive clubs are concerned (and they are all, more or less, so,) his chances of pleasant companionship would only be diminished by the enlargement of his acquaintance: not because the *bores* of all sorts, who stand no chance of invitations in general society, invariably take refuge by whole droves in the different clubs—but that, by the very constitution of every such guild, its brethren must necessarily be centrifugal, rather than centripetal. If faith be due to the vulgar adage, that two of a trade can never agree, the dictum must be equally true of a thousand more, especially when thus thrown together to compare in their own minds their respective merits and advancement in their common profession. The success of the few can only have been obtained at the expense of the many; and the rivalship and envy, the heartburning and bitterness, which might have slumbered in the absence of the objects by which those feelings have been provoked, are here awakened and inflamed by their perpetual presence. It is unnecessary, however, to multiply reasons for the unsociableness of these associations, when the fact is susceptible of ocular demonstration. Let the reader cast a passing glance at any of the clubs, about the hour of dinner. He will see a very handsome hotel, and, at various separate tables, he will behold solitary feeders, or small detached parties, discussing their viands and their wines with a becoming gravity and earnestness; but he will find little companionship, little conversation, little intellectual hilarity, or none that might not have been enjoyed just as well, though not perhaps so cheaply, at a tavern. We are speaking of sociableness—not of economy. I admit the latter, but I deny the former.

If the division of the male community into grades and classes be a confessed evil, what shall we say to the wide separation of the sexes which this club-mania is daily and rapidly effecting. As this is unquestionably the most mischievous and monstrous evil of the whole system, I have reserved its exposure for the last. It will be admitted that man and woman were meant for one another, collectively as well as separately. Socially speaking, they are as naturally married to each other, in the aggregate, as are the individual husband and wife; and "whom God hath joined together let no man put asunder." The beneficial, the civilizing influences, which the sexes mutually impart and receive in society, are best to be appreciated by the deep and instant degradation which Nature, who never suffers her laws to be violated with impunity, has invariably entailed upon their disjunction. For evidence of this fact, it will be only necessary to refer to the monasteries and convents. In the society of man, the softer sex, discarding some portion of its frivolity and inherent weakness, acquires mental corroboration, and is imperceptibly imbued with the best and finest emanations of masculine character. In female society, the lord of the creation, losing the ruggedness, arrogance, and licentious coarseness of his nature, becomes softened, courteous, and refined, chastening himself with feminine graces, while he loses not a fraction of his proper manliness and dignity. Polish is the result of collision, both morally and physically; and man's iron nature is not injured, or unduly nullified, but made more useful and attractive, by coming in contact with the magnet of beauty. Acting at once as a stimulant and a restraint, the social intercourse of the two sexes draws forth and invigorates all the purifying, exalting, and delightful qualities of our common nature; while it tends to suppress, and, not seldom, to eradicate those of an opposite character. From this unrestricted communion flow the graces, the affections, the charms, the sanctities, the charities of life; and as benignant Nature ever blesses the individual who contributes to the advancement of his species, from the same source is derived our purest, most exquisite, and most enduring happiness.

From all this, our epicurean monasteries—I beg pardon—I mean our clubs—are as far removed as the nadir from the zenith. If the bachelor and the misogynist chooses to hide and wallow in these Circean dens of luxury where

"The soul grows clotted by contagion,
Imbodies and imbues, till she quite lose
The divine property of her first being"—

he may perhaps assert his independence, and claim a right to follow what pursuits he pleases; though this plea I might deny, for no man is altogether independent of others—no man belongs to himself alone, but to the community. Let the uncowled bachelor brethren, nevertheless, betake themselves to their club—let them drink—let them indulge in gross and licentious ribaldry—let them laugh at all the decencies and respectabilities of life, and more especially at marriage—let them wrangle over their sullen game of whist—let them adjourn to the gaming-table, or to the haunts of secret infamy;—all this injures and degrades themselves alone. But I lay it down as a broad, incontrovertible axiom, that no married man has a right to belong to a club, and to become an habitual absentee from his home, indulging in hoggish epicurism, while his wife and family are perhaps keeping Lent that he may afford to feast. What hath he sworn to in his marriage-oath? Merely to maintain his wife, and to make her the mother of his children? No such thing; he hath sworn to forsake all others, and to keep only unto her, until death shall part them. Is it consistent either with the letter or the spirit of this vow that he should deprive her of his society, and make a sort of concubine of his club? Is a virtuous, honourable, and accomplished wife to be treated like an impure Dalilah, into whose house her paramour sneaks in the dark, and skulks away again in the early morning? The little occasional bickerings, from which few married couples are totally exempt, nor unfrequently prove, under the soothing influences of children, and the pleasures of the domestic meal, a renewal and confirmation of love; but *now*, the sullen husband escapes to his still more sullen club; he becomes embittered by feeding upon his own angry heat; a reconciliation is rendered every day more difficult: he begins to hate his home; and his occasional absence is soon made habitual. Meanwhile, the children lose the benefit of the father's presence and example; the father, whose loss is of still more mischievous import, is deprived of all the heart-hallowing influences of his offspring; and the neglected wife, thinking herself justified in seeking from others that society which is denied to her by her husband, is exposed to temptations and dangers, from which she cannot always escape without contamination. To over-rate the conjugal and domestic misery now in actual progress, and all springing from this prolific source, would, I believe, be utterly impossible. How many married couples are there in the middling classes of society, the course of whose alienation and unhappiness might be traced out in the following order?—

HUSBAND. The club—a taste for French cooks, expensive wines, and sensual luxuries—fastidious epicurism—a dislike of the plain meals which he finds at home, although the only ones adapted to his fortune and his station—confirmed absenteeism and clubbism—hatred of the wife who reproaches him for his selfish desertion—late hours—estrangement—profligacy—misery!

WIFE. Natural resentment of neglect—reproaches—altercations—diminution of conjugal affection—dissipation, as a resource against the dullness of home—expensive habits—embarrassment—total alienation of heart—dangerous connections—infidelity—misery! Of this account-current, the items may vary either in quality or sequence, but the alpha and omega will ever be the same. It will begin with the club, and end with misery.

But is it possible, I shall perhaps be asked, that these institutions should spring up and multiply so rapidly, unless they supplied some manifest desideratum in our social system, and were adapted to some prevalent want of our common nature? Certainly not; these foundations are laid in the feelings, or rather in the vices of mankind; but let us put the saddle upon the right horse; let us not attribute them to sociableness, to a love of intellectual improvement, or to professional sympathies, with which they have no relation whatever. The clubs are, simply and solely, founded upon two of the ruling passions of the present day—*videlicet*, selfishness and sensuality—selfishness, the most heartless and intense; sensuality, the most ignoble and grovelling. What are their leading objects? Epicurism, in the least elevated acceptation of that misunderstood word—to place the greatest possible luxury, but more especially the pleasures of the palate, within reach of the lowest possible sum—to combine exclusiveness with voluptuousness—to foster, at the same moment, the love of self and the alienation from others—to remove men from their proper and natural mode of living—to enable five hundred a-year to command the state, and splendour of five thousand—to destory the taste for simple and domestic pleasures—and to substitute a longing for all the expensive and sensual enjoyments that might have gratified an ancient Sybarite. Our injurious and absurd law of promigeniture, which, in the upper classes, limits the privilege, or at least the ability, of maintaining an establishment to one son, together with our costly habits of married life, have imposed upon a large portion of society a compulsory celibacy, with all its demoralizing and heart-withering effects. This, which was already the predominant evil of our social system, the club-mania will immeasurably aggravate and enlarge. Formerly, a young man of moderate income, revolted by the annoyances of bachelorship and a tavern life, took refuge in the comforts of marriage, aspiring, in that state, to nothing beyond a plain, decent, respectable establishment. A modern Sir Epicure Mammon of the clubs, even if he have one or two thousand a-year, exclaims, with the true calculating selfishness of his order—"Zooks! I should be a loser by marrying, and having a house of my own; *here* I have splendid saloons, gorgeous furniture, numerous livery servants, French cooks, rare wines, a handsome library, all the newspapers and periodicals, none of which I could command if I were to commit matrimony, and settle out of reach of my club!" If an heiress offers, indeed—*à la bonne heure*; the same selfishness that has hitherto kept him a bachelor makes him a Benedict; but the code of the club-spoilt Sybarites allows not any alternative between celibacy and a splendid marriage.

The same conviction of their objectionable tendency, which has made me uniformly and sturdily reject all applications to become a member of these societies, has prompted me to record my opinion of them with a sincerity which may savour of harshness. That they may offer some trivial advantage, I will not pretend to deny; but that these are incalculably outweighed by their evils, I hold to be incontrovertible. Their predominance in the capital, their diffusion in the provinces, constitutes one of the very worst features of the times, so far as social manners, domestic happiness, and general morality are concerned. All abuses, however, have, luckily, a disposition to correct themselves. From the multiplication of these clubs, there is a hope that the exclusiveness will out number the excluded, when, according to the English standard of gentility, they must, of course, become vulgar. Formerly, it was deemed a distinction to belong to a club; the time is rapidly approaching when it will be held a mark of superiority and good breeding to have kept carefully aloof from them.

GREAT BRITAIN.

In whatever manner we are called upon to examine the character and circumstances of the inhabitants of Great Britain, we feel impelled to remark, that they are altogether an exceedingly peculiar people, and that they possess talents and properties possessed by no other nation under heaven—that of the great western republic, who are of British descent, always excepted. Their country is comparatively small, and its climate is inferior to that of any other in the neighbourhood, or in a large portion of Europe; yet under these disadvantages, they have contrived to place themselves at the head of the affairs of nearly the whole world, and to dictate the terms of their bargains with a confidence which certainly no other people has dared to imitate. The whole secret of all this superiority lies in their industrious habits and intelligence. They have also been much indebted to the isolation of their country for the preservation of their national character; and a genealogist might fondly trace their greatness to the happy mixture of Celtic and Gothic blood, and the amalgamation of Saxon simplicity and steadiness of character with the gallant bearing of the Normans. Besides possessing these natural advantages, they have been fortunate in the enjoyment of security of property, since the rise of the middling classes in Henry the seventh's time. If to this we add the possession of inexhaustible stores of mineral products, as iron, lead, tin, and coal, the cause is given of their extraordinary industry and opulence. The fossils which have been of the greatest benefit to the British people, are iron and coal. Without these no nation can be permanently great or independent. The iron of the Mendip Hills, Somersetshire, Derbyshire, North Wales, and Alsten in Cumberland, as well as that used at Carron in Scotland, with the coal of Northumberland, Durham, and Lancashire, have reared a mighty fabric of trade, commerce, and machinery, no where paralleled, and which it would be impossible to supersede.

The whole of England, and some of the counties in Scotland, is but one immense manufactory, sectioned into divisions, and swarming with a population whose innate skill and industry put to shame the perseverance of the ant, or the ingenious labour of the bee. Let us, for example, take a glance at this wonderful human hive. Entering England from the north, we first fall in with the great trading districts on the Tyne, covered with ship-building establishments, soaperies, glass works, potteries, iron foundries, and other works of a similar kind, connected with the coal trade and mines. In Cumberland we find manufactories of ginghams, calicoes, corduroys, and other cotton goods: sail-cloth, carpets, paper, pottery, and glass bottles. The hilly district of Westmoreland, we find, gives employment to the woollen manufactories of Kendal, and other towns in that quarter. In Durham are found extensive foundries and forges, producing anchors, mooring chains, files, edge-tools, sword blades, and all such hardware as is necessary for artificers Yorkshire comes next, and we perceive it has an extraordinary variety of manufactures. The East Riding furnishes wool in large quantities to the weavers of the West Riding, which is without exception the greatest manufacturing district in the world. The manufactures of Leeds, Wakefield, Bradford, Halifax, Huddersfield, and places adjacent, comprise broad and narrow cloths of all qualities, shalloons, calimancoes, and flannels, with every kind of woollen goods. From Sheffield, cutlery, printing types, and plated goods, are exported to all parts of the world. The knives of Sheffield have been celebrated for many centuries. West from Yorkshire lies Lancanshire, which is famed for the extent and variety of its manufactures, consisting of silk, cotton, woollen, linen, hats, stockings, pins, needles, nails, watch tools and movements, tobacco and snuff, earthenware, porcelain, paper, and many other articles. In busy scene lies Manchester—a city of cotton-mills and machinery, forming light fabrics of goods intended for the clothing of females, in every part of the globe which can be reached by merchants. Here also is manufactured an inconceivable variety of small wares, as tapes, threads, laces, &c. In the vicinity are situated the establishments for printing and dyeing the calicoes. In this district are also found manufactories of iron and copper, glass, white-lead, lamp-black, vitriolic acid, paints, &c. Liverpool is the great outlet for these products.

Proceeding down into Cheshire, we discover manufactories of silk, cotton, linen, ribbons, thread, buttons, leather, and salt. Shropshire, adjoining, has its coal, iron, and tar works, besides manufactories of garden flower pots, tobacco pipes, china, and queen's ware; also some linen and cotton manufactories. In Montgomeryshire, we find some of the best flannel manufactories in Britain. Let us retrace our steps, and view the centre of England. Here we find the stocking, silk, and lace manufactures of Nottinghamshire; the worsted, woollen, and hat manufactures of Leicestershire; the woollen, linen, cotton, silk, and polished marble manufactures of Derbyshire. The great wonder of England is the Staffordshire potteries, which occupy a central district. For ten square miles the whole land seems a series of volcanoes, as interesting, and a thousand times more profitable than those of Sicily, or the Neapolitan territories. An abundant supply of coal found here, has produced the establishment of these potteries, which give employment to an immense population, and send out Delft goods to every country. Warwickshire falls next under our notice. Here every town is celebrated for manufacturing some particular article. Birmingham is filled with manufactories of hardware, muskets, pistols, and other goods of a similar nature. In Coventry and neighbourhood, not less than sixteen thousand people are employed in making watches, which are reckoned among the best in Britain. Gloves, horn combs, hosiery, flaxen goods, and needles, are a few more of the chief Warwickshire products. Worcester is the great mart of the glove and carpet trade. Gloucestershire has its manufactories of iron, tin-plate, edge-tools, brass-wire, wire-cards, pins, and nails. On the water of Stroud are extensive manufactories of fine scarlet, blue, and black cloths; the best worsted stuffs are made at Cirencester, and stockings at Tewkesbury. In Buckinghamshire, lace and paper are the chief manufactures. In Dunstable, Bedfordshire, straw-plait is the principal source of employment. Kent has the most extensive paper-mills in the world; gunpowder, calicoes, sacking, and hop-bagging, are also made to a great extent, and the various dock yards of Deptford, Woolwich, Chatham, &c. employ numerous hands. In the southern county of Berkshire, sacking, paper, cotton, blankets, and copper, are manufactured. In Wiltshire, the finest woollens, flannels, broadcloths, kerseymeres, fustians, and gloves, predominate. Dorsetshire is celebrated for its twines, cordage, sail-cloth, nettings, and shirt-buttons; Somersetshire for its stockings, woollen cloths, coarse linen, ticks, and gloves. The metropolitan districts abound in manufactures, and in London itself almost every kind of goods is made and prepared for exportation. In all the large towns on the sea-coasts round the whole island, ship-building is carried on to a greater or less extent, and which necessarily engages a variety of local manufactures. Such is a superficial glance at the pursuits of industry in England alone (for I find I must leave Scotland to form the subject of another paper); and in these are demonstrated some of the main causes of the true glory and prosperity of the empire.

THE ENGLISH IN ITALY.

[The following somewhat overcharged description of the *economy-mania* of our countrymen, when making the grand tour, is from the pen of a Frenchman. *Of course*, we present the tirade to our readers merely as a *caricature*. How *can* it be otherwise?]

Of all civilized beings, an Englishman, I am convinced, is the least sensitive to the beauties of art,—the greatest slave to habit, the least accessible to external ideas and impressions. Take him at a morning lounge, or at the theatre—in the drawing-room or amidst ruins still you have the same air of sadness and discontent—of sullenness and ennui. This, the principal trait in his character, is indeed the only clue we have for the explanation of contradictions, otherwise unaccountable. It is a common idea, for instance, that, on the Continent, the English pay very dear for every thing. Nothing, however, is more untrue, in Switzerland and Italy at least. A traveler, in either of these countries, meets at every step with Englishmen, and very rich ones too, disputing for hours together on a matter of two francs Frequently indeed they do not rest here,—since, after giving vent to their indignation in a storm of words, they will often inscribe their troubles in pathetic imprecations, verse and prose, in the large registers, wherein travellers are accustomed to enter their names. I have known the heir to one of the highest and richest families in England vituperate, in a dozen very elegant lines, the infamous cow-herd of the Scheideck, "who had charged him an exorbitant price for his luncheon of cheese, black bread, and cream." At Lauterbrunn, I have seen a party of rich Englishmen flatly refuse to pay four francs a head at the table-d'hôte. Two hours afterwards, on my return from the cascades, they were still wrangling on the subject At Venice, I have known four Scotchmen, the poorest of whom had three thousand pounds sterling per annum, on arriving at ten o'clock at night, after a most fatiguing journey, run all over the town, from one inn to the other, in order to obtain an abatement of about twenty sous on the price of their beds for the night; and yet, in all those places, the price was regular and fixed, and such as every one was used to pay. On leaving Milan for Venice and Rome, I happened to have for my fellow-traveller a young Englishman, of otherwise engaging and elegant manners, and, as is mostly the case, extremely rich. As I spoke Italian somewhat less badly than he, the care of the accounts was confided to my keeping. The first evening came, and with it the carte: it was very moderate, and I paid it without a remark. My young English friend kept looking at me with surprise, and nodding and winking, but to little purpose. I guessed what was coming the instant we were alone. "You don't consider," said he, "we could have struck out a couple of francs at the least, with a little firmness." I declared to him once for all, that such was not *my* system. "I am aware," said I, "that it is the custom with your countrymen; but this is the calculation I make. I travel through Italy for my amusement; now there is nothing in this world I so much detest, nothing which more upsets my temper for the time, than a dispute every day with a tavernkeeper, or indeed with any person whatever. And suppose by this I lose two francs a day—that you will say is sixty francs a month—granted—and I am quite willing to sacrifice so much to my daily comfort." I then asked him how it was, that, rich as I knew him to be, and coming from London, he could yet feel annoyed at the moderate expenses of Italy. By degrees he seemed to come round to my opinion. Things now went on very smoothly till we reached Venice; but there he happened to light on some of his English acquaintance; and whenever Englishmen meet each other on their travels, their first question invariably is? "Where do you lodge? how much do you pay? As ill luck would have it, it came out on cross-examination that we were paying twenty sous more than our new acquaintance, and for his own justification my companion was obliged to explain to them my system. I was not present at the discussion, but in the evening I observed he was more pensive and silent than usual. "Tis impossible," exclaimed he at last,

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

"that we can go on being made dupes of in this way." "As you please; I willingly resign my office."—"Well, then, from Venice onwards. I take charge of expenses."—"Agreed."—Two days afterwards, at Bassano, the bill is brought. I placed it in the hands of my fellow-traveller. "*Quanto?*" he demanded, with peculiar stress on the last syllable. "*Signor, dieci lire.*" "*E troppo,*" replied my English friend, with an ominous shake of the head—"*Troppo, signor?*" and with it the Italian falls to explaining that it is impossible to keep open inn at a less price. "The houses were very high rented at Bassana—and the taxes grievous;—meat which formerly cost eight sous was now sold for twelve—fruit was beyond all price—vegetables not to be had for money;"—in short, the surprising volubility of the Italian, who proposed going down stairs to fetch him all his bills and invoices for the last twelvemonth, proved too much for my honest Englishman, who would willingly have answered every fresh assertion; but unfortunately he knew scarcely ten words of Italian, and a variety of inarticulate sounds alone testified his displeasure. At last, finding it impossible to make himself understood, "*Bene, bene,*" said he, and the bill was paid. One would think, perhaps, that this *coup-d'essai* satisfied him. By no means. Every evening the same scene was enacted; composed on the part of the landlord, of a whirlwind of arguments, protests, and lamentations, and on the part of the Englishman of three short phrases, "*Quanto?*"—"*é troppo,*"—"*bene,*" which invariably recurred in the same order, and at like intervals.

In all this, I believe, there is more, much more than the love of money. English pride, in the first place, which revolts at the very idea of being over-reached; and then, the necessity of passing away time. To expend little, has become with young Englishmen who travel, a kind of occupation—second point of honor. They recount their prowess one to the other, and hold him greatly in esteem who, at the least possible expence, has traversed the greatest possible number of miles. From whatever source this mania may arise, it is nevertheless extremely general, and may be traced through all their books of voyages and travels. Well, with the exception of a tolerable dose of splenetic rhapsody against France and Frenchmen, the history, nature, precedence, and price of the made dishes and entrées served up to the author, constitute the most interesting portion of the work. To live well, and pay little, seems to be the principal end and purpose of the journey. Just as I was leaving Palermo to explore Sicily, an Englishman, a man of good information and intelligence, was desirous of joining our party. He took an early opportunity of informing me, that two of his friends, who, in the preceding year, had passed many months in Sicily, had, previously to his departure from London, as a special favor, lent him their journal. "This journal is very instructive," added he, "and may be of infinite use to us; will you consult it" I accepted the offer with joy, and two hours afterwards I opened the precious manuscript. The following are extracts:—"1st day—From Palermo to Alicata. Stopped to breakfast at * * * They gave us six eggs, two pounds of bread, and a dozen oranges, for which we paid about one shilling. At Alicata, we had at dinner a small piece of beef, badly cooked, a salad a couple of pullets, by no means of the tenderest. Three shillings, (English). Bed, one shilling, 2nd day—Trapini. In the whole place, only a few eggs, and a little bad meat, could be mustered; they made us however pay the value of three shillings—the same price as yesterday. N.B. Much too dear." And so on to the end of the "Journal."

AN OFFER.

A young Persian, of good family, lately residing at Florence, at the Pacha's expense, was taken by Mr. H——, an English gentleman, to a rout given by Mrs. B——, whose three daughters, from their extreme loveliness, excited a great sensation. The Persian's noble features and magnificent costume did not fail to attract the admiration of these young ladies, whose eyes appeared to beam with additional lustre, when directed towards the stranger. On the following morning, the Persian paid Mr. H—— an unusually early visit, requesting him to go at once to Mrs. B——, and make a proposal for him. "I do not object," said Mr. H——, "although it is not customary to make a proposal in so precipitate a manner; but pray for *which* daughter am I to propose?" "For all *three*," was the reply, "I will give a thousand pounds for each of them, and shall send them, by the very first opportunity, as a present to the Pacha; he is a great admirer of tall, fine women, as they are rarely met with among us, and will without doubt, duly appreciate my handsome present." *(Court Journal.)*

NOTES ON MANILLA, AND ITS CIGAR MANUFACTORY.

(From the MSS. of George Bennett, Esq.)

THE city of Manilla disappointed my expectations, and had not that fine imposing appearance and commercial bustle which I had heard described. It is surrounded by strong fortifications The streets are narrow and gloomy, abounding in monastic buildings; the churches had a very heavy appearance, which is to be attributed to their being built (as well as private houses) of very thick walls, which are necessary, on account of the frequent earthquakes. The churches are fitted up in a style of great magnificence; the large cathedral of St. Peter, with its dome, had externally a very heavy appearance, without beauty or symmetry in its architecture; its interior, however is, fitted up in a manner which combined elegance with chasteness of style, being of white and gold mouldings. The altar for the celebration of high mass is tastefully decorated, and surmounted by a canopy of crimson silk.

Near the cathedral (which formed one part of the square) is the residence of the governor, which had a mean appearance, and seemed to have been two private houses united; opposite to it was the Cavildo, or town-hall; and in the centre of the square is a statute of Charles IV. of Bourbon. The new custom-house, a very prominent object in passing up the river Pasig, is an elegant building

The principal portion of the population of Manilla, reside in the suburbs, where are the offices and residences of the merchants, &c. and numerous shops, displaying an infinite variety of articles, principally kept by the Chinese. The suburbs are connected with the city by a bridge constructed of stone thrown across the Pasig; the centre arch of which, however, having been demolished by an earthquake, has since been replaced by one of wood. The streets of the suburbs are wide, but the houses have no symmetry either in their external or internal construction; the walls are built of immense thickness; the rooms are very spacious, and well calculated for the climate; according to the Spanish custom the lower part of the houses is devoted to offices, coach-houses, &c. the upper part only being inhabited by the family. The windows of the houses have fitted into them, instead of glass, small transparent oyster-shells, called *capez*, which do not reflect an unpleasant glare during the heat of the day; the shells are naturally very thin, and peel off into laminæ like talc.

The roads in the vicinity of the city are very good, and on each side are either native habitations neatly constructed of bamboo, and surrounded by gardens, in which the gay flowers of the *Santan*, (ixora Sp) displayed their scarlet tinge, or the road is overshadowed by the towering and waving bamboo.

In the evening, the inhabitants resort in their vehicles to the calçada, where may be seen the fashionables of the city. This public drive is near the city walls, and is in some parts planted on each side with the Persian almond tree. The governor (Don Ricaforte) may also usually be seen enjoying the coolness of the evening on the calçada, in his chariot and four, attended by a body-guard of mestiza (mulatto) cavalry.

The "dark-complexioned" ladies did not exhibit beauty of features, but they have fine forms and a dignified walk; their dress consists of a tunic or *camisa*, made of fine *sinamaya*, or native grass cloth, with coloured figures, and worked with much neatness; around the waist is the *saya*, or under-petticoat, which is usually a piece of cotton cloth of European or home manufacture; over this is the *tapis*, which is a piece of silk or fine cotton, wrapped round the waist, and descending to the ancles, like the *pau* of the females of the Sandwich islands, or the *cambaya* of the Malay females; their hair is of a beautiful shining black, and is permitted sometimes to fall down over the back and shoulders, or is tied in a knot at the back of the head, and ornamented by gold or silver pins; on their feet they wear a small decorated slipper, which just covers the toes, and causes them to shuffle along as they walk. Although the beauty of this class may not be striking, it is impossible to escape the piercing eye of the Spanish European ladies or their descendants, who still retain that fascination of look and manner peculiar to the fair sex of Spain.

The passage from Cavitè to Manilla can be made either in the *gilalo*, or passage-boats, or in the native boats called *bancas*. The former are very large, with outriggers, and sail with rapidity; they contain a medly of the different grades of residents at this place, and afford an opportunity to the foreigner of remarking the native character. Besides passengers, these boats carry merchandize, dried fish, and fruit for sale at the city. The latter are small boats, like canoes, and the passengers sit under a thatched awning, which affords coolness during the heat of the day; they are usually pulled by four or five men, besides a man who is at the stern and steers with a paddle.

In the streets are stalls with fruit, &c. exposed for sale, but those for the favourite native masticatory, the betel, are most numerous; the betel is prepared with chunam, tobacco, &c. ready for use. The red lips and blackened

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

teeth of the natives, both male and female, indicates the universal use of this mastic; they regard it as a good stomachic. In most of the shops either the cigar or the betel is offered to customers.

There is a restriction on foreigners visiting the interior without passports, and they are seldom or never granted for any distance:—such is Spanish policy.

On the 22d of July I accompaniod Dr. Keirulf on his professional visit to a friar of rank, at the country-house of his order some distance above the city, near the river Pasig. The governor and suite arrived soon after us, on a visit to the invalid (Padre Carlos), and I had the honour of an introduction. The friar was a well-informed man, and said he could read both English and French works, but could not venture to converse in those languages. I generally found the European friars very polite, but the half-caste padres always a vicious and impudent race.

The banks of the Pasig, beyond the city, were neither enlivened by plantations, nor decorated by villas or gardens. The bamboo most commonly adorned the banks, and occasionally native houses; abundance of the quiapo plant, with its feathered roots, floated with the stream, being brought from the lakes of the interior.

During the time our ship underwent the necessary repairs* we resided on shore, in a house belonging to a good-humoured friar, named Padre Ecclesiastica, who was one of the Dominican order. He was an obliging old man, and had his countenance partially disfigured by a severe cut down the right cheek, received in the revolt of 1822: he informed us that he was left as dead. He stated that he had been taken prisoner about the year 1807, near the straits of St. Bernardin, by the English frigate *Caroline*, when on his passage from San Blas to Manilla, and conveyed to Penang; he spoke highly of his treatment, and evinced a partiality for the English.

One of our midshipmen, when with a watering party at a river in the vicinity of Cavité, was accosted by a native woman, who asked him if he was an Englishman; on his answering in the affirmative, she brought him fruit, bread, and other refreshments; the cause of this could not be ascertained, but the natives appeared partial to the English.

There is a strict injunction on several literary works, and all books are carefully examined previous to being landed; the clandestine introduction of the works of Rousseau and Voltaire, is punishable with death.

At Cavité there is a monastery, where the priests arriving from Spain reside, to study the Indian dialects previous to their being sent into the interior.

Among several fragrant flowers used by the native women in the decoration of their hair, was the *uvaria odorata*, called *hilong hilong;* they also tie them in a corner of their handkerchiefs, which diffuses over them a delightful fragrance.

The guitar is the instrument in most general use among the natives, in imitation of the Spaniards, and they accompany the instrument with their voice in a very agreeable manner; they play the Spanish as well as their native Tagalese airs: the latter were pleasing but mournful. The flute, violin, &c. is also used amongst them.

The *siesta* is usually taken in the afternoon, and is refreshing in a sultry climate; the lost time is regained during the cool nights, when the inhabitants enjoy themselves in the verandahs, or perambulate the streets during the moonlight.

The lower class is buried without any coffin, the body being borne on a bier, with the hands and face exposed. Observing one entering the church at the village of St. Roque, I also entered, being desirous of witnessing the ceremony. The corpse was that of a native female, apparently about fifty years of age; the head was decorated with flowers, a crucifix was in the right hand; the body was placed before the altar, with lighted candles about it, and the mourners, attired in dark coloured cotton cloth covering the head, knelt and prayed for the soul of the deceased. After some time, the body was borne to the grave, stripped of its finery, and wrapped in a mat. The attendant priest chaunted some prayers, sprinkling the body with holy water; all was done in a hurried unimpressive manner, and being speedily concluded, the grave was filled up.

The straw hats manufactured by the natives are very durable; they are usually dyed of a fine black colour, and are sold at from one to twenty-five dollars. Cigar-cases are also made from a fine kind of grass, which grows on the mountains, and which is dyed of various hues.

The vegetable productions, both indigenous and exotic, are very numerous in Manilla. The mango tree bears fruit of an excellent quality and large size, and is in season from March to September. When the natives are desirous of producing a premature bearing, the following method is adopted: heaps of straw or rubbish are placed around the tree and set on fire, having been previously so placed that the smoke could ascend among the branches and leaves, which seems to bring forth the blossoms prematurely; this process is repeated for several successive days, generally taking place in the evening. A premature bearing of this fruit yields a great profit to the owners, one tree producing from 3,000 to 4,000 dollars. The *mabolo* tree *(diospyrus mabolo)* was also abundant: it attains the height of thirty or forty feet, branchy, with ovate, thick, glabrous, entire leaves of a dark green colour; the flowers are small, white, and fragrant; the fruit is large, covered externally with a rough integument of a rose-pink colour, the flesh of which is white, containing from four to eight somewhat semilunar seeds: in taste it is sickly, and has a strong and peculiar odour. The fruit is much eaten among the natives, and is in season during July and the subsequent months. The *santol* tree is also abundant; it attains the height of thirty feet, branchy, with leaves somewhat ovate, thick, entire, distinctly veined, and of a dark green colour. The fruit is about the size of a peach, of a cream colour externally, and the interior contains a glary pulp, covering several semilunar seeds. There is a species of *ficus* found growing on old walls called *isis* by the natives; it bears fruit of a dark red colour, which is eaten. The *manungy*, or *malungy*, is a handsome tree, usually seen growing about the habitations; it attains the height of twenty-five to thirty feet, but is of small circumference; the flowers grow in large clusters, white and fragrant; the fruit is leguminous, attaining the length when mature of a foot to eighteen inches; when young, they are gathered, and boiled as a vegetable. A species of *acacia*, called *camachtli* by the natives, is planted for its shade; it attains the height of thirty or forty feet, but is of small circumference; the branches are spreading and drooping, the leaves trifoliate, the flowers corymbose, with white anthers and a crimson pistil: the capsules are tortous, containing from three to six seeds of a reddish colour, which are eaten by the native children. The *atiz*, or custard apple is also abundant, as well as most of the tropical fruits.

The *cæsalpinia sappan*, the tree from which the sapan wood is produced, is abundant; it is called, in the Tagalo language, *sibaçao;* it sells from five to ten reals a picul (130 lbs.) but a mercantile gentleman informed me that the sapan wood produced on the island was not of good quality.

On the tolling of the vesper bell, all business is suspended; the pedestrians and carriages are retarded in their progress, and the deep hollow tone of the bell, the muttering of prayers, and apparent devotion that prevails among the persons around, produce a solemn effect. The prayers being finished, passengers and equipages again move on, and the bustle is resumed.

Provisions are abundant and cheap at Manilla; beef is sold at 25 lbs. for a dollar.

In the front of some of the houses, palm leaves were placed in various ornamental forms; they had been used in the processions on Palm Sunday, and were placed there as a protection against lightning. The cigar* is a constant companion among all classes at Manilla; among some of the lower orders they were so large as to fill the mouth; one I have in my possession measures six inches in circumference and twelve inches in length, and is neatly bound round with floss silk.

On the 4th of September, Mr. W. Keirulf kindly accompanied me on a visit to the royal cigar manufactory. It is situated at Binondo (in the suburbs of Manilla), and near the church of the same name. We first entered by a stone passage, close to which were the storehouses for the leaf tobacco; from this we passed into a narrow lane walled at one end, having at the other a small lodge and gate, through which persons employed in the manufacture take their departure, having previously undergone a search in the lodge by persons appointed for the purpose to prevent smuggling. On entering this lane, the heavy stone building of the manufactory was before us, and over the entrance-door were the royal arms of Spain. On entering and ascending a staircase, we came to the "receiving hall for cigars," where, on bamboo platforms, were seen the bundles of cigars ready for sale. From this hall we passed into a long room, in which the powerful smell of tobacco, and an incessant clattering of stones informed us we were in the midst of the manufacturers. In this room a great number of women were employed, and the whole number of that sex of all ages employed in the manufactory, was stated to be 4,000. The women were seated at a low table, and employed in rolling the leaf tobacco into cigars, which is effected in the following manner: the leaf is spread on the table, moistened with a little water, and then pasted over; after this it is beaten quite smooth with a round stone; another leaf is then joined to it, and, after undergoing the same process, forms the wrapper of the cigar; the small pieces of tobacco (usually the cuttings of the ends of the cigars, when cut to the requisite lengths), are then placed inside, and being rolled up, the cigar is so far completed. They are then tied into bundles, each bundle containing a certain number, and passed into the hands of other women, who cut a small piece from each end to make them of the requisite length, when they are ready for sale. The quantity of cigars manufactured must be enormous, the principal portion of which is consumed in Manilla and the neighbouring provinces. The quantity exported, a mercantile gentleman informed me, did not amount to more than the value of 100,000 dollars annually. The revenue derived by the government from this monopoly, is stated to amount to 500,000 dollars per annum. Underneath the rooms in which the women are employed, 1,000 male natives are engaged in the manufacture of small paper cigars, named *cigarillos;* they sit at tables, having enclosed before them a quantity of chopped tobacco; the paper (ready cut in the requisite sizes) is at hand for the envelopes; the necessary quantity of tobacco is then taken in one of the pieces of paper,† and rolled up, in which action the two thumbs are principally employed, and they

* Owing to her driving on shore at the island of Rotama.

* Cigars of the best quality are sold at Manilla for eighteen dollars the aroba (25 lbs.), containing about 4,000 cigars.

† By practice the persons employed will take up in the envelope only the quantity of chopped tobacco requisite for the cigar. It has been stated that from 400 to 500 are made by each person in one hour.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

are made with great rapidity. The cigarillos are tied up in bundles of thirty each, which are placed in an envelope on which the royal arms are stamped. The consumption of this kind is local; when this is considered, and that each bundle contains thirty, and that 1,000 men are constantly engaged in making them, and 4,000 women engaged in the manufacture of the cigars, some idea may be formed of the prodigious consumption of tobacco in the Philippine Islands alone.

Attached to the tobacco establishment is a guard, dressed in a blue uniform with red facings, a Chinese-formed hat covered with black horse-hair, and armed with a sword and pistols. These guards are attached to certain districts where the tobacco is grown, and purchased by government from the growers at a fixed price; and likewise—as that article is a government monopoly—to prevent smuggling or illegal sales of it. The principal tobacco districts are those of Cagayan and Gapan. The natives are only permitted to plant tobacco in certain districts appointed by government, and no plantations are permitted except under their direction; and by law every planter is obliged to deliver to the government-agents a list, in which the number of tobacco-plants under cultivation is specified, which number is at the proper season to be delivered, properly cured, to the persons appointed by the government to receive them, under a penalty of imprisonment for every plant missing from the original number stated in the list as having been planted. If, however, by accident, any of the plants should be damaged by insects or any other cause, it is the duty of the planters immediately to report it to the agents who, on proofs being produced to them, erase them from the number previously reported in the list. If the number of plants annually produced should be more than are required by the government, they are destroyed, without any remuneration being made to the cultivator.

THE PAPUAN CHILD.

MR. BENNETT thus writes respecting a female child of Papuan birth:

The Papuan race is so little known, that any thing relating to them cannot fail of being interesting. The Papuans resemble the negro race, and are distributed over a large portion of the globe from the Andaman Islands in the Bay of Bengal, and many parts of the Indian Archipelago, to New Guinea and the New Hebrides group. They have excited much curiosity and been a frequent subject of speculation amongst those who pursue the investigation of the varieties of the human race, and their origin. The questions of, from what part of Africa, and at what time, they emigrated, cannot, in the present state of our knowledge, be satisfactorily answered; our only means of solving those problems is by observing, as far as possible, the coincidences existing between the Polynesian and the African negroes in manners, customs, language, &c.

It is remarkable that but few observations have hitherto been made respecting the Papuan race. In the East-Indian islands, they inhabit generally, and I believe invariably, the mountains of the interior are savage in the extreme; and have little or no intercourse with the other tribes in their vicinity. Hence Europeans have had no opportunity of viewing them in their native state, except occasionally a solitary individual, who has been captured. The islands in the Southern Pacific Ocean, inhabited by this race, have been but very rarely visited, owing to the savage disposition of the inhabitants. From these circumstances, but few facts have been collected which will enable us to form a correct hypothesis concerning their origin. The Papuans are described as a dwarfish, puny race, deficient in mental and physical powers. We are, however, too prone to form hasty general opinions from a few instances. The first view I had of the natives of Erromanga, one of the New Hebrides group, led me to form an opinion that they were a diminutive race; but subsequent opportunities of observation corrected the opinion I had too hastily formed; as I observed stout muscular men amongst them, varying in height from five feet to five feet eight inches; while, as regarded colour, some where much darker than others. At Manilla, I had an opportunity of seeing a negro from the mountains in the interior of the Island of Luconia, and his general appearance was very similar to that of the natives of Erromanga: he was a muscular man, and his height was apparently about five feet six or seven inches. As the African tribe vary in general appearance, as well as in manners, customs, language, &c. any analogy that can be drawn between the Papuans and the African race is more likely to lead to the discovery of the particular tribe of Africa whence they originated.

This Papuan child (named Elau,) born of parents leading an unsettled life, and living in a state of the utmost barbarism, where wars are constant, where bloodshed and cannibalism prevail, and who is now receiving instruction in England, cannot fail of exciting much interest amoug those who engage in hypotheses in regard to the question whether savages are capable of mental improvements and civilization.

When adult natives have been brought to this country, experience proves that no benefit has been produced either to themselves or to us, in our commercial intercourse with their countries.

The natural mental powers of this child, although she is young, are excellent; her perception is quick and her memory retentive; she is alive to the minutest circumstance that passes under her notice, and not unfrequently drawn a comparison between her own and other countries she has visited: the sentiments of benevolence and attachment are well developed.

The child will prove a subject of great interest in deciding many disputed points; she will supply at least an opportunity (if she lives) of either confirming or negativing the various hypotheses which have been formed on the subject of education; and it is from the young mind only that we can judge of the future character. I am aware the undertaking is one of some magnitude. I feel a deep responsibility and an interest in the result; but they are lighter when I know her to be possessed of an affectionate disposition, and considerable intellectual powers.

On arriving in England, her attention was much directed towards the steam-boats, and she always distinguished them when at anchor by the "chimney and wheels." Every object called forth her admiration and delight, and there was not one that escaped her notice. She related in England circumstances which occured at Erromanga relating to the destruction of her parents, the native mode of cooking, and other customs, &c. which we had never heard her relate, or were the subjects mentioned before her on board. When orders for finery to deck her person were given in her presence, she desired to have "dress like other ladies," and a savage burst of ecstacy was expressed when she saw herself decked in gay European finery; already had she *instinctively* acquired that love of ornament found among the human race, whether civilized or barbarous, bond or free.

She could not be bribed by niceties; if hungry she readily ate any food, preferring that which was simple. Her disposition is liberal, and she will readily share with others what she has, even when unsolicited.

She retains when brought into society a high spirit of native independence. I took her one evening to the conversazione at the Royal Institution of London; although it was the first time that she had ever entered a large room, splendidly lightly and filled with company, not the slightest degree of fear was manifested; she left me, mingled with the throng, and permitted all who were attracted by her novel appearance to speak to her, and walked about looking at the articles in the room quite unconcerned. When placed on the table, she also appeared destitute of fear, and this feeling was displayed not only in this but in several other subsequent instances. She resided for a short period at the house of a lady in the vicinity of London; one of the daughters (since dead, who was devotedly attached to the child) was singing a simple pathetic ballad, which she executed with such an exquisite feeling and taste as to rivet the attention of the child, who was engaged playing about the room. Elau approached the piano, kept her eyes fixed on the fair songstress during the contiuance of the ballad, and with such effect did it act upon the feelings of the young untutored savage, that the tears tricked down her cheeks, and her countenance remained fixed on the lady until she had concluded.

The child has now been nearly ten months in England, and her disposition has not changed, whilst her mind is increasing in power under the system I have directed to be pursued. Her education will be private, in order to prevent her acquiring the habits sometimes acquired in a public school. To the various arts in which the needle is used her attention will be directed, and her education will be sufficient to make her calculated for a station in society neither beyond her means nor her hopes.

She is now residing at Plymouth, and the lady under whose charge she is placed, and who takes much interest in the orphan stranger, will cultivate her mind, instil into her precepts of moral and religious duty, and suppress thos stubborn and overbearing passions seen so often in children, and enlarge her ideas. The result will be anxiously looked for.

We concur with Mr. Bennett in thinking this experiment likely to lead to interesting results, if it be managed with care and judgment. It is to be regretted that little Elau has totally lost her native tongue; though possibly the retention of a barbarous dialect would be of little service either to herself or to science

POLITICAL ECONOMY.

Industry is promoted by the following means:—

By directing education and early habits in a manner that tends to increase bodily strength and reconcile the mind to application and perseverance:

By placing within the reach of the labourer a competent share of those enjoyments which are suitable to his station;

By affording him, at all times, an opportunity of exerting his industry to advantage;

By securing him the free possession and enjoyment of what his industry has gained;

By offering, not only a share of the enjoyments of life, but respectability and an advancement in the scale of society, as a reward for successful industry.—*Hamilton's progress of Society.*

THE BRITISH EXPEDITION TO THE CAPE OF GOOD HOPE, IN 1805.

The Landing and Battle of Blueberg, and final Capture of the Colony—Its varied Population—The Ladies—Slaves, &c.

THE following extracts from the Journal of the late Capt. Carmichael, of the 72d Regt. are now permitted to see the light. The author was distinguished for his love of Natural History, including in it the study of mankind. In 1805, the corps to which he belonged was one of those which formed the Expedition against this Colony;

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and from this period, he carefully noted whatever occurred to him that was deserving of remark,—keeping a diary, in which, from time to time, he entered such observations on men, opinions, climate, plants, &c. as might be instructive to others, or amusing to himself. The following particulars are Capt. Carmichael's own words:

The expedition under the command of Sir David Baird, which was destined to act against the Cape of Good Hope, consisted of the 24th 38th, and 83d regiments, commanded by Brigadier-General Beresford; and the 71st, 72d, and 93d, commanded by Brigadier-General Ferguson; three companies of the Royal Artillery under General Yorke; and two squadrons of the 20th Light Dragoons. To this force must be added the 59th regiment, embarked for the East Indies, which was ordered to co-operate with us in the reduction of the Cape. The naval force, commanded by Sir Home Popham, consisting of two 64 gun-ships, and one of 50 guns; two frigates, a sloop of war, and two gun-brigs.

"The expedition sailed from the Cove of Cork on the 2d day of September 1805, and, on the 4th of October, the fleet, amounting to about seventy sail, came to anchor in Funchal Roads, off the Island of Madeira. We weighed anchor again, and directed our course for St. Salvador, on the coast of Brazil, were we arrived on the 12th of November, with the loss of the Britannia Indiaman, and the King George transport, with General Yorke on board, which were wrecked on the shoal called the Racers, off Cape St. Augustine. Leaving St. Salvador on the 26th of November, we made the Cape of Good Hope on the 3d of January, 1806; and, on the evening of the 4th, the whole fleet came to an anchor in the channel, between Robin Island and the Blueberg.

"Early on the morning of the 5th of January, General Beresford's brigade made an attempt to land; but, on approaching the shore, the sea was found to break with such violence, that it was thought prudent to desist. As that part of the coast was known to be subject to a heavy surge, and the situation of the fleet was such as forbade any unnecessary delays, the Diomede, with the transports carrying the 38th regiment and General Beresford, was dispatched to Saldanha Bay, and the whole fleet would have followed next day, had not the Highland Brigade have been fortunate enough to effect a landing about six miles farther to the southward, in Sospiras Bay. The enemy's riflemen appeared lurking among the bushes, and showed a disposition to annoy us; but they were speedily dislodged by a few shots from the gun-brigs that covered our approach. The only serious accident that occurred was the loss of one of our boats, having on board about forty men of the 93d regiment, which was overset on a bank of shore weed, and every soul lost.

"The 7th of January was employed in disembarking the remainder of the troops and the field artillery. Five hundred volunteers from the ships of war and Indiamen were also landed, for the purpose of dragging the guns, a service which they performed with their accustomed enthusiasm. At four o'clock, on the morning of the 8th, we moved from the sand hills along the road that leads over the shoulder of the Blueberg. When we arrived on the crest of the hill, we perceived the enemy drawn up on the other side. Our disposition was soon made. We were formed in echellons of brigades; the left or Highland brigade, being about two hundred yards of the other. In this relative position we advanced, sometimes in line, at others in file from the heads of companies, according to the nature of the ground. We no sooner arrived within the range of the enemy's artillery, than he opened his fire on us from twenty field-pieces, which were advanced considerably in front of his line. The action, on our side, was begun by the grenadiers of the 24th regiment, sent to dislodge a body of mounted riflemen, which occupied a rising ground on our right flank. This duty the grenadiers performed with great intrepidity, but not without serious loss: Capt. Foster being killed on the spot, and fifteen men either killed or wounded.

"The line, in the mean time, continued to advance over a tract of ground where we were buried up to the middle in heath and prickly shrubs. Owing to some misconception of orders, we began firing before we had arrived within killing distance of the enemy; but this error was speedily corrected by the rapidity of our movement, which alarmed him so much, that, by the time we came within a hundred yards of his position, he began to retreat. This he effected in very good order; for, to tell the truth, we were in no condition to molest him. Fresh from the cool bracing climate of Ireland, then cooped up for five months on board of crowded transports, a march of six hours over the scorching sands of Africa, exhausted us to such a degree, that even the exhilarating sight of a flying enemy could not prevent immense numbers from escaping to the rear.

"Our force of every description in this action was about five thousand men; that of the enemy three thousand. The loss was nearly equal, being about three hundred in killed and wounded. After the engagement, we advanced as far as Riet Valley, where we received from the fleet a supply of provisions and water. Next morning we marched on towards Cape Town, and had approached within a few miles of it, when we were met by a flag of truce, demanding a cessation of hostilities for forty-eight hours, in order to arrange terms of capitulation. Sir David Baird returned for answer that they should have six hours only, and that, if the place was not surrendered at the expiration of that period, he would enter it by storm in the course of the night. This menace had the desired effect, and the 59th regiment marched in that evening and took possession of the lines. The rest of the troops lay on their arms, at the mouth of the Salt River, until three o'clock P. M. next day, at which hour the British flag was hoisted on the castle, a royal salute was fired by the ships of war, and the Highland brigade marched to Wynberg.

"We thus, without much difficulty, got possession of the capital, but Janssens was still unsubdued. After the action at Blueberg, he had retired with his whole force to the pass of Hottentot's Holland Kloof, where he designed to establish himself in such a manner as should cut off the communication of Cape Town with the interior. With a view to dislodge him from this stronghold, the Highland brigade and 59th regiment marched on the 12th to Stellenbosch, and were followed, in a few days, by Sir David Baird in person. After some preliiminary overtures between the two generals, a negociation was set on foot, which terminated in the formal cession of the whole colony to the British arms."

"The regiment being ordered to Cape Town, Captain Carmichael has time to describe its remarkable features.

"The first thing which arrests the attention of a stranger, on his arrival in Cape Town, is the wonderful diversity in the features, colour, and costume of the various descriptions of people who crowd the streets. He feels himself amazed at finding himself in a sort of Noah's Ark, where he meets with more varieties of one species than the patriarch had under his charge of the whole animal creation. Here he may see the pure spotless robe of the Hindoo rubbing against the painted kaross of the Caffre and the soot-stained sheepskin of the Hottentot; here the barefooted boor from the snow mountain stares at the polished boots of the London cockney; here he may contrast the crop of the Pennsylvanian with the pendant crown-lock of the Chinese: here the Brazilian may shake hands with the Malay, and the Guinea Negro with his brother from Madagascar. In the midst of this motley group, Europeans of every description, either as traders or prisoners of war, pass in review before him. The geographical position of the colony will account, in some measure, for the concurrence of these heterogeneous elements of population. The peculiar circumstances under which it was originally established, facilitate the emigration of people from all parts of Germany and the north of Europe. The revocation of the Edict of Nantz drove numbers of French Protestant families here for refuge; the practice of discharging soldiers in the settlement, after a certain period of service, few of whom ever returned to Europe; the extensive communication between Europe and India, in the course of which numberless adventurers were induced by hope, or forced by distress, to relinquish their prospects in the east, and settle in the colony; and, finally, the salubrity of the climate, inviting the martyrs to tropical diseases to repair hither for the re establishment of their health: such are the lights of the picture; the shades are furnished from the coasts of Africa and the Indian Archipelago.

"In a society so constructed, the manners must be as varied as the materials of which it is composed; and ages must elapse ere they can amalgamate and assume a national form. This renders the colonists peculiarly prone to adopt the customs of strangers; and as these adoptions are oftener the fruit of caprice than sound judgment, they are apt sometimes to excite a smile. Can there be conceived for iustance, a more awkward or more ludicrous object than a huge boor heaving up his ponderous shoulders in imitation of a Parisian, twisting his neck, and drawling out "Ilk wit neit," whilst his utmost endeavours cannot throw the corresponding expression into a countenance where the muscles are so deeply imbedded in blubber, that even the convulsions of death could not produce any visible derangement of features.

"No difference of ranks exists at the Cape; and, if the population be not occasionally reinforced from Europe, the distinction of colour will soon vanish. The intermixture of African with European blood can already be traced in some of the first-rate families of the colony; the hue of the skin and the lineaments of the countenance unequivocally betraying their origin. The abolition of the slave trade, and the facility with which the poorest inhabitant can, by ordinary activity and perseverance, obtain a competency, will accelerate this union, and it is probable that before two centuries shall have elapsed, all the colours will be blended in one.

"The complexion of the Cape ladies is, in general, fair, perhaps too fair. It is of that sickly delicate tint which indicates exclusion from the air and light. It is altogether deficient in the lively bloom which gentle exercise and exposure to the elements diffuse over the cheeks of the British fair. Great care is taken, while young and single, of their figures; they are accordingly then light and elegant in their form; but they are no sooner married than they begin to neglect their persons, and, by indulging in the pleasures of the table, acquire a degree of obesity that renders them objects of disgust. The habit of using vegetable acids as seasoning to every article of food, soon destroys the teeth. So universal, indeed, is this defect, that a fine set of teeth never enters as an item into the catalogue of female beauty; and the total neglect of the brush renders such as they have offensive to the sight of any person of delicacy.

"Almost every private house in Cape Town is open for the accommodation of such strangers as have occasion to take lodgings for any time in the town. This custom supersedes the use of taverns; but, as it was originally the offspring of poverty and necessity, it will fall into disuse in proportion as the inhabitants become more opulent. The town may at present be aptly compared to a large inn on a well-frequented road. The same incessant routine of arrivals and departures; the same chaotic medley of characters; and the same insatiable thirst of gain, and disregard of reputation in the manner of acquiring it, are characteristic of both.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

"I happened, some days ago, to step into one of the Venduties, or public sales, in Cape Town, where, among other *articles*, I saw three or four slaves set up to sale. This was altogether a new sight to me. I could not without pain remark the anxiety with which those poor creatures regarded the persons who were bidding for them. It seemed as if they wished to trace the character of their future master in the lineaments of his countenance, and showed indications of joy or fear, according to the opinion they had formed of his disposition.

"Among the terrible reactions produced by the slave trade, none is perhaps more merited or more evident than the dissoluteness of morals and ferocity of disposition which it creates among the people who are concerned in it. The cold-blooded calculator of profit and loss, the prime agent in this unhallowed traffic, feels its influence but in a remote and subordinate degree. It is when we cast a view on those who are placed immediately within the sphere of its action, that we perceive its deteriorating effects; their morals, their temper, their air, and their very features confessing its malignant influence. The softer sex, more especially, are transformed by it into cruel tyrants. When you mix in female society, you look in vain for that cheerful play of features which indicates a sweet disposition; in vain you listen for that harmonious tone of voice which is mellowed by the habit of associating with one's equals.

"The slaves at the Cape are composed of more various races than are to be met with in any other part of the world where the traffic in human flesh is sanctioned. The coast of Guinea, Mosambique, Madagascar, Malacca, and the islands of the east, have contributed in their turn to supply the colony; and from the intermixture of this heterogeneous group, aided by a dash of European and Hottentot blood, a mongrel race has sprung up, which exhibits an astonishing diversity of feature as well as of disposition. Of all the unadulterated race of slaves, the Malay bears the most marked character. He is cunning, active, and intelligent; but, at the same time, implacably revengeful.

"Before the British got possession of the colony, slaves convicted of capital crimes were sometimes put to the torture, because an acknowledgment of guilt, either voluntary or compulsive, was necessary to authorise the magistrate to pass sentence of death on the criminal But this inhuman practice has been abolished by the British government, and the sentence of death is executed now without any preliminary cruelties. The place of execution is at the base of the Lion's Rump, facing the Amsterdam Battery. Three pillars, erected in the form of a triangle, support as many beams placed across them, and from these beams the criminals are suspended. It was probably to a gallows of this construction that allusion is made in Schiller's play of the Robbers, in which somebody says, 'Maurice, beware of the beast that has got three legs.'"

THE IRON COLLAR.

"By the rood, Father, I mark not the drift of thy speech. Is not the deed merciful? Nay, is it not reasonable?"

This question was put by a man, apparently about the mid-day of life, who, leaning on an iron-pointed staff, his cap half pulled across his brow, his lips suddenly compressed, and his eye fixed steadfastly upon another's face, seemed as if he would snatch an answer from the simple look of him he had so earnestly addressed. The monk—for it was a son of the church from whom the speaker waited for counsel—was unmoved by the energy of the question, and with his still, passionless eye, glanced at a man, standing submissively apart, yet evidently not without a violent effort, feigning composure, nay indifference. There were three actors in the scene. The first was the master of the anxious wretch, whose fate was about to be decided. A bold open-featured man, with, it would seem, his heart in his eyes, a man of good worldly substance and of cheerful mind: a strong contrast to the monk, whose mealy features told more of the chime and the wassail-bowl, than of holy thoughts and nocturnal meditations: and, in truth, the monk was one of those who—and it were done with all secrecy—would change the rib of a canonized saint, for the fat body of a capon. He seemed expressly made to eat, drink, move slowly, talk gravely, and wear a grey gown: he fulfilled his ordinance. The third man was a slave. He looked wan and shrunk; he had a restless eye, and his lip moved with ill suppressed emotion, as he cast a side-long look at the priest. He bore about his neck the badge of his condition—an iron collar.

The speaker, vainly waiting for the answer of the monk, repeated his questions—"Is not the deed merciful? Is it not reasonable?"

The priest replied with another question, put in a tone of seeming wonder—"Why, Sir, what hath urged thee to this business? Take off the iron collar of the villain? Why, when didst thou first dream of this? Tell me the history of this strange matter?"

"I know not, Father, if it be not a thought sent from Heaven itself. It hath been with me since last spring. I was abroad early, and all things about me seemed living with a new life: the young corn shot up freshly and strongly—the air quickened the blood about my heart—all things looked of a brighter colour to me; the birds were singing in the sky and on the boughs, and I saw the hand of God working in the trees"—

"A goodly matin meditation. Well, what didst thou see next?"

"Looking round, I saw the iron collar of my serf."

"Aye, thy *lawful bondman*. Well?"

"From that moment doubts possessed me,—and I did think it but a fitting deed to take that iron badge away."

"Then thou hadst no other communion?—By my order, I did look for some angelic descent,—thou hadst no divine intelligence, then?"

"None,—but my own thoughts—none but"—

"Have a care, son—lest in the idleness of thy mind thou dost take its wanderings for high behests. I see nothing in these meditations that should call on thee to remove the badge. Why shouldst thou object to place upon thy slave that mark of which *law and custom* have given thee warranty?"

"Aye,—but in truth, Father, I begin to doubt—nay, and I date my doubt from the time of which I have spoken—the mercy, the reason of that custom; it is on this that I would have thee resolve me?"

"Speedily. And answer, my son,—se shalt thou profit. Since thou hast possessed thy lands, have they not been tilled by serfs, each with his iron collar?"

"Aye,—and for many a day before us, Father."

"Hath the earth proved stubborn and unfertile? Hath not the seed burst in the ground, though cast there by collared villains? Hath not the green blade shot up—hath it not ripened in the sun, been cut down in its fulness, and returned thee seed a hundred fold, though reaped by serfs with iron collars? Hath not all this happened?"

"Even so."

"They who take thy swine to mast—wear they not the badge?"

"Aye!"

"And yet the hogs stray not—but fatten; and when killed, are nourishing and toothsome—though tended, killed, cooked, and served by men with iron collars?"

"All this is true."

"Then wherefore move the collar?"

"Act of mere justice to him who bears it. Thy arguments are subtle, Father, but to my mind, selfish and tyrannic. I will remove the badge from his neck, and from the necks of all my bondmen."

On this, the speaker departed with his serf,—and the monk went his way, loudly prophecying the sudden dissolution of the social fabric, from the instant that the "lower orders" were relieved from iron collars.

This legend is somewhat old, but there may be curious people who even now may fit it with an application. J. D.

COBBETT ON CHURCH-GOING.

My practice always is *to go to church*, which I always do in the country, and never in town, because here, not only am I not offended by the sight of vanity and ostentation, but I have a very good opportunity of making an estimate of the *condition of the people*—(*July 12th*, 1832.)

THE EXPEDITION TO THE NIGER.

BEFORE this meets the public eye, the commercial expedition for Central Africa will have sailed from Liverpool As a jealous secrecy has (perhaps with great propriety) been preserved concerning it, we have not much to add to the accounts we have already laid before our readers. The equipment consists of the Quorra, a steam vessel of 200 tons, and another steamer of less burthen, which are expected to ascend the river as high as Boussa. Thence boats, and overland excursions, may convey our enterprising countrymen to places whither they may desire to go.

As we have formerly mentioned, this is simply a mercantile speculation, though, in unison with the enlightened spirit of the times, it purposes to combine objects of greater and more general interest. The leading feature is to introduce British manufactures into regions hitherto unknown to the civillised world; and, with traffic, to diffuse improvement of every kind of which the natives may be found susceptible. The vessels are accordingly laden with articles most acceptable to the African population; and returns of African produce are anticipated by the shippers to remunerate them even in the first instance

As we have also stated, government has nothing to do with the outfit of this expedition. Lieut. William Allen, of the Royal Navy, proceeds with it; but without rank or command, as a passenger, instructed to make surveys and observations, for which we learn he is well qualified by his scientific attainments.

Richard Lander, to whom we owe this grand geographical discovery, may, of course, be considered as the head of the party which he accompanies in his third voyage to Africa. With him is associated Mr. Laird, jun., of Liverpool, as supercargo. Mr. Laird, we understand, is an able engineer, and otherwise intelligent and well informed. Messrs. Briggs and Harris are the master and surgeon; and we presume the surgeon to be a sufficient naturalist, and especially a botanist, competent to investigate the very important branches connected with these sciences, either for philosophical or commercial results.

Altogether, we have fervent hopes respecting this design, and most heartily do we wish it success. We had almost forgot to notice that the travellers carry with them a number of copies of an address, prepared in Arabic by M. Salamé, and intended to explain the subjects of their visit to the native chiefs and kings. These are on all kinds of coloured paper; and, being adorned with pictures of the two steamboats, are likely enough to be regarded not merely as ambassadorial lettters, but as beautiful specimens of the fine arts by the sovereigns to whom they are presented.—*Lit. Gazette.*

Punishment.—A doctor and a poet quarrelled; an indifferent person was referred to to settle the dispute,—the latter made the following reply:

'You're faulty both, do penance for your crimes:
Bard, take his physic—doctor, read his rhymes.'

Laconism.—'Never apologise for shewing feeling my friend. Remember that when you do so, you apologise for truth.—(*Conturint Fleming.*)

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

SELECT NOTICES.

Our Colonies.—The *claims* of our Colonies must be regarded. They must be freed from the burden of unjust and impolitic restrictions; but they must be taught to respect the *rights* of their *coloured peasantry*, and to depend upon their own *honest* and sagaciously supplied *industry*, not upon bounties and restrictions for support.—(*Tait's Edinburgh Magazine for July.*)——*Slavery.*—The question of slavery is *not* one of pounds, shillings, and pence. If any person has a claim for compensation, it is the slave who has been over-wrought and under paid. What the holder may lose now he formerly made in exorbitant profits. Let the Planters open, as the Mexicans did, an account of debtor and creditor with the Slaves, for their respective prices, and allow them to work themselves free. As to their other sources of loss, rational retrenchment, and exchanging a gambling speculation for the rearing of more marketable produce, will soon remedy them all. (*ib*)——*Botany.*—The East India Company have presented to the Linnæan Society their magnificent Herbarium, amounting at least to 70,000 specimens——*The Church.*—On the authority of several respectable periodicals, we learn that many young men of family and fortune yet at the Universities, hesitate to take Ordination, and several Clergymen are mentioned as having seceded from the Episcopal Church.——*Toads* are so numerous in the island of Jersey, that they have furnished a nick name (*Crapaud*) for its inhabitants; while in Guernsey, not a toad is to be found, though they have frequently been imported.

Signs of the Times.—The latest London papers state that the Duke of Sussex's last Conversazione, given at his apartments in Kensington Palace, was more numerously attended by men of eminence, than any other similar meeting since the days of Sir Joseph Banks. More than a dozen members of the Episcopal Bench, including the Archbishop of Canterbury and the Bishop of London, were present.—*The Bench* — A late Judge, eminent on the Northern Circuit, having been extremely annoyed by the slovenly manner in which the Court was kept during the assizes, at length observed to the Sheriff's officers—"There has been so much noise and confusion in Court, that I could not hear a single word of the three last cases I decided."—(*John Bull.*)——*New Club.*—A new Club, (the Conservative) has been formed in London, which is to consist of a thousand members. Altogether, the incomes of 700 of the members are said to amount to upwards of seven millions annually. The leading men of this Club are the Dukes Cumberland, Gloucester, and Wellington. Among the London resident members of the Clubs are six East India Directors, a large number of West India Proprietors, three Bank Directors, and several Ship-owners.——*The Pyramids out-done.*—Herodotus mentions a bridge which was built of polished stone, adorned with the most curious sculpture, and its length *five miles*. This bridge, of which no vestige now remains, must have been the most admirable work of antiquity.——*Heidelberg Gazette.*—This paper states that above 83,000 Poles have been ordered to Siberia, that they have been deprived of their names, and designated by numbers only. The wives of a great many of the most respectable Poles have been distributed among the Russian soldiers.——*The Earl of Fife.*—The personal effects of this nobleman have been seized and sold for a debt of £425. Among the few books in possession of the Earl, were Tom Paine's works, which sold for 22*s.*——*Heidelberg, 14th May.*—Within these few days, ten large vessels have passed this place, full of Swabian families emigrating to America. They are well provided with every thing for the voyage. It is estimated that the number of German emigrants this spring, is 20,000.

Bermingham Railway.—The proposed railway from London to Birmingham, for the completion of which a bill is at present before Parliament, will be 112½ miles in length. There will be ten tunnels; but, with the exception of two, none of them will exceed a third of a mile—a distance which a railway coach will shoot in somewhat less than a minute. The entire cost will not exceed 2,400,000*l.*; the returns calculated will amount to 671,000*l.* The shares subscribed for, on which a deposit of five per cent. has been paid, amount to 1,900,000. The entire distance to Birmingham will be accomplished in five hours and a half; it now occupies twelve hours.

The Moravians.—According to a late statement of the Moravians, the total number of the brethren scattered over the earth, amounts to no more than about 16,000; nevertheless, they keep up 127 missionary establishments among the heathen, at an expense of not more than 9,000*l* per annum.

Mortality among the Great.—Within the last month (June) or six weeks, a remarkable number of eminent men have been taken from the circles of the living—Cuvier, Remusath, Perier, Lamarque, in France; Sir William Grant, Sir James Mackintosh, Jeremy Bentham, and Charles Butler, Esq., in England.

Horticulture.—The practice which is adopted at the Botanical Garden in Geneva, might be imitated with great advantage amongst ourselves. De Candolle has introduced the custom of distributing presents of plants and shrubs among two or three hundred of his fellow citizens every year, and has, in this simple way, excited a degree of attention on their parts to the general culture of their gardens, which has been attended with the most beneficial effects.

New Manufacture.—A new and beautiful manufacture has just been produced at Halifax. It is a damask, of which the ground-work is silk, and the figure is worsted. The effect is almost as good as that of silk damask wholly, yet the price is not more than one half.

Cast-Iron Roofs.—Sheet-iron coverings are now universally made use of in all new buildings in Petersburg, Moscow, &c. In case of fire no harm can happen to such a house from sparks falling on the roof. The sheets are painted on both sides once, and when fixed on the roof a second coat is given. The common is red, but green paint, it is said, will stand twice the time. Small bits or ears are introduced into the tops to nail them to the laths. The cost is about 3*d.* per foot.

Anchors.—The cost of anchors for the public service is immense: to supply the navy once only, requires a sum above 500,000*l.* Each first-rate anchor employs twenty men forty days; forty per cent. of metal is wasted in the forging; and the cost of such an anchor is 400*l.*

Query.—Is it more disagreeable to have no appetite for your dinner, or no dinner for your appetite?

CAPE OF GOOD HOPE.

NOTES OF THE MONTH.

(By Vivian.)

THE COLLOQUISTS.

A. and *B.*

A. Do you not think many are deterred from paying attention to Botany, by the Greek and Latin terms?

B. A few feeble minds may: but every man, woman, and child, hourly uses words emerging from languages far more abstruse and obscure, than the classical. A common gardener, with a little practice from a bare catalogue, will shortly remember the botanic terms as if they were English. The greatest stumbling-block is that of scientific arrangers, so often and so capriciously changing the names. I confess also, that the definitions in Natural History are sad barriers to the study of nature. Every object must be defined forsooth, by a definition. And what is the consequence? There is a description of twenty lines to explain a definition of as many words.

A. In reference to the *languages*, it affords me great pleasure that my eldest son makes such progress at the College. He learns his lessons surprisingly well. It is quite wonderful to discover his acquaintance with so many languages: I do believe he has at least some ten or a dozen grammars or catechisms.

B. So much the worse, friend *A.* Education, remember, is not a *recollection of words.*

THE OAK AND THE THISTLE.

On our way to Kirk last Sunday, we were much struck with a beautiful spring of bubbling water, which had arisen through many a stony obstacle, and was displaying itself in front of the *Lutheran Church.* This object supplied many reflections arising from scriptural recollections. It was to us a sort of third miracle; the two former being as follows: When the ground of St. George's Church was consecrated by the Bishop of Calcutta in 1829, an oak tree on the spot, paid his Lordship and the Episcopal Church a compliment by throwing out a branch with *white* leaves. This honour in favour of lawn sleeves we witnessed with our own eyes. At the same time, when the Presbyterian Kirk (St. Andrew's) was founded, the *thistles* in all the neighbourhoods of the town, bloomed two months earlier than the accustomed period. They were also more abundant and of taller growth than our botanists ever remembered. We have, by-the-bye, a little more to tell of the thistle. The late Rev. Mr. Lambert, the senior fellow of Trinity College, Cambridge, during a tour in Scotland, amused himself by endeavouring to ascertain what particular species of thistle was the prototype of the national emblem. He found the inhabitants not at all agreed on this point; and that the thistle of the seal of the Edinburgh Botanic Garden, that of the national insignia, and that of the Order of the Thistle, were apparently all different thistles; while such botanists as Mr. Lambert had opportunities of consulting on the subject could furnish no satisfactory historical clue respecting the species. The curiosity of Mr. Lambert hereupon began to subside, when it was once more excited by a bill from a silversmith, sent to his lodgings with some articles he had ordered, on the head of which bill a thistle, unlike the other thistles he had seen, was engraved as an ornament. On paying his bill, he remarked to the silversmith the dissimilarity of his thistle to those he had seen adopted in other places. The silversmith professed himself regardless of what others had adopted, maintaining that his (the *Cnicus acaúlis*) was the true Scottish thistle; and that it was proved to be so by the following narrative:—"At the time," said the silversmith, "that the Danes invaded Scotland, it was not the practice to commence an attack by night; but of this clandestine mode the Danes on one occasion resolved to avail themselves; and, to insure success, went

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

barefoot. By this means they had approached unperceived near to the Scottish camp, when a Dane, having his naked feet pricked by a thistle which he trod upon, instinctively uttered an ejaculation; and thus sounded an alarm to the Scottish soldiers, who instantly rose as one man, and slew the Danes with a great slaughter: and in commemoration of this signal service of *Cnicus acaúlis*, it was adopted into our national insignia," Soon after the king's visit to Scotland, some seeds were presented to the botanic garden at Bury St. Edmunds by a relation of the Bishop of London, who received them as seeds of the identical thistle, or kind of thistle, carried in the processions that attended on His Majesty in Scotland: these developed *Onopòrdum Acánthium*.

A FEW ILLUSTRATIONS OF POLITICAL ECONOMY.

FREE and slave labour are equally owned by the capitalist.

Where the labourer is not held as capital, the capitalist pays for labour only.

Where the labourer is held as capital, the capitalist not only pays a much higher price for an equal quantity of labour, but also for waste, negligence, and theft, on the part of the labourer.

Capital is thus sunk, which ought to be reproduced.

As the supply of slave-labour does not rise and fall with the wants of the capitalist, like that of free labour, he employs his occasional surplus on works which could be better done by brute labour or machinery.

By rejecting brute labour, he refuses facilities for convertible husbandry, and for improving the labour of his slaves by giving them animal food.

By rejecting machinery, he declines the most direct and complete method of saving labour.

Thus, again, capital is sunk which ought to be reproduced.

In order to make up for this loss of capital to slave owners, bounties and prohibitions are granted in their behalf by government; the waste committed by certain capitalists abroad, being thus paid for out of the earnings of those at home.

Sugar being the production especially protected, every thing is sacrificed by planters to the growth of sugar. The land is exhausted by perpetual cropping, the least possible portion of it is tilled for food, the slaves are worn out by overwork, and their numbers decrease in proportion to the scantiness of their food, and the oppressiveness of their toil.

When the soil is so far exhausted as to place its owner out of reach of the sugar-bounties, more food is raised, less toil is inflicted, and the slave population increases.

Legislative protection, therefore, not only taxes the people at home, but promotes ruin, misery, and death, in the protected colonies.

A free trade in sugar would banish slavery altogether, since competition must induce an economy of labour and capital; *i. e.*, a substitution of free for slave labour.

Let us see, then, what is the responsibility of the legislature in this matter.

The slave system inflicts an incalculable amount of human suffering, for the sake of making a wholesale waste of labour and capital.

Since the slave system is only supported by legislative protection, the legislature is responsible for the misery caused by direct infliction, and for the injury indirectly occasioned by the waste of labour and capital.

LATE ARRIVALS.

(NEW BOOKS ON OUR TABLE.)

I. *A Queer Book, by the Ettrick Shepherd*, 8vo.—We are sorry for Mr. Hogg in this instance. The book is simply a re-publication of odd things which we have read before in Blackwood. The author is gifted with an extraordinary fancy, but in the present instance there is a deal of rank nonsense.——II. *The Alhambra, by Geoffrey Crayon*, 2 *vols.* 8vo.—These are not the volumes we expected from the pen of the American Addison They will be very soon forgotten by every body who reads them. —III. *Gould's Century of Birds from the Himalaya Mountains.* Beautiful, beautiful—The glory of the British press.——IV *Kotzebue.* *by the English Opium Eater*, 8vo—The language in which it is written is very beautiful; the plot is deep laid,—in fact, it is intricate —— V. *Contarini Fleming*, 4 *vols.*—These volumes are said to have been written by Mr. D'Israeli, Jun. They are a sort of auto-biographical sketch between fact and fiction, in which we cannot always ascertain the boundaries where the one ceases, and the other begins. The work must not be judged of hastily. We confess that in looking it over, our opinion of its merits have frequently varied. "How delightful!" we have sometimes exclaimed "What fine thoughts!" Then, again, we have found reason to cry out—"How ridiculous!—what trash!"——VI. *The Radical, by the author of the Member.* 8vo.—Lord Chancellor Brougham is not to be sneered into insignificancy by John Galt, the novel writer. We used to think pretty well of Mr. Galt; his Scottish novels were indeed most interesting. Ever since he wrote that wretched affair *Lawrie Todd*, and took to politics, he has been a twaddler. The "*Radical*" before us is a poor creature, accountable to Mr. Galt for all the nonsense he utters. ——VII *Tait's Magazine.*— Mr. Tait, there is much ability in many parts of your new periodical; but we are sorry for your politics. "The King a superfluity in the Constitution!" Avaunt thee!——VIII. *Domestic Manners of the Americans, by Mrs. Trollope* 2 *vols.*—There are those who hate every thing American, and would dissever the ties of amity and mutual respect between the two countries. We are by no means in love with American Republicanism, yet, in fairness, we must admit that the system in *that* surprisingly improving country works well. Mrs. Trollope's book has been puffed to the skies by the Quarterly Review and similar publications. We envy not the Quarterly the castigation which he has drawn down on himself and his ally by a "Yankee" reviewer. The Fanny Wright alluded to by Trollope, is the Mary Woolstoncroft of America, a goddess of reason, lecturer of moral philosophy, a *mother*, says the Quarterly, and *not a wife*, and would-be founder of a new sect.

"We, *Americans*, as they call us here, have received another scurrilous attack in the Quarterly Review, as you will see, and doubtless hear—as it must be likely to make some little talk. One Mrs. Trollope.....has found it convenient to make an excursion of two or three years through our country, and has had the *cleverness* to make a *clever* book, 2 vols. on 'The Domestic Manners of the Americans.' The long fasting of the Quarterly having created a most voracious appetite of this particular kind, had prepared them well to pounce on the offer of such prey. And here is their first sentence: 'This is exactly the title-page we had long wished to see.'

"And who do you imagine this Mrs. Trollope is, that is in such high credit and authority with the Quarterly, and into whose fellowship and sympathies they have so cordially entered? A companion and fellow-labourer with Fanny Wright. And such are the kennels into which the Quarterly Reviewers stoop to descend, that they may rake up and gather materials for abusing a community, which they have resolved, in despite of all evidence, and pledged themselves, to hate and persecute.

"And really what apology can be found for such an ungracious assault, sustained by such authority, at this particular juncture? It would seem at first glance to be wanton; a mere love of dealing in scandal; a malice, or at least an ill humour, so highly charged with unhappy ingredients, as to be utterly blind to reputation in the choice and employment of the instruments of its gratification. For surely, nothing could have been more unworthy, or more disreputable, than the selection of such authority."

IX. *Six Months in America, by G. T. Vigne, Esq. of Lincoln's Inn*, 2 *vols.* 8vo—A work which puts forth, as we imagine, no exaggerated accounts of *American freedom*, but a plain and simple statement of matters that came under the author's observation.——X. *History of the Peninsular War, by R. Southey, Esq. LL.D.*—The third and last volume, with details of British valour and heroism. The book ends with the words LAUS DEO, after the manner usual amongst our old monkish chroniclers. But it is much to be lamented, that the writer who can command these words so freely, and who has introduced the name of the Deity in almost every page of his voluminous work, should occasionally have indulged in language which breathes very little of that 'good will' of which he speaks, towards those men who have differed with him in political views. For instance—"impious," "accursed," "savage," "ferocious," "sinister," "self interested," "nefarious," "mischievous," "factious," "seditious," "rancorous."

POETRY.

THE following impromptu lines by Coleridge, have been kindly presented to us in the handwriting of their Author.—ED.

GOD OMNIPRESENT.

My Maker! of thy Power the trace
In every creature's form and face,
The wond'ring Soul surveys!
Thy wisdom, infinite above
Seraphic thought, a Father's love
As infinite displays.

Thou mad'st, then fillest, Earth and Air,
Yet didst the lisper, Man, declare
The whole Earth's voice and mind!
O! let us still with heedful heart,
Lord! even as Thou all present art,
Thy presence know and find!

Then come what will of weal or woe,
Joy's bosom-spring shall steady flow:
For tho' 'tis Heaven thy Self to see,
Where but Thy *Shadow falls, Grief cannot be!*

S. T. COLERIDGE.

Sunday, 19*th June*, 1814.

CORRESPONDENCE.

'*A Friend without Guile*,' is thanked by *Orlando* for the favour of his interesting communication. As the *Lectures on Natural Philosophy* now in progress are intended (at the request of several talented individuals) to form, when completed, a small pocket volume, with notes, additions, and emendations; the one or two typographical errors which have been *kindly* pointed out, will of course meet with correction. *Orlando* will be most thankful for any assistance in the way of criticism or otherwise, which may be transmitted to him through the publisher of the *Literary Gazette*,—trusting, at the same time, that the spirit of fairness and candour, similar to the one now under acknowledgment, may accompany such communication.

Hannah is *not* original. It is the production of James Montgomery, and was published in his Wanderer of Switzerland some years since.

"*Some additional particulars*" in reference to a late public dinner, are not in unison with the objects of this Journal.

So far from the Lectures on Natural Philosophy by *Orlando*, being an emanation from *The South African College*, we can assure *An Inquirer* that no single communication has appeared in this Journal from the source suspected. This explanation is due to several of our valuable contributors—apart from the "Wisdom of the Schools."

LECTURES
ON NATURAL PHILOSOPHY.

LECTURE IV.—BY ORLANDO.*

[OUTLINES OF SOME OF THE CHIEF PRINCIPLES AND PROPERTIES OF THE ORGANIZATION AND SYSTEM OF THE VEGETABLE CREATION.]

GENTLEMEN!—The command for the rise of the Vegetable Kingdom presents them to us in the three natural divisions of — the GRASSES, the HERBS, and the TREES: and it extended to ordain their appearing with their reproductive powers for the formation of their seeds and fruits, in order to provide for their perpetuation on earth in an unfailing succession, without any new creation. (1) Let us review some of the main features that were selected and adopted to mark and constitute the system for that peculiar order of living things, which the vegetable tribes display.

All vegetables, in every region, and of all sorts, from the most minute to the most towering, possess, in common with all animals and with the human race—organization; an interior power of progressive growth; a principle of life with many phenomena that resemble irratibility, excitability, and susceptibility; and a self reproductive and multiplying faculty. In these qualities, they are distinguished from inorganic and earthly matter, and from all fluids and gases; and by these are raised high in the scale of being above them. In these they resemble all animated nature, and our prouder selves. We may dislike such a relationship; but to this extent our bodily frame and functions establish a natural kinship between us. They are very humble cousins, but we cannot destroy the organical and living affinity, nor escape the closing assimilation. We decline and die as they do: and they sicken, fade, decay, and die, like every human being. There is also another analogy. Their substance nourishes us, and ours not unfrequently becomes a part of theirs. They can feed on us, as we more continually and universally do on them. All living nature is linked together by actual connection, if not by perceivable sympathies.

An organized being is a peculiar conception and fabrication of the Divine Mind. And vegetables have been caused to be organized beings of definite figures, diversified from each other into distinct classes and species. To form a correct idea of what an organized being is, you may observe, that in human mechanism we have an imitation and an analogy of vegetable and animal organization, which enables us more fully to understand it, and to perceive how it has originated. Neither watches, cotton mills, nor steam-engines grow; they must be made by human hands, under the direction of a designing thought and will; and this mode of their fabrication discovers to us how all similar things, whose forming agents we have not seen at work, and therefore, how all natural organizations, whose principles of construction are the same, and of which they are in perfect similitude, must have been made.

All mechanism, from the pair of tongs, or the snuffers, to the windmill, the ship, and the manufacturing machines, consist of pieces or particles of matter, taken out of their natural and preceding state, and put into a peculiar arrangement in due relation to each other; so that, from this specific combination, the action of the completed thing may produce the effect intended by its planning, adjusting, and commanding maker. Recollect, Gentlemen! that the plant and the animal, and the human being are, in their structure, material machines. They are so many mechanized substances, consisting of parts that have been put together from some other state into designed and adapted arrangements; and by their artificial and special construction, they each possess and exert powers which thence arise, and produce the phenomena which it was intended to effect. Nothing but human workmanship and skill will account for human mechanism. No metal in the mine could by any chance move itself into the wheels and springs, and parts and adjustment which constitute a watch, or an organ; and begin marking time or playing a melody. So nothing but Divine agency and intelligence will explain the manner in which the inert particles of things become combined originally into vegetable or animal organizations; because all other known agencies are known to be utterly incompetent to such effects. In neither human or Divine mechanisms do the parts of which they consist, tend in themselves to be what they are, or to do what they do. Iron has no tendency to be a hammer or a chain; nor brass to be in a clock or cannon, or in a telescope, or in a piano-forte. So none of the particles that constitute plants have any natural tendency to be a carnation, an apple, or an acorn, nor to form animal flesh, to be wings, feathers, feet, or fins. But to our more immediate subject.

Without affirming a plant to be a real animal, as some of the Grecian philosophers imagined, (2) we shall best understand its true nature and construction, by considering it as an animal in the principle of its systematic form; but without being sentient or intelligent; and differing also in one

* Delivered before the Members of the Poker Club.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

essential point in the matter of its composition. They are distinguished also by another general peculiarity in their material nature. Animal bodies seem, by some interior though yet unknown process, to produce lime, (3) —plants never; but these, as their appropriate function, appear to generate carbon instead. (4) The absence of any intellectual quality makes their principle of life to be very dissimilar to, or at least very distinct from, that of animals. (5)

Most vegetables have an upright body with vessels ascending and communicating with each other, as in us, but with *sap* instead of *blood;* with *wooden fibres* instead of *bones;* with *pith* instead of *brain* and *nerve;* with *bark* or *rind* instead of *skin* or *hide.* (6) Their leaves imbibe air, as we breathe it, and also light and moisture; and in their continual motion answer the purposes of our respiration and exercise. They also imbibe and expire an aërial fluid, as we do, though with this difference -that they emit oxygen gas, under the influence of the solar rays, while animals absorb and retain it. They require food as we do, but their roots are their mouths. They have not, like quadrupeds, a particular stomach and arrangements for its digestion; but like some of the lower animals, they have a power of assimilating and converting what they take into their own substance, without these functions. (7) But all vegetables are fixed in their place of growth; they have no locomotive power. Where they are born they live and die. * * * The seed contains the embryo plant in the little corculum, which all, on being carefully opened, display. It is familiarly called the heart of the walnut—the little figure at one end of all nuts and kernels. Vessels extend from this to the substance in which it lies, which has received the name of Cotyledon. If this be single, as in the grasses and corn, it is a mono-cotyledon seed and plant; if, as in the larger herbs and trees it consists of two lobes, they are called di-cotyledons; if no such are discernable at all, they are termed acotyledon plants, which in some, and perhaps in most countries, are the most numerous. All plants consist of two substances, vessels and cellular tissue. In general language, what is not one, may be deemed the other. * * * Nothing is more curious in nature than the persevering efforts made by the living principle in plants to force their radicle downwards; whatever efforts are made to give it another direction, are constantly baffled by the growing power, which knows where its nutrition lies, and will go nightly to seek it. No animal can display a more persisting volition. Earth is not so essential to vegetable growth as moisture; for even trees will grow in water only. (8) Earth is but the bed in which the vegetable nutriment is best prepared and presented to the absorbing roots. This is now stated to be an oxyde of carbon or humic acid, made by a chemical union with the water, and which forms that humous or soil that most occasions or promotes vegetation. (9) When the plant develops in the befitting soil, the roots nourish it from below, and the leaves above contribute also their auxiliary supplies. (10) Buds emerge in due time from the stem or branches, each of which may be considered as a new vegetable, growing from its parent, but living in unseperating union with it, yet only in close association, for it seeks its own independent nurture by its distinct, though strictly combined root (11) Plants with few and small leaves depend chiefly on the soil. Those with many and large ones, more on the atmosphere. But some can find nutriment and grow, even from animals. Thus certain cryptogamic plants have been found vegetating on living wasps in the West Indies. (12) This curious fact has been noticed elsewhere. They will even grow in the stomach of living animals; for several instances of this have occurred, in which the force of vegetation has prevailed over the animal's digestive power; at least in those who were entirely carnivorous. (13) Warmth and moisture usually commence the process of germination as soon as they concur to the seed; but if the due means for the further nutriment do not accompany the growth, the process stops, and the plant soon dies The main fluid in vegetables is the sap. It is really the blood of the plant, by which the whole body is nourished, and from which the peculiar secretions are made.

Light represses the evolution of the seed, but is essential to the production of the florification and fruit; yet, as if to shew us that all things are but what they are, specifically organized and actuated to be, and never are the chance productions of blind necessity, there is one which has been so formed, as to flower *only* in the dark—-the night-flowering Cereus. But all such exceptions in nature are never casual, but always arise from a peculiarity of structure, which is adapted to cause the particular result, and which is always constant in the species in which it occurs.—Plants grow most in the night; at noon, all increase is suspended. Between morning and noon. aud evening, it is but small. But flowers advance more in the day, and especially in the meridian light and heat.

It is not merely in their principles and analogies of construction, nutrition and growth, that plants resemble animals; but the creating Hand has linked and established the affinity between them, by causing some vegetables to produce animal products, and to be as it were, the animals whose peculiar properties they imitate. Thus their living principle in peculiar and adapted organizations, can imitate the *bee*, the *cow*, and the *sheep;* for the Myrica Pennsylvanica yields an annual supply of vegetable *wax;* (14) the Palo de Vaca, in South America, gives a copious emission of actual *milk;* (15) and another tree, in Guayaquil, produces a fine *wool;* (16) while one in China secretes a *Tallow*, like animal *fat.* (17) The Tillandria of Buenos Ayres, resembles another element, in becoming a kind of vegetable fountain, for it yields on incision, a copious quantity of pure water. (18) They have even some relations, yet unexplored, with the mineral kingdom; for they not only form the carbon they contain, but some have been found to have copper particles, and several to secrete flint, and likewise sulphur, as in our common corn. We may add iron and gold also, for both of these metals have been found in vegetables, and more especially the former Thus all the departments of Nature have been made with mutual associations; the material causes and references of which we have not yet explored.

The *food* of plants peculiarly distinguishes them from animals. While these subsist only on what has been organic matter, vegetables derive their nourishment from that which is inorganic, as mere earths, salts, water, or the gases. The particles of these become arranged in them, by the agency of their living principle, into organized substances, and by this mysterious process are fitted for animal nutrition. The vessels of vegetables are so fine in their radicles and leaves, and in the smaller plants that the particles which they im-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

bibe must be in the most attenuated state. They are injured like animals, by too great supply of what they feed on; and hence many plants decline or perish on too rich a soil. Each will grow only on that kind of ground which suits its organs or appointed functions. The kindred nature of all plants is surprisingly shown by the power and effect of their growing and fructifying when GRAFTED on each other—one organization attaching to that of another, and feeding on its sap. The Ancients took some pleasure in these experiments, for Plutarch saw and notices, in a garden on the Cephissus, an olive upon a juniper, a peach upon a myrtle, pears upon an oak, apples on a plane tree, and mulberries upon a fig. In Hollaud, a rose was grafted on an orange tree; and in our times, carnations have been engrafted on fennel, and a peach upon a mulberry. Such facts prove the absolute similarity in nature of the different classes of the vegetable kingdom. Their general system and principle of life are the same. It is the specific and purposed variation of their organization, which, from material elements, causes the specific diversities of their products to appear. No result is a random accident.

Plants have been manifestly designed and framed on the principle of *improvability*. I trust that this observation will not be thrown away, for it is of great importance to our Settlers in this colony. This faculty in plants to improve, is truly wonderful—it is one of the greatest distinctions of man. Animals have it to a certain degree, but very limited, and apparently far less than vegetables. Very agreeable, but surprising transformations have arisen from this property. The rose is the product of cultivation. The original plant, from which all our beautiful varieties have proceeded, is considered by Botanists, to be the common wild brier. Our Plums are the cultivated descendants of the sloe; the peach and nectarines, of the common almond tree; filberts are the improvments of the wild hazle; the delicious apples, whose species may now be reckoned by hundreds, are the cultivated successors of the small austere crabs and wildings, which swine will scarcely eat; the original pear is a petty fruit—hard and crude. Our corn was once in a state very like grass; our cauliflowers, cabbages, and other domestic vegetables, are the artificial products of human skill and of vegetable improvability.

It is this undiminishable and undecaying property in plants, which may rescue our country from that chimerical dread of a superabundant population of the Earth, under which we have been labouring for the last thirty years, until Mr. Sadler's tables, calculations, and reasonings, have at last rescued us from it. A great mistake has been prevailing on this subject. The true law of nature was misconceived. Partial effects were taken to be the general rule, and the real agency greatly overrated; and thereby an imaginary law has been assumed, which has never operated as was alleged. In nature, the law of population has never exceeded that of the productive power, and never will. Cultivated produce has hitherto outrun population in every country, and there is every appearance that it will always do so. Ordinary, but diligent exertions have hitherto abundantly sufficed for all that has been needed. (19) The vast abundance of seeds which an animating causality is every where producing in many plants, is another specimen that this energy, and the obedient organization in which it is subsisting, have been both formed with a capacity of enlarging into a productability, whose limits we cannot fix, (20) and into a magnitude that sounds romantic. (21) In the alimentary plants, the great care for providing an ever succeeding sufficiency of human subsistence is manifested in all regions. In some, the same tree which affords it, bears the produce of different seasons on its branches. (22) This phenomena is occasionally, though imperfectly, manifested in Great Britain, and on her common trees; thereby indicating such extraordinary successions of produce, by increasing skill and cultivation. In this wonderful colony, whenever this skill and this industry shall be put forth, it would seem that all-bountiful Nature hath in store for such exertions—"good measure, pressing down, and running over." But the fact has been, that nature has always, under the smallest exertion of human thought and labour, produced so much more than society has wanted, in her vegetable food, that no art has been less studied, until lately, than that of agriculture, and none so little improved. No stimulus has been great enough to urge mankind to watch, and try, and pursue it with the diligence and scrutinizing judgment, which have so highly advanced the mechanic arts, and effected such wonders in the sciences. Even still many tribes chuse to be content with nature's spontaneous produce, which is always scanty, as if to *compel* our *industry* to exert itself; although the living principle implanted in vegetation is quite ready to answer any demands that may be made on its productive powers, by any augmentation of human population. It only requires that human art and industry should be increased in this branch of our necessities, as much as they are in the less essential one of our luxuries; and then its supplies will never be inferior to the need. This hath hitherto always occurred in some degree. *Want* has *stimulated* the *mind*, in our northen climates; and the superiority of the population, sustenance, and comfort, is visible to every observer. Enlarging numbers only magnify the effect; for mankind seem to thrive and civilize in proportion as they multiply; and, by a recurrent action, to multiply again in proportion as they civilize and prosper.

Gentlemen! I have, as I am aware, merged into the subject of Political Economy—but this great question seemed to require some slight reference in the course of our present discussion. It is, perhaps, entirely owing to the neglect of this important study, that we advance so feebly in this colony. Hence the supplies of Nature are limited, there is a chain put upon human industry by monopolies of every description, by the adoption of slave labour instead of free, and by that greedy *dog-and-the manger* system which allows a very large number of the farmers to occupy immense tracts of the best lands, without the possibility on their parts, of bringing such into extensive use: and, indeed, did the possibilty exist, the love of monopoly and of a *fixed price*, would induce many I fear, to supply the market with no more than would *keep up* the old prices. But, gentlemen, we leave the *particulars* of this branch of science for the present, and in conclusion, observe as the *moral* of this evening's lecture—that no population that will *think*, and *labour*, however numerous, can ever starve from continued want, under the present system of vegetable nature. The Great Author may chuse, through his atmospherical agencies, to disappoint, by occasional vicissitudes, the expectations of his intelligent creatures, when they are forgetting the primal Cause and Giver of all that they are enjoying—but these are only temporary and partial corrections. Away, then, with all the dread and spectres of human starvation from multiplied population. Let Religion improve and guide our social spirit; let wisdom characterize our Laws, and integrity conduct their administration: let enlightened policy and sound moral principle superintend, and regulate, and assist the distribution, and individual acquisition and application of what nature will always

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

sufficiently produce generally for all; let reasonable diligence and care have always the means of obtaining what is fairly needed; and let Nations have intercourse with each other as unrestricted as the public welfare will allow; and let *us*, as colonists, no longer *covet our neighbour*—whether Hottentot, Bushman, or Caffre,—but rather let us work with our own hands, assisted by our sons and daughters. And lastly, let due recollections of the Great Benefactor of All, accompany these provisions with our daily life; and no portion of mankind will ever find that they are overpassing the productivity of nature, nor will ever be destroyed by its defective supply. Dryden exclaims of himself,—

'I live a rent-charge upon Providence;'

So do we all—but if we duly *feel* this truth, and conduct ourselves conformably to the impression, we shall find that it is such a rent-charge as will never be left in arrear, but be always punctually and munificently discharged. Such has been my personal experience, without any native, peculiar, or other advantages, beyond those which are common to us all. Such, I hope, will be yours; and such your verdict, my young friends, when youth shall have advanced to manhood, maturity, or old age.

NOTES.

(2) Plutarch remarks, that Plato, Anaxagoras, and Democritus, thought vegetables to be earthly animals.
(3) Dr. Macculloch.
(4) *Ib.*
(5) Haller.
(6) Linnæus thought the *pith* to be the seat of life and source of vegetation.
(7) Smith. Sir J.
(8) Du Hamel reared in water, plants of the horse-chesnut and almond to some considerable size, and an oak till it was eight years old.
(9) Dr. Sprengel.
(10) That the leaves nourish the bark appears from Mr. Knight's experiments; when he reduced the number of leaves in a shoot, the bark became shrivelled and dry. Phil. Trans. 1801.
(11) M. Poiteau remarks, that a tree or plant is not a simple individual. It is an union of universally independent plants, arising each from a bud. He shews that the woody fibres are the roots of the buds.
(12) Mr. Ricord, in Guadalope, saw many wasps laden with these parasitical excrescences, which had taken root on their sternum.
(13) Thus of three Gneiss pebbles taken out of a cod's stomach, on one, a plant of the fucus kind, of a deep green was found, growing in active vegetation and nearly two feet long; on the other, a plant two-thirds shorter was growing; and another was attached to it about three inches long.
(14) Humboldt mentions a Palm, the trunk of which was covered with vegetable wax, which the natives of S. America employed for their tapers.
(15) Humboldt found this wonderful tree in Venezula, and Lockart met with many in Carraccas. Smith saw it on the river Demerary. Humboldt describes it as a handsome tree, resembling the broad leaved Star-apple. The milk flows from the tree copiously at sun-rise, when the natives take their bowls to the tree to milk it.
(16) Ceibo Wool is the product of a very high and tufted tree. Its filiments are so fine, that the natives think it cannot be spun, and only use it to fill mattresses. (Ulloa's Voy. to New Spain.)
(17) This has been lately introduced in the Mauritius and successfully cultivated. The tallow obtained from it is stated to be equal to that which is melted from our Cape sheep.
(18) It is a genus of Hexand. Monog. like an aloe. It yields a quantity of pure water, so good, that the woodmen of the forests never take any with them. (Andrew's Journey.)
(19) Thus Humboldt found the natural produce of Wheat in different countries, with all the carelessness of their indifferent cultivation to be—In Germany and Poland, 5 or 6 for 1; in Hungary, 8 or 10; and La Plata 12; in North Mexico 16; in the equinoxial Mexico 24; in New Grenada, 25; and in fertile years 35. So in Greece, it is 12 for 1, and on the best soils, even 15 or 18.
On Cape Wheat, 50 grains produced 4.074, or 80 for one!
(20) The two stamina of the Orchides fecundate 8000 seeds; and the five of the Tobacco 900. Mr. Hobson found that a plant of the common Malva Sylvatica, yielded in one summer 200,000 seeds. It has been computed, that if all the successive seeds of a single fern, of one peculiar sort where to germinate without obstacle, this species would in 20 years cover the whole globe. —(Bull Univ. 1829. p. 438.)
(21) Man, improving on nature, produces cabbages, and turnips of *half a hundred weight*, and apples of one pound and a half. (*Louden*, 263.) We also read of a strawberry 7 inches round, a lettuce weighing 4½ lbs.—a bunch of grapes weighing 15 lbs.—a mushroom about a yard round—and a pear of 2 lbs weight—a black currant 2½ inches round—a gooseberry 3½ inches—a melon weighing 18 lbs.—a cauliflower nearly 16 lbs.
(22) The Bread Fruit tree in *Tahiti*, produces three and sometimes four crops a year, and many hundreds of fruit at a time. (Ellis.)

RURAL RIDES.

A VISIT TO, AND SKETCH OF, "SIR LOWRY'S PASS,"

HOTTENTOT'S HOLLAND.

"One of the pleasantest things in the world," says Hazlitt—poor Hazlitt!—"is going a journey; but I like to go by myself." To the first declaration we subscribe *simpliciter;* to the second we beg leave to enter our protest, or at least to propound some exceptions. In all pedestrian or equestrian excursions, from the time that our first sire and his consort

'Through Eden took their solitary way,'

down to the time when Wordsworth, dear delightful Wordsworth, and his philosophic Pedlar, paced the dales of Westmoreland,

'With no appendage but a staff,
The prized memorial of relinquish'd toils,'

the company of a friend has been held to impart a delightful zest to all rural wanderings, reveries, and adventures. *It is not good for Man to be alone.* Man is essentially a social animal; and, in travelling, he does not surely change his nature. To stop and chat, and wonder at the ravages of time,—to bivouac or *uitspan* by the way,—to compare notes on the varying phases of men and things,—to moralize in concert by the side of some ravine, and suggest hydraulic plans for raising up the water courses at its base,—to devise ways and means for creating roads o'er beds of sand,—to wish for the sylvan bower in the desert,—the little inn by the way side,—rural cottages and rosy children,—the smithy,—the church, and the school. To travel thus in social joy and union, and with reflected pleasure, is well worth, even for one day's journey, all the secret lofty imaginations which the heart of man poetical, bound on solitary inquest, can conceive. But are these awakenings of the inner man—the overflowing of the *divinus afflatus*—necessarily excluded by such companionship? Certainly not. No two friends travelling together are always cheek by jowl, or talking incessantly. Gibbon studied Horace while marching with the Hampshire militia. Byron and Hobhouse, we are told, were sometimes a mile asunder when in Greece; and even Dr. Johnson and his bride, sought devious and different tracts while journeying to the altar. Each wanderer has leisure to pursue unmolested the current of his own thoughts; pauses and intervals of expressive silence will intervene, while either is "i'the vein;" and these self communings over—the spirit of romance being exercised—both resume their wont and friendly converse. But we must not moralize too largely. The architect who would erect a huge portico to a small structure, would justly be proscribed by the Dilettanti Society, and we are reminded of the similitude. To the question then. Gentle reader! your are taking a journey with us to visit the improvements at Hottentot's Holland Kloof—now called, and with a great deal of propriety too,

SIR LOWRY'S PASS.

And all this introductory matter has been suggested by a recent travel to this grand display of British Colonial Enterprise. This Kloof has figured for some two or three half centuries past as the stupendous portal to the interior of the Cape Colony. It has been famous in *the chapter of accidents*, and heart-breaking to the farmer and traveller. Just think for a moment, sirs, that when the Rev. Mr. La Trobe visited this Colony in 1815, twenty-four oxen were unable to draw the worthy gentleman and suite over this

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

terrific mountain pass. It was with difficulty that fifty-four oxen accomplished the business of dragging a couple of loaded wagons! Now, how easy and pleasant is the task! Half-a-dozen being able to accomplish the business. From an intimate acquaintance with this Pass in 1825 and 1827, as well as the one contiguous, (the Great Hawe Hoek,) our visit on the present occasion did most agreeably excite our admiration, wonder, and gratitude. We are totally unable to express all the delight we felt in crossing to and fro these now agreeable mountain passes, and the pleasure we experienced in witnessing the *heavy laden* traveller enjoy a similar, but more chastened triumph with ourselves. The task of more minute description is left to a kind correspondent who has been pleased to favour us with some of the localities of Sir Lowry's Pass. Before we transcribe these, we must indulge after our favourite manner in a few reflections.

During our visit to this Pass, and contemplating our passage through the stupendous rocks, we thought of Hannibal, and his alleged method of making roads by decomposing rocks with vinegar. It has been very sagely observed that the story cannot be true, because it would have required a whole ocean of acid. To get rid of the difficulty, it has been conjectured that the vinegar implied the *posca*, or drink given to the soldiers, to animate them in their labour. The excellent author of *Theron and Aspasio*, (Hervey,) conjectures, (and with much propriety, we think,) that *perseverance* was the vinegar which assisted Hannibal in his famous march from the Rhone to the Alps. But let us just glance at the page of history, in reference to this subject. It may be the means of awakening the dormant susceptibilities of some of our Cape students.

According to Livy, Hannibal was obstructed in his road by a huge rock, which he had no means of avoiding ("per quam unam via esse poterat," says Livy.) He therefore cut down trees, laid them in heaps on and about the rock, and set them on fire, that the rock might either split into fragments, or be more easily broken by the soldiers' tools. Pliny, knowing a common property of acids, informs us,* that vinegar will *break* (i. e. decompose) rocks, which have been tried in vain by an antecedent fire; and Livy† observes that the vinegar *was so used* by Hannibal's soldiers, while the rock was red hot. In short, this was the common process, before these massess were blasted by gunpowder, a material then unknown. Thus the wonder turns out to be only a puerile exaggeration of a very simple and usual process, where there was no other means of avoiding rocky impediments. It has, however, had the effect of exciting much curiosity concerning the road which Hannibal really used when he effected his passage. Livy says,* that the subtle Carthaginian took a circuitous route to the Alps, because he wished to avoid collision with the Romans before he came into Italy; and under this impression, perhaps, the Roman historian has made the direction of his march to be from Lyons (*Lugdunum*) to Vienne (*Vienna*), thence to Valence (*Jalentia*), Luc en dois (*Lucas Augusta*), Gap (*Vapincum*), Briançon (*Brigantio*), and Turin (*Augusta Taurinorum*).

The main point, the particular road by which Hannibal passed the *Alps* themselves, has been ascertained by two Oxonians [Henry L. Wickham, Esq and the Rev. I. Cramer of Ch Ch.]

The claims of the little St. Bernard to the distinction of being the road of Hannibal are set forth in a manner so clear and so convincing, that we feel as sure of the fact, as we do of the existence of Hannibal himself.

Leaving the general question to be debated by our Cape *literati*, we proceed to notice more particularly the triumphs of British Perseverance at the Cape of Good Hope, in the formation of

"SIR LOWRY'S PASS," HOTTENTOT'S HOLLAND.

(By a Correspondent.)

The recent operations of the colonial government in forming a new line of road over this hitherto *almost* inaccessible barrier, independent of its incalculable advantages in a commercial point of view, have so completely exposed the stratification, that the geologist will have little difficulty in ascertaining the nature of the materials composing this magnificent range of primitive hills, which extend from the southern extremity of False Bay, to their junction with the Tulbagh, Twenty-four Rivers, and Cedar Mountain ridges, on the western border of the Cape of Good Hope peninsula.

Sir Lowry's Pass† is situated about an hour's ride from the village of Somerset, and nearly equi-distant with the shores of Fish-hook Bay, a small inlet of the sea, connected with False Bay, and skirting the base of the mountains on the right hand side of the road in the direction of Cape Hanglip. The length of the Pass, measuring from the temporary toll house near the bottom of the Kloof, to the summit of the mountain, may be estimated at two miles and a half, the whole distance acquiring a gradual and easy ascent, from the scientific design and arrangement of the engineer‡ entrusted with this gigantic undertaking.

In a geological point of view, this formidable boundary or line of demorcation between the Cape isthmus and the interior, affords no *extensive* degree of interest, (at least as far as my superficial researches have enabled me to ascertain.) It is composed of similar materials with most of the primitive chain of mountains intersecting the Colony, and from the base to the summit displays an uninterrupted arrangement of quartose sandstone; differing, however, in colour and density, in proportion as the oxide of iron, which predominates throughout the lower strata, becomes more diffuse in its approach towards the upper. The secondary or inferior elevations appear to be formed of the same components, only in a more advanced stage of partial decomposition and mechanical division, as the excavations on the line of road fully demonstrate—strata of gravel or loose siliceous pebbles and alluvial earth, interspersed with occasional groups of crystallized quartz, and in some places an unctious or plaster kind of clay, constitute the lower formation of the road; while the upper portions are worked (with prodigious labour) through ponderous masses of compact and indurated sandstone, until the excavations terminate on the summit of the mountain. The descent on the other side of the ridge, to the margin of the Steenbrassen River, is a continuation of this new and interesting road. At or near this place, it forms a junction with the old and disused one; and from thence, with occasional improvements, on the southern side of the little estate of Grietjesgat,* it winds its circuitous course through a region of rocks and siliceous debris, until the Palmiet River arrests its course, and affords to the eye of the traveller a striking illustration of a different line of territory. At the summit of the "Pass," and in a most romantic and picturesque situation, stands the new toll-house, "hewn out of the solid rock;" or, in other words, built with materials from the mountain. The prospect from this eminence is exceedingly beautiful: it affords a complete panoramic view of the Cape Isthmus, and the whole extent of the southern promontory; while, on a clear and cloudless day, the intervening villages of Simon's Bay, Muizenberg, Wynberg, Rondebosch, the detached habitations dispersed over the Cape Downs, and the adjacent Hamlet of Somerset, are all distinctly visible, and fill up the distant and variegated outline of this interesting landscape.

From the condensed and continual moist state of the atmosphere on the summits of these Alpine regions, their surfaces are always covered with vegetation, and afford an extensive field for botanical research. During the winter solstice they are for the most part covered with snow and hail, and the adjacent plains deluged with water, but the spring and summer months are salubrious and refreshing; and, in a medical point of view, I know of no similar situation within the Colony, (except the Kamies Mountains in Namaqualand,) more conducive to health, or the gradual recovery of convalescents. Were there suitable conveniencies and accommodations in the the neighbourhood of Palmiet River, this site would afford an eligible half-way house on their way to Caledon; and (with due deference to the Cape faculty,) I would venture to affirm that, in nine cases out of ten, it would be of more essential service for them to remain and take moderate exercise among the rocks and valleys of this temperate and healthy neighbourhood, than become martyrs to the suffocating influence of a Stellenbosch atmosphere, or the debilitating effect of the warm baths of Caledon.† G.

TEA, COFFEE, AND CHICOREE.

In the absence of *good tea* at the Cape, and we appeal to the ladies if this be not the case, we are glad to find a stir among the *coffee* dealers. We recollect the discussions of old on this subject at the Commercial Exchange,—some gentlemen pleading for *tea*

> 'The cups
> That cheer but not inebriate;'

others for *coffee*, as a cheap alimentary infusion—an agreeable tonic, and an exhilirating beverage. Then we had the *interregnum*, till *Mr. Hind* took the field, and proclaimed his superior *reform* coffee, and grinding skill. This produced a happy rivalry, — hence *Mr. Hudd*, assisted with his poet lau-

reate, rose up and tuned the lyre, in praise of coffee; then followed Mr. Ingram, and lastly in the *list*, and *cloathed* in the *befitting* language of recommendation, comes

The Messieurs James *Carfrae*,
With their "much approved *Chicoree*,
A great improvement to *Coffee*."

Now, what is this chicoree?* As the inquiry is pretty general, we shall endeavour to throw some light on the subject. Chicoree is a powder which is put into coffee before boiling, and a great deal has been said of its amazing virtues. The truth is, however, that this powder, which is made from the dried and roasted root of the cultivated *dandelion!!!* is only used in coffee-houses and other places of public entertainment in France, for the purpose of *adulteration*, as the addition of a tea-spoonfull of it to an ounce of *coffee*, will give as much colour and flavour, as the addition of half an ounce of genuine coffee. The cost of the chicoree is something under 3d per pound in France, but in England, where it is recommended to be mixed with coffee, to correct its alleged heating properties, it has been modestly advertised at half-a-crown. So much for

Chicoree, which, by-the-bye, acts *Medicinally*.

We shall now proceed to furnish our readers with some miscellaneous particulars respecting

COFFEE.

Coffee was first discovered by a goat-herd of Arabia Felix, towards the middle of the 17th century. Coffee soon found its way into Europe, and wherever it was introduced, it invariably caused much dispute. The grain of coffee, like the celebrated horse of Troy, was associated on all sides with thousands of enemies as to our health, as paralysis, nervous attacks, consumption, imbecility, and every other affliction. The decoction, however, gained an ascendancy over all its enemies;—the following quaint old reprint was generally circulated in 1660:

"The quality of this drink is cold and dry; and though it be a drier, yet it neither *heats* nor *inflames* more than *hot posset*.

"It so closeth the orifice of the stomach, and fortifies the heat within, that it's very good to help digestion; and therefore of great use to be taken about three or four o'clock after noon, as well as in the morning.

"It much quickens the *spirits*, and makes the heart *lightsome*

"It is good against sore eyes, and the better if you hold your head over it, and take in the steam that way.

"It suppresseth fumes exceedingly, and, therefore, good against the *head-ache;* and will very much stop any *defluxion of rheums* that distil from the *head* upon the *stomach*, and so prevent and help *consumptions*. and the *cough of the lungs*.

"It is excellent to prevent and cure the *dropsy*, *gout*, and *scurvy*.

"It is a most excellent remedy against the *spleen, hypochondriac minds*, and the like.

"It will prevent *drowsiness*, and make one fit for business, if one have occasion to *watch;* and, therefore, you are not to drink of it *after supper*, unless you intend to be *watchful*, for it will hinder sleep for three or four hours."

As it regards the making of coffee, it seems to be as little understood in this colony in general, as it is in England and Scotland. You are asked to take coffee—you accept the offer, and the consequence is you are forced (the urbanity of your manners force you) to swallow a tepid and muddy decoction, or else a cup of snuff-coloured liquid, 'weak as water, and cool as a zephyr,' distinguished only by a slight bitterness of flavour, indicating that the berry had been roasted to a cinder, and then pulverizes at a single heat, and that *boiling water* was an article of which the household lived in the profoundest ignorance. We shall offer a few particulars as to the *method* of manufacturing good coffee from the best authorities.

"Nothing requires more attention," says Dr. Mosely, than the *roasting of coffee;* and the strength and agreeable flavour of the beverage especially depend on this operation. The general method often deprives coffee of all its qualities. Bernier, when at Grand Cairo, where coffee is commonly drank, was assured that there were only two men in that large city who were capable of preparing this beverage in high perfection.

If coffee is not sufficiently roasted, it loses its virtue, and overloads the stomach; if it is too much roasted, it turns sour, insipid, and of a disagreeable burnt flavour; it then likewise heats the body, and acts as an astringent.

As soon as coffee is roasted it should be covered up. *Be careful to mark this.* Without this precaution it loses its strength, its volabile quality, and fragrant odour, which are among its essential recommendations. Again, the *grinding of coffee* is an operation which has considerable influence on its properties. The berries should never be ground before they are *entirely cold*, their substance being rendered viscous or clammy by the action of the heat. It is also desirable that coffee should not be ground till the moment before it is required for use. The powder should not, however, be too fine; for in this case, it is more apt to deposit in the vessels in which it is served at table, and consequently liable to be less pure than if the coffee was coarsely ground. A French writer of considerable distinction, observes that the usual mode of roasting and grinding coffee, is not the best: he asserts that the grain, when bruised in a mortar, will preserve its *aroma* much longer than when ground in a mill.

Once more: the infusion of coffee is not less worthy of attention than the roasting, &c. and it has the same influence upon the perfection of this delicious beverage.

When the coffee is sufficiently roasted, it should be allowed to cool before it is ground, otherwise still retaining the heat from roasting, the hard substances becoming clammy by the action of the fire, will choke up the grooves of the mill, and thus the powder will not pass through. Now come we to the *making*. The forms of coffee-pots are *too numerous to mention*. They are generally (we believe) made of tin, glazed earthenware, or china, and sometimes of silver. The general shape is, however, large at the bottom, and narrow towards the top. The proportions for making coffee by infusion, are usually one pint *of water to two ounces and a half of coffee*. We believe the recipes for making good coffee are as numerous as tinctures for the tooth-ache. We will not venture, therefore, to advise farther on this subject. We invite, however, for the sake of our friends, any communication respecting these particulars. As to the cultivation of coffee, be it remembered, that all land within the extent of 5 degrees crossed by the line, is suitable for the cultivation of coffee, except land composed of hard and cold clay, or light and sandy ground on a bed of marl. The leaves of the coffee planted in such soils, turn yellow, and the tree perishes or is barren. It requires, in preference, a new and free soil, a little elevated, where coolness and the rains moderate the excessive heat of the torrid zone, which would overpower the plant, if exposed to all its violence.

In commerce, coffee is distinguished by the names of the countries in which it is cultivated. Thus there are *Moka* coffee; Bourbon coffee; Martinique; Cayenne coffee, and St. Domingo. The quantity of coffee consumed in Europe is very great. Humboldt estimates it at nearly an hundred and twenty millions of pounds. Since the

* A "wholesome and nutricious root, so highly esteemed *in* Holland, and *on* the Continent!!!"—(See Advertisement in the Papers.)

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

time when this estimate was made, a vast increase has been experienced in the use of coffee in England.

REASONS FOR REPOSE.

"Do you not think the signs of the times in Europe somewhat awful?" said a friend of ours the other day—"have you no fear lest you should have rejoiced too soon, in common with the people of England, over those measures of a sweeping nature which the government of the country has introduced?" Our answer was, we think, one of moderation, to the exclusion of all vain boasting. But our thoughts, in solitude, were directed more closely to the subject; and, taking up a volume by the late Rev. R. Cecil, we derived considerable confidence from the following passage, which we did not fail to apply to the case in question.

"Like a man who is told that the foundation of his house is in danger, I call for the key of the vaults on which my dwelling stands. I light a candle, walk down stairs, and pass very deliberately through the arches: I examine *very particularly the arch suspected;* and after having satisfied myself that the foundation remains perfectly safe, I walk up again, lock the door, hang up the key, put out the candle, and quietly go about my business; saying as I go—"*They may raise an alarm, but I find* ALL *is* SAFE."

From this perusal we took up several of the recently-arrived publications of the periodical press of Great Britain; and as safe-guards, we endeavoured to take advice from those publications which we have always understood to be conducted by men of sound religious principle. Their differences in matters of Church Government was not a point then in question.—What say they as it respects the late public measures of the two Houses of Parliament? They are agreed in their verdict:—we refer to *The Christian Observer*, conducted by Members of the Established Church of England; to *The Edinburgh Christian Instructor*, supported by Members of the Established Church of Scotland; and *The Eclectic Review*, in connection with the Orthodox Dissenters. We conclude these plain remarks by an extract from the latter.

It is feared by some persons, for whose judgement and superior attainments we have an unfeigned deference, that the influence of the Crown will, by the restoration of the representative principle, be so far deprived of its salutary preponderance in the House of Commons, as to render any steady system of government impracticable. In apology for entertaining a different opinion, or rather for cherishing a different expectation, we beg leave to remark, that neither history nor experience warrants the apprehension, and that for contingent evils there will probably be found contingent remedies. We have almost been led, indeed, to adopt it as an axiom, deduced from the strange turns of affairs for the past 20 years, that what is expected never takes place. Premising this, we may perhaps venture to disclose our own expectations, which nevertheless are theoretically checked by the overruling persuasion that the precise contrary is very possible. We expect, then, as the result of passing the Reform Bill, we shall continue to have, at least for some years to come, a popular ministry, during which the influence of the Crown must of course maintain its preponderance. We expect an executive government stronger by reason of the withdrawment of the oligarchical counter-force. We expect, that, in the new House of Commons, there will be a larger number of members *directly* connected with the Aristocracy, partly consisting of the new county members, partly of men of family and substantial wealth chosen by the larger towns. We expect that fewer adventurers of desperate fortune will disgrace the legislature; and that, in consequence of the diminished expense attending elections, gentlemen who have shrunk from ruining their estates and beggaring their children for the honour of a contested seat, will consent to be put in nomination by their friends and neighbours. We expect a more religious House of Commons. We expect what Lord Wynford forebodes,—the abolition of slavery; what Lord Henley recommends, —a reform of the Church; what Europe hopes for, —a continuance of peace; what England needs, —an honest, statesman-like revision of the various branches of our domestic administration. We expect that the people, feeling confidence in the integrity of the Government, in the patriotism of their sovereign, and in the *bonâ fide* character of the representation, will exhibit more patience and subordination under any evils that may yet continue to press upon them, and any hardships not proceeding from wrongs. We expect all this, if the Reform Bill be but received by the nation in a right spirit, (the spirit pointed out by Mr. Douglas in his admirable pamphlet on 'the Prospects of Britain,') as 'knowing that every blessing, if not held as coming from God, will in the end prove a calamity.' Our trust is not in men, nor in measures, but in Him who works by both, and overrules both for the welfare of those whom he designs to save and deigns to bless.

ORIGINAL CORRESPONDENCE.

ON NOVEL READING.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—No person possessing the least particle of the spirit of philanthropy, can but admire your remarks* on the apparent intellectual deficiencies of the *Youth* of this Colony. There may be persons who cannot perceive any harm in a novel or a romance; but experience teaches us that there is a tendency in novel-reading to affect and deterioate the mind; and no determined novel reader ever arrives at that state of intellectual knowledge, which we find those possess whose reading has been confined to sober facts.

It is a fact, that Man will not be satisfied with the opinion of his fellow Man, till he has, from actual experience, discovered it himself; else, how can we account for the infatuation of the drunkard? He has constantly heard, that a habit of drinking once contracted, cannot be left off; but still he is not convinced till experience, painful experience, assures him of the fact; and in most cases, he falls a victim to its influence;—the youthful novel-reader, hears from those who have been satiated with this class of publications, what tendency it has to contract the mind, and cause a distaste for higher and nobler enjoyments; but this has no effect upon him, he commences a tale, and proceeds from volume to volume, till his mind becomes so infatuated, that, in the language of a celebrated writer, "the novel-reader requires his tale as the drunkard does his potion."

It is painful to behold the young reader engaged in works which cannot but create in his mind ideas of the world that can never be realized. How often does the man whose mind, when young, has been corrupted with pleasing tales of fiction, and whose knowledge of the human heart, has been derived from such sources, find, when he comes in contact with his fellow men, that what was pictured to his imagination, has no real existence in actual life.

It was my intention to have enlarged upon this subject, but a work written by a celebrated author, has lately come under my observation, that contains ideas so nearly corresponding with what I could wish to say, that I cannot but avail myself of a quotation from it, in hopes that it may have some effect upon that class of persons for which it was originally intended,—the Youth.

"I object to a course of novel-reading, *as it produces an undue excitement in the mind.* The design of the novel-writer is to interest and inflame the passions; and this design is generally accomplished by giving that position to incidents and characters, which shall fill the imagination, and excite the deepest feeling of the heart.

"The evil of this excitement must be apparent. Where it is indulged, the relish for sober pleasures and rational pursuits is lost; the understanding and the judgment are enslaved to an inflated imagination, and *ennui*, the inseparable companion of violent emotion, sheds its destructive mildew on all the soul. The habitual novel reader feeds on essences and liquors, rather than on a temperate and wholesome diet.

"And if the observation is to be applied to *youth*, the case is aggravated. In youth, the fancy wants restraint, and the understanding cultivation; a course of novel reading at this period, must be as perilous as the administration of stimulants, where there is every symptoms of fever.

"My principal objection to novel reading, is *its immoral tendency.* This charge, though a most serious one, is, I fear, to be applied to nearly all the books which pass under the name of novel. In making this assertion, however, I am taking the New Testament as the standard of morality; and by this standard, although there will be no comparison in the shades of guilt, few will escape condemnation. What are we to say of works which fritter away the distinctions between right and wrong; and deceive the unwary into the paths of vice, by surrounding them with the way-marks of virtue? What are we to say of works which

* See Literary Gazette, No. 7, vol. 2.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

treat with contempt those admirable qualities industry, frugality, and prudence; while they squander their praises on extravagance, carelessness, and folly? What are we to say of works which alienate the heart from domestic and retired duties—which convert every quiet home into a prison-house—and make the best of parents appear either ridiculous or tyrannical? What are we to say of works which are polluted by luscious description of sensual pleasures, lascivious inuendoes, and infidel bon mots; and which, almost uniformly, make love a passion wholly irresistible? What are we to say of works which justify not only the inordinate desires of the corrupted mind, but pride, vanity, revenge, ambition, and hatred; of works which, in some instances, become the apologists of drunkenness, gambling, duelling, swearing, lying, and suicide?"

I sincerely hope that the *youth*, who are, or ought to be, the pride of our Colony, will give ear to the admonitions of those who are so deeply interested in their welfare; and maniest it, by a perusal of those works which are calculated to render them ornaments of society.

A Well-wisher to the Youth of this Colony.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—Various attempts have been made by Commentators to explain the Dial of Ahaz, none of which appear to be satisfactory.

If you judge the following endeavour to illustrate this subject sufficiently interesting, I shall be obliged by your inserting it in your valuable Miscellany.

H. O.

THE DIAL OF AHAZ.

ii. Kings, c. xx. v. 8.

The first idea of a Dial was derived from the shadow of a pillar erected perpendicularly to the horizon; the placing of the Gnomon parallel to the earth's axis being invented at a later period, and when the knowledge of the sphere was farther advanced. The Babylonian Dial was of this construction, and served as a model to the Greeks and Romans.

It is probable that Homer alludes to a Dial of this description in the Odyssey, Lib. xv. v. 402, when he remarks of the island Syria, one of the Cyclades, "that there are the Tropics of the Sun."

The plane of the Babylonian Dial was parallel to the horizon; and the Gnomon, instead of being parallel to the axis of the earth, was perpendicular to the horizon. The tropics, the equator, and other parallels of declination, were projected upon it, and the shadow of the vortex or pole of the Gnomon traced the parallel for the given day. The hours of the day were not only noted by letters of the alphabet, pointing out the time from sun-rise, but also by the *length* of the Gnomon. Hence the origin of the expression among the Greeks, "What shade is it?"

Several passages occur in the Greek writers, in which the hour of the day is shewn by the *length* of the shadow. It will be sufficient to adduce one from Aristophanes, Eccles. v. 648, which may be thus translated: "you will take care to go neatly dressed to supper, when the shadow shall be *ten feet long*." As the Dial of Ahaz was in all probability a copy of that at Babylon, and the same language was used to ascertain the hour of the day, the expression of Hezekiah, if referred to the extension of the shadow, and not to its angular motion, will appear extremely natural; and the obscurity, which for a long period has involved this subject, will be removed.

"It is," said he, "a light thing for the shadow *to go down* ten degrees, but let the shadow return backward." By the expression "to go down," may be understood "to be lengthened," which is the exact meaning of the Hebrew word. We may therefore have imagined Hezekiah to have said, "It is a light thing for the shadow *to go down*, i. e. *to be lengthened* ten degrees, but let it return backward, i. e. let it be shortened." On this supposition the event must have taken place toward the evening. A sudden extension of the shadow would indeed, even in this case, be miraculous; but as the shadow lengthens very fast toward the evening, its extension would not be so surprising, as the diminution of its length, or its returning backward.

That by the word degrees we must understand equal spaces, probably feet, will appear from the following consideration.

When the Gnomon is parallel to the earth's axis, its shadow coincides with the hour lines; but when the Gnomon is perpendicular to the horizon, no set of hour lines can be drawn with which its shadow can uniformly coincide; hence it is evident that the *length* of the shadow was necessarily adapted for shewing the hour of the day; the lengthening or shortening of which was naturally expressed by certain equal parts, probably feet, which in the scriptural account are called degrees.

The following Table, omitting fractional parts, shews the length of the shadow of the Gnomon of six feet for the latitude of Babylon (32o 30'N.) when the sun is in the tropics and the equator.

It will be necessary to observe, that the day was anciently divided into twelve equal parts from sun-rise to sun-set. At Babylon the longest day contained about fourteen of our hours, which divided into twelve parts, allows seventy minutes for each of their hours when the sun is in the tropic of Cancer.

The shortest day in the latitude of Babylon contains ten of our hours, which allows fifty minutes for each of their hours, when the sun is in the tropic of Capricorn.

The length of an hour when the sun is in the equator, is evidently the same on every latitude, i. e. sixty minutes.

The sun was on the meridian at six o'clock according to the ancient notation.

TABLE.

Morning Hours.	Evening Hours.	Hour = to 70'	Hour = to 60'	Hour = to 50'
	XII.	Sun rises.	Sun rises.	Sun rises.
1.	XI.	24	28	39
II.	X.	10	13	17
III.	IX.	6	8	13
IV.	VIII.	3	6	11
V.	VII.	2	5	10
NOON. VI.		1	4	9
		Sun in the tropic of Cancer, . .	Sun in the Equator, ...	Sun in the tropic of Capricorn, .

Explanation.—When the sun is in the equator, the length of the shadow at

1 hour after sun-rise, . . = 28 feet.
2 hours do. . . . = 13 „
6 hours after sun-rise, or noon, = 4 „
8 hours after sun-rise, . . = 6 „ &c.

In a note to the third volume of the Travels of Anacharsis, a table is given

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

from Palladius Rutilius, of the lengths of the shadow of a similar Dial for January, which are nearly the same as those which are given in the table above for the tropic of Capricorn, with the exception of that for the hours of I and XI, which is evidently incorrectly copied, the length being only twenty-nine feet instead of thirty-nine.

The learned author of Anacharsis is mistaken in supposing that the Dial mentioned by Rutilius was adapted to the climate of Rome; for when the sun is in Capricorn, the length of the shadow at noon is about fifteen feet in that latitude instead of nine. According to the table above, it appears to have been constructed for the latitude of Babylon.

THE PHILOSOPHY OF ASTRONOMY.

To the Members of the Poker Club.

GENTLEMEN!—I have read with pleasure the third lecture of *Orlando*, and fully agree with him "that light has a distinct existence separate and independent of the sun;" but that it has properties still to be developed, which I shall endeavour to shew.

With light was created an inherent *propelling power*,—hence the growth of the vegetable kingdom, and, by analogy, set this world in motion on its axis. And as a strong corroboration of this assertion, the obliquity of the Poles preserve the same angle during the annual course round the sun. This earth, and the rest of the planets, must have rolled forward each on their axis in parallel lines; but for the formation of, and the controlling power contained within the sun, directing the whole in the course of their respective orbits.

The light here spoken of having its existence before the formation of the sun, and being equally diffused throughout the whole universe, must in some way have been affected by such formation; and the only reasonable conclusion to be adopted is, that a co-mingling of the solar rays with *light*, produced heat. What we call night to our earth, is but the *repose* of the co-mingled solar rays and *light*,—the latter is ever exerting the *propelling* power not on our globe alone, but on the whole solar system.

By way of illustration:—Permit light to enter a darkened apartment, through a small aperture in a shutter, and you will see thousands of atoms having motion on their axis, and forming orbits round the continuous line of light.

That the sun is but an apparent fixed star in the firmament, in common with the others, I have no doubt; and that, on their formation, the *propelling power* of light gave to each motion on the axis: and as the sun is the centre and controlling power of planets in his system, so is this *great central light*—(the Divine Spirit of God)—the *propelling and controlling power* over all the stars or suns of other systems unknown to us (except by analogy), whose motion in their orbits being equal and alike round the common centre of the universe, present to the naked eye an apparent fixed station in the firmament of heaven. May not the extremes of the easterly and westerly variation of the compass be caused by such a motion of the sun in its orbit, at once fixing the *period* of such revolution round the *central light* and *propelling and final controlling power?*

The gradual disappearance and re-appearance of certain fixed stars after a long lapse of time, go far to confirm the theory of the Philosophy of Astronomy.

LITERATURE.

GRAND JURIES.

An Inquiry into the Use and Abuse of Grand Juries; with reference to their Adjudicating on Cases which have undergone previous Investigation before a Magistrate. By PETER LAURIE, *Esq., B.C.L.* London: 1832.

WHAT is the reason that the Press of this Colony has been silent on the Jury System of modern introduction among us? Does it *work well?*—aye or no; we leave the question to be decided by competent witnesses; only stipulating that they *tell the truth, the whole truth, and nothing but the truth.*

But of Grand Juries—what of these? The author before us thinks as we do—or rather, we think as he does;—and we do really believe that many of his objections may be fairly applied to many of our *un-read* colonists; who, from the length of their purses, from slave and other property, are constituted *Judges* of *Law* and *Equity*. Now, we dare say these remarks will cause such personages to pout, kick, and flounce. But as Col. Napier justly observes—history would be an "old almanack," if, out of respect to persons and things, errors having a palpable influence upon public events were suppressed"

Mr. Laurie, the author of "An Inquiry," &c. is a man who appears to pay a proper regard to the institutions of his country: he—

Readily avows his admiration of that constitution to which we owe our greatness—that constitution which the Roman historian conceived but the ideal creation of European enthusiasm—which legislators have studied and tried in vain to imitate, and which has conferred on us "the prerogative of teaching nations how to live."

Without daring, however, to tie up our hands from re-adjusting, from time to time the various branches of our constitution to those changes which will continue to roll upon us till the circumstances of human society shall become more quiescent, he with the same readiness admits the fact, with respect to the constitution generally, that—

As in many instances its provisions have outlived its necessities, so in others it has been found inadequate to the new and increasing wants and opinions of the world, it is, indeed, impossible to fix an unalterable standard for what must unavoidably be ever fluctuating; and, it would be as impolitic to insist upon our being governed by those laws which our ancestors found sufficient, as absurd to assert that the laws against forgery, and the exportation of machinery, would have been necessary to them.

He limits his remedies to the actual faults to be cured, and opposes the taking-down system with all his might. Notwithstanding all that has been said to the contrary, he questions even the fact whether any of our rights and liberties rest on revolutions or violent innovations of any kind as their foundation. In the very outset of his inquiry, he observes:—

Our most valuable institutions have been handed down to us unaltered in principle and from the earliest times, and our Courts of Parliament and Justice may be said to have been modelled by the hand of Alfred. It is worthy of remark, also, that the struggles of by-gone days were not commenced to favour innovation, but to procure the restitution of ancient rights; the contest being for the maintenance or recovery of an ancient "inheritance," and not for any fresh acquisitions. It was no new code that was wrung from the tyrant John, but a recognition of the laws enacted two centuries before. Thrones and dynasties have passed away, but the customs and privileges of our ancestors have escaped unscathed either by the flames of civil warfare, or by the riots of commotion. The wars of the Plantagenets, the contests of the Roses, the tyranny of the Stuarts, and the tumultuous rule of the Commonwealth, have never materially affected the leading features of the ancient Constitution of Britain, nor has the pressure of despotism, the frenzy of democracy, party spirit, nor popular insurrection, been ever able to wean the attachment of the people from their old rights and franchises.

It is in this spirit that the author approaches the subject of Grand Juries, as these institutions are presently administered in England, so that, in intention at least, he cannot be called a rash innovator. Indeed, the diffidence with which he ventures to say a word on the subject he has chosen to consider, is enough to save him from all suspicion of the kind, for he very modestly says, he will be perfectly satisfied with the fate of his labours, though they should be thought to have no other merit than that of attracting superior talent to an examination of the subject.

With all his diffidence, however, the author is still a keen observer of the advantages and disadvantages of the institution he ventures to examine, and, on an examination of facts and cases, shewing how it has been working of late years, he ventures to denounce it as one of those rotten branches of the constitution which ought to be lopped off. The institution of Grand Juries is not known in Scotland, the duties they are deputed to discharge being in this end of the kingdom, devolved on the Lord Advocate. The Inquiry before us, therefore, cannot so vitally interest Scotchmen as Englishmen. The institutions in question, however, being part and parcel of the constitution which binds Scotland and England together, the question of their usefulness ought to excite the attention of every one who would have the country rid of useless expense. For the sake of their very pockets, therefore, our countrymen are interested in knowing the fact that whatever advantages the country may have derived from Grand Juries in former times, the author of this Inquiry, an admirer of the principles of the British constitution, after weighing calmly and dispassionately all

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

that can be said in favour of their usefulness at the present day, comes to the conclusion, not only that their utility may be impeached, but that they may fairly be represented as anomolous in theory, unnecessary in practice, impediments to justice, and prejudicial to the public interest.

PRINCIPIA RERUM NATURALIUM.

(Translated from the Latin.)

BY PHILOCHRESTOS.

FOR THE LITERARY GAZETTE.

(Continued from Page 373, No. 10, Vol. 2)

In this our present state of ignorance we can only derive knowledge through experience; not merely our own experience, and that of our own age, but the experience of the whole literary world, and of many ages: for after we have obtained an acquaintance with whatever the learned world has hitherto discovered, we are likewise individually enabled, in this age of experiment, to superadd new experience of our own, and thus continually to become more enlightened. I affirm, therefore, that at this day we are made wise only by means of experience; nor can we approach wisdom through any other path. It is impossible to receive knowledge immediately from the soul; but man attains it through the mediate organs and senses. The first fountain of science springs from these sources, and it is by means of the connexion existing between these, and the faculties of reason and judgment, that we acquire a perception of objects: that is, it is only by means of experience impressed on the organs, and transmitted from thence to the mind, that we are capable of becoming wise. The means, therefore, of all our wisdom rest on experience; without which the human race would be barbarous, merely animal, and irrational. Suppose a person, destitute of education, left wholly to himself with wild beasts and apes, or advancing to manhood without the society of any animal, what kind of brute would he be? What intelligence would he enjoy from nature? What would be the operation of his faculties, or mind, on the organs of his body, or, at a riper age, what would be the operation of the organs of his body on his mind? Man is made and formed, and distinguished from the brutes, by education alone; in the process of which, the organs that mediate between the mind and the body, being brought into exercise, are, as it were, cultivated and fashioned; and exercise so arranges the elements enclosed in the small membranes and organs, as to enable the most subtile tremors and motions to pass and repass over them, and opens, as it were, those secret and intricate avenues which lead to the most subtile and active substance of our nature: it is by means of this that the oracles of the august mind are issued and disclosed. All the sciences we possess, we have received from experience. By experience we know how to discharge the duties of a citizen, and to live with others in moral society; we learn to be prudent, we learn to be philosophers. By experience we acquire the arts of war and fortification; we learn to train soldiers in such a method, that each individual, of himself conjointly with the battalion, and the battalion with each individual, is enabled to stand secure against the attack of the enemy. We learn by experience to construct ships, to build houses, to cultivate fields and gardens; which arts first originated from the sense of their necessity, and being thence practised, attained perfection through the experience of ages. Let us instance the sciences of metallurgy and chemistry. Metallurgy commenced by the experience of many ages before the flood, and was continued until it attained the point of perfection which it at present possesses; which is such, that it is now fully understood how the hardest rocks can be penetrated; how shafts of different kinds can be worked through mountains themselves, a passage made to the bowels of the earth, and her metallic veins opened and explored; how laboratories and furnaces should be constructed for the purpose of extracting and smelting the better part of the ore, and how the metal is afterwards to be forged and refined, with many other arts which relate to the separation of the vein, and the formation of the metal itself. These arts are all owing to that great instructress experience, who seems to have been more ingenious in regard to this art, and more desirous of learning it, because it produces silver and gold, or riches, to which all things are obedient; which procure subsistence and honors for their possessors, and which, upon that account, so greatly interest all mortal minds. It is also hereby known what that most extensive science chemistry is, or the art of separating metals, and all the productions of vegetative nature, and extracting them from the ore, both by the dry and the humid method. How sulphur, spirits, oils, and liquids of various kinds, may be elicited by means of fire or a menstruum; how the lighter parts, and likewise the heavier, and metallic substances, may be dissolved by the menstruum, rendered liquid, and driven to the bottom or top; how the flame and fire are to be tempered, and to what degree of heat a body capable of being subdued by it should be subjected; or how a slow fire devours substances, or a stronger and fiercer descends deeper into their pores, or how it penetrates and divides their inmost and abstruse principles, and separates them into parts. But this entire science is the offspring of experiment. We are indebted to experience for all our knowledge, and experience itself is indebted to the senses, by means of which objects are subjected to the ratiocination of the mind, and thus we are finally enabled to acquire wisdom. In proportion, therefore, as the supply of experience is more abundant, and as it is better disposed and distributed through the organs; in proportion as the mediate organs are more exact in their harmony, and better adapted in their figure; and in proportion as a more exalted path is thrown open to the most subtile principles of things by series and continuity, in the same proportion may man become more wise. But, gracious God! what is our wisdom? truly, such as what is finite is to what is infinite; it is, therefore, as it respects infinite wisdom, nothing.

The reason why we are to acquire knowledge by means of experiments, and to investigate the nature of objects and set them in a distinct point of view, by subjecting them to the operation of the reasoning faculty, is, because we have an active and most subtile principle and soul, to which the subjects of our enquiry can be submitted; whereby we are enabled, through the comparison and series of many phenomena, to form a judgment respecting them; and, by considering their equations, similitudes, analogies, and analyses, to discover their causes by a course of geometrical and rational investigation. Man is distinguished from brutes by reason alone; in other respects we are mere animals, and organized forms; our senses are similar to those of brutes, and we have an interior texture not unlike theirs; our sole distinction consists in that invisible or reasoning faculty, that more subtile active principle, which enables us to consider objects more deeply than they can, and consequently to perceive things with more distinctness. It cannot be denied but that there is a connection between the organs of the senses and the soul, and that the affections of the organs of the senses can be in a moment transmitted to the soul by means of that connection; it is equally certain that those affections thus pass out of a more gross medium into a more subtile one, and that these mediums are contiguous, and succeed each other in order. For if the affection impressed on the organs be instantly perceived in the soul, and if the organs of the senses be of a grosser substance than the soul, it follows, that all perception passes out of a grosser into a more refined medium, by means of the connection existing between them, or through something contiguous, and thus arrives at that most active principle, which is the primary and ultimate constituent of man. We can form no idea how this perception is experienced in the soul, but by comparing it with the elements. For there exists a first and a most subtile element, and others that are successively more gross; there is air, ether, and others. If the particles of a grosser element should by any means be excited, either individually or collectively, so as to experience either an undulation or a tremulation, or any other kind of modification, such modification would pass out of

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

this grosser medium into a more subtile one. If these mediums were in such close contiguity and connection as to form together one volume, then the motion arising in the grosser element or medium would be more sensibly felt in the more subtile one. The tremulation of one particle, or of its superficies, in the grosser medium, might cause an undulation among the particles, or in the volume, of the more subtile medium; and if mediums and elements of a still more subtile nature were present and intermixed, the same affection which was tremulous in the first, and undulatory in the second, might cause a local motion among the particles of the third. It follows from hence that when a motion passes from a grosser medium into one that it is more subtile, it becomes successively more sensible; and if more sensible, then more distinct. We are distinguished, therefore, from brutes by this circumstance, that their perceptions do not penetrate to so subtile a medium as they do in man, but that they stop, as it were, in the midway, where perception is less distinct. Let us suppose the organs of the senses to be mechanical, and formed according to the mechanism of the motions existing in the elements; let us suppose that there are membranes which are acted upon either by the air, or the undulating ether; let us suppose, also, that these membranes are of different kinds, either more gross or more subtile; and let us suppose that the brain has a hard meninx, a soft one, and one more subtile still; (for it is observable that all things, both in the vegetable and animal kingdom, branch out into ramifications, which become more and more subtile, till they arrive at the highest degree of fineness, as is the case with the muscles, with the nerves, with the veins, with the membranes;) if, therefore, a motion arise in a grosser membrane, and pass into one that is more subtile, the effect will be exactly the same as in passing from a more gross into a more subtile medium. If the mediums, or the membranes, be so contiguous, and connected together, that a motion impressed on that which is more gross can be instantly perceived in that which is more subtile, then the least motion in the more gross becomes greater, and of a higher kind, in the more subtile, and consequently more sensible and distinct. That the membranes perceive, is a very common form of speech among anatomists. But let us leave these subjects, from which we only mean to infer that we ought to be instructed by the senses, and that it is only by means of the experience conveyed from them to the mind that we are able to acquire knowledge and wisdom.

(To be continued.)

THE BRITISH SETTLERS AT THE CAPE; *Or, "Life in the Wilds."*

Miss Martineau, in her new Work entitled—Illustrations of Political Economy—has presented to us the following little graphic tale characteristic of a rising village at the Cape, which had at one time suffered great distress. The moral of the story is—that *labour* can effect great things; and that it should be encouraged, economized, and rewarded.

'One fine evening, about the beginning of February,—that is, near the end of summer at the Cape,—a very extraordinary sight was seen by our settlers. The boys who were climbing trees for fruit perceived it first, and made such haste down from their perches, and shouted the news so loudly in their way home, that in a few minutes every one was out at the door, and all formed in a body to go and meet the new arrival. This arrival was no other than a loaded waggon, drawn by eight oxen; a scanty team at the Cape, where they sometimes harness twelve or sixteen.

'There was a momentary anxiety about what this waggon might be, and to whom it might belong; for it did now and then happen that a new band of settlers, or a travelling party from Cape Town, passed through the village, and requested such hospitality as it would, in the present case, have been inconvenient or impossible to grant. The young eyes of the party, however, presently discovered that the driver of the team was their friend Richard the labourer, their messenger to Cape Town, of whom they spoke every day, but whom they little expected to see back again so soon. It was Richard assuredly. They could tell the crack of his whip from that of any other driver. The captain waved his cap above his head and cheered; every man and boy in the settlement cheered; the mothers held up their babies in the air, and the little ones struggled and crowed for joy. The oxen quickened their pace at the noise, and Richard stood up in front of the waggon, and shaded his eyes with his cap from the setting sun, that he might see who was who in the little crowd, and whether his old mother had come out to meet him. He was here presently, leaning on the captain's arm, and then he returned the cheer with might and main. A load of anxiety was removed from his mind at that moment. He had left his companions in a destitute state, without shelter, or arms, or provision beyond the present day. He had not received any tidings of them: it was impossible he should; and a hundred times during his journey home, he had pictured to himself the settlement as he might find it. Sometimes he fancied it deserted by all who had strength to betake themselves to the distant village: sometimes he imagined it wasted by famine, and desolated by wild beasts or more savage men. At such times, he thought how little probable it was that one so infirm as his mother should survive the least of the hardships that all were liable to; and though he confided in the captain's parting promise to take care of her, he scarcely expected to meet her again. Now, he had seen her with his own eyes; and he saw also, that the general appearance of the throng before him was healthful and gladsome, and his heart overflowed with joy.

'"God bless you, God bless you all!" he cried, as he pushed his way through the crowd which had outstripped his mother and the captain.

'"Let him go; do not stop him," exclaimed several who saw his eagerness to be at his mother's side: and they turned away and patted the oxen, and admired the waggon, till embrace was received, and the blessing given and Richard at liberty to greet each friend in turn.

'"Tell me first," said he in a low voice to Mr. Stone, "are all safe? Have all lived through such a time as you must have had of it?"

'"All but one. We have lost George Prest. We coud ill spare him; but it was God's will.'

'Richard looked for George's father, who appeared to be making acquaintance with the oxen, but had only turned away to hide the tears which he could not check. Richard wrung his hand in silence, and was not disposed for some time to go on with his tale or his questions.

'The first thing he wanted to know was, where and how his friends were living.

'"You shall see presently," said the captain. And as they turned round the foot of the hill, he did see a scene which astonished him. Part of the slope before him, rich with summer verdure, was inclosed with a rude fence, within which two full-grown and three young antelopes were grazing. In another paddock were the grey mare and her foal. Across the sparkling stream at the bottom of the slope lay the trunk of a tree which served as a foot-bridge. On the other side, at some little distance, was the wood, in its richest beauty. Golden oranges shone among the dark green leaves, and vines were trained from one stem to another. On the outskirts of the wood were the dwellings, overshadowed by the oaks and chestnuts which formed their corner posts. Plastered with clay, and rudely thatched, they might have been taken for the huts of the natives, but for their superior size, and for certain appearances round them which are not usual among uncivilized people. A handmill, made of stones, was placed under cover beside one of the dwellings; a sort of work-bench was set up under one of the trees, where lay the implements of various employments which had been going on when the arrival of the waggon had called every one from his work. The materials for straw-plaiting were scattered in the porch, and fishing-nets lay on the bank of the stream to dry. The whole was canopied over with the bluest of summer skies. Dark mountions rose behind.

'"We are just in time to shew you our village before sunset," said the captain, observing how the last level rays were glittering on the stream.

'"And is this our home?" said Richard, in quiet astonishment. "Is this the bare, ruined place I left five months ago? Who has helped you? Your own hands can never have done all this."

'"Nature,—or He who made nature,—has given us the means," replied the captain: "and our own hands have done the rest. Well-directed labour is all we have had to depend on."

'"Wonderful!" cried Richard. "The fields are tilled——"

'"By simple, individual labour. There can be little combination in tillage on a small scale, where different kinds of work must succeed each other, instead of being carried on at the same time."

'"These houses and so many utensil ——"

'"Are the produce of a division of labour as extensive as our resources would allow."

'"There must have been wise direction as well as industrious toil."

'"Yes," said Mr. Stone, smiling, "we have been as fortunate in our unproductive as in our productive labourers.

DEMERARA.

We must make room for another extract from the same work: it will require no comment.

'"I have always wondered," said Mary, "why there was no sugar grown in Africa, or in any part of South America but the little angle we inhabit. So it might be anywhere within that line."

'"Anywhere (as far as climate is concerned) within thirty degrees of the equator. There are duties which prohibit the English from purchasing sugar from China, New Holland, the Indian Archipelago, Arabia, Mexico, and all South America, but our little corner here; and from Africa none is to be had either. The slave trade has been like a plague in Africa."

'"Well, but you have passed over Hindostan."

'"The trade is not absolutely prohibited there; but it is restricted and limited by high duties."

'"What remains then?"

'"Only our corner of the world, and a tiny territory it is, to be protected at the expense of such vast tracts—only the West India Islands, and a slip of the continent."

'"But surely it is a hardship on the inhabitants of these other countries, to be prevented supplying the British with sugar."

'"It is a hardship to all parties in turn:—to the British, that the price is artificially raised, and the quantity limited; to the inhabitants of these vast tracts, they are kept out of the market; to the west India planters; but most of all, to the slaves."

'"To the planters? Why, I thought it was for their sakes that the monopoly was ordered."

'"So it is; but they suffer far more than they gain by it. The cultivation of sugar is at present a forced cultivation, attended with expense

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

and hazard, and only to be maintained by a monopoly price, both high and permanent.

'"Look at Mitchelson's plantation, and see whether its aspect is that of a thriving property! A miserable hoe, used by men and women with the whip at their backs, the only instrument used in turning up the soil, while there are such things in the world as drill ploughs and cattle! A soil exhausted more and more every year! A population decreasing every year, in a land and climate most favourable to increase! Are these signs of prosperity? Yet all these are the consequence of a monopoly which tempts to the production of sugar at all hazards, and at every cost."

'"I see how all these evils would disappear, brother, if the trade were free; but could the proprietors stand the shock? Could they go through the transition?"

'"O yes; if they chose to set about it properly, living on their own estates, and making use of modern improvements in the management of the land. if the soil were improved to the extent it might be, the West Indies might compete with any country in the world. The planter would estimate his property by the condition of his land, and not by the number of slaves. He would command a certain average return from the effective labour he would then employ, instead of the capricious and fluctuating profits he now derives from a species of labour which it is as impolitic as guilty to employ; and, as the demand for sugar would continually increase, after the effects of free competition had once been felt, there would be no fear of a decline of trade. A soil and climate like this are sufficient warrants that the West Indies may trade in sugar to the end of the world, if a fair chance is given by an open trade."

'"Then if economy became necessary, there would be no slaves; for it is pretty clear that slave labour is dear."

'"Slavery can only exist where men are scarce in proportion to land; and as the population would by this time have increased, and be increasing, slavery would have died out. At present, land is abundant, fertile, and cheap in Demerara, and labour decreases every year: so that slaves are valuable, and their prospect of emancipation but distant. But in my estate, as I have told you, the land is by far less fertile, labour more abundant, and slavery wearing out. My exertions will be directed towards improveing my land, and increasing the supply of labour; by which I shall gain the double advantage of procuring labour cheap, and hastening the work or emancipation, I hope no new monopoly will be proposed, which should tempt me to change my plan, and aid and abet slavery." pp. 96—99.

Assuredly, when political econome comes to be better understood, ther will be no such thing under a civilized Government, as slavery. We cordially thank the Author for her illustration of this truth.

NATURAL HISTORY.

INSECTS.

We have just received and looked over a new number of the *Animal Kingdom* of Cuvier, translated by Griffith and others. It treats of insects, a class of the creation that, more, perhaps, than any other, is calculated to excite our attention, from the wonderful varieties which it comprehends, and the astonish ing minuteness of anatomical mechanism which it discloses. In both these points it surpasses every other. The number of species which have been already observed, exceeds 20,000, and it is not too much to say that, taking the species indigenous to Asia, Africa, and America into consideration, there are at least as many more of which we have, as yet, no adequate description. Travellers too often content themselves with collecting only those insects which appear to them most remarkable for the singularity of their forms, and the beauty of their colours. Hence it happens that their catalogues are very scanty, and their specimens still more limited.

To the multitude, insects are uninteresting, because they are generally so small. But to all persons who have a moment for reflection, this very minuteness of conformation is the very feature of all others that renders them so attractive. 'Infinity,' observes Mr. Griffith, 'exists in small as well as in great things, and the insignificance of an atom, the imparting to it, under such minute dimensions, so many organs, capable of a variety of sensations, is a greater marvel than the production of those colossal animals on which we look with terror and astonishment. "Wherefore," asks another writer, —one of the most philosophical observers of nature—"should we fear to bestow too much praise on the works of the Supreme Being? A machine is the more admirable, and does the greater honour to its inventor, in proportion as it is simple in relation to its destined object, though complex as to the number and variety of its parts. The union and concurrence of so many different and necessary pieces to the production of one given end, impress us with a high idea of the genius of the mechanist. He who has formed those animated machines which we term *insects*, has assuredly admitted no unnecessary parts into their composition. Notwithstanding their minuteness, they cannot fail to excite our admiration in a much greater degree than larger animals, when we consider that there are many more component parts in their body, than in the enormous living masses of the elephant or the whale. In the production of the butterfly, and of every insects which undergoes a true metamorphosis, *the equivalent at least of two animals is produced.*"

What a theme for meditation is suggested by these few remarks! In every insect that undergoes a complete transformation, there must be, in fact, the germ of one animal contained in the perfect body of another. Thus in the lion-ant we have the four winged fly, and the beautiful butterfly in the mean-looking, crawling caterpillar. What is the use of all these insects and transformations? we have heard a thousand times asked. What good do they produce? Is it not, we ask in return, a sufficient good if they remind us even for a moment of the power and ever active presence of the Omnipotent? Supposing we were told that this object alone was the only one which the Creator had in view, when He peopled the air, the water, and the earth with insects, would it not be an adequate object for the display of such varied and miraculous power? He has intended us for Himself: but He knew that, placed in a world in which the multitude would have to labour for their maintenance, we might too often give up all our thoughs to the occupations which existence renders nescessary, and He has in consequence strown our path every where with objects—like so many fire-flies—which may at every moment of the brilliant day or the winter night, speak to us of Him! No person has ever yet asked the *use* of an insect, who has paid the slightest attention to its wonderful structure? for besides the unknown, or rather unnoticed part which may be assigned to it in carrying on the necessary operations of nature, it is in itself one of the letters in that divine alphabet which the Deity has framed for his favourite creature man, to enable him to read, if he have but the will to read, the precious volume which is here unfolded for his perusal.

These provisions of nature, and others which might be mentioned, afford indisputable proof of a system established from the creation, and ought constantly to lead our thoughts to that Eternal Intelligence by which it was ordained. How justly may we not exclaim with Cowper,

"These are thy glorious works, thou source of good,
How dimly seen, how faintly understood!
Thine, and unheld by thy paternal care,
This universal frame, thus wondrous fair."

The parasite order of insects, though highly interesting in a scientific point of view, do not furnish us with many ideas of an agreeable nature. We shall therefore pass them by altogether, suggesting only to the attention of the reader the exhibition of the "WONDERFUL FLEAS," which we read in the London papers, now open in Regent Street. One of these well disciplined tiny animals draws up a bucket from a well; another is harnessed to the model of a man of war of 120 guns, with sails, &c., four hundred times its own weight, which it draws after it without any difficulty; while others are engaged in carrying upon their backs effigies of the Duke of Wellington and Napoleon, and in combating with swords in regular warfare. Mr. Griffith mentions a flea of middling size that has been seen to draw a silver cannon supported on two little wheels, which was charged with powder and let off, aparently without giving the insect the slightest alarm. Hook has recorded the labours of an English artist, who constructed an ivory coach for six horses, holding four persons, having two lackeys behind, and a coachman on the box, with a dog between his legs, which was drawn by a single flea! M. Latreille, remarking on such works of art, asks why such delicacy and fineness of labour should not be devoted to subjects of greater utility? We quite coincide in the answer which Mr. Griffith has given to this question. We shall add to it his very sensible observations upon the insects in question.

'If every work of man was to be measured by its *direct* utility, some of the noblest productions of art and genius might be undervalued and despised. The exercise of human ingenuity is in itself laudable, and though it be employed on an object of no direct utility, it may, and not unfrequently does, lead to the most useful discoveries and inventions. The man employed on such a task as we have described, was at all events improving himself in his art, and increasing the delicacy of his tact, and the accuracy of his vision. Better to be so employed than in fabricating engines of destruction, or mingling in scenes of dissipation, vice and folly.'

In studying so small an animal as the flea, many subjects of admiration present themselves to our mind. What prodigious force of muscle must not that be which enables this insect to raise itself thirty times its height! How singular the structure of that tube with which it sucks our blood! Nature, with her usual wisdom and foresight, has given this animal a compressed form, which enables it to insinuate itself with more facility between the hairs of animals, and conceal itself there. She has encased its body in a sort of armour, by enveloping it in a firm and elastic skin, capable of resisting the pressure of our fingers.

It is not necessary to enter into any detail here, of all the means which have been prescribed for the destruction of these troublesome insects. Some recommend the placing in apartments plants of a powerful and penetrating odour, such as savoury, wormwood, &c. or acid plants, such as *persicaria*, or vegetables with glutinous leaves, and branches of the alder. Others have recourse to a mercucial unguent, to boiling water, into which simple mercury has been put, and which is scattered through

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

out the chamber. Some prescribe the vapour of sulphur. The inhabitants of Dalecarlia, place in their habitations a hare's skin. These insects take refuge there, and are then easily destroyed by fire or water.

We often murmur against Nature, and consider fleas and other vermin as a spot which soils the beautiful picture which she presents to our eyes. But let us be reasonable, and admire the wisdom of her designs, in having chosen the sensation of pain as a *sentinel* to give us warning of the consequences of our vices, or the irregularity of our habits. We should conform ourselves to her views. *Cleanliness* without fastidiousness should be observed in our dwellings. If, towards the end of autumn, and the commencement of spring, the different articles of furniture that we use, were exposed to a heat of sufficient strength, the sources of our inconveniences would be speedily destroyed, at all events we should cease to calumniate Nature, even if we had not sufficient gratitude to study and admire her. But a small number of the species of the flea is as yet known; but it is probable that if the fleas of different animals were examined with a little more attention, that several others might be discovered.'

SCIENCE.

ECONOMY OF MANUFACTURES.

Tanning, Bleaching, &c.

THE use of machinery and its advantages are perspicuously pointed out in a little volume entitled "On the Economy of Machinery and Manufacturers, by Charles Babbage, Esq A.M." &c. We have not space enough in this Journal to devote all the attention we could wish to the interesting contents before us. We can only afford a single extract. It has been the successful endeavour of those persons to whom we are indebted for many of the modern improvements, to abridge as much as possible the time which nature would require to complete certain processes. In tanning and bleaching a very considerable saving of time has thus been effected.

'The process of tanning will furnish us with a striking illustration of the power of machinery in accelerating certain processes in which natural operations have a principal effect. The object of this art is to combine a certain principle called *tanning*, with every particle of the skin to be tanned. This in the ordinary process is accomplished by allowing the skins to soak in pits containing a solution of tanning matter; they remain in the pits, six, twelve, or eighteen months, and in some instances, if the hides are very thick, they are exposed to the operation for two years, or even during a longer period. This length of time is apparently required in order to allow the tanning matter to penetrate the interior of a thick hide. The improved process consists in soaking the hides with the solution of tan in close vessels, and then exhausting the air. The consequence of this is to withdraw any air which might be contained in the pores of the hides, and to employ the pressure of the atmosphere to aid capillory attraction, in forcing the tan into the interior of the skins. The effect of the additional force thus brought into action, can be equal only to one atmosphere, but a further improvement has been made: the vessel containing the hides, is, after exhaustation, filled up with a solution of tan; a small additional quantity is then injected with a forcing pump By these means any degree of pressure may be given which the containing vessel is capable of supporting; and it has been found that by employing such a method, the thickest hides may be tanned in six weeks or two months.

'The same process of injection might be employed to impregnate timber with tar, or any other substance adapted to preserve it from decay; and if it were not too expensive, the deal floor of houses might thus be impregnated with alumine or other substances, which would render them much less liable to be accidentally set on fire. Some idea of the quantity of matter which can be injected into wood, by a great pressure, may be formed from considering the fact stated by Mr. Scoresby respecting an accident which occurred to a boat of one of our whaling ships. The line of the harpoon being fastened to it, the whale, in this instance, dived directly down, and carried the boat along with him. On returning to the surface the animal was killed, but the boat instead of rising was found suspended beneath the whale by the rope of the harpoon; and on drawing it up, every part of the wood was found to be so completely saturated with water, as to sink immediately to the bottom.

'The operation of bleaching linen in the open air, is one for which considerable time is necessary; and although it does not require much labour, yet, from the risk of danger and of robbery, from long exposure, a mode of shortening the process was highly desirable. The method now practised, although not mechanical, is such a remarkable instance of the application of science to the practical purposes of manufactures, that in mentioning the advantages derived from shortening natural operations, it would have been scarcely pardonable to have omitted all allusion to the beautiful application of chlorine, in combination with lime, to the art of bleaching'—pp. 30—32.

LITERARY EXTRACTS.

HOPES, FEARS, AND PROSPECTS OF FRANCE.

Whatever benefits the revolution may have conferred, or may yet have in store, in other matters, its influence on literary taste has not been favourable. The productions of the day seem rather to have become more ephemeral, their aim less dignified, their manner more heatrical and exaggerated than before. Nothing wears an aspect of permanency; nothing seems to address itself to posterity, or to have any higher object in view than that of amusing, exciting, astonishing—if any thing could astonish—the present generation. Every thing seems hurried up with the coarse rapidity of scenes for the theatre; the temples and fairy grots, and gloomy caves, are only made to be viewed under the glitter of gas, and after attracting for a few weeks, to be washed out and superseded by some newer but not more substantial pageant. Periods of perplexity and change, in fact, are not those in which men labour for eternity; in the suspense, the all-engrossing interests of the present, the future, like the past, is scarcely thought of. Let us eat and drink, is then the watchword of literature, for to-morrow we die. For the creation of those enduring works, which appeal, not to the present century, but to all, there must be confidence, tranquillity of mind, sequestration from the anxieties, and struggles, and shifts of party. There must be one clear, decided, overruling bar of public opinion to appeal to, not an endless babble of conflicting judicatories. There must be a morality fixed and immutable, based in religion, felt in its beneficent effects, not a morality of economy and expediency, always vacillating with the last theory. There must be some general recognition of religious principles, binding mankind into one, supplying some stay and leaning place, in this incessant motion of all things around, and harmonizing all those discords of society which are at present obtruded in such jarring tones upon the general ear.

Is this to be found in France as the feature of the national mind? We fear not, and the literature of the day bears traces sufficiently evident of the chaos of opinion which prevails. Its most salient and characteristic feature is its aimlessness, its contradictory nature. It is not a professedly infidel literature, like that of the 18th century, possessing a certain grandeur even from the unity, the combination with which it accomplished its evil work; nor is it one of general faith and positive convictions, like those of the 16th and 17th. In truth, it seems to have no general aim. The efforts, like the opinions of its members, contradict each other; seldom indeed is any one long consistent even with himself. No commanding tone is heard above the rest, but only a babylonish gibbering among the workmen, all labouring away, as one would think, with much seeming energy on the edifice of social and moral improvement, but in truth doing little or nothing to advance the work. The royalist, the republican, the middleman, each presses forward, anxious to make his own block the corner stone of the building; while the St. Simonian ever protests that all their attempts will crumble to pieces, because they build on the old foundations, however they may attempt to vary the superstructure; that society must be reconstructed from its very elements, that there must be a new heaven as well as a new earth, and that he, the disciple of St. Simon, is the man to give us both.

* * * *

The picture at present exhibited of the state of society is, in France, not encouraging—but we fear it is true. It is only one of the numerous features that indicated a deep rooted moral disease, manifesting itself in this and in many other forms. The prospects of literature, while such a condition of society prevails, are gloomy enough. A vast mass of talent and genius is at work, but with little concert, with scarcely any sense of the real dignity of literature, toiling for their daily bread, or the scarcely nobler wages of daily popularity. Even the better spirits seem to feel the evil influence of the times. Their productions want that sterling force, that real grandeur, that reference to the future more than to the present, which always stamps with the seal of immortality the productions of the highest order of genius. When is a better order of things to commence? When will men, after sweeping away goverunments and institutions, as unsuited to the temper of the times, and reconstructing all, as they think, on a basis more consistent with the general happiness, learn, in its full practical extent and comprehensiveness, the truth, how little all this can do to relieve misery, to place society on a firmer basis, to reconcile the governor and the governed, unless they can *first* cultivate a principle within, which produces a true equality, makes all physical evils comparatively light, and cements the classes of society, not by the coarse and iron links of a worldly expediency, but by the invisible yet adamantine chain of an eternal and immutable obligation? Already, we should say, the want of the cementing principle of society is felt. Nothing but this feeling of destitution, this growing conviction how little is to be effected for human happiness in its widest bearing by the steam processess of political machinery, could account here for the notice which the wild visions of the St. Simonians (on which we propose by and bye to speak more at length) have already attracted in France. They see the evil plainly; they have even a dim conception of the remedy; but pride, folly, enthusiasm, self-interest, licentiousness, artifice, mingle with and prevent their views; and the result is an insane, impious, and impracticable dream. This moral anarchy, however, cannot last for ever. The mind cannot always live on doubts and negatives, nor be whirled round without end in the eddies of political commotion. The swell must at last

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

subside; the great land-marks of society and morals, sooner or later, re-appear. This consummation may be promoted, though it cannot be produced, by co-operation. If men can combine for evil, they can do so also for good; returning from the field in which they have battled so long, and where so many have fallen unprofitably, the better spirits of literature may warn others back from the fatal conflict. They may lend their aid to strengthen the growing conviction, that happiness is more from within and from above, than from without and from beneath, and that the first step to true and rational freedom lies in the cultivation of the heart and of the affections, more than in the exercise of barren intellect, or the industrious manufacture of constitutions. Then might we hope that Europe, now shaken like the still vext Bermoothes, might find a breathing time; then might we expect that the stream of literature, which always runs side by side with the course of society, and reflects on its surface every volcanic movement that troubles the waves of the other, subsiding into tranquillity, again might roll down its single current calmly to the ocean, through scenes of domestic peace and fertility, instead of hurrying in a thousand petty channels, through blasted heath and rocky defiles, and wasting its waters unprofitably on parched and desolate sands.—(*Foreign Quarterly.*)

On an ALLEGED CASE of SPECIAL MANIFESTATION of DIVINE DISPLEASURE.

To the Editor of the Christian Observer.

I TAKE the liberty of sending you the particulers of a very extraordinary case, which occurred in my native village; but fearing that the authenticity of it may be doubted by many of your numerous readers, I beg leave to assure them, that it is an *indubitable* fact. The parties involved in the following relation have for many years lived near my father's residence; and he has been in the habit of seeing them often, and has been perfectly acquainted with the circumstances. But not only might *his* testimony, but likewise that of the family, the principal inhabitants of Baltonsborough, and all the surrounding villages, be adduced in confirmation of the truth of the relation; the case in question being of so singular a nature, that it obtained great notoriety throughout the surrounding country. This case has already been brought before the public, in the Lancet, by a Mr. Hoare, a very respectable surgeon living at Warminster, in Wiltshire; but I have sent it to you, as I consider the narrative to be more suitable for a religious than a medical publication. It may possibly benefit the cause of religion in these days of infidelity and scepticism, by its affording a striking manifestation of the Divine displeasure, against a presumptuous and ungrateful individual; and confirming the truth of a superintending Providence, which overrules the affairs of men.

Toward the latter end of the year 1831, died, a farmer Higgins, an inhabitant of Baltonsborough, near Glastonbury, in Somersethire; some of the peculiar incidents of whose life are worthy of being recorded, and handed down to future generations, as an example of the Divine displeasure against hasty and inconsiderate resolutions, and violent imprecations against the arrangements of the Omnipotent will. From the time of his marriage, which took place in the year 1793, Higgins became extremely anxious for a son; but his wife presenting him with three daughters in succession, and no son, he became very disconsolate, and even enraged at his repeated disappointment, and vowed, with an oath of imprecation, that should his next child be a daughter he would never speak to her. Before the birth of his fourth child he impiously repeated the same solemn vow: the child however, to his inexpressible joy, proved to be a boy; but the father's satisfaction was but of short continuance, for this long wished-for and much-desired son, was destined by Providence to be to him the cause of years of remorse and pungent sorrow. Farmer Higgins, indeed, *very soon* had reason to repent of making such a rash vow; for the child, as soon as it began to take notice of surrounding objects, was observed to avoid him, and never could be induced, even for a moment, to remain in his arms. As the boy advanced in years, and the time of articulation arrived, his shyness towards his father became more and more apparent; and it was soon observed, that whilst he conversed freely with his mother and sisters, he never addressed a word to his father, or *uttered a syllable in his presence.* At first this shyness was thought to be accidental, as his father was much from home; but when the boy had gained the full powers of speech, and still observed a constant and marked silence towards him, it became but too evident that farmer Higgins was destined never to hold any conversation with his son.

The afflicted parent would often entreat him to speak to and converse with him, but neither entreaties, threats, nor promises were of the least avail; he even promised him the half of what he possessed, would he but converse or even speak to him, but it was all to no purpose.

The mother also often admonished and desired him to oblige his father by talking to him; but his reply invariably was, "No, mother, do you not think I would talk to father if I could? Whenever father approaches, my voice begins to falter, and before he comes within hearing, the power of speaking entirely fails me." It is a very remarkable part of this young man's history, that the inability of speaking, applied to all other males* as well as the father; and this very singular feature in his life continued for thirty-five years, up to the period of farmer Higgins's death. Immediately after this occurrence he began to converse with all around, both males as well as females, taking upon himself the ordering and arrangement connected with his father's funeral, and he still continues to enjoy the *full* powers of speech. He was always a kind and dutiful child to his father, and cheerfully obeyed all his commands; but it was observed that at his death he evinced great apathy, exhibiting no signs of distress or sorrow. He was fifteen years of age when he was first made acquainted with his father's vow, but it produced on him no perceptible effect.

I am, Sir, your obedient servant,

JOHN WILLOT EASTMENT,

Wincanton, Somersetshire.

Surgeon, M. R. C. S.

* Since I drew up the above statement, a second report of this case, by Mr. Hoare, has appeared in the Lancet (for April 7 1832), accompanied with a letter, in corroboration of the principal fact, from Dr. Colston, a very respectable clergyman living in the parish adjoining Baltonsborough. Dr. C., however, states, that Eli Higgins, the young man in question, did a few years since speak to *two* different gentlemen. As soon as I read the above letter, I desired my father to call on the individual; and he acknowledged, when the names of the persons mentioned in the Lancet were stated to him, that he did on one occasion say a few words to them: but he is totally unable to account for this exception, as he always felt distressed at being unable to converse like other young men. I have ascertained the truth of this singular exception, from a wish not to state any thing more in reference to the above case, than what is perfectly correct. J. W. E.

AN INCIDENT IN THE LIFE OF A GERMAN MERCHANT.

LATE one evening, a packet of letters, just arrived by the English mail, was handed to Mynheer Von Kapell, a merchant of Hamburgh His head clerk awaited, as usual, for any orders which might arise from their contents; and was not a little surprised to observe the brow of his wealthy employer suddenly clouded; again and again he perused the letter he held, at last audibly giving vent to his feelings—

"Donder and blitzen!" he burst forth, "but this *is* a shock, who would have thought it? The house of Bennett and Ford to be shaken thus! What is to be done?"

"Bennett and Ford failed!" cried the astonished clerk.

"Failed! not so bad as that; but they are in deep distress, and have suffered a heavy loss; but read, good Yansen! and let me have your advice."

The clerk read as follows:—

"*London, August 21st.*

"Most respected friend,

"Yours of the 5th inst. came safe to hand, and will meet prompt attention. We have to inform you, with deep regret, that the son of the trust-worthy cashier of this long established house has absconded, taking with him bills accepted by our firm to a large amount, as per margin; and a considerable sum in cash. We have been able to trace the misguided young man to a ship bound for Holland, and we think it probable he may visit Hamburgh, (where our name is so well known and, we trust, so highly respected) for the purpose of converting these bills into cash. He is a tall, handsome youth, about five feet eleven inches, with dark hair and eyes; speaks French and German well, and was dressed in deep mourning, in consequence of the recent death of his mother. If you should be able to find him, we have to request you will use your utmost endeavours to regain possession of the bills named in the margin; but, as we have a high respect for the father of the unfortunate young man, we will further thank you to procure for him a passage on board the first vessel sailing for Batavia, paying the expence of his voyage, and giving him the sum of two hundred louis d'or, which you will place to our account current, on condition that he does not attempt to revisit England till he receives permission so to do.

"We are, most respected friend,

"Your obedient Servants,

"BENNETT, FORD, AND CO."

"Mynheer Von Kapell."

"My life on't," said Yansen, "'tis the very lad I saw this day, walking up and down in front of the Exchange, who appeared half out of his wits; looking anxiously for some particular object, yet shunning general observation: his person answers the description."

"That's fortunate," said the merchant, "you must devote the morrow to searching for him; bring him to me if possible, and I'll do my utmost to serve my excellent frinds, Bennett and Ford of London."

Early next morning, Yansen went to the Exchange, and kept an anxious watch for many hours in vain; he was returning hopeless, when he saw the identical youth coming out of the door of a Jew money-changer: he brushed hastily past him, exclaiming, "The unconscionable scoundrel! seventy per cent. for bills on the best house in England!"

Yansen approached him. "Young Gentleman, said he, in a very mild tone, "you appear to have met with some disappointment from that griping wretch Levi. If you have any business to transact, my house is close by; I shall be happy to treat with you."

"Willingly," replied the youth, "the sooner the better. I must leave Hamburgh at day break."

The clerk led him to the house of the merchant, and entered it by a small side door, desiring the young man to be seated, whilst he gave some directions. In a few minutes he reappeared, bringing Von Kapell with him. The worthy Hamburgher having no talent for a roundabout way of doing business, said bluntly, "So Mynheer! we are well met; it will be useless to attempt disguise with me; look at this!" and he put into his hand the letter he had the night before received.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Overwhelmed with consternation, the young man fell at his feet.

"Oh Heaven!" he cried, "I am lost for ever—my father, my indulgent, my honourable father, is heart-broken and disgraced by my villany. My mother!" Here he became nearly inaudible, and hid his face in his hands. "You," he continued, "are spared all participation in the agony your wretched son is suffering."

"Boy, Boy!" said the merchant, raising him, and quite melted at this show of penitence, "listen to me! are the bills safe? if so, you may still hope."

"They are," eagerly exclaimed the youth; "how fortunate that I did not listen to the offers of that rapacious Jew. Here, Sir, take them, I implore you," pulling from his breast a large pocket-book; "they are untouched. Spare but my life, and I will yet atone—Oh, spare me from a shameful death."

There was a pause, broken at last by Yansen's saying significantly to his employer, "as per margin."

The merchant turned to the unhappy young man. "Take heart," said he, "'Wenn die noth ist amgröszten die hülfe ist am nächsten.'* There's an old German proverb for you. Sit down, and hear what I have to say. I think myself not a little fortunate in so soon being able to fulfil the wishes of my English correspondents; your natural alarm did not suffer you to finish their letter; you will perceive how generously they mean to act; their house's credit saved, they intend not to punish you. Read, read; and Yansen, order some eatables, and a bottle or two of my old Heidelberg hock, trouble always makes me thirsty—three glasses, my good Yansen.

Again the young Englishman hid his face, and sighed convulsively, "I do not deserve this lenity. My excellent father! this is a tribute to your virtue."

Von Kapell left his guest's reflections undisturbed, 'till a servant entered, who placed refreshments on a well polished oak table; when she retired he resumed,

"And now, what tempted you to play the ——runaway;" swallowing the term he had intended to use. "Was it the dicing table?"

"Spare me, most kind and worthy Sir, I intreat you! To my father I will make full confession of all my faults; but he must be the first to know the origin of my crimes."

"Well, well, take another glass of wine; you shall stay in my house till we can find a passage for you. It was but last night my good ship the Christine sailed for Batavia, and ——"

"Under favour," interrupted Yansen, "she has not yet left the harbour; the wind blew too fresh for her to venture on crossing the sand-banks at night, and it is now only shifting round a point or two."

"You are lucky, youngster;" quickly added the merchant, "the Christine has noble accommodations; you shall aboard this evening. Put these in the chest, good Yansen," handing him the bills, "and count me out the two hundred louis d'or the boy is to have. Come, man! finish your meal, for I see," and he, regarding a vane on the gable of an opposite house, "you have no time to lose."

The meal was finished—the money given—the worthy merchant adding as much good advice as the brief space would permit. The Briton was profuse in his expressions of gratitude, promised amendment, and returned the warm grasp of Von Kapell, unable to speak for his tears. Yansen accompanied him on board, gave the owner's most particular charge to the skipper, to pay his passenger every attention on the voyage. The vessel cleared the harbour—was in a few hours out of sight—and the next morning, Mynheer Von Kapell wrote to London a full account of the transaction, returning the bills he had so fortunately recovered.

* When things are at the worst they must mend.

In less than a fortnight the following letter reached the good old German:—

"Sir

"We have to inform you, that we never lost the bills sent in your last favour, every one of which is fabricated, and our acceptance forged. Our cashier has no son, nor has he lost a wife. We are sincerely grieved that your friendly feeling towards our house should have led you to listen to so palpable a cheat.

"We remain, with great respect,
"Yours,
"BENNETT, FORD, & Co."

"P. S. If you should ever hear again of the person you have, at your own expense, sent to Batavia, we shall be glad to know."

* * * * * * * * *

What can be said of the good old German's feelings, but that they may "be more easily conceived than described?"

H.

PHILANTHROPIC INTELLIGENCE FROM THE WEST INDIES.

1. *Resolutions of the Black Freeholders of Kingston.*

"*Kingston, April* 16, 1832.

"At a meeting of the black freeholders and other inhabitants of the city of Kingston, held at the house of Miss Woolery, in Church Street, it was unanimously resolved, that Mr. D. R. Lee be called to the chair.

"Resolved 1st.—*That we, the black inhabitants of the city, are loyally attached to our gracious and beloved Sovereign William the Fourth.*

"Resolved 2d—*That we are desirous, by legal means, to secure to all classes of his Majesty's subjects in this island the blessings of the Free Constitution of Great Britain.*

"Resolved 3d.—*That we are not, as has been insinuated, inimical to the amelioration and ultimate emancipation of our brethren in slavery.*

"Resolved 4th.—*That we are not, as has been stated, at variance on material questions with our coloured brethren. On the contrary, we are ready to co-operate with them, and all liberal and just men, in every effort which may be legally and constitutionally made for the welfare of all classes in the island.*

"Resolved 5th.—That we respect the rights of private property not less than we desire the welfare of our brethren in slavery, and, *whilst looking forward to the ultimate emancipation of the slaves, pursuant to the resolution of Parliament and of his Majesty's Government, we do not forget that the best redress for evil is always to be found in the melioration of law, supported by the liberal feeling of all classes of the community.*

"Resolved 6th.—*That not having exercised the right of the elective franchise, by means of a general dissolution of the House of Assembly, which would have enabled us to give an opinion on the choice of the popular branch of our legislature, we cannot be considered as represented by the legislators by whose laws we are governed.*

"Resolved 7th.—*That in pursuance of the foregoing sentiments, we will cordially join our liberal-minded brethren, of every complexion, in any Petition or Memorial to his Majesty, or his Government, for the final settlement of the question of slavery, so that the peace and security of the island may at once be established on a permanent basis.*

"Resolved 8th.—That the above Resolutions be published in the Times, Atlas, and Examiner, London Newspapers, and Kingston Daily Papers, and Watchman twice.

"DAVID ROBERT LEE, *Chairman.*

2. The following Document is no less important. It embodies the sentiments of the respectable and wealthy *free black and coloured inhabitants of Trinidad*, on the measures of reform, of his Majesty's Government, with a view to the extinction of slavery. It appeared in the Royal Gazette of Trinidad, of April 14, 1832, with this preface:—

TRINIDAD.

"The public will peruse, with much satisfaction, the address from his Majesty's free subjects of African descent to his Excellency the Governor, which we now publish for general information. The sentiments which have been expressed by so numerous and respectable a portion of the community are highly creditable to their good sense and integrity, and will be duly appreciated by all who are well-wishers to the true interests of this valuable colony.

"*To His Excellency Sir Lewis Grant, C. H. Governor, &c. &c. &c.*

"SIR,—We are charged by the persons whose signatures are affixed to the enclosed expression of their sentiments upon a late public event, to transmit the same to your Excellency, and we have now the honour of performing that duty,

"Remaining, with all due consideration and respect, Your Excellency's very obedient and humble Servants,

(Signed) J. W. HOBSON, A. RADIX, LEWIS LEBRE, Jun. J. EDWARDS.

"*March* 29, 1832.

"*To His Excellency Sir Lewis Grant, Governor and Commander-in-chief, &c. &c. &c.*

"SIR,

"*May it please Your Excellency,*

"We, his Majesty's most dutiful and loyal subjects, whose names are hereunto subscribed, do feel it a duty incumbent upon us to convey to your Excellency, for ourselves, and on behalf *of all our fellow subjects of African descent, our unanimous opinion upon certain circumstances arising out of the promulgation of the Order in Council of the 2nd of November last.*

"We should have limited ourselves to the strict observance of that line of conduct which we have hitherto pursued, as dutiful and obedient subjects of the King, and have consequently abstained from any interference whatever with the opinions and proceedings of a public meeting, held on the 6th January last, at which we declined assisting, but for *one* of its resolutions on the subject of *allegiance* to the crown of Great Britain.

"Considering that this resolution has been ushered into publicity in a form at once solemn and imposing,—that it will be rapidly transmitted, through the medium of the daily papers, to every quarter of the world, and officially conveyed to the Throne, the Peers, and Commons' House of Parliament of Great Britain, in the name of the whole inhabitants of Trinidad,—it becomes our duty, as a part of these inhabitants, to express our unequivocal dissent from its declared objects.

"With reference to a protest against the late Order in Council of the 2nd of November last, tendered to your Excellency by the illustrious Board of Cabildo, purporting to be on behalf of 'all the inhabitants of this colony,' and published in the Port of Spain Gazette, we beg leave respectfully to state to your Excellency that no individual of *African descent* has been admitted into that body, and consequently we do not recognise it as the genuine organ of the *political opinions* of our numerous class.

"Under these circumstances, we now declare to your Excellency that the attachment which we feel to the Throne and Government of Great Britain (originating in some of us from natural affection, in others from adoption, and in all confirmed and fostered by a grateful remembrance of its liberality,) is unalterable; and that, in the ardour of these sentiments, we deprecate a dissolution of the ties which bind us to the mother country, as the greatest calamity that could possibly befal ourselves and our posterity.

"Faithful to the engagements which we have contracted by nature and from compact, we glory in the title of *British subjects. We hold it to be an enviable distinction among the nations of the*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

earth, and are always prepared cheerfully to fulfil every duty which that character imposes upon us, either in obedience to the ORDINANCES *of our King, or in defence of his crown and dignity.*

"Humbly praying your Excellency to transmit to our gracious Sovereign these loyal sentiments of his faithful subjects,

"We have the honour to subscribe ourselves, with the most perfect consideration and respect,

"Your Excellency's most dutiful and obedient humble servants.

"*Port of Spain, March* 26, 1832."

"*Government-House, Trinidad, April* 8, 1832.

'GENTLEMEN,—I had the honour to receive the Address which accompanied your letter of the 26th ultimo, and which was signed by upwards of 400 persons.

"It was my duty, as well as a gratifying task to me, to do early justice to the spirit of good feeling and loyalty which pervaded that address. I accordingly availed myself of the opportunity which immediately offered after its receipt, to transmit it to the Secretary of State for the Colonial Department, with the resquest that it might be laid before his Majesty.

"I did not fail, in my Despatch which enclosed your address, to point out the circumstances which, on this particular occasion, elicited from you, and those whom you represent, your declaration of attachment to his Majesty's Person and Government; and I have no doubt that your proceedings, and the laudable motives which gave rise to them, will be duly appreciated by his Majesty's Government.

"I have the honour to be, Gentlemen,
your most obedient Servant,
(Signed) LEWIS GRANT.

To JOHN WELCH HOBSON,
ANTONIE RADIX,
LEWIS LEBRE, Jun.
JOHN EDWARDS,
} ESQUIRES.

3. A similar address has been presented by the *free black and coloured inhabitants of New Providence, in the Bahamas,* to Sir James Carmichael Smyth, the Governor, declaring that, "if all classes of the free inhabitants are to be admitted into the calculation, the extraordinary contumacy of the late House of Assembly, with respect to the several recommendations of his Majesty's Government, are far from being in unison with the general feeling of the population;" and though that House did profess an intention, under another Governor, of "entering on a consideration of the rights still withheld from the people of colour, and the further amelioration of the condition of the slaves, yet the pledge is far too vague and inexplicit to be entitled to any confidence, when emanating from persons whose conduct and conversation, particularly with respect to the slave question, continue even to this hour in open and avowed variance with all such professions."

They therefore highly approve of the dissolution of this contumacious Assembly, and they tender their thanks to the Governor "for continuing to the colony the central schools, which afford the pleasing prospect that the rising generation, among the poorer classes, though abandoned by their guardians, to ignorance, and idleness, and vice, have happily found a cherishing source of protection in your Excellency's parental solicitude and care."

The reply of the Governor to this address is not a little remarkable:

"The little difficulties, he says, and the opposition I have met with, were, almost as a matter of course, to be expected. I arrived amongst you at a moment when the mother country (which has so long been solely engrossed by the events of the late stupendous war) was beginning to be steadily directed towards the details of our colonial system and policy. It was not in human nature that gentlemen who have passed their lives in the West Indies should at once get rid of those notions, respecting difference of colour, which we, in Europe, look upon as prejudice; nor that, accustomed from their infancy to see slaves governed principally by coercion, they should immediately be aware of the propriety of restraining the power of the master, and the policy and necessity of a more liberal and humane slave code. You, gentlemen, who have risen above the narrow notions and prejudices by which you are surrounded, I honour and respect. I do not, however, blame other gentlemen for not seeing things exactly in the same point of view that we do. I shall receive every convert with pleasure; and, as the more these subjects are discussed, the more readily and rapidly truth and justice must prevail, I anticipate with much satisfaction, that as the foolish agitation and excitement of the present moment gradually subside, so will the opposition to the views and to the recommendations of the truly paternal government of his Majesty cease equally.

"With respect to myself, I can safely assert that no man can be more truly anxious than I am for the peace, happiness, and prosperity of these islands. My best and unceasing efforts will always be directed to advance your interests. Most sincerely do I hope that when we come to have another House of Assembly, gentlemen will be chosen as members, who will see the justice and the policy of at once removing all degrading and harassing distinctions from the free coloured inhabitants; and of adopting the enactments of his Majesty's Order in Council of the 2nd November, as the slave law of the colony. The future tranquillity of these islands will then be established upon a durable and substantial foundation. Nothing short of these arrangements can lead to any satisfactory result."

DEGREES.

DUTCH AND GERMAN LL. D's.

One should suppose that justice was one of the simplest ideas in nature, but how complicated must it appear when we travel from the *Tractatus Tractatuum* down to the latest publications on all sorts of law? Little ought to be our surprize, when we find that German and Dutch *magnificent* professors, as they call themselves, and who in general are only schoolmasters, are the numerous and principal writers on the laws ecclesiastical, civil, and of nature, and of nations. A Bynkershoek, a Huberus, a Vattel, a Hubner, a Schlegel, a Busch, a Heineccius, a Grotius, or Pufendorf, are men who have written to serve a particular private personal, or otherwise some public political purpose. Had the wife of Grotius published her opinions upon some certain subjects, said a reader of lectures upon the Roman and civil law in one of our own universities, she would have been of a different opinion. It is well known that in foreign universities that whosoever takes a degree, (and degrees are mostly taken in law,) print and publish theses, which they make or are made for them. Nothing can be more ridiculous, when it as notorious that a *thesis may be bought, as well as burghers briefs and false passes, for one or a few rix-dollars,* than to see such things dressed up with all the professorial pedantry of learning, and the authors as theatrically antiquated as if they appeared in trunk-hose, jackboots, slashed doublets, great slouched hats and feathers, ruffs or bands.—(*Marriott.*)

HYMN OF THE BRITISH PEASANT.

For the pride of our fields, for our garden-deck'd land,
For our valleys and rivers, the work of thy hand,
We praise thee, we bless thee, our Father, our God,
We praise thee, we bless thee, our Father, our God!

For the fragrance of morn, for the lark's early song,
That bids us from slumber awake and be strong;
For the dews, for the clouds, for the day's varied sight,
We praise thee, we bless thee, the Fountain of Light.

For the sweets of our toil, for the oak's covert shade,
'Neath whose breathings at noontide our banquet is laid;
For the strength of our limbs, for our cheek's joyous glow,
We praise thee, who crownest the sweat of our brow.

For evening's calm hour, when labour is done,
For the fond little crowds, from each cottage that run,
For their greetings of love, when around us they come,
We praise thee, we bless thee, who giv'st us our home.

For our Sabbaths and Churches, thy Spirit's abode,
Where the old and the young swell the chorus to God;
For each holy transport that kindles us there,
We praise thee, we bless thee, the quickener of prayer.

For the promise of Spring, for thy Summer's proud state,
For the glories of harvest, for Autumn's rich weight;
For the wood fires of Winter, so gladdening and clear,
We praise thee, we bless thee, who rulest the year.

For the kind British hearts, ever joying to give,
For the friends of the poor, amid whom we live,
We praise thee, we bless thee, our Father, our God,
We praise thee, we bless thee, our Father, our God!

(Chambers.)

IMPORTANCE OF A PENNY.

From the birth of Christ till Christmas Day, 1815, one penny let out at simple interest, at 5 per cent. per annum, would only amount to 7*s.*7¾*d.*; at compound interest, to £122,774,235,714,481,746,358,966,996,740,755,491:9:6. Supposing the value of a solid inch of gold to be £38:16:6, and this immense sum condensed into a globe, its diameter will be 6,193,604 miles, 2 furlongs, 106 yards, 1 foot, 6 inches and a fraction, which would exceed in magnitude all the planets in the solar system. Supposing the earth solid gold, it would not discharge the interest of the above debt one day.

CORRESPONDENCE.

Nemo will observe, we have already anticipated his remarks on *Sir Lowry's Pass* in our present Number.

It is impossible to expatiate sufficiently on the immense advantages of good Roads to a country. Expeditious locomotion, to the commercial world, is equivalent to capital: and such is the vast importance of economy of time here, that no extra expense is considered as too great to accomplish the utmost speeds. We have this practically illustrated in the preference which British Society at home gives to a complicated machinery put into motion at an enormous expense, to travelling by the winds of heaven which cost nothing. The fact is, time gained is equal to money: and we conceive, the patriotism that suggested, the wisdom that planned, and the courage that executed *Sir Lowry's Pass* at Hottentot's Holland, did at once grant relief to the country farmers equal to each man's amount of annual taxation.

BIOGRAPHY.

The Rev. F. Fallows, A. M. F. R. S. &c. &c. late Fellow of St. John's, Cambridge, and of the Royal Observatory, Cape of Good Hope.

Few studies are so pleasing, so instructive, and so necessary, as the study of Biography. From the obliquities of errant genius, we may learn to trace the straight path of undeviating wisdom, from the failure of the unprincipled, we may learn the necessity of a true and invigorating faith; and by dwelling on the example of those who have climbed "the steep whence Fame's proud temple shines afar," we may be led to follow in their steps. Who is there that does not rise from the perusal of a *Nero,* with a soul inflamed with hatred of oppression? Who is there that can read of the virtues of a *Howard,* nor be conscious of an inward satisfaction that he claims with the philanthropist a common origin? And when we turn from the history of such men as these, to the lowly, modest worth that has adorned the private dwellings of humble life, or to the beings who have shone in literature and science, and tracking out for themselves an untrodden path to the loftier citadels of human estimation, a different but not less delightful view is opened to our contemplation.

Perhaps of all the publications of modern times, there are none of greater interest than the two little volumes entitled—*The Pursuit of Knowledge under Difficulties,* by the Society for the diffusion of Useful Knowledge. Should another volume appear, some notice of the late Mr. Fallows will doubtless enrich the work: for we think, that after the perusal of the following biographical sketch of our late lamented Astronomer Royal, his name will be handed down to posterity, along with those illustrious men who, under the most unpropitious circumstances, have possessed themselves of the highest acquirements in science and literature, in spite of every disadvantage of birth.

Fearon Fallows was born, July 4, 1789, at Cockermouth, in the county of Cumberland, and his early years were spent in following his father's occupation, that of a weaver, with no further time or opportunity for education than could be afforded by the ordinary intervals of labour. Fortunately, his father was himself a man of considerable information and studious habits, and devoted these leisure moments to the education of his child, who thus became early acquainted with the principles of arithmetic and geometry, subjects in which he chiefly delighted. When a mere boy, a mathematical book was his constant companion at the loom; and this taste was encouraged by the kindness of many persons in the vicinity, who supplied him with books, and such assistance in his studies as they were competent to give. His father having become parish clerk at the neighbouring church of Bridekirk, the extraordinary acquirements of the young mathematician became known to the Rev. Mr. Hervey,* vicar of that parish; and by the advice and recommendation of this gentleman, Mr. Fallows was engaged as an assistant by Mr. Temple, at that time head-master of Plumbland school. On the death of Mr. Temple in 1808, Mr. Hervey further exerted himself to obtain for Mr. Fallows the patronage of some gentlemen of fortune and interest, in order that he might be enabled to go to the University. In this purpose he was successful; and in 1809, Mr. Fallows commenced residence as a student of St. John's College, Cambridge.

Whatever difficulties might have previously embarrassed Mr. Fallows' career were now dissipated. At St. John's, honourably distinguished (perhaps above all other colleges) for attention to the education and interests of unfriended merit, he found every assistance which could be desired,—kind friends, most able instructors, and an unlimited power of consulting books. His progress was, accordingly, rapid and successful, though directed, as was to be expected, in the line of the older English geometers, with whom he was already familiar, rather than according to the continental mathematicians. In 1813, he proceeded bachelor of arts, and was third, Sir John Herschel being senior wrangler.

Shortly after taking his degree, as there was no fellowship open at St. John's to which Mr. Fallows was eligible, he removed to Benet College, as mathematical lecturer; but was gladly recalled to his own college in 1815, when a fellowship became vacant. Here he resided for some years; and when His Majesty's Government had resolved upon establishing an Observatory of the highest class at the Cape of Good Hope, Mr. Fallows was selected as the person best qualified to direct the future establishment.

The few months which intervened between the time of his appointment and his removal to the Cape, were spent by Mr. Fallows in the public and private observatories of the country, in the workshops of the most celebrated artists, in the calculation of special tables, and in devising the best and simplest means of making, registering, and reducing astronomical observations.

* A descendant of the admirable Rector of Weston Flavel—the author of *Theron and Aspasio, &c. &c.*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

On the 1st Jan. 1821, he married Miss Mary Anne Hervey, eldest daughter of the Rev. H. A. Hervey, vicar of Bridekirk, and embarked on the 4th May following. Mr. Fallows arrived at the Cape on the 12th of August, 1821.

His first undertaking was an approximate catalogue of 275 principal stars, published in the Phil. Trans. 1824. From the description of the instruments employed, it will be seen that they were of a very humble description, viz., a portable transit of only twenty inches focal length, and a very indifferent altitude and azimuth instrument by Ramsden, ill-divided, and unstable in its adjustments, being indeed originally constructed as an equatorial. It is probable that the length of time which must necessarily elapse between the design and completion of a first-rate Observatory, in a foreign station, was not fully taken into account, either by the Government or the astronomer; otherwise the temporary instruments would, doubtless, have been of a very different class. The plan of the Observatory was received by Mr. Fallows in the latter part of 1825, and he immediately proceeded to carry it into effect. A site was selected about three miles from Cape Town, and Mr. Fallows lived in a tent on the spot, to determine the lines of the building, and to superintend the workmen. The foundations were dug out before the clerk of the works arrived to relieve him from this task.

In the beginning of 1829, the transit and mural circle were fixed in their places, and we might now have anticipated a season of enjoyment for the Cape astronomer; but, for some cause hitherto unexplained, the circle, to which he had looked forward with pride and exultation, proved for a long time a source of bitter uneasiness. Some part of this must, doubtless, be attributed to the shattered state of the observer's health; but the fact, that "the index error of two opposite microscopes was ever variable at different parts of the instrument, while with three microscopes, at 120° distance from each other, or with the whole six, the index error was nearly constant," was sufficiently startling to harass a person of less sanguine and zealous temper. Finally, Mr. Fallows was of opinion that some permanent injury had been received by the circle and axis, from a fall which the package received whilst it was removing from the hold of the ship at the time of landing; but that the mean of the six microscopes might be fully depended upon; since high and low stars, when observed directly and by reflexion, gave the same position of the horizontal point. Before he had come to this conclusion, which seems to have been some time in the middle of 1830, sickness deprived him of the services of his assistant, Capt. Ronald; and Mr. Fallows was left, unaided, to do the best he might with a transit and mural circle. He was relieved from this difficulty by the affection and intelligence of Mrs. Fallows, who offered to undertake the circle observations while he was engaged with the transit. A very little instruction sufficed to render her perfectly competent for this task; and the Cape astronomer had, like Hevelius, the pleasure of finding his best assistant in the partner of his affections. Some of his letters, written at this time, express a strong hope and confidence that he should at length be able to justify the high expectations which had been formed of the Observatory, and that his work would bear a comparison in accuracy, though not in extent, with that of any other establishment.

But the labours of the Observatory were too much for a constitution already much enfeebled by previous illness. He had suffered very severely from a *coup de soleil* soon after his arrival at the Cape, while fixing the small transit; and, besides some less serious complaints, experienced a dangerous attack of scarlet fever in the summer of 1830, from which he seems never to have fully recovered. In the beginning of 1831, his health was visibly impaired, but he could not be induced to leave the Observatory before the equinox. Towards the end of March, he became incapable of struggling any longer with the disease, and went to Simon's Town; but it was now too late, and he breathed his last on the 25th July, 1831, in the forty-third years of his age.*

To those who were acquainted with Mr. Fallows, it is unnecessary to dwell upon the integrity and simplicity of his character, or the depth and clearness of his understanding: as an astronomer, he had few rivals. Perfectly acquainted with the practical and scientific departments of astronomy, he carried into the Observatory the same straightforward zeal and honesty which were the distinctive features of his private character; and if his life had been spared, would unquestionably have realized the most sanguine expectations of his friends and admirers.

Mr. Fallows did not leave his observations completely prepared for publication, but so nearly as to require very little additional labour. His wish was to have had them printed under his own eye, after they had been examined and approved of by competent judges in England; for which purpose, examined copies were transmitted by him to the Lords Commissioners of the Admiralty. They consist of about 3000 transit, and several hundred circle observations, with six microscopes, and some series with the invariable pendulum. The instrumental errors are ascertained, and the current reductions computed, so that there will be no difficulty in presenting the results, though not perhaps in the independent manner proposed by the observer. It is to be hoped that these observations and reductions will be speedily published, by the order of the founders and patrons of the Cape Observatory; and we are confident, that they will be found in every way worthy of Mr. Fallows and of the country which committed this important and magnificent establishment to his charge.*

In the absence of the *South African Quarterly Journal of Science*, or any similar publication at the Cape, we feel it our duty to give publicity to the following interesting particulars relative to

LOCKED JAW.

A case of this disease occurred very lately on board a ship on her voyage to Calcutta from England, in which, as the plan of treatment that was used, proved eminently successful, it is important that the same should be made as generally known as possible, considering that this complaint is one of very frequent occurrence, and that it almost always proves fatal, under the modes of practice usually recommended and adopted. I therefore present the account of the case, as given by the medical gentleman who suggested the treatment, together with

* It cannot be concealed, for biography, like history, as we quoted in our last Number, must not be "a dead almanack;" that the Colonial Government of 1827 did, by its series of petty meannesses, greatly annoy and injure the mind and body of the Astronomer Royal.

* In Number 16, page 197, of this Journal, there is an interesting Reminiscence of Mr. Fallows. It describes his attachment to certain publications of popular as well practical interest; —viz: Huber on Bees and Ants, Bewick on Birds, and the illustrious Bunyan.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

his remarks, for publication in the Cape Literary Gazette, if considered fitting; and I would say, that of all the numerous remedies I have ever seen, or heard of being tried for the cure of this dreadful affliction, none appears to me so scientific and rational, and at the same time so likely to prove generally successful, as the one that was here employed. The *instantaneous* remission of the Tetanic symptoms which was obtained on the division of the nerve, strongly impresses us with a conviction, that the same happy result will attend the operation in other cases; and leads us to wonder, that the principle upon which it is founded, should have been so seldom acted upon in the same simple manner, and that this operation itself should have been little more indeed than cursorily spoken of.

The idea of *amputating a limb* for the removal of local irritation confined to a small spot, which has been so repeatedly done in this disease without success, and but too often to the acceleration of the death of the patient, from the great additional shock it gives to the system, strikes us now as quite shocking and barbarous; and the operation of excising the wounded part, which is proposed with the same view, must be not only inefficient, but generally impracticable and injurious, from the nature of the parts concerned; for how can tranverse incisions be made with propriety among the numerous nervous filaments, and the membraneous parts about the hands and feet, (where the wounds which give rise to Tetanus are generally situated;) or do otherwise than add both to the local and constitutional irritation, and aggravate the disease?

Those surgeons who have seen most of Tetanus, generally discourage the practice of these operations, from the want of success that has attended them; and the authors who speak of amputation, reason upon its ill success in this manner: "That although the general spasms are the consequence of the local affection, the constitution when it has been once excited, will continue the disease through its career, whether the original cause be removed or not." This reasoning, however, appears to be quite incorrect; and indeed it is disproved by the present case, from the marked relief given to the Tetanic Spasms, the moment that the local cause of irritation was cut off; and, although the general symptoms did not *entirely* cease till a couple of days after the operation, there cannot be a doubt that the cure is attributable to the division of the nerve, and not to the other means employed; and it is certainly unreasonable to suppose that when the primary, and still continuing local cause of irritation is removed, the constitutional excitement, which proceeded therefrom, will not also be relieved.

Mr. Wardrop's cases of wounded nerves, related in Med. Chir. Transactions; and the following observations regarding Tetanus, made by Dr. Pinnock, in the American Journal of Medical Science, No. 3, are of much interest, and tend to confirm what I have adduced: "My attention," says he, "has been forcibly directed to the astonishing effects which are produced by the application of cupping glasses in arresting Tetanic symptoms:—even where decided Opisthotonos has been exhibited, we have witnessed a subsidence of the symptoms, by means of pressure thus applied. I therefore venture to propose it as one of the means of combating that teriffic disease Traumatic Tetanus. This variety of Tetanus appears to be occasioned by the injury sustained by the sentient extremities of the nerves of the wounded part. It has occurred to me, therefore, that if these wounded and irritated nervous extremities could be paralized, the general spasmodic action which is produced by the local irritation, would be arrested. Would not pressure by weights or ligatures, or the application of exhausted cups over the wound, or in its immediate vicinity," *(how clumsy the means!)* "paralize the sentient extremities of the wounded nerves, and thus suspend, and perhaps remedy, the general spasmodic action? If the constitutional symptoms should be arrested, as a security against their return, before the cup over the wound is removed, an incision so extensive as effectually to remove the wounded portion of the nerves, ought to be made."

I agree with Dr. Murray, that his having had early recourse to the operation, very probably led to its more certain success, than if it had been long delayed, as the nerve, from its enlarged size, seemed to have already become much affected, and the disease was probably propagating itself to the general nervous system through the medium of it; but I think it is quite clear, from the immediate effect obtained from the operation, that it should never be omitted in any case in which it is practicable, and that it holds out a good chance of success even in the very latest stages of the disease; besides, it possesses this great advantage, that there need be no hesitation or delay in having recourse *to it*, on the first appearance of Traumatic Trismus, although one would naturally both hesitate and delay long, before trying such a desperate remedy as amputation.

It is obvious that the surgeon is required to be perfectly acquainted with the situation and distribution of the different nerves of the body, in order to know exactly what nerve or nerves supply the wounded part, and be able to cut down upon the branch or branches affected, in the most eligible and proper place, as much will depend upon his skill and dexterity; and that it may frequently be necessary to divide more than one, where the injury is extensive. As it appeared in this instance, that the nerve re-united in the course of two or three days, so as to restore the sensibility of the part, and thus to re-establish its communication with the general nervous system in that time, it may in some instances become a question, in the event of the Tetanic symptoms returning afterwards, whether it would not be advisable to remove a small portion of the nerve; but, as a precedent, it is rather to be considered a fortunate circumstance that this was not done in the "*Pattison*" case.

In directing the attention of the Profession to the *local remedy* which was employed in this instance with so much success, it is on no account to be understood that other remedial means are to be neglected; on the contrary, in each separate case the practitioner must consider what general plan of cure is indicated by the symptoms, and adapt it to the constitution and habits of the individual; and whether bleeding, purgatives, opium, tobacco, the warm or cold bath, mercurials, stimulants, *Galvanism*, or any combination of these be deemed necessary, whatever is indicated as proper to be done, ought to be carried into effect with decision and promptitude.

I would further add, that it has occurred to me, from the best consideration I have been able to give to the Pathology of another disease no less dreadful than Tetanus, and which, from its almost invariable fatality, ranks equally amongst the *Opprobria Medicorum*, that this same simple operation promises to prove in it also, a remedy of superior value to any other that has yet been tried—I mean *Hydrophobia*, in which the modes of treatment at present in use, are as multifarious, opposite, uncertain, and empirical, as in Tetanus.

I apprehend, however, that I have already intruded too much upon the patience of your general readers, and I purpose therefore giving my ideas on this subject elsewhere. J. M.

CASE OF TETANUS,

Following a punctured Wound in the Foot, cured by division of the Posterior Tibial Nerve.

I was a Passenger in the ship "James Pattison," from England to Calcutta; when in the Channel, three days after leaving Portsmouth, at 10 o'clock A. M. on the 15*th August* last, the Surgeon of the ship (Mr. D. Leslie) came and reported to me that Mr. Wm. Pile, one of the Midshipmen, Æt. 15, had trod upon a rusty nail the preceding evening about 9 o'clock, which penetrated the left foot between the Metatarsal bones of the great toe and the adjoining one; and that symptoms of locked-jaw had made their appearance. The patient had kept his watch after the accident during the night, which was cold; and the wound had been very painful. When he was seen in the morning, at 8 A. M. he complained of a stiffness about his Jaw and Throat, which had increased very much since that time,—his countenance was anxious, and his lips appeared swollen, and rather livid. A poultice to the wound was the only treatment that had been employed. On consultation, the following draught was agreed to be given, R Pulv. Camph. dr. ½, Tinct Opii m LXX, Syrup: Simpl. oz; m. S. S. and, as the jaws were nearly closed, and great difficulty found to get them opened to the extent of a quarter of an inch, a piece of wood of this thickness was inserted between the teeth. Half an hour after taking the draught he was visited again, but no beneficial effect had resulted from the opiate. The Tetanic symptoms were rather increased,—the spasms had partially extended to the muscles of the neck, and the piece of wood was deeply indented by the teeth—the limb was cold, and he said "it was dead, excepting at the site of the wound which was painful; and that he had little power of moving it." His pulse was 120, and what may be called irritable; and his situation altogether seemed to be one of great danger. He was ordered to be carried to one of the best cabins, and after considering all the different modes of treatment that have usually been recommended and employed in Tetanus, and finding how undecidedly they were all spoken of, as to affording hopes of cure, I proposed to Mr. Leslie the division of the Posterior Tibial Nerve, (by which the injured part was supplied,) as a remedy that held out a good prospect of success, from its effectually cutting off the communication between the source of irritation and the brain, at the same time that it was an operation easily performed, and unattended with danger or deformity. I proposed also, that the original wound should be dilated and cauterized. My proposal being agreed to, so soon as the necessary preparations could be made, the operation was performed. A straight incision, an inch and a half in length, was made through the integuments and the aponeurotic fascia, about an inch posteriorly to the Malleolus internus, which laid bare the sheath of the vessels; and, on dissecting deeper, I easily found the Nerve in its usual position. By an Aneurism Needle I separated and raised the Nerve, so that I might divide it with greater facility and expedition. When brought thus into view, it appeared to be so remarkably large, (being nearly twice the usual size,) though of the natural colour, that a doubt was expressed by Mr. Leslie about its being the Nerve. To satisfy him on this point, I requested the patient to extend his foot, which he did with difficulty, and in an imperfect manner, as he said he had nearly lost the power of moving it; but he did it sufficiently to shew the difference between the Nerve and a tendon, as it did not become tense in this action. The Nerve was then rapidly divided by a single cut of the Scalpel, which gave acute pain; and although he could not articulate distinctly before, on account of the closed state of his jaws, *he immediately opened his mouth with an exclamation;* and, on looking at his countenance, I was astonished at the striking change in it for the better. I asked him how he felt, and he said, "He was already much better, and that his leg had come to life again."—He expressed at the same time a great inclination to go to stool. There was scarcely any hæorrhage from the wounds, which was then simply dressed, by bringing the edges together by adhesive plaster, with lint and a bandage over it. We next dilated the original wound made by the rusty nail, which also gave (rather unexpectedly) great pain, but did not cauterize it as proposed, as the symptoms had already yielded—a poultice sprinkled with laudanum was applied over it. His bowels were then copiously moved, and on being placed in bed, without any additional opiate, he fell into a sound sleep, which lasted without interruption for four hours, and he awoke very much relieved from all his former disagreeable sensations. His jaws still however felt rather stiff, but, by a strong exertion, he could open them nearly to the full extent. The excessive pain in the original wound, of which he complained previously to the operation, had now entirely ceased, and the motion of the limb was quite restored. It was found, on examination, that the heel and sole of the foot were quite benumbed, but the sense of feeling in the upper part was not affected. At night he got the following powder, Pulv. Opii gr. ij.. ——Camph. scr. i. m.

August 16*th*. Slept indifferently during the night—complained still of the stiffness of the jaws and neck, and to a greater degree than the preceding evening. He had also pain and tightness across the chest, with headache. I was very sea-sick, and in bed by this time, and unable to make more minute inquiries about the symptoms; but I recommended V. S. and another opiate to be given. He was bled accordingly to the extent of twelve ounces, which induced syncope and gave great relief; and he got the same opiate as last night, after which he slept a good deal during the day. His bowels were naturally opened, and the opiate was repeated at bed time.

August 17*th*. The opiate of last night appeared to produce considerable excitement for some time after it was administered, but this was followed by sound sleep—the stiffness of the jaws and neck, and tightness across the chest, have nearly altogether disappeared. He complains of a good deal of numbness in the leg and foot.—Pulse 80, and natural, tongue clean, bowels regular. Repet. Pulv. h. s.

August 18*th*. The Tetanic symptoms have entirely disappeared, the numbness of the leg is gone off, and he complains of pain in it, extending from the knee downwards—the parts in the site of the operation are very tender, and extremely painful on pressure—the original wound continues to be poulticed, and looks healthy—The opiate powder to be repeated in half the quantity.

From this date, no unfavorable symptoms appeared—the wound in the sole of the foot healed in a few days—that of the operation did not unite by first intention, and did not heal till about a fortnight after—the sense of feeling began to return in the sole of the foot on the third day after the operation, and is now natural in most places, but there is still, up to this date, an entire want of sensation in the little toe, and heel. He complained for some time of not being able to perform the action of separating the toes so easily as formerly, but that no longer exists, and he finds no inconveniece whatever in walking, and in the performance of all his regular duties:—In fact, he is quite well.

REMARKS.

I have thought the above case worthy of notice, from the result of the usual modes of treatment pursued in this disease, as given by our best authors, having been so generally unsuccessful. Hennen, whose experience in it must have been great during the Peninsular War, says, "Happy should I be if I could afford any thing satisfactory on this complaint; but, in truth, my observations have tended more to shew me what I could not trust to, than what I could place the smallest reliance on, when the disease was once fully formed;" and, he further adds, "I have never been fortunate enough to cure a case of acute symptomatic Tetanus." I think it important to notice that he mentions, that in one case, he found, on dissection, the nerve connected with the injury *thickened*, seeing this appearance was so remarkable in the instance I have here recited. The lengthened account of Tetanus in Cooper's Surgical Dictionary, which I consulted at the time, rather bewildered me as to the treatment to be followed, and only shewed the great difficulty to ascertain, amongst numerous discordant accounts, what practice seemed to have been attended with the least *ill success*. "Nothing," as he says, "is a more certain proof of our not being acquainted with any effectual method of treating a disease, than the multiplicity of remedies recommended, which are as opposite as possible in their effects." I decided upon following the indication which seemed to me the most rational, and not to adopt any plan, or to use any remedies proposed, on empirical principles, seeing how unavailing they had mostly all been. I am only aware of one case of Tetanus in which the communication was cut off between the wounded part and the sensorium, *by a suitable division of the nerves supplying the part*. It is one adduced by Baron Larry, and as in that instance the operation was followed by a similar result to the present, I am surprized that the hint never seems to have been taken from it, and followed up by others. Amputation has frequently been performed with the same view; but has seldom succeeded, probably from its having been too long delayed; and I would ask why such a severe and *maiming* operation should ever have been thought of, or persisted in, when the same object can be so much more readily and scientifically attained *by a simple incision?*

We are told that when the disease invades very quickly, the danger is always greater, than when it comes on at a more distant period from the receipt of the injury. In this case its attack was very early, and the progress of the symptoms rapid; and I have no doubt that it would soon have run its course to a fatal termination, if it had been left to the sanative powers of nature alone, or treated in the usual manner; but very little time was lost in having recourse to the operation, that proved a remedy of immediate and effectual power, after the disease had decidedly formed; and I think it may have been of the greatest consequence that it was resorted to so soon after Trismus appeared.

JOHN MURRAY, M D.
Assist. Surgeon, Hon. E. I. C. Service.
Cape of Good Hope, 24th October, 1832.

EMIGRATION.

It cannot be denied that this colony, abounding with every other blessing, suffers exceedingly from the paucity of agricultural as well as all other description of servants; and the great mystery is, that nothing is done to remedy the evil to an extent equal to the demand. Disposed as we are, to sympathize with our enterprising settlers on the frontier, as it respects their deprivations on this head, we lament to find the Graham's Town Journal tempted in its remedial suggestions, to abridge the liberty of that class of His Majesty's coloured subjects who have but lately been delivered from the *house of bondage.**

* Aristotle, in that very book where he establishes the grand principles of a free government, is not ashamed to assert, that the Greeks were destined, by nature, to rule the other nations of the earth; and founds this right on their superior genius and civilization!

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

As it regards emigration, we think the tide will scarcely flow much longer in favour of Australia; and we trust, the press will do its duty in favour of our more interesting Cape Colony. Let the following descriptive account of the state of things in New South Wales lead the reader to be thankful that his lot is cast in this country, that he enjoys "a goodly heritage."

PENAL COLONIES.

(From the Foreign Quarterly Review.)

The morals of the colony of New South Wales are of an exceedingly depraved description. It is so far from being a country where men begin a new life and enter upon a fresh course with resolutions of amendment, that the testimony of all respectable men examined on the subject unites in asserting that the habits of the freed men, even of those who have acquired property and have families, are of the most dissipated character. Of the emancipists, to whom grants of land have been made and who are often wealthy, very few, not more it is said than half a dozen, can be selected whose lives are not of a vicious description, who do not indulge in dishonest practices of one sort or another, and who have not risen to wealth by fostering and practising some species of villany. These men procure convicts to be assigned to them, who become members of the families, and assist them in carrying on their various frauds. In Sydney the grog shops are very numerous, and grog shops are receiving houses. A constant trade in stolen goods, is going on between Sydney and the remotest parts of the colony, and even between Sydney and this country. The convicts in remote settlements have no means generally of indulging in licentiousness, but they see constantly before them the *freed* labourer who has, and they burn to enjoy similar privileges: and should their place of occupation be too remote from a theatre of indulgence, they get a week of holiday at Sydney, where they arrive in numbers, and, for the time they stay, wallow in every species of debauchery. In such a state of society the public standard of morality must necessarily fall to a very low degree. The leaven spreads from the corrupted part into the whole mass. Just as the slang of London thieves is become the classical language of Sydney, so do necessarily a familiarity with crime, hatred to law, and contempt for virtue, make their way into the minds and hearts of those who are untainted with actual crime. So far from a reformation being even begun in New South Wales, it would seem that roguery had been carried a degree beyond even the perfection it has reached here. Property is very insecure in Sydney, and the most extraordinary robberies take place. Mr. James Walker, in his evidence before a committee of the House of Commons, says, "the colony has a curious effect upon the most practised thieves in this country; one of the most experienced thieves in London has *something to learn* when he comes out there; probably he would be robbed the first night he came into his hut." (913) This was the answer given by an experienced settler to the question, whether he thought any considerable degree of reformation took place among the convicts residing at a distance from Sydney. It is nearly impossible that it should be otherwise. The master can only punish his servant by travelling with him some twenty or thirty miles to a police magistrate, by which he loses his own time, the labour of his servant, perhaps for months, if he is condemned to a road gang, and after his return has little advantage from his services. Unwillingness to work for a master who has been the cause of his punishment is a difficult feeling to counteract. The convict has the game in his own hands: he either does no work, wounds himself, falls sick, or perhaps, and it is not uncommon, spoils either the materials entrusted to him, or the tools which have been put into his hands.

The number of executions in New South Wales in the year 1830 exceeded the whole number of executions in England and Wales, in the same year; which, taking the proportion of the populations of the countries, makes capital punishments upwards of three hundred and twenty-five times as frequent as in the mother country. This horrid fact is pretty well, of itself, an answer to all argument drawn from the idea of reformation. But direct testimony is abundant. Major M'Arthur, the son of one of the wealthiest and most extensive settlers in the colony, and to whom it owes so much for its present progress in production and commerce, states, "It is painful to know that those whose sentences have expired, or to whom pardons have been granted, seldom or ever incline to reform, even when they have acquired property." Intoxication and fraud are habitual to them; and hardly six persons can be named throughout the colony, who, being educated men, and having been transported for felonies, have afterwards become sober, moral, and industrious members of the community. Crime is of constant occurrence, and so completely organized, that cattle are carried off from the settlers in large numbers, and slaughtered for the traders in Sydney, who contract with the commissariat. It is not, therefore, the vicious habits alone of the town which are to be dreaded, but the effects that are communicated and felt throughout the country. The agricultural labourer is encouraged to plunder his master, by finding a ready sale for the property he steals, and whenever his occupations call him to the towns, he sees and yields himself to the vicious habits around him. He returns intoxicated and unsettled to his employer's farm, and incites his comrades to the same sensual indulgences, with equal disregard of the risk and consequences. To these causes the present vitiated and disorganized state of the convicts in New South Wales is chiefly attributable; and the extent of the evil may be in some degree estimated, when it is stated *that the expense of the police establishment amounts to more* than £20,000 per annum for a population of 40,000 souls.—(Rep. App. No. 6, p. 142.)

The white slave trade is even worse than the black; we planted an impure population on an innocent shore; we have inculcated our impurities, propagated poison. Sydney is a Upas tree of crime, and we have spent millions in aggravating its noxiousness. Let the evil cease. Ages will take place before that unhappy land is purified from the contaminating dregs of our civilized crowds, but let us not renew the mischief from day to day, aggravating and perhaps perpetuating the most horrid enormities. The Australian colonies have been born in sin, and many ages must elapse before the stain is wiped out. Were the infant in the cradle, as is but too often the case, to fester with the diseases inherited from its debauched parents, it would be an apt illustration of the brilliant invention which transplanted crime into a soil yet better adapted than our own for its vigorous increase and continuation.

A REMINISCENCE OF AN ENGLISH WINTER.

At four o'clock in the afternoon of the 12th of January, 18—, the velocity coach had reached within a few stages of Liverpool from the metropolis. She was the quickest coach on the road, travelling at the rate of nine miles and a half in the hour, including stoppages. The weather had been raw and chilly, but it now appeared inclined to frost.—The travellers, who were four outside and three in, besides the guard and driver, began to wrap themselves up in additional coats and handkerchiefs. A slight snow came on, which lasted for about half an hour, and after it had ceased the frost became most intense.—I'll tell thee what, John, said the guard to the driver, this is going to be one o' t' hardest frosts we ever had. I think it be, indeed, replied the driver. It's very cold, very; said a very fat Yorkshire clothier, who sat behind the driver. You're right there, said his neighbour, a thin traveller in the worsted line. I wish I had a glass of brandy, said the next, a jolly rubicund person, whom Nature seemed to have designed for a publican, though he was only a sinner, in the shape of the manager of a strolling company. I would rather have a pipe, said the fourth, also sitting in the same row—a gruff sea-captain. At the end of the next stage the manager had his glass, and the captain his pipe, but worsted and cloth took nothing. About the middle of the stage following, the three insides (being of one family) got out and left the coach at a house by the road side, to which they belonged. The outsides were offered inside births till other insides came; but they all refused, on the ground of the cold which they would endure if compelled to turn out.

I'll tell thee what, John said the guard, as they arrived at the end of the stage, I never felt such a night as this is. I wish we may all get safe to Liverpool. Hoot, Hoot! said the driver, *I's* warrant us safe enough. The sea-captain employed himself before the coach set off again, in wrapping straw about his legs; an example speedily followed by the whole party. The guard asked if any one had particularly tight boots—because, he observed, your feet will swell, and nobody knows how you will get the boots off. It happened, however, that nobody had boots on but the guard himself. Be so good as waken that stout gentleman, said the guard; that gentleman with the nightcap on. There's nothing so dangerous as sleeping in frosty weather.—Egad I always like my bed best in frosty weather, observed the manager.—But not to sleep upon deck, growled the captain. The old clothier had put on a nightcap under his hat, and was sncring away as if already in a snug warm bed at Manchester. He was roused, and the worsted traveller undertook to keep him alive by the aid of his snuff-box. I'll trouble you for a pinch, Sir, said the driver. I believe I shall go to sleep myself if I don't take care. To whoo—to whoo—tereng—tereng—tereng, went the horn of the guard, who thought perhaps that was the most effectual way of preventing slumber. An I'll take one too, said the captain, till I can get a pipe—for I'll be *blowed* if I know whether my nose be on my face. He took a pinch, and sneezed loudly. I was going to ask for one, said the manager, but I do not know how I could feel it—for I have just lost the use of my right hand finger and thumb. Put them in your mouth said the sailor. If your's was wide enough, said the manager, I'd leap down your throat and stay there till we get to Manchester. O—o—oh! au! au! ya—a—a—au! said or rather uttered the clothier, spreading out his arms, and evidently desirous of once more slumbering. Take another pinch, exclaimed the traveller. The old clother did so and sneezed so powerfully, that he had like to have blown all the snuff out of the box.—for some time the coach proceeded in solemn silence, till the guard again blew, and set all the tongues a-going, but not quite with the celerity of the former conversation. The manager called for brandy whenever an opportunity of drinking a glass was offered to him, and the captain had his pipe. Mr. Thompson the worsted traveller thought it was not half so cold as the others imagined, and the clothier abused him for his opinion, and gave him as a proof of the state of the atmosphere that his (the clothier's) nightcap was frozen on his head, and that his whiskers were adhering to his shirt collar. Some slight and sleepy argument took place on the subject; but the truth of the matter was, that Mr. Thompson's extreme cold had already passed, and he was not wise enough to perceive that he could not possibly feel so intensely as before, because he was becoming benumbed.—About this time the horses suddenly stopped, and stood unmoved in the middle

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

of the road. This aroused all parties. The guard got down and went to the heads of the fore-horses.

Guard.—Here's a man lying, but whether he's drunk or dead there's no seeing. Here he flapped his arms together to put something like circulation into his frame, but he succeeded so badly, that at length he concluded with the remark that both his legs and his arms were dead, and they must just do their work as well as they could without feeling. He seized the body as well as he could and laid it at the bottom of his own seat, and the driver gave a gentle flourish—as it were a mere wave of his whip, and off went the horses once more. But little curiosity was excited by this body.—Every one seemed to be too much absorbed in himself to pay any attention to what was going on around, and in a few minutes even the guard seemed to have forgotten the intended object of his humanity. All was now silent, save now and then the guard himself giving some faint notes from his horn, as if the music like that of the postillion's horn in the Baron Munchausen had stuck fast with the frost, and would come out of its own accord as soon as the frost should cease. A thought struck the guard that all were going to sleep, and he rubbed his eyes, as well as he could feel them, and shouted out—gentlemen, I'm afraid you are all going to sleep. Don't go to sleep I pray you, gentlemen; don't go to —ya—a—a—au! sleep. Its a —— oh dear!—ya—a—a—au!—very bad thing in frosty weather. And straight he fell sound asleep himself.

The gate about ten miles from Liverpool was wide open, and the coach went past without any stoppage, though it was usual there to water the horses. The man who was standing at the door of the gate house with his pails ready, observed that the cold weather would keep them from thirst, and he thought John the driver was wise in not giving them water in such an inclement season. He shut the door and went to bed.

The coach arrived at the Bull's-head at 11 o'clock at night. The waiter rushed out as usual and opened the coach door. There was no one inside. He shut the door again, and all was silent. Where was the driver? The drunken scoundrels, said he—the guard and he have had no passengers, and after making beasts of themselves, have fallen off the coach and let the horses bring it in of their own accord as it did once before. But he would bring a light and call his master—for the rascals must be trounced. He brought a light and his master, and there appeared the figures of guard and driver, and of the four passengers, sitting on the coach, but still all was silent. The waiter mounted the driver's box. There he was with the whip in his hand in the act of giving the last faint flourish after the man was found on the road.—The captain had his pipe in his mouth, and was holding it with his left hand, while he appeared to have been pressing the tobacco down with the fore finger of the right. The manager had a phial to his head which he had had filled with brandy, but it was now emptied, and he was just in the attitude in which he swallowed the *last* drop.—The worsted man—his last yarn spun out—was turning towards the clothier with his snuff box in his hand, just offering a pinch to the old boy, who was fixed in the position of sneezing, the petrifaction of sternutation. The guard (poor fellow) had his horn to his lips, and his cheeks were distended, as if at the very last he had been exerting himself to avert danger from the company. They were all stiff and irrecoverably dead. The man they had picked up had been apparently intoxicated, and had fallen in the middle of the road, and slept to drink no more. They were all buried in one grave, and old people are yet living who date their recollection of the severest frost they ever knew to what they denominate "the night of the Velocity."

DIVINES OF THE CAPE.—No. I.

(EXTRACTS FROM THEIR PUBLISHED WRITINGS.)

On the Duty of submission to Lawful Authority.

REV. GEO. HOUGH, M. A.

ACCORDING to the Politics of the Gospel, (if we may so express ourselves,) form the greatest security to all temporal jurisdiction, and are the most effectual means of rendering every man, within the bounds of his proper station and duty, useful to society and to Government. They recommend us to cultivate a principle of obedience to our legitimate rulers, under what class or denomination soever of constituted authority they be ranked, whether Kings, supreme,—or Governors, or Officers, or Magistrates. We are repeatedly and earnestly called upon to consider Government as the Ordinance or appointment of God, and the effect of His superintending Providence for the peace and benefit of mankind; and persons in sufficient and legal authority as His deputies; nor let the "presumptuous and self-willed," who "resist the power," suffer themselves to be deluded by the belief, that if they happen to escape the visitation of human justice, they are likewise secure from the Divine. The day will come, if not in this world, yet in another, when "the Lord shall render unto every man according to his deeds;" and, "he that hath done evil" in any department of life, or sphere of his duty, "shall receive for the evil that he hath done." By St. Paul, "every soul" is required to "be subject to the higher powers:" because, as he informs us, "there is no power but of God: the powers that be are ordained of God."

The Condition and Circumstances of a British Soldier. (By the same.)

ADDRESSED TO THE MILITARY.

IT might be demonstrated, that the condition and circumstances of a British Soldier, as such, are so far from impairing his natural advantages, or from placing him below the standard of comforts enjoyed by the great majority of his fellow-countrymen and subjects, that now, for a period of thirty years, more and more effectual provision has been made for *your* benefit than is, or in the existing state of things than can be furnished for any other class of English citizens. No soldier need be poor or cheerless. You are better off than the great bodies of men engaged in manufacturing or in agricultural employments: better off, perhaps, than two thirds of the whole English population: and incomparably better paid, better fed, better clothed, better lodged, and more humanely and beneficially treated, than any other Military Service of Europe.

Calvinism and Puritanism.

REV. E. J. BURROW, D. D.

IT would be deemed invidious, perhaps, and deserving of your strong displeasure, to point out, in the pages of history, the lamentable effects which have already ensued in this country, from the influence of Calvinistic doctrines and Puritanical separation.

The Past and the Future. (Ib.)

THE past is the mirror in which we are anxiously to observe the future. Little did the first Puritans, some of whom may be deserved to be ranked with the greatest ornaments of the Christian Church, little did they expect that their exhortations would even finally produce regicide and anarchy, blasphemy and murder; and would place the sovereign power of Church and State into the hands of a crafty designing hypocrite.

Criminal Virtue. (Ib.)

THERE is no virtue, which, if carried to an extreme, does not border on, or actually become a vice.

Baptismal Regeneration. (Ib.)

I believe that I am not asserting too much, when I affirm, that if Baptismal Regeneration is proved to be doctrine of our Liturgy, Offices, and Articles, then all that has been said of the Calvinistic tendency of the latter, must be deemed unsatisfactory and groundless. It will, I suppose, be admitted, that we may look for consistency between our Confessions of Faith and the Common Prayer Book If, therefore, the office for Baptism distinctly and solemnly declares that children are thereby regenerated, the Articles must be interpreted as to convey the same truth.

Opponents to the above Doctrine. (Ib.)

It seems almost unnecessary to prove, that the tenets of those writers to whom I have before referred, and whose works are most esteemed by the Evangelic Party, are uniformly and expressly opposed to the doctrine of Baptismal Regeneration.

Evangelical Doctrine.

REV. H. OKES, D. D.

THE necessity of more fully asserting the doctrine of the atonement, and of pointing out the value of Christ's sacrifice, was, perhaps, never more apparent than at the present period. To the neglect and obloquy with which this doctrine has been for a long time attended, may with some justice be attributed to the prevalence of deistical sentiments, and the fatal effects of which they have been productive. To preach Christ crucified, becomes the most important duty of the Christian Minister.

The Sabbath Day. (Ib.)

NEXT to idolatry, no sin is more reprobated than the violating the Sabbath Day. The day was blessed and sanctioned by the Almighty, previously to the institution of the ceremonial law under Moses. The observation of it, as a sacred day, was then renewed by a positive command.

The Christian Faith.

REV. J. ADAMSON, D. D.

WE echo the voice of triumph, when we find men holding the faith of the Gospel of Jesus Christ, and rejoicing in its progress. We seek that every man, lofty, intellectual, and virtuous as he may be, should have it among the attributes which grace him. Being so, he is our brother, otherwise he is nothing. His mind is then to us a temple, in which God is not and cannot be. We care not for its symmetry or splendour. It may be to other men a storehouse of exhaustless wealth: we see in it, in its riches or its graces only a source of temptation to them. We seek that the Spirit should in his time, shake down its gates, that the King of Glory may enter and be the Ruler of its wealth We pray that all which in his mind, station, graces, affection, or influence of man opposes him, may fall prostrate as the world's idolatries and their glorious shrines and idols sink in ruin, by that moral earthquake, which our faith spread in its first diverging shock amid men's associations, when there came out Zion the Deliverer.

The efficacy of Christian Belief.

REV. J. PHILIP, D. D.

FROM the hour we believe in Christ, and feel the transforming efficacy of his sacrifice, death ceases to be any longer of a penal nature, and the curse is changed into a blessing. The things of time are now estimated in the light of Divine Truth; the glories of eternity are placed against the wealth and honor of the world: the fulness of joy which is in the presence of God, is contrasted with the momen-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

tary gratifications of sense; and the favour of God is valued above the friendship of the world.

The Schoolmaster abroad.

Before the days of Christ, the schoolmaster was to be found in the houses of the noble and of the great; but it was Christ who first sent the schoolmaster *abroad*, and it is Christianity which keeps him abroad.

Mahommedan Slave Proprietors.

REV. WM. WRIGHT, M.A.

I have already alluded to the noble example of giving freedom to their slaves, set by the Mohammedan proprietors at the Cape of Good Hope. I have also stated that the slaves of this persuasion have been at all times regularly married, although their marriages are not sanctioned by law. It may not, perhaps, be generally known, that in those laudable customs they are but obeying the precepts of their Prophet That extraordinary man having either imbibed much of the spirit of these sentiments, (although but imperfectly acquainted with the Scriptures of the New Testament,) or at least, having adopted them in his political wisdom, of which he possessed no small share, has fully sanctioned both the compulsory manumission principle, and the rights of marriage in the case of the slave, and has made them the subject of special rules.

The word "Methodist" Explained.

REV. W. J. SHREWSBURY.

THE name "Methodist" is perfectly harmless; though many are accustomed to associate with it a train of dismal ideas of heresy, schism, and rebellion; yea, the name has now become the most honorable appellation in the world, next to that of christian; but it is no longer confined to the people whose it is *by right*, but it is commonly applied to every man who "lives soberly, and godly, and righteously, in this present evil world." Every Church-of-England man, *who by the aid of grace tries to observe his baptismal vow*, is to all intents and purposes a Methodist; for, according to the true original application of the term, a Methodist is nothing more than *an improved Churchman*.

ORIGINAL CORRESPONDENCE.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—I should not venture to trouble you with the following Observations on the Era of our Saviour's Crucifixion, if any Chronological Table already published, were found to harmonize with the account given by the Evangelists. The most approved Chronological Table is, probably, that of Dr. Doddridge, or that usually annexed to the quarto edition of the Bible, published by the Society for Promoting Christian Knowledge, called the "Index to the Bible." Each of these, on the authority of Sir Isaac Newton, assigns the crucifixion of our Saviour to the 4746th year of the Julian Period, A. D. 33, at which period our Saviour must have been in his 37th year. Dr. Doddridge, in his Notes, states that St. John began to baptize in the 15th year of Tiberius, A. D. 26, reckoning from the time he was associated with Augustus, and supposes that our Saviour was baptized in the year following, when he "was thirty years of age and some odd months;" but, according to his Chronological Table, our Saviour was baptized A. D. 29, in the 33d year of his age, and the 15th of Tiberius, reckoning from the death of Augustus. Both Dr. Doddridge and the Bible Index make an interval of *four* years between the baptism of John, and the first Passover of our Saviour, which they place A. D. 30, when our Saviour was in his 34th year. But there appears to be no authority from the Scriptures for so long an interval. I shall endeavour to shew from the Scripture account of the Passover, that our Saviour could not have been crucified in the year assigned by Sir Isaac Newton.

How far these Observations may be suited to your Publication, I must leave you to determine.

H. O.—S. T. P.

Cape Town, Nov. 1832.

ON THE ERA OF THE CRUCIFIXION, AND ITS ACCOMPLISHMENT, ACCORDING TO THE PREDICTION OF THE PROPHET DANIEL.

Many Commentators, from misunderstanding the meaning of the word "Passover," as applied by St. John, have supposed that our Saviour ate the Paschal Lamb a day *before* the other Jews, and that he was crucified on the day when the Paschal Lamb was slain. It is probable that this is the foundation of the assumption of Sir Isaac Newton, who says in his Observations on Prophecy, (Book i. ch. 11th, pp. 144 and 168,) "I take it for granted, that the Passover was on Friday, the 15th day of the month Nisan," (i. e. on the day when the Paschal Lamb was slain,) "the great feast of the Passover, on Saturday, the 15th of Nisan, and the resurrection on the day following." Sir Isaac Newton having made this assumption, proceeded to determine the year of our Saviour's crucifixion, by calculating the time of the Paschal Full Moon for several successive years. According to his computation, the 14th of Nisan fell on a Friday, in the 4766th year of the Julian Period, April 3. He supposes that Jesus was crucified on the same day that the Paschal Lamb was eaten. But if what he has assumed be erroneous, his calculation cannot determine the year in which Christ suffered. I shall proceed by shewing, on the authority of the Scriptures, that the *Thursday* on which our Saviour ate the last Supper with his Disciples, was the day of the Paschal Full Moon, when the Paschal Lamb was killed; that in the year of our Lord's crucifixion, the 14th of Nisan fell, not on *Friday*, but on *Thursday*, and consequently, that our Saviour ate the Passover on the *legal* day, and was crucified on the day AFTER the Passover. The Paschal Lamb was killed on the fourteenth day of the first month, "between the two evenings," (Exodus, chap. xii. 6, marginal reading,) i. e. between three o'clock in the afternoon, and six o'clock. This day is named "the first day of unleavened bread." St. Mark says, "And the first day of unleavened bread, when they *killed the Passover*, his disciples said unto him, where wilt thou that we go and prepare, that thou mayest eat the Passover?" (Mark, ch. xiv. v. 12.) In St. Luke we read, "Then came the day of unleavened bread, when the *Passover must be killed*. And he sent Peter and John, saying, Go and prepare us the Passover, that we may eat." (Luke xxii. v. 7, 8.) That by the expression in these passages of "killing and eating the Passover," we must understand, killing and eating the Paschal Lamb, is evident from the words of our Saviour: "And when the hour was come, he sat down, and the twelve disciples with him, and he said unto them, 'With desire, I have desired to *eat this Passover* with you *before* I suffer.'" (Luke xxii. v. 14, 15.) These passages of the Evangelists, fully prove that our Saviour ate the *Paschal Lamb* with his disciples, nor can we perceive any just reason to suppose that he did not eat it on the *legal* day, and on the same day with the other Jews. But the day on which he ate it, was on the day preceding his crucifixion, i. e. on the *Thursday*. The Paschal Full Moon must, therefore, have fallen, in the year of our Saviour's Passion, on *Thursday*, and not on Friday.

In support of the opinion that our Saviour did not eat the Passover with his disciples on the legal day, several passages have been quoted from St. John. The first is that which occurs in chap. xiii. in which our Saviour is represented as washing his disciples feet, but the argument deduced from this passage cannot be applied, for the supper here mentioned, is the same with that at Bethany, and has no reference to the last supper. The next passage occurs in St. John, ch. xviii. 28, according to which, the Jews, having led Jesus from Caiaphus to the Hall of Judgment, the Evangelist informs us, that they "themselves went not into the Judgment Hall, lest they should be defiled; *but that they might eat the Passover*." A third passage occurs in the chapter following, ch. xix. v. 14: "And it was the *preparation of the Passover, and about the sixth hour*." But as Dr. Lightfoot observes, these expressions respecting the Passover do not refer to the Paschal Lamb. By the *preparation* mentioned in St. John, are intended, the *sacrifices* made by fire for a burnt-offering, on the day *after* the Paschal Lamb had been slain. This OFFERING, which was made the day after the Paschal Lamb had been eaten, is also called the PASSOVER, as will appear by comparing Deuteronomy, chap. xvi. 2, and Numbers, chap. xxviii. 17. In Deuteronomy we read, "Thou shalt sacrifice the *Passover* unto the Lord thy God, of the *Flock* and of the *Herd*, seven days shalt thou eat unleavened bread." In the book of Numbers we read, "And in the *fourteenth* day of the first Month in the *Passover* of the Lord, and in the *fifteenth* day of this Month is the *Feast*. Seven days shall uncleaned bread be eaten. In the first day (i. e. on the fifteenth of the first month) shall be a holy Convocation, ye shall do no manner of work therein, but ye shall offer a *sacrifice* made by fire, for a burnt offering unto the Lord; two young *bullocks*, and one *ram*, and seven *lambs* of the first year." Thus it is evident from these passages, that Moses applies in the book of Deuteronomy, the word *Passover* to the sacrifice of the *flocks* and of the *herds*, i. e. as appears from the book of Numbers, to the sacrifice of the two *bullocks*, the *ram*, and the seven *lambs*. On the *fourteenth* day of the month Nisan, which is also called Abib, the Paschal lamb was slain; this was the day of the Paschal Full Moon. On the *fifteenth* day, the day on which our Saviour was crucified, was the *feast*, the day on which they were commanded to have an *holy convocation*, and to offer the *burnt-offering*. It was that they might not incapacitate themselves by any defilement, for eating of the *burnt-offering*, which, both by Moses and St. John, is called the *Passover*, that the priests and elders would not enter into the house of Pilate, who was a heathen.

Having thus shewn that our Saviour ate the Paschal Lamb on the *legal* day, and that he suffered on the day *after* the Passover, we must in the next place endeavour to determine the year, and the day of the month on which he suffered.

Mr. Benson, from historical evidence, concludes in his work on the Chronology of Christ, that our Saviour was born in the 4709th year of the Julian Period. The same year is determined by Ferguson, in his Astronomy, (p. 394,) from the circumstance of Josephus having mentioned, (book xvii. ch. 8,) that there was an eclipse of the Moon at the time of Herod's last illness, "which eclipse, (says Ferguson,) appears by our Astronomical Tables, to have been in the year of the Julian Period 4710, March 13, at 3 hours past midnight. Now, as our Saviour must have been born some months *before* Herod's death, since, in the interval, he was carried into Egypt, the latest time in which we can fix the true era of his birth, is about the end of the 4709th year of the Julian Period." If we reckon thirty years from this period, it will bring us to the year J. P. 4739, which year coincides with the 15th year of Tiberius, reckoning from the year in which he was associated in the empire with Augustus, which event took place in the year A. D. 12, according to the best Chronologists. This account agrees with that of St. Luke, who refers the fifteenth year of Tiberius, and the time when Jesus himself was about thirty years of age, *to the same year*.

If we admit that our Saviour entered upon his public ministry immediately after his baptism, and that he was present at Jerusalem at the four following Passovers, his last Passover will fall A. D. 30, J. P. 4743, when he was between thirty-three and thirty-four years of age. But did the 14th of Nisan, i. e. the day on which the Paschal Lamb was slain, fall, in this year, on a Thursday? Mr. Ferguson, (p. 326 and 396,) without any reference to the crucifixion of our Saviour, has calculated that the Passover, A. D. 30, happened April 6th, at 25' 2" after eight in the evening, which day is proved by his Tables to have been on a *Thursday*, (p. 404.) We may therefore conclude, with some degree of confidence, that this was the year in which our Saviour suffered; that he ate the Passover with his disciples *Thursday*, April 6th; that he was crucified *Friday*, April 7th; that he rose from the dead, *Sunday*, April 9th, and ascended into Heaven, *Thursday*, May 18th.

It may be further remarked, that A. D. 30, J. P. 4743, the year in which Christ was crucified, coincides exactly with the middle year of the last of the seventy weeks mentioned by Daniel (ch. ix. 25-27,) for if we subtract 69 weeks of years, and 4 years, i. e. 487 years from 4743, the remainder will be J. P. 4256, or the year 457 before Christ, according to the vulgar era; in which year a commission was given to Ezra, by Artaxerxes Longimanus, to restore and re-build Jerusalem, (Ezra, ch. vii. 11.)

According to the Prophet Daniel, Messiah was to be cut off after seven weeks, and threescore and two weeks, i. e. after 483 years, and in "the midst" of the last week he was to cause the sacrifice to cease. If, by "the midst," we are to understand the *middle year* of the last week, which appears to be the natural meaning, the year decided for the crucifixion of Christ presents a most satisfactory and exact completion of the Prophecy of Daniel.

To illustrate the preceding observations, a short Chronological Table is annexed; from the inspection of which it will appear that our Saviour was baptized, according to St. Luke's account, when he was about thirty years of age, and in the 15th year of Tiberius; that, agreeably to the opinions of the most celebrated Harmonists and Commentators, he was present at four Passovers, and that the *Thursday* on which he ate the Passover with his disciples, being the day of the Paschal Full Moon, was the *legal* day. Moreover, the expression of St. John respecting the eating of the Passover, in reference to the offerings that were made on the day after the Paschal Lamb had been slain, has been shewn to be supported by the authority of Moses.

Thus the statements of the Sacred Writers harmonize with each other, without any forced interpretation or gratuitous assertion; the dates of our Saviour's birth, baptism, and crucifixion, are in unison with the relations they have given, and the year and day assigned for the last Supper of our Lord, correspond with astronomical calculation.

CHRONOLOGICAL TABLE.

Julian Period.	Vulgar Era. B.C.	True Year of C.	Year of Tiberius.	The Son of Man goeth as it is written of him! Matt. xxvi. 24.
4256	457			From this year the 70 weeks, or 490 years of Daniel are computed. (Ezra vii. 8.)
4709	5			True year of birth of J. C. towards the end.
4710	4	1		J. C. completes his first year.
4711	3	2		Herod dies after the birth of Christ. (Matt. ii.)
4712	2	3		
4713	1	4		Jesus born, Dec. 25th, according to Vulgar Era.
	A.D.			
4714	1	5		V. Era commences from the circumcision.
4721	8	12		Jesus questions the Doctors. (Luke ii. 42.)
4725	12	16	I.	Tiberius co-partner with Augustus.
4728	15	19	IV.	Augustus dies, Aug. 19.
4739	26	30	XV.	John baptizes, (Luke iii.) Jesus baptized. Last week of Daniel commences. (Dan. ix. 27.)
4740	27	31	XVI.	1 First Passover.
4741	28	32	XVII.	2 Second Passover.
4742	29	33	XVIII.	3 Third Passover.
4743	30	34	XIX.	4 Fourth Passover. Christ crucified in the middle year of the last week.
4744	31	35	XX.	5 Fifth year of Daniel's last week.
4745	32	36	XXI.	6 Sixth year.
4746	33	37	XXII.	7 Last year of Daniel's seventy weeks. 457 *pl.* 33=490 yrs. and 4746—4256=490 years.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—It was delightful to me upon my arrival here, to find a Work in vogue so instructive as that of your valuable Miscellany; but, Sir, without derogating from its merits, may I suggest to your Correspondents, that somewhat of that light entertainment we meet with in your co-temporary Literary Gazette of England, is very gratifying; and, to a man of business, when his avocations are finished, or after the man of leisure has been perusing with study the depth of thought shewn by some of your abstruse metaphysical inquiries, I repeat, Mr. Editor, how delightful it must be to either to meet with something light,—some trait of character, for instance, such as, from its simplicity and delicacy of expression, I have taken the liberty of forwarding for insertion.

COLLATOR.

Cape Town, 17th Nov.

THE WIFE.

I have often had occasion to remark the fortitude with which women sustain the most overwhelming reverses of fortune. Those disasters which break down the spirit of the man, and prostrate him in the dust, seem to call forth all the energies of the softer sex, and give such intrepidity and elevation to their character, that at times it approaches to sublimity. Nothing can be more touching than to behold a soft and tender female, who had been all weakness and dependance, and alive to every trivial roughness while treading the prosperous paths of life, suddenly rising in mental force, to be the comfort and support of her husband under misfortune, and abiding with unshrinking firmness the bitterest blasts of adversity.

As the vine, which has long twined its graceful foliage about the oak, and been lifted by it into sun-shine, will, when the hardy plank is rifted by the thunderbolt, cling round it with its carressing tendrills, and bind up its shattered boughs; so is it beautifully ordered by Providence, that woman, who is the mere dependant and ornament of man in his happier hours, should be his stay and solace when smitten with sudden calamity, winding herself into the rugged recesses of his nature; tenderly supporting the drooping head, and binding up the broken heart. I was once congratulating a friend who had around him a blooming family knit together in the strongest affection. "I can wish you no better lot," said he, with enthusiasm, "than to have a wife and children; if you are prosperous, there they are to share your prosperity; if otherwise, there they are to comfort you." And indeed I have often observed that a married man falling into adversity, is more apt to retrieve his situation in the world than a single one; partly because he is more stimulated to exertion by the necessity of the helpless and beloved beings who depend upon him for subsistence; but chiefly because his spirits are soothed and relieved by domestic endearment, and his self-respect kept alive by finding that although all abroad is darkness and humiliation, yet there is still a little world of love at home of which he is the monarch; whereas the single man is apt to run to waste and self-neglect, to fancy himself lonely and abandoned, and his heart to fall to ruin like some deserted mansion for want of an inhabitant. There is in every woman's heart a spark of heavenly fire, which lies dormant in the broad day-light of prosperity, but which kindles up, and beams and blazes, in the dark and solemn hour of adversity. No man knows what the wife of his bosom is! No man knows what a ministering angel she is, until he has gone with her, through the fiery trials of the world!!

ON COFFEE.

To the Editor of the Cape of Good Hope Literary Gazette.

SIR,—As there appears in the Literary Gazette an invitation for any information on the subject of Coffee, I beg leave to offer a few remarks. In the first place, be careful that your water boils, which done, pour one pint to two or three ounces of *Mocha Coffee*, and let it stand by the side of the fire for about five minutes, so as to extract the essence of the berry; when the grounds are settled, pour it into the vessel you intend to bring to table; let your milk be boiled, and fill the cups three parts with coffee, and the remainder with milk; if loaf sugar be used the better. By following these directions, you will have a cup of most delicious coffee.

I am, Sir,
Your obedient servant,
C. HIND, No. 8, Plein-street.
13*th Nov.* 1832.

PRINCIPIA RERUM NATURALIUM.

(Translated from the Latin.)

BY PHILOCHRESTOS, FOR THE LITERARY GAZETTE.

(Continued from Page 395, *Vol.* 2.)

I have said before, that man is formed by education and exercise, and that the organs that mediate between the senses and the mind, are fashioned by continual culture, without which culture and exercise, those organs would be closed, and then man would be like a brute. The slowness of man's progress from infancy to manhood, contribute in a most important and essential manner, to the forming and opening of such organs or motions in the most subtile membranes; besides the construction of the brain itself. For we do not grow up in less than fifteen or twenty years, or more, whilst the larger, more robust, and muscular animals, arrive at maturity in between three and five years; and during the time of adolescence, our organs are yielding and soft. like wax, which enables them to receive the natural and simple motion of the elementary world, and to accommodate it to themselves in a gradual and orderly manner, so that the vestiges and elements, or figures and diversities, of the motions they are exposed to, whilst they acquire hardness, can be fashioned in them. The reason is, because whilst the surrounding parts are fitted to each other, and increase in size, they grow hard by degrees. If, therefore, during this interval, the parts, which as yet are weak, tender, and easily affected, be agitated by perpetual and long-continued motions, their tender texture being thus constantly moved and agitated for a long time, and always acquiring finer during its growth and expansion, is rendered pliant and yielding to the innumerable different motions of this description. But on the other hand, if an animal arrive sooner at maturity, and its parts be interchangeably arranged before they are accustomed to such motions, they must be rendered more rigid, and become in a manner callous; whence the more subtile parts, and those which approximate to the most simple, afterwards yield with difficulty to the motions impressed on them, and afford no passage through them but what is gross and obscure, as if the impressed motion had to pass through a thick coat; for the greater rigidity and thickness of the coat of the organs and membranes, renders them less obedient to subtile tremors. In proportion, therefore, as an animal is longer in arriving at maturity and the full tension of its parts, the passage to its most subtile principles or organs may be rendered more open, and the coats of its membranes and parts will be thinner, more obedient to the motions impressed on them, and branching out into more numerous ramifications; consequently, the animal itself will become more perfect, provided the means capable of perfecting him be employed; which consist, as was said before, in perpetually calling his parts and faculties into use, cultivation, and motion, by means of education.

But although we acquire wisdom by experience alone, it does not therefore follow that they are the wisest who are the most experienced, or who retain a great deal in their memory; but I affirm, that they are capable of becoming wise, and that experience is the medium which leads to wisdom. For experience, considered merely by itself, is science, and not wisdom; it is the threshold and entrance by which wisdom may be approached. He is only in the first degree of wisdom, who is possessed of scientific knowledge, and is merely skilled in experiment; for such a person is only acquainted with what is posterior, and is ignorant of what is prior; thus his wisdom does not extend beyond the organs of the senses, and is unconnected with reason; when, nevertheless, true wisdom embraces both. In the state of ignorance in which we live, experiment is a kind of phantom, a mere effigy, which simulates the appearance of wisdom. At this day, they are reputed the most wise, who are most experienced, or most versed in experiment, by making a display of which they are immediately regarded as persons of acute judgment and refined perception; and the more so, if they are possessed of eloquence and an harmonious series and connection of language; and still more so, if they know how to tickle and captivate the ears of their auditors, by a sweetness and melody of voice and accent. But they alone arrive at the goal of true wisdom, who not only possess the greatest store of experience, but have also their organs so formed and disposed, from the senses even to the soul, by means of exercise, and so well and closely connected and arranged, that they can adduce from their treasures of experience whenever there is occasion, such instances, and such only, as are adapted to the present case and opportunity; by the similitude, analysis, and comparison of which, they are enabled to reason distinctly, and to arrive even at the causes of the subject of inquiry, or at the things antecedent and prior to it, by a chain of argument. But experience taken by itself, as was said before, is not wisdom. A painter who is possessed of colours and dyes, and can draw lines with them, is not therefore master of his profession; nor is a mere manufacturer of instruments capable, on that account, of touching the strings of the harp with harmony and skill. He who possesses an ostentatious number of books, is not necessarily a man of learning, nor does he, for that reason, deserve the laurel crown, for his wit may very probably be of the dullest and grossest kind. Or, to consider the matter nearer and more interiorly, the historian who has turned over a multitude of books, and has learnt from them the fates and vicissitudes of former ages, and the lives and exploits of all the heroes, is not on that account wise, and worthy of being raised to the chair of state; that is, he is not, from that circumstance alone, an able member of the commonwealth, and more deserving than others to be seated at the helm. He ought to have the events and transactions of former times so arranged, by means of his organs and the various chambers of his memory, as to be able, on every occurrence, to refer to such historical circumstances as are most similar and analagous to the case in hand, and these, and no others ought, as if spontaneously, to offer themselves to his recollection. Nor is he even then wise, unless he has previously penetrated, by means of a national philosophy, into the causes and principles of things, in order that he may afterwards be able to reason respecting present subjects, from causes and principles, or from reason and *à*

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

priori, and to form more certain conclusions by means of a connected chain of inferences; and, having his counsels derived from such a source, that he may always be able, by the timely adoption of proper measures, to provide for the welfare of the state.

Hence it follows, that he who retains all the natural experience of the world laid up in the store-house of memory, is not on that account a philosopher, and capable of knowing the causes of things, and of reasoning *à priori*; to do which he must know how to digest all things analytically, by means of geometry and rational philosophy; and must possess the faculty of reasoning philosophically, which consists in the situation and figure of the organs, as connected with the rational faculty, by continual cultivation and use. It is thus that a man may first become a philosopher, may be enabled to penetrate into the causes of things, and afterwards, from causes, to speak by means of experience or experiment.

Hitherto we have treated of the first medium leading to philosophical wisdom, or the knowledge of the mechanic or organic world: we now proceed to the next.

(To be continued.)

LITERATURE.

THE GENTLEMAN'S MAGAZINE.

THIS veteran publication is now in the hundredth year of its monthly career The symptoms of old age appear in some late exhibitions of querulous captiousness. He is very indignant at the late Parliamentary measures, and tirades with some vehemence against Byronism, Calvinism, and many other *isms*. In a review of *A Clergyman's Recreation or Sacred Thoughts in Verse*, we find in the old "*Gentleman's*" last, as follows:

"The reading world has been so long accustomed to feast, like children, on the "hot spiced ginger-bread all hot," of Byron's Banditti-Muse, and lounge over the witty but profligate pages of Don Juan, or the more decorous but not less enervating, "Loves of the Angels," and other intellectual *bijouterie* of *Little* Moore, that an author, whose harp resounds only to the songs of Zion, must expect to find himself unheeded by a multitude that is devoted to vanity."

Now, this critique is all well enough, but in the very next page there is a review of *Select Christian Authors with introductory Essays*. And we find tolerable good proof that Byron and Moore do *not* possess that general suffrage which the Reviewer had just before attributed to them.

Upwards of sixty-one volumes in prose and verse have appeared, being a selection of approved christian authors. "So large a reprint speaks highly for the present age." These are the Reviewer's own words. To these volumes we find the following contributors as introductory Essayists: Chalmers, Gordon, Wilberforce, Daniel, Wilson, Erskine, Foster, Simeon, Young, Brown, Andrew Thomson, James Montgomery, Wardlow, J. P. Smith, and Watson.

As it respects *Calvinism*, "so convinced are the Bishops," observes the Gentleman's Magazine, (page 337, Sept.) "of its irrational blasphemies, palpable absurdities, and pernicious effects, that they will not ordain, nor the Divinity Professors in our Univerities grant certificate, (or we believe) allow the attendance at their lectures or candidates for holy orders, who do not abjure Calvinism!! Calvin was in fact, no more than an unblushing impostor." One more *ism* from the same gentlemanly authority, and we have done. "*Presbyterianism* was a Jesuistical stratagem of John Calvin, intended to place society completely under the denomination of a republic of priests. For the *effectuation* of this pernicious scheme, John Knox infuriately advocated sacrilege! felony!! persecution!!! and even assassination!!!!"

MEMOIRS OF THE DUCHESS D'ABRANTES.

A new Volume, the third, has just appeared, and is by no means devoid of interest. The Duchess is a warm admirer of the character of the late Mr. Fox. She relates the following anecdote of that extraordinary man:*

Amongst the creditors of Mr. Fox, was one possessed of a bill of exchange, signed by him, which he could not get cashed.

This man called on Mr. Fox regularly three times a week, to demand the three hundred guineas due to him. The valet of the honourable debtor answered as regularly, that the master had no money, and the creditor retired in despair, for he was really in need. At length one morning he arrived, determined on forcing through all impediments, and speaking to Mr. Fox himself. The valet gave him the accustomed answer, but the creditor, who heard in an adjoining room the clinking of coin, took his resolution, hastily gained an opposite door, opened it, and found himself in the very presence of Mr. Fox, who was counting and ranging before him in rouleaus several hundred guineas. He did not exhibit the slightest embarrasment on perceiving his creditor, and listened with perfect composure to his opening observation:

"It appears, Sir, that no impossibility obstructs the payment of my bill. I am rejoiced to find you in so much better circumstances than your valet represented."

"You are under a mistake, my dear Sir, said Mr. Fox, I have not ten guineas at my own disposal. You must wait a luckier chance."

"You are certainly jesting, Sir."

And the creditor pointed with his eye and his finger to the sum of eight hundred guineas spread upon the table before him; it was sufficiently visible, partly in bank notes and partly in gold.

"This money is not mine," said Mr. Fox, "it is destined this very morning, before noon, to liquidate a debt of honour, a sacred debt."

"And yet, Sir, I doubt whether the claims you are about to satisfy are of as long standing as mine. Consider that you have been more than three years indebted to me for this sum which I advanced to you without interest."

"Oh!" answered Mr. Fox, smiling, "the creditor I am about to satisfy cannot certainly dispute with you the priority of claim, for I have been his debtor a few hours only——But," added he with more seriousness, "it is a debt of honour, and you know such debts cannot be deferred beyond four and twenty hours."

The creditor did not understand the meaning of a debt of honour in the acceptation of the gay world, till Mr. Fox explained it.

"I lost last night this sum of eight hundred guineas to Sheridan upon the simple security of my honour. If any accident should befal me before I had paid it what resource would he have? You have at least my bill, my signature; and my family would not fail to redeem it."

The honest man listened to the man of the world with a troubled countenance.

"So," said he at length, "the name of Charles Fox attached to this bill of exchange is the reason that same Charles Fox refuses to cancel the debt? Well then!" added he, tearing the paper to pieces, "now my debt is also a debt of honour, for I have no longer your security for its payment, and I have the advantage of priority over the creditor of last night."

Mr. Fox had witnessed the man's proceeding with an astonishment that may be easily conceived, his was a nature promptly susceptible of the impressions inspired by generosity and confidence. This creditor had judged him aright; he took three hundred guineas from the table, and presenting them, said—

"I thank you for your reliance upon me: here is your money. Sheridan must wait for the completion of his. Adieu, once more I thank you for trusting to my honour."

* Not altogether new to many of our readers, but very important to those who are ignorant of *the law of honour* in this colony.

LITERARY EXTRACTS.

RECEIPTS FOR IMPROVING THE MEMORY. Several writers on Mnemonics have given medical precepts for strengthening the memory. Wholesome air is accounted a great requisite; exercise in delightful places is recommended; bathing the feet in decoctions of camomile; eating particular meats, as the brains of sparrows, hares, and rabbits; and a breakfast consisting of twelve raisins, without drink of any kind. Frequent prayer, and the daily habit of combing the hair backward, while fasting, are very beneficial to memory. The supper should be larger than the dinner—(which we should think very necessary, if the dinner consisted of sparrows' brains, and the breakfast of a dozen raisins);—meals should be taken at regular seasons, and the patient or student,—whichever we may consider him,—should be careful to shut his chamber window at bed-time, and to avoid sleeping under the moon beams. One writer recommends the refraining from too much sleep, from sleeping in the day-time, or 'upon the noddle of the head.' Various medicaments are prescribed; among others, the shavings of ivory taken in a little wine in the morning, and a grain of white frankincense in a draught of some liquid, at bed time, &c. It is good to anoint the back part of the head with oil of mustard-seed, or to apply to it a plaster made of certain flowers, leaves, and spices. Very much more has been said on the subject, than we have room to quote; but one prescription, as likely, perhaps, to be efficient, as any that have been recorded, is Dr. Johnson's, who recommended a kick on the shins. A more gentle nature might have prescribed a more agreeable and not less powerful remedy for a bad memory; but, this, like other complaints, will probably require different treatment, according to the constitution of the patient.—(*Calcutta Literary Gazette*)

UTILITY OF DULLNESS.—Dull, timid, and weak men are, as it were, the cement of society. The mortar which serves to connect and bind together the more valuable parts of the great

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

fabric. They are, like their supposed prototype, an indispensable part of a superstructure; a sort strifling negative series of particles, which, however worthless in themselves, cannot be done without.—They are the seasoning of society—somewhat liberally springled, to be sure. They give a *gout* and flavour to the social circle, which even attic salt cannot impart. Paradoxical as it may appear, they are the finest possible breaks in the continuity of mere liveliness, and converse would actually become *tame* without them.—A dull uniformity would prevail; and we all know by experience, that nothing palls so much as unvaried sprightliness, unshaded mirth, and unrelieved brilliancy. Deathlike dullness itself is not so tiresome and fatiguing. When a boy, I have often made fireworks:—once in compounding a set of squibs I forgot to mix up with positives of saltpetre and gunpowder the negative of pounded charcoal; and in firing them off, each consisted of but one explosion, bright no doubt, but transient also and dangerous withal; while the squibs which were rightly mixed up were both bright, sparkling too, and much more lasting;—besides they did not scorch me. Dull men are then, to Society what charcoal is to squibs.—[We extract this from a very agreeable volume, composed of short pieces in verse and prose, called the *Chameleon*.]

"*A little Learning is a dangerous Thing*."—Then make it greater. No learning at all is surely the most dangerous thing in the world; and it is fortunate that, in this country at least, it is a danger which cannot possibly exist. After all, learning is acquired knowledge, and nothing else. A man who can read his Bible has a little learning; a man who can only plough or dig, has less; a man who can only break stones on the road, less still, but he has some. The savages in one of the islands in the South Sea, stood with great reverence round a sailor who had lighted a fire to boil some water in a saucepan; but as soon as the water began to boil, they ran away in an agony of terror. Compared with the savages, there is no boy in Europe, of the age of ten years, who may not be called learned. He has acquired a certain quantity of practical knowledge in physics; and, as this knowledge is more than instinct, it is learning; learning which differs in degree only from that which enables a chemist to separate the simple metals from soda or potash.

The geographer Malte Brun remarks, that in many cities of the United States, that which is called a mob scarcely exists. Now it will be found that in these cities education has been unstintedly bestowed upon all classes, down to the very lowest.—*(Penny Magazine.)*

THE VALUE OF A PENNY.

It is an old saying, that, "a pin a day is a groat a year," by which homely expression some wise man has intended to teach thoughtless people the value of small savings. We shall endeavour to show the value of a somewhat higher article, though a much despised one,—we mean a penny.

Pennies, like minutes, are often thrown away because people do not know what to do with them. Those who are economists of time, and all the great men on record have been so, take care of the minutes, for they know that a few minutes well applied each day will make hours in the course of a week, and days in the course of a year; and in the course of a long life they will make enough of time, if well employed, in which a man may by perseverance have accomplished some work, useful to his fellow-creatures, and honourable to himself.

Large fortunes, when gained honestly, are rarely required in any other way than by small savings at first; and savings can only be made by habits of industry and temperance. A saving man, therefore, while he is adding to the general stock of wealth, is setting an example of those virtues on which the very existence and happiness of society depend. There are saving people who are misers, and have no one good quality for which we can like them. These are not the kind of people of whom we are speaking; but we may remark that a miser, though a disagreeable fellow while alive, is a very useful person when dead. He has been compared to a tree, which, while it is growing, can be applied to no use, but at last furnishes timber for houses and domestic utensils. But a miser is infinitely more useful than a spendthrift, a mere consumer and waster, who, after he has spent all his own money, tries to spend that of other people.

Suppose a young man, just beginning to work for himself, could save one penny a day; and we believe there are few unmarried young workmen who could not do this. At the end of a year he would have 1*l.* 10*s.* 5*d.*, which he could safely deposit in a savings' bank, where it would lie safely with some small addition for interest, till he might want it. After five years' savings, at the rate of a penny a day, he would have between 8 and 9*l.*, which it is very possible he might find some opportunity of laying out to such advantage as to establish the foundation of his future fortune. Who has not had the opportunity of feeling some time in his life how advantageously he could have laid out such a sum of money, and how readily such a sum might have been saved by keeping all the pennies and sixpences that had been thrown away? Such a sum as 8*l.* or 9*l.* would enable a man to emigrate to Canada, where he might, by persevering industry, acquire enough to purchase a piece of land; and, if blessed with moderate length of life, he might be the happy cultivator of his own estate.

Eight pounds would enable a mechanic, who had acquired a good character for sobriety and skill, to furnish himself on credit with goods and tools to five or six times the amount of his capital; and this might form the foundation of his future fortune.

It often happens that a clever and industrious man may have the opportunity of bettering his condition by removing to another place, or accepting some situation of trust; but the want of a little money to carry him from one place to another, the want of a better suit of clothes, or some difficulty of that kind, often stands in the way. Eight pounds would conquer all these obstacles.

It may be said that five years is too long a time to look forward to. We think not. Britain is full of examples of men who have risen from beginnings hardly more than the savings of a penny, through a long course of persevering industry, to wealth and respectability. And we believe there is hardly a condition, however low, from which a young man of good principles and unceasing industry may not elevate himself.

But suppose the penny only saved during one year; at the end of it the young man finds he has got 1*l.* 10*s.* 5*d.* Will he squander this at the ale-house, or in idle dissipation, after having had the virtue to resist temptation all through the year? We think not. This 1*l.* 10*s.* 5*d.* may perform a number of useful offices. It may purchase some necessary implement, some good substantial article of dress, some useful books, or if well laid out, some useful instruction in the branch of industry which is his calling. It may relieve him in sickness, it may contribute to the comfort of an aged father, it may assist the young man in paying back some part of that boundless debt which he owes to the care and tender anxiety of a mother, who has lived long enough to feel the want of a son's solicitude. Finally, however disposed of at the end of the year, if well disposed of, the penny saved will be a source of genuine satisfaction. The saving of it during the year has been a daily repetition of a virtuous act, which near the end of the year we have little doubt will be confirmed into a virtuous habit.

Suppose a dozen young men, who are fond of reading, were to contribute a penny a week to a common stock: at the end of the year they would have 2*l.* 12*s.* This sum judiciously laid out, would purchase at least twelve volumes of really useful books, varying in price from three to four shillings, besides allowing some small sum for the person who took care of them and kept the accounts. Another year's saving would add another twelve volumes; and in five years the library might contain sixty volumes, including a few useful books of reference, such as dictionaries, maps, &c.—an amount of books, if well chosen, quite as much as any one of them would be able to study well in his leisure hours.

But suppose the number of contributors were doubled or trebled, the annual income would then amount to 5*l.* 4*s.*, or 7*l.* 16*s.*, for which sum they could certainly procure as many useful books as they could possibly want. There might be some difficulty in the choice of books, as it is not always easy to know what are good and what are bad. Do you intend doing so? At present we will merely suggest what *classes* of books might gradually find admission into such a library. There are now good practical and cheap treatises on the principles of many of the branches of industry which are followed by mechanics—such as books on the elements of geometry and measuring of surfaces and solids; on arithmetic; on chemistry, and its application to the useful arts, &c, lives of persons distinguished for industry and knowledge; descriptions of foreign countries, compiled from the best travels; maps on a pretty large scale, both of the heaven and of different parts of the earth: such books as these, with an English dictionary, a gazetteer, and some periodical work, would form a uselul library, such as in a few years might be got together.

It would be impossible to enumerate all the good things that a penny will purchase; and as to all the bad things, they are not worth enumerating. But there is one which we cannot omit mentioning. A penny will buy a pennyworth of brandy or wine, and a man may spend it daily without thinking himself the worse for it. But as every penny saved tends to give a man the habit of saving pennies, so every penny spent in liquor, tends to cause him to spend more. Thus the saver of the penny may at the end of the year be a healthy reputable person, and confirmed economist with 1*l.* 10*s.* 5*d.* in his pocket: the spender may be an unhealthy, ill-looking, worthless fellow; a confirmed drinker, with nothing in his pocket except unpaid bills.

We wish it were in our power to impress strongly on the working people of every kingdom, how much happiness they may have at their command by small savings. They are by far the most numerous part of the community; and it is by their condition that the real prosperity of the country should be estimated; not by the few who live in affluence and splendour. Hard as the condition of the working classes often is, are they not yet aware that by industry, frugality, and a judicious combination of their small resources, they can do more to make themselves happy, than anybody else can do for them? *(Ib.)*

DR. FRANKLIN'S MORAL CODE.

The great American philosopher and statesman, Benjamin Franklin, drew up the following list of moral virtues, to which he paid constant and earnest attention, and therby made himself a better and a happier man:—

Temperance.	Eat not to fullness; drink not to elevation.
Silence. . .	Speak not but what may benefit others or yourself; avoid trifling conversation.
Order. . . .	Let all your things have their places; let each part of your business have its time.
Resolution. .	Resolve to perform what you ought; perform without fail what you resolve.

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

Frugality. . Make no expense, but do good to others or yourself; that is, waste nothing.

Industry. . . Lose no time; be always employed in something useful; cut off all unnecessary actions.

Sincerity. . . Use no hurtful deceit; think innocently and justly; and if you speak, speak accordingly.

Justice. . . . Wrong none by doing injuries, or omitting the benefits that are your duty.

Moderation. Avoid extremes; forbear resenting injuries.

Cleanliness. . Suffer no uncleanliness in body, clothes, or habitation.

Tranquillity. Be not disturbed about trifles, or at accidents common or unavoidable.

Humility. . Imitate Jesus Christ.

The same great man likewise drew up the following plan for the regular employment of his time; examining himself each morning and evening as to what he had to do, what he had done, or left undone; by which practice he was better able to improve his future conduct:—

Morning. *Hours.*

To question, What good shall I do today?

6 Rise, wash, and address Almighty God! contrive the day's business, and take the resolution of the day; prosecute the present study; and breakfast.
7
8
9
10 Work.
11
12
1 Read or look over my accounts
2 and dine.
3
4
5 Work.
6
7

Evening. *Hours.*

The question, What good have I done today? what have I left undone which I ought to have done?

8 Put things in their places; amusement;
9 supper; examination
10 of the day; address the Almighty.
11
12
1
2 Sleep.

A steady perseverance in *some plan* for the arrangement of our time, adapted to circumstances, cannot fail improving our general conduct in life, and rendering us better members of society, and better Christians.

WONDERFUL ROBERT WALKER.

Wonderful Robert Walker, as he is still called in the district of the country where he resided, was curate of Seathwaite, in Cumberland, during two thirds of last century. The fullest account that has appeared of Mr. Walker is that given in the notes to his series of sonnets entitled "The River Doddon," by Mr. Wordsworth. From this memoir it appears that Walker was born in the parish of Seathwaite, in 1709; that, being of delicate constitution, it was determined by his parents, whose youngest child he was, to breed him a scholar; and that accordingly he was taught the elements of reading, writing, and arithmetic by the clergyman of the parish, who also officiated as schoolmaster. He afterwards contrived to acquire a knowledge of the classics; and becoming in this manner qualified for taking holy orders, was ordained, and appointed to the curacy of his native parish, which was at this time (about the year 1735,) of the value of five pounds per annum. On obtaining possession of this living, Walker married,—his wife bringing him what he calls himself, in one of his letters, a fortune of forty pounds. About twenty years after Walker's entrance upon his living, we find its value, according to his own statement, increased only to the amount in all of seventeen pounds ten shillings. At a subsequent period it received a further augmentation, to what amount is not stated; but it was not considerable. Before this Mr. Walker had declined to accept the adjoining curacy of Ulpha, to be held, as proposed by the bishop, in conjunction with that of Seathwaite, considering, as he says himself, that the annexation "would be apt to cause a general discontent among the inhabitants of both places by either thinking themselves slighted, being only served alternately, or neglected in the duty, or attributing it to covetousness in me; all which occasions of murmuring I would willingly avoid." Yet at this time he had a family of eight or nine children. One of his sons he afterwards maintained at the college of Dublin till he was ready for taking holy orders. He was, like his predecessors in the same cure, schoolmaster as well as clergyman of his parish; but "he made no charge," says his biographer, "for teaching school; such as could afford to pay, gave him what they pleased." His hospitality to his parishioners every Sunday was literally without limitation; he kept a plentiful table for all who chose to come. Economical as he was, no act of his life was chargeable with any thing in the least degree savouring of avarice; on the contrary, many parts of his conduct displayed what in any station would have been deemed extraordinary disinterestedness and generosity. Finally, at his death, in 1802, he actually left behind him no less a sum than two thousand pounds.

There is in all this, as Mr. Wordsworth remarks, something so extraordinary as to make some explanatory details necessary. These we shall give in his own words:—"And to begin," says he, "with his industry; eight hours in each day, during five days in the week, and half of Saturday, except when the labours of husbandry were urgent, he was occupied in teaching. His seat was within the rails of the alter, the communion-table was his desk; and like Shenstone's school-mistress, the master employed himself at the spinning-wheel, while the children were repeating their lessons by his side. Every evening after school hours, if not more profitably engaged, he continued the same kind of labour, exchanging, for the benefit of exercise, the small wheel, at which he had sate, for the large one on which wool is spun, the spinner stepping to and fro. Thus was the wheel constantly in readiness to prevent the waste of a moment's time. Nor was his industry with the pen, when occasion called for it, less eager. Entrusted with extensive management of public and private affairs he acted in his rustic neighbourhood as scrivener, writing out petitions, deeds of conveyance, wills, covenants, &c. with pecuniary gain to himself, and to the great benefit of his employers. These labours, at all times considerable, at one period of the year, viz. between Christmas and Candlemas, when money transactions are settled in this part of the country, were often so intense, that he passed great part of the night, and sometimes whole nights, at his desk. His garden, also, was tilled by his own hand; he had a right of pasturage upon the mountains for a few sheep and a couple of cows, which required his attendance: with this pastoral occupation he joined the labours of husbandry upon a small scale, renting two or three acres in addition to his own, which was less than one acre of glebe; and the humblest drudgery which the cultivation of these fields required, was performed by himself. He also assisted his neighbours in haymaking and shearing their flocks, and in the performance of this latter service, he was eminently dexterous. They, in their turn, complimented him with the present of a haycock, or a fleece, less as a recompence for this particular service, than as a general acknowledgment. The sabbath was in a strict sense kept holy; the Sunday evenings being devoted to reading the Scriptures, and family prayers. The principal festivals appointed by the Church were also duly observed; but through every other day in the week, through every week in the year, he was incessantly occupied in works of hand or mind; not allowing a moment for recreation, except upon Saturday afternoon, when he indulged himself with a newspaper, or sometimes with a magazine. The frugality and temperance established in his house were as admirable as the industry. Nothing to which the name of luxury could be given, was there known; in the latter part of his life indeed, when tea had been brought into almost general use, it was provided for visitors, and for such of his own family as returned occasionally to his roof, and had been accustomed to this refreshment elsewhere; but neither he nor his wife ever partook of it. The raiment worn by his family was comely and decent, but as simple as their diet; the home-spun materials were made up into apparel by their own hands. At the time of the decease of this thrifty pair, their cottage contained a large store of webs of woollen and linen cloth woven from thread of their own spinning. And it is remarkable that the pew in the chapel in which the family used to sit, remained a few years ago neatly lined with woollen cloth spun by the pastor's own hands. It is the only pew in the chapel so distinguished; and I know of no other instance of his conformity to the delicate accommodations of modern times. The fuel of the house, like that of their neighbours, consisting of peat, procured from the mosses by their own labour. The lights by which, in the winter evenings, their work was performed, were of their own manufacture, such as still continue to be used in these cottages; they are made of the pith of rushes dipped in fat. *White* candles, as tallow candles are here called, were reserved to honour the Christmas festivals, and were, perhaps, produced upon no other occasions. Once a month, during the proper season, a sheep was drawn from their small mountain flock, and killed for the use of the family; and the cow, towards the close of the year, was salted and dried for winter provision; the hide was tanned to furnish them with shoes. By these various resources this venerable clergyman reared a numerous family; not only preserving them, as he affectingly says, "from wanting the necessaries of life, but affording them an unstinted education, and the means of raising themselves in society."

All this is a striking example of what assiduity and perseverance will do in any pursuit. But with all his industry of another description, Mr. Walker did not find it impossible to nourish and exercise also his mental powers. "It might have been concluded," his biographer proceeds, "that no one could thus, as it were, have converted his body into a machine of industry for the humblest uses, and kept his thoughts so frequently bent upon secular concerns, without grievous injury to the more precious parts of his nature. How could the powers of intellect thrive, or its graces be displayed, in the midst of circumstances apparently so unfavourable, and when to the direct cultivation of the mind so small a portion of time was allotted? But in this extraordinary man, things in their nature adverse were reconciled; his conversation was remarkable, not only for being chaste and pure, but for the degree in which it was fervent and eloquent; his written style was correct, simple and animated. Nor did his *affections* suffer more than his intellect; he was tenderly alive to all the duties of his pastoral office; the poor and needy 'he never sent empty away'; the stranger was fed and refreshed in passing that unfrequented vale; the sick were visited; and the feelings of humanity found further exercise among the distresses and embarrassments in the worldly estate of his neighbours, with which his talents for business made him acquainted; and the disinterestedness, impartiality, and uprightness, which he maintained in the management of all affairs confided to him, were virtues sel-

Digitised by the Department of Library Services in support of open access to information, University of Pretoria, 2024

dom separated in his own conscience from religious obligations."

What may be deemed out of character, we may merely add, in some of the occupations in which this excellent clergyman was wont to employ himself, ought to be judged of with a reference both to the times in which he was born and grew up, and to the simple and sequestered population among whom it was his lot to pass his life. "Had he lived," says Mr. Wordsworth justly, "at a later period, the principle of duty would have produced application as unremitting; the same energy of character would have been displayed, though in many instances with widely different effects."

FREE TRADE.

The whole increase of British tonnage from 1821-2-3 to 1830-1, is 605,523.* Of this increase there has been in

Northern Europe	284,877
Southern Europe	64,193
United States of America	35,324
To these we may add, for the Foreign West Indies, and Continental Colonies	22,235
With the inconsiderable exception of our possessions in the Mediterranean, the whole of this is strictly foreign trade, in the sense of the North-American reviewer; and the *total increase*, on an average of the last two years, *of British shipping employed in foreign trade, since the adoption of "the new system," is*	†406,929
Now let us take the countries with which our trade is chiefly with our own possessions, as	
Asia†	30,684
Africa	43,095
British Northern Colonies	101,128
British West Indies	14,296
Channel Islands	28,435
Increase upon the trade with our own possessions	§217,638
